At the global space creative and qualitative human resources are becoming a major factor determining differentiation between countries and are important elements of competition both in global and regional level. Statistical data show that European countries pay special attention to lifelong learning programs (continuous training) to improve the quality of human resources, especially because the European countries are characterized by high differentiation in the human resources. In the recent projects, which are focused on the development and crisis management, human capital is recognized as an important tool (Iatagan, Dinu & Stoica, 2010). Concerning this, European Union member countries use vocational education and various types of training (through expanding existing programs and the introducing of new) for mitigating impact of the global economic downturn (Heyes, 2013).

Similar findings have been received in the U.S. Research results indicate that in order to reduce the impact of globalization, the development of skills and competencies should be encouraged, what mean investments in human capital (Hickman & Olney, 2011).

Importance of human capital in economic development increased with the emergence of endogenous growth theory (Lanzi, 2007), in which technology, knowledge, intellectual capital and productivity are indicated like basis for economic development (Chen & Dahlman, 2005). According to the strategy „Europe 2020” and its initiative „Innovation Union” economy should be based on science-intensive and high-technology sectors that contribute to the formation of an innovative economy.

It should be noted that the European Union member countries have different levels of economic development, experience, available resources, consequences of the global economic downturn, but a common goal, set by the strategy „Europe 2020”, as a result they also have a different starting position to achieve this goal.

Widely recognized fact is that achieving sustainable economic development without investments in human capital is not possible, because it is one of the most important factors of development. The link between economic growth and human capital has long been recognized. Many studies, particularly in Western Europe showed a positive impact of human capital on economic growth (Jajri & Ismail, 2012).

Human capital and education are positioned as significant factors in the economic growth process (Romer, 1986; Lanzi, 2007) however, it should be noted that economic growth is not always conducive to employment, because high productivity level can ensure prosperity in conditions of unchanged number of employees (Krasnopjorovs, 2010). In this regard, once again the high level of competition in the labor market should be highlighted, what makes it necessary to raise the level of human capital development.

Importance of education in employment is actively emphasized in studies, because, depending on the level of education level of productivity varies, as a result wage level also varies (Furia, Castagna, Mattoscio & Scamuffa, 2010). As pointed out by Becker (1964), individuals choose the most appropriate level of education in order to balance the marginal costs and marginal returns, while McKenna (1996) points out that education expands employment opportunities, because educated workers are productive in all jobs, while uneducated workers are productive only in some works.

## 3. The Data and Methodology of Research

Purpose of this article is to assess interaction between human capital, education and the labor market in Latvia. Author defines the human capital in present research like prospective employees in Latvia, who through the choice of higher or professional education and certain programmes increases quality of their human capital, as well as tries to realize their potential in the labor market.

Identification and evaluation of interaction are carried out using data on:

- new enrollees in higher and vocational education – assessment of changes in share of new enrollees by thematic groups can help us identify whether prospective employees properly assess changes in the structure of economy and thus in future will be in demand in labor market;
- employment and gross value added by sectors of economy – usage of these data make possible to evaluate the changes in the structure of economic sectors, which leads to changes in the labor market also; this information as well as information on regional specialization prospective employees should take into account;
- occupied posts and vacancies by economic activity – usage of these data make possible to evaluate the information on labor market dynamics.

The data of Central Statistical Bureau of Latvia are used for the period since 2005 till 2012.

Data analysis is based on calculations of Structural Change Index (SCI) to assess changes of relative importance of the studied issues (Productivity Commission, 1998). During the study regional specialization were identified in Latvia. In the author's opinion this is important information which should be taken into account by prospective employees, when they choose direction in education. Identification of regional specialization is based on Location Quotient (LQ) calculations (Florida State University. Department of Urban and Regional Planning. Planning Methods III: Forecasting, 2013). Interaction between education and labor market is assessed using correlation analysis.

#### 4. Research Results

The global economic downturn severely affected the Latvian economy. As a result, GDP fell by 25%, while the unemployment rate increased by about 20% (Ekonomikas Ministrija, 2012).

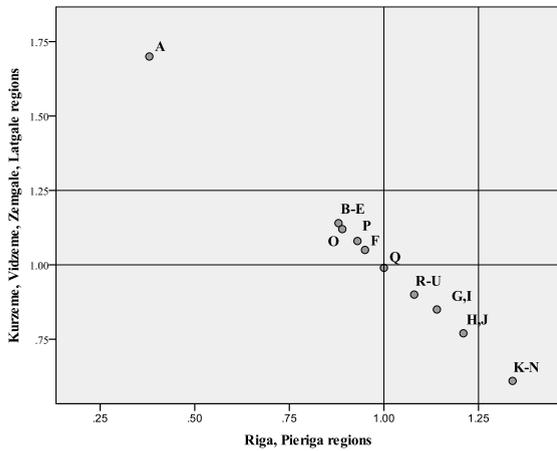

Given that the service industries with low productivity level and strong focus on domestic market predominated in Latvia during the pre-crisis period, in turn, currently the country's economic recovery is based on export-oriented manufacturing sectors, mismatches between skills of job seekers and labor market demand could be formed. In addition, the growth mainly will be driven by an increase in productivity rather than an increase in number of employees. Almost  $\frac{2}{3}$  increase in demand of the labor force by 2020 will be provided through three sectors - manufacturing, trade and business services (Ekonomikas Ministrija, 2012).

Latvia is characterized by high regional differentiation and Riga region produces more than half of the country's GDP, thus greater job opportunities in Riga region could be observed. Regional specialization which may constitute a larger share of the labor market demand within the region is an important factor to be taken into account by future employees.

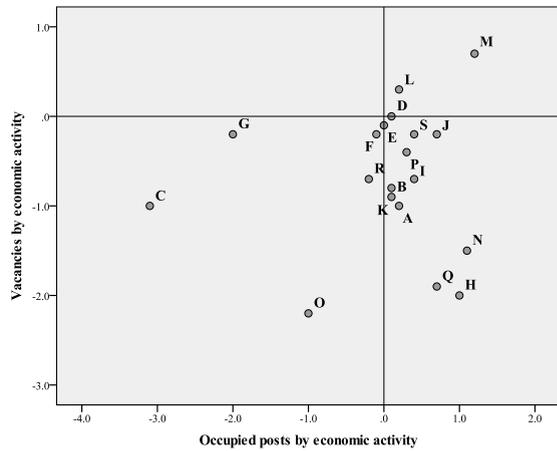

For example, the LQ calculations indicate that regional specialization in Riga and Pieriga is based on „Financial, insurance, scientific and administrative activities” (K-N) sector, in turn, other regions of the country are specializing on „Agriculture, forestry and fishing” (A). In conformity with LQ calculations „Industry and energetic” (B-E) sector is positioned as sector of local interest in Latgale, Videzeme, Zemgale and Kurzeme regions, in turn, in Riga and Pieriga regions „Trade, accommodation and food service activities” (G,I) sector and „Transportation, storage, information and communication” (H,J) sector are sectors of local interest (see Fig.1.).

Calculated LQ values indicate that in Riga and Pieriga regions, where more than half of the country's GDP is produced, and thus higher number of employees is employed, service sector is dominated. The fact that among the region's specialization also an export-oriented service sectors are observed as positive aspect could be noted. In other regions much more emphasis on sectors, which produce material goods, is done, particularly, on agriculture sector.

Dynamic of occupied posts and vacancies between the 2005 and 2012 indicates that the major role in the country's employment such service industries as „Real estate activities” (L) and „Professional, scientific and technical activities” (M) play. But the biggest amount of persons, who lost their job, in industries such as Manufacturing (C), Wholesale and retail trade; repair of motor vehicles and motorcycles (G), Public administration and defense; compulsory social security (O) was observed.

(b)

Fig. 1. Characteristics of labor market in Latvia: (a) Regional specialization in Latvia, LQ values in 2012, (b) Occupied posts and vacancies by economic activity in Latvia in 2005 and 2012, changes in %

(a)

(b)

Fig. 2. New enrollees and graduates in higher and vocational education in Latvia in 2005 and 2012, changes in %: (a) New enrollees and graduates in higher education, (b) New enrollees and graduates in vocational education

Future employees in choosing scope and direction of education should take into account not only the global labor market trends, but also regional specialization and dynamic of occupied posts and vacancies. Analysis of

this indicators show that important role in the country's economy „Financial, insurance, scientific and administrative activities; real estate activities” (K-N) sector has, as well as „Agriculture, forestry and fishing” (A) depending on region.

Calculated LQ values that represent the regional specialization indicate a relatively weak interest of prospective employees in education in relevant areas. For example, the number of new enrollees and number of graduates in programme „Agriculture” practically unchanged, despite the fact that the agriculture in accordance with the LQ calculations can be regarded as sector of regional specialization in four regions in Latvia, and over the period analyzed, despite the reduction in vacancies, changes in number of occupied posts almost did not happen (see. Fig. 1.).

One more example indicates that both in higher, as well as in professional education a marked decrease in the programme „Social sciences, business and law” was observed, but specialization of Riga and Pieriga regions is „Financial, insurance, scientific and administrative activities” (K-N) sector, and during period analyzed a slight increase in vacancies in this sector was observed (for example, industries „Real estate activities” (L) and „Professional, scientific and technical activities” (M)) (see Fig. 2.).

It is also important to consider the fact that a large proportion of workers are employed in positions for which they have no adequate level of education, and statistically this phenomenon is difficult to determine, therefore the analysis is based on the assumption that all students plan to work in accordance with their education.

A gradual increase in popularity in such areas of education as „Engineering, manufacturing and construction”, „Natural sciences, mathematics, and information Technologies”, „Health and welfare” was observed, what is in accordance with aim of country to base economic growth on high-technology and science-intensive industries.

An important factor in the choice of a particular educational program is the existence of state financed budget places. In conformity with data the biggest amount of new enrollees in 2010 and 2011 was observed in such programmes as „Engineering, manufacturing and construction” (26.1 and 26.6% of all budget places) and „Health and welfare” (16.8 and 16.3% of all budget places) (Ekonomikas Ministrija, 2012).

Changes in the structure of economy in Latvia reflect global economic trends and strive to an economy based on industries with high value added. Gradually, this trend is also reflected in the students' choice. This is partly a result of the state's activities - allocation of budget places and scholarships, thus affecting students' choice.

The question is whether these processes reflect tendencies in the Latvian labor market and are linked to them?

In order to determine the interaction between the labor market and education (education essentially impacts quality of human capital and its necessity in labor market), as well as to evaluate this interaction, correlation analysis for structural changes in the economy (employment and value added), education (higher and vocational education) and labor market (vacancies and occupied posts) was used.

The data of correlation matrix (see Table 1) indicate that the choice of future employees in favor to a particular educational direction is not related to changes in the structure of economic sectors (assessing these changes by number of employees and value added).

The calculations suggest that between SCI values of higher education and employment structure a weak positive statistically insignificant correlation is observed (value of correlation coefficient is 0.147) (see Table 1). Similar characteristics of relationship between SCI values of higher education and value added are detected. Despite the slightly higher value of correlation coefficient (value of correlation coefficient is 0.403), relationship between SCI values of higher education and value-added also indicates on weak positive statistically insignificant correlation (see Table 1).

The choice of new enrollees in favor to vocational education also is not influenced from structural changes in the economy. The correlation coefficients between the SCI values of vocational training, employment structure and the structure of value added point to a weak negative correlation (values of correlation coefficients, respectively -0.457 and -0.243) (see Table 1). Taking into account results of correlation analysis author concludes that the interaction between education and the labor market in Latvia, assessing this interaction in terms of

changes in structure of economy, is weak. So, the tendencies in country's economy do not affect the choice of new enrollees and brighter this process is reflected in vocational education.

Interaction between education and labor market is evaluated by using changes in structure of vacancies and occupied posts also.

The data of Table 2 also indicate the weak interaction between education and the labor market. In accordance with calculations weak positive statistically insignificant correlation (value of correlation coefficient is 0.462) between SCI values of higher education and vacancies was detected. A similar relation between the SCI values of vocational education and vacancies was found. Despite the fact that the correlation coefficient is slightly higher, the relationship remains weak, positive and statistically insignificant (see Table 2).

The correlation coefficient between the SCI values of education and occupied posts also points out on a weak and statistically insignificant linkage and its value is even negative in the case of vocational education (value of correlation coefficient is -0,216) (see Table 2).

Table 1. Correlation matrix for SCI values of Latvian economy, higher and vocational education

	Employment	Gross value added	Higher education	Vocational education
Employment	1	.327	.147	-.457
Gross value added	.327	1	.403	-.243
Higher education	.147	.403	1	-.027
Vocational education	-.457	-.243	-.027	1

Table 2. Correlation matrix for SCI values of Latvian labor market, higher and vocational education

	Vacancies	Occupied posts	Higher education	Vocational education
Vacancies	1	.585	.462	.371
Occupied posts	.585	1	.215	-.216
Higher education	.462	.215	1	-.027
Vocational education	.371	-.216	-.027	1

Assessing the interaction between education and the labor market on the basis of structural changes in the vacancies and occupied posts, the weak interaction also was detected.

The calculations indicate that changes in structure of economy do not determines the choice of future employees in favor to specific education (which would be desirable), as well as vacancies' dynamics do not influence this kind of choice (which would be relatively logical).

## 5. Conclusion

A rational reaction of workforce on the needs and changes in labor market is important factor, which affects sustainability of economic growth welfare. Human capital in Latvia is recognized as one of the most important resources, but at the same time in the country's labor market a number of problems are identified, hindering the realization of human capital's potential. Most of them were associated with relatively low and relatively inadequate investments in human capital. Emergence of the problem of discrepancies between changes in labor market and workers' skills and education in Latvia creates a need to assess interaction between education and the labor market. Author's evaluation was based on two aspects: changes in the structure of the economy and

changes in the labor market structure. The research results indicate that changes in the branch structure of economy practically do not affect the choice of prospective employees. A relatively weak interest of prospective employees in field of education, which would allow them to work in regional specialization areas, should be noted. Analysis indicates that changes in the structure of labor market relatively little affect the choice of prospective employees in favor to certain educational direction. During the research, the author concludes that the interaction between education and the labor market in Latvia is weakly expressed.

## Abstract

Within the framework of equality and social justice, social work is an applied science and profession which aims to solving the problems of individuals, families, groups and communities and to strengthening their problem – solving capacities via the perspective of “person in environment”. The human rights education is one of the fundamental values of this applied field. Knowing and using their rights provide them to ensure their psychosocial well-being and life in human dignity. Social workers have helped their clients by using professional roles. In this study, it will be examined the curriculum of Hacettepe University The Department of Social Work which is the pioneer in Turkey and will be discussed the place of human right education in social work.

Keywords: Social work, human rights education, Hacettepe University the department of social work undergraduate curriculum.

---

## 1.Introduction

The notion of human rights which has been used widely in our age has appeared after the destructions of the Second World War and has been secured at the international level by UN-Declaration of Human Rights which was accepted in December 10, 1948. Human rights, as the starting point, which has been featured the understanding of reserving and securing the human rights against the state which is accepted as the most violating the human rights and freedoms, are innate and inalienable rights (Karataş, 2002). These rights occupy an important place as a discipline and profession in the social work.

The principle of social work which aims at developing the social functionality of the clients by dealing with the problems of individual, family and groups with the help of the approach of the person in environment can be defined as a profession serving the human rights within the frame of basic tenets of it. Social work deals with fundamentally the problems and needs of human beings. When these problems are not solved and the needs are not required, this means an abuse of a human right. Social work is responsible for removing the obstacles to use rights (Karataş,2002). The fact that the profession of social work depends on the human rights and the

\* Corresponding author. Tel.:+90 0312 297 63 63 / 350; fax:+90 0312 297 63 65.  
E-mail address: edabeydili@gmail.com

principles of social justice is simply stated in the definition of social work, accepted by IFSW in 2000. According to this definition, social work profession facilitates social change and development, social cohesion, and the empowerment and liberation of people. Principles of social justice, human rights, collective responsibility and respect for diversities are central to social work. Underpinned by theories of social work, social sciences, humanities and indigenous knowledges, social work engages people and structures to address life challenges and enhance wellbeing (<http://ifsw.org/get-involved/global-definition-of-social-work/>).

In our country, the settlement of social work discipline which adopts so distinguished purposes has importance in respect of the development of human rights. Hacettepe University Department of Social Work, which had the first social work school and had the feature as the first until 2002 has raised social workers with the master and PhD programs in addition to undergraduate education. This department in question serves as a model in behalf of some departments of social works which have been tried to be founded with the help of scientists who are from different disciplines such as sociology, psychology and medicine because of the decrease of the qualified academicians who develop themselves in terms of social work and whose numbers gradually increase. In this work, the importance of human rights for social work will be argued through the examination of undergraduate program. In addition this, there will be an endeavor to show how should be the education of human rights for the departments of social work which will be founded or have been founded.

## **2.The General Information About Social Work Education**

Towards the end of the 19<sup>th</sup> century, the solutions seeking for the problems especially poverty, which were appeared in United States and Europa after the Industrial Revolution caused the first education activity to begin in behalf of social work. The courses which was opened in German and England in 1890s and the summer school in New York in 1898 are accepted among the first practices of education (Karataş ve Erkan, 2005). In Amsterdam, the first school of social work was opened in 1899.

The social work education makes a great progress in the World since the first times when it began whereas in Turkey, coming into question of the social work arrives considerably late. In 1959, the Institute of Social Works was founded and in 1961, Academy of Social Work went into action depended upon Ministry of Public Health and Welfare. In 1967, The Graduate School of Social Work was founded in Hacettepe University and these two schools were syndicated as one school in 1983 as a result of the conditions of social, politics and economics in that age. Until 2002, Department of Social Work in Hacettepe University had the property of first school in the field of social work. In 2006, it was joined with Faculty of Economics and Administrative Sciences.

In the department of social work, in addition to the fundamental sciences with the help of generalist social work approach, there are also lectures dealing with the theory, practice and method of the social work (Kut, 2005). At the same time, the issues such as the social conditions and social problems have an important place in

the curriculum. The students of this department are encouraged to search the solutions for the social problems with the help of the research methods which are thought as both theoretical and practical. By providing for the students to intern in company with at least one supervisor in the institutions of social work, it is intended to gain knowledge about their professional role and functions such as administration and planning and use their knowledge by practicing. With the courses of practice which constitute a great part of eight-section curriculum, it is tried to increase the awareness, skill and knowledge about which roles the students will take over after the graduation, which field of problems they will face with and how they solve these problems according to social work ethic principle and values. In education, one of the main values which are tried to be gained by the students is the respect of honor.

### **3.Human Rights and Social Work**

The expression that the human rights which people have them only because they are human (Tufan and et al. 2009) is one of the most important expressions in our age. In Universal Declaration of Human Rights, there is a stress on the division of human rights as three zones. According to this information, first zone rights are civil rights and political rights. Beside these, there are some rights which are defined as first zone rights such as the right to due process, right to talk and religious freedom and freedom of movement. These rights also are defined as rights of status negativus. The state cannot interfere in these rights (Reichert, 2011). Second zone rights are defined as the rights of status positivus. Second zone rights include the ones which emphasize the preservation of the rights such as nutrition, housing and health by the state through necessary precautions and the providing of making individuals have adequate standards in respect of these rights again by the state. Third zone rights are interested with the issues which require all people in the world to collaborate. These include rights dealing with environment such as living in the peaceful, balanced and harmonious world, utilization of the trade of world and economic developments and use of clean air and water (Ife,2008).

None of these rights are more important than another. The protecting and securing of all these rights are the fundamental responsibility of the states and these rights are assured at international and national levels. However, even today, people continue to face with the violation of their rights in different places of the world. For example, in the six-page section of Turkey in the 2013 Report of the World, which was published by Human Rights Watch and included the violations of human rights around the world, it is stated that there is a continuation of the violation of the human rights such as the freedom of expression, assembly and organization, violence against women, violence against the security forces, ill-treatment and use of excessive force. ([http://www.hrw.org/sites/default/files/related\\_material/turkey\\_tr.pdf](http://www.hrw.org/sites/default/files/related_material/turkey_tr.pdf)).

The department of social work encouraged its students for necessary steps to provide required conditions for people to live healthy in order which has this three zone rights. The social workers are change agents. If there are obstacles to the way in which providing and securing of the human rights, the social workers fulfill the duty and the professional role such as advocacy, empowerment, and facilitator, bridging the gap, activist and lobbying in order to remove these obstacles and provide the social justice. Human rights provide for the social workers an

approach while they are working with the individual, group and society. There is a need to integrate human rights with the policies and practice of social work. According to IFE (2008), there is a symbiotic relationship between the community development and the human rights and both of them use each other as base in order to reach their goal.

The human rights are accepted as one of the principles of organization for social work practicing. However, the needs, which are required to be needed, oblige a transition from the endeavoring for needs to confirmation of rights. In other words, a fundamental need can be a positive right and there can be a demand from the state to be provided these rights (Tuncay ve Akbaş, 2008).

Social workers make an evaluation of needs while they remove the social problems. This can be an evaluation of individual, family, society and agency and institute. It is important for the students to understand the situation is a need or a right. The notion of need which is used in the glossary of the social work is rather complicated. The need is a requirement whereas right is an obligation. One person can demands financial aid due to her/his poor situation. The meeting of this demand should be made not as an aid but as a right of that person. For the fundamental right like living, this financial aid is a necessary. The right is not given, but taken. While the social work deals with the meeting of the fundamental rights and solving the problems, it acts from the fact that all of these are a right. If the fact that the need of the social work is appeared as result of injustices which are faced by people is taken into account, the importance of right based practicing of social work will be understood better. The starting point and reflection of right based practicing will be given just with the education ( Şahin, 2002).

When the problems faced by individuals are solved and while working with the individuals, there is a need to realize what are the social, economic, cultural and political obstacles. People cannot use of their rights or know what are these rights because of these obstacles. One of the requirements of teaching the human rights in the education of social work is to provide for student to realize their professional identity while they serve the people who are marginalized in respect of social and economic (Deweese ve Roche, 2001).

For example, while working with the groups such as the women under the pressure, refugees and homosexuals, knowing about the borders which make these groups be disadvantage can be helpful for the professional staff in order to solve the problems of these groups. It is emphasized that the impact of human rights on practicing, policy and research. The discipline of social work respects the differences with ethic principle and values and has the role of advocacy and empowerment in order to be provided the social justice. For this reason, human rights and the discipline of social work have a common ground. In the consideration of all this information, in the education of social work, the existence of human rights is absolutely a need. From this view, Hacettepe University the Department of Social Work's eight-section curriculum is examined in respect of human beings, social justice and equality and there happens these results:

With the course of the Introduction to Social Work, which is given in first year of the school, the fundamental philosophy of social work is taught and the emphasize on how to provide the justice on behalf of the individuals is made. At the same year, with the course of Introduction to Law, it is aimed students to have main law information. Since the second year, in the course of Social Work Theory 1-2-3, the fundamental approaches in the social work are told for the students who are taught the fundamental philosophy of social work. In these courses, the issues such as respect to individual, honor of individual and providing of social justice have a wide place. At the same year, with the course of Social Work Legislation, the fundamental legal regulations which are used by the students in the institution of social work and are for individuals and groups dealing with this profession, are taught. At the third year, with the course of Human Rights and Social Work, all social work legislation and philosophy are integrated and the students are made to realize the violation of human right which they are faced with. In the same year, with the course of Social Work Ethic Principle Value and Responsibilities, while the needs of human beings are met, how to solve the ethical dilemma about using the values of social work.

Even if human rights are mentioned as a word in the names of the courses in respect of quality, in fact, in the courses, there is always an emphasis on the human rights for women, children, disabled, old, young, refugee and homosexual people who are faced with various problems. In order to overcome the problems of these people with disadvantaged situation, the students are made to increase the level of knowledge and skill about the required legal regulations, the sources in the society and how they reach these sources. When these courses are taught, various methods are used such as reading, writing report, making presentation and case study. In these courses, there should not remain limited with the knowledge about the human right. Also, there should be more concentrated on the practicing in order to make students teach the human rights and social justice and interiorize this knowledge by adapting this knowledge on both their professional and special life. Beside these, film screenings, group workshops, drama and theater activities should be included into the curriculum.

#### **4.The Conclusion and The Recommendation**

Hacettepe University which has been the first school in the field of social work for long years, has an important place when it is compared with other social work departments which has been just opened in respect of the curriculum. In education, in addition to the fact that the emphasize on the human right is widen and the readings in education activity, in order to prevent to violation of human rights to clients with the situation of disadvantaged, it is important that the fundamental skills are gained such as case study, film screenings, drama activities and workshop works in the focus on human rights on behalf of these groups. At the same time, the students should be made to realize by opening master and PhD programs dealing with the human rights. There should be paved the way for being specialist activist of human rights. The departments of social work which have been just opened or will be opened, should shape the emphasis and the practicing on the human rights in the curriculum in cooperate with the Hacettepe University the Department of Social Work. In the intern period of the students, there should be an occasion for the students to practice in the organizations of human rights.

Undoubtedly, the human rights are not only important for the social work profession and discipline. The fact that the violation of human rights is increased is a truth. To prevent these violations is possible with the social policies of the countries. The human rights should be appeared in the policies in the direction human differences and needs. Also, in order to increase the awareness, knowledge and skill of people, there should be an endeavor about awareness raising of all individuals through meetings, drama activities and symposiums since the elementary school. Thus, the interiorizing of the human rights will be provided both for the society and for the people with the help of education.

# Identity status, coping strategy and decision making process among Italian university students

Monica Pellerone\*

*"Kore" University of Enna, Faculty of Human and Social Science, Via Cittadella Universitaria, Enna, 94100, Italia*

---

## Abstract

The research has investigated: the identity development, the decision making process, the coping strategy, predictive variables on the academic performance and the decision making style. The research involved 82 Italian university students divided into: a group of 50 subjects of mean age 21.86 (S.D = 2.35); a second group of 32 students, mean age 24.50 (S.D = 1.30).

The sample completed: Ego Identity Process Questionnaire, General Decision Making Style and

Coping Orientation to Problems Experienced. Results showed that: low-profile identity foretells the avoiding decisional style; high self-exploration is predictive of the academic success and the coping style.

Keywords: Identity Status; Coping Strategy; Decision Making .

---

## 1. INTRODUCTION

Adolescence is a crucial stage where new and risky contexts require the individual to decide about his or her own future and to face the consequences of his or her choices (D'Alessio, Baiocco, & Laghi, 2006).

The adolescent, having to make choices for his or her future, has not only to consider his or her own aspirations and interests but also to possess a capacity for exploration and identity commitment and cognitive schema (Eccles, & Wigfield, 2000; Wigfield, & Eccles, 2002).

Reflection on identity appears to be an essential passage for defining projects for life; choice is a complex cognitive task, which also has to take into account all possible options, including future ones, ones that are not predictable, of the development of complex competences, as well as the ability to face changes (Eccles, & Wigfield, 2000; Wigfield, & Eccles, 2002; Pellerone, 2011).

\* Corresponding author. Tel.: +393294324311

E-mail address: monica.pellerone@unikore.it

In the light of these premises, the objective of the present contribution is to investigate the following: a) identity development; b) the influence that it has on the process of decision making and the coping strategy; c) predictive variables on the academic performance.

### *1.1 IDENTITY DEVELOPMENT AND DECISION MAKING PROCESS*

In the last few decades various theories have emerged that deal with adolescent development in the processes of change in self-imaging; in particular, the theme was investigated beginning from the seventies using psychoanalytic and psychosocial models (Lucky, Goossens, & Soenens, 2006; Schwartz, Zamboanga, & Wang, 2009): the former model focuses attention on the relationships between infantile and adolescent growth, on the modalities through which the individual feels and works out the changes in himself or herself, and on the maturation of the Self, that constitutes the basic structure of the relationship with reality (Hartmann, 1964). The psychosocial approach, and in particular Erikson's theory, affirms that the individual develops from "psychosocial stages", and stresses that the experience that is produced by such settings influences the phases of development (Erikson, 1968; 1982).

Guichard and Huteau (2007), starting from the psychosocial model, represent adolescence as a phase of suspension, in which identity strategies are challenged and infantile identifications become identity; the adolescent constructs imaginary representations of himself or herself, which are not directly accessible to the conscience (Guichard, & Huteau, 2007; Wigfield, & Wagner, 2005).

Marcia's model (1989), instead, proposes to operationalize the psychosocial identity construct, defining it a dynamic structure and not a static one, whose formation depends on different factors like the "decisions" taken during life. The author works out the conception of identity statuses, which represent the styles through which to face identity problems, delineating two of their key components: the commitment with which adolescents make choices on material issues, and exploration of alternatives in relation to objectives, beliefs and convictions (Wigfield, & Wagner, 2005; Laghi, 2008; Pellerone, 2011, 2012; Pojaghi, 2008).

The author, jointly analyzing the two dimensions, identifies four identity statuses that correspond to as many modalities for facing events: to) Achievement, b) Moratorium, c) Foreclosure, d) Diffusion. In the achievement status the adolescent makes an identity choice after investigating the possible alternatives through experimentation; the moratorium status is characterized by tension and reflection on the different solutions, although a choice has not yet been made; that of foreclosure is typical of those adolescents that cling uncritically to the first identificatory models without experimenting with alternative ones; the diffusion status is typical of those who effect superficial experimentations, without reflections and therefore not aiming at a future commitment (Crocetti, Rubini, & Meeus, 2008; Pojaghi, 2008).

According to Marcia' model, Wigfield and Wagner (2005) organized the four identity statuses along a healthy (acquisition of identity and moratorium) vs. unhealthy continuum (foreclosure and diffusion of identity) showing that: students with a positive identity status differ from those with negative status due to the capacity to have good relationships with classmates, positive emotions connected with academic goals, a good level of self-effectiveness, self-esteem, high learning motivation and an effective process of decision making.

Likewise Kathleen and collaborators (2006), on a sample of 133 subjects, investigated how these people choose their future profession, hypothesizing a correlation between decisional modality and aptitude for planning in relation to cognitive structures. From the study it emerges that the modality with which adolescents choose

their professional future is linked to ethical principles and moral values, showing that indecision is correlated with lack of capacity for exploration both of the environment and of the self. This places young people in a risk condition, since undecided students seem to show poor perception of themselves and the social context they belong to and therefore to be more inclined to make not very effective choices.

Hence in adolescence the lack of decisional competences is correlated with a lack of that knowledge of one's own abilities and present and future preferences that is necessary to work out a self-image mirroring one's own identity (Petter, 2002).

Thus the decisional process is a complex and dynamic one and constitutes a competence that is concretized in a personal style of choice, characterized by two general decisional modalities, one typical of those people that have the tendency to seek the best possible result, defined Maximizers, and one characterized by the tendency to be sufficiently satisfied with a good alternative, the Satisficers (Nenkov, Morrin, Waerd, Schwartz, & Hulland, 2008; Schwartz, Ward, & Monterosso, 2002).

Mann (1989) proposes five decisional styles, grouped in two macro-categories: adaptive, which includes the self-confident and vigilant style (which attentively considers all the choices before facing decisions); and disadaptive or anxiety-provoking categories (during the creation of the decisional process), evasive (with a tendency to procrastinate) and complacent (following others' advice).

Likewise, the model of Scott and Bruce (1995) distinguishes five decisional styles: Rational (characterized by a complete and exhaustive search for information and consequences); Intuitive (attentive to global aspects, reducing the systematic search for information); Dependent (linked to others' advice and suggestions); Avoiding (represented by the tendency to avoid or procrastinate); and Spontaneous (the choice is dictated by immediate feelings).

The literature shows that styles in decision making are predictors of the modalities and outcome of the execution of complex tasks, like problem-solving, coping style, learning and the process of vocational decision-making. In this connection, adolescents with a sure decisional process have the ability to plan their careers and a highly developed vocational identity, which is enacted through greater exploration of the self and the environment, with initial awareness of the decisional process, followed by a capacity for evaluation of the possible career alternatives on the basis of interests, skills and values (Hirshi, & Lage, 2007).

## *1.2 DECISION MAKING AND COPING STYLE*

The literature details the role of individual differences, skills, and resources during the use of coping strategies, and the importance of understanding how people avoid and offset potential stressors.

For example, Aspinwaal and Taylor (1997) analyze the processes through which people anticipate or detect potential stressors and act in advance to prevent them from happening or to mute their impact (proactive coping). The authors describe five stages in proactive coping: 1) resource accumulation, 2) recognition of potential stressors, 3) initial appraisal, 4) preliminary coping efforts, 5) elicitation and use of feedback concerning initial efforts.

Most of studies indicate that strategies coping serve two main purposes: to reduce the risk of harmful consequences of stressful event (problem-focused coping) and to contain negative emotional reactions (coping

focused on emotions). The first type of coping is divided in two factors, active coping and planning over; the second type is expressed in four factors (Lyne and Roger, 2000):

- a) spacing (to deny the existence of the problem);
- b) self-control (not to be carried away by their emotions);
- c) accountability (considered more or less responsible for the situation);
- d) positive reappraisal (recognizing the changes that come from the modified situation, to see reality from a positive point of view).

A second group of research has distinct strategies to approach compared to avoidance strategies (for example, the dimensions of "monitoring" and "blunting" studied by Miller, 1987); in according to this theory, the greater is the sense of control experienced by the individual and the greater the use of strategies to approach.

Finally, a third perspective has especially emphasized the role of social support, which Lazar represents as a dimension common to many coping strategies. Literature shows that life satisfaction is positively correlated to coping strategy and social support seeking in fact; in detail life satisfaction is significantly correlated to decision self-esteem and to all decision-making styles (vigilance, buckpassing, procrastination, and hypervigilance). In addition, significant relationships were found among coping with stress, decision self-esteem and decision-making styles (Deniz, 2006).

Robitschek and Cook (2002) show the relationship between personal characteristics and vocational identity to investigate both career exploration processes and outcomes. The authors study a group of college students, 107 women and 98 men, according to Harren's model of personal characteristics. Results show that personal initiative predicts environmental exploration and vocational identity. Coping style predicts self-exploration. Social support is claimed to be the predictor of vocational identity by environmental exploration.

Recently, Radford et colleagues (Radfor, Mann, Ohta and Nakane, 2010) study decisional self-esteem, decisional stress, and they examine decision coping styles in a group of 743 Japanese and 309 Australian university students. Results of this study show that for both cultural groups the decisional self-esteem is positively correlated with decision making style, but is negatively correlated with decisional stress and the "complacency," "avoidance," and "hypervigilance" coping styles in personal decision making. There are some cultural differences, in particular Japanese students show lower decisional self-esteem than Australian students, but higher decisional stress, complacency, avoidance, and hypervigilance coping styles than Australian students. These findings are related to cross-cultural differences between Australian individualistic culture and Japanese collectivistic culture.

### 1.3 METHOD

#### 1.3.1 Objectives and research hypothesis

The aim of the present research is to explore whether there is a relationship between identity statuses, operationalized in high profile (acquisition and moratorium) and low profile (blockage and diffusion) and the level of the academic success measured in the students participating in the research. In agreement with the literature (Meeus *et al.*, 2010, 1993; Wagner, & Wigfield, 2005; Wigfield, 2005) it is hypothesized that

adolescents with an adaptation status obtain higher average scores in academic performance level in comparison to students with a diffusion status.

A further objective is to investigate whether there is a relationship between Identity Status and decisional styles (classified according to the Model of Scott and Bruce). In agreement with the literature (Luyckx *et al.*, 2009; Wigfield, & Wagner, 2005), it is hypothesized that adolescents with a low-profile status sometimes tend to use a dependent decisional style (that is to say one characterized by the continual search for others' advice and opinions before facing a choice), and sometimes an avoiding style (typical of those people who make continual attempts serving, as much as possible, to avoid taking decisions).

The aim is also to investigate predictive variables of academic success, hypothesizing, as confirmation of the literature, that among the predictors we find the following: I) level of identity (Renninger, 2002); II) use of a rational decisional modality (Baiocco, D'Alessio, & Laghi, 2008); III) internally locus of controll.

### *1.3.2 Participants*

The research involved 82 students (10 males and 72 females) who attended the faculty of Human and Social Sciences of "Kore" University; with reference to the varying age, the participants were subsequently divided into:

a) a group constituted by 50 subjects, i.e. 7 males (14%) and 43 females (86%) aged between 18 and 21 ( $M = 19.86$ ,  $S.D = 2.35$ );

b) a second group constituted by 32 students, i.e. 3 males (9%) and 29 females (91%) aged between 22 and 25 ( $M = 23.50$ ;  $S.D = 1.30$ ).

### *1.3.3 Measures*

#### *Questionnaire for collecting anamnestic data*

Anamnestic data were collected through the administration of a questionnaire constructed ad hoc for the goals of the research, to acquire: basic information, age, gender, school, year attended, academic qualifications and profession of parents, university performances level,

#### *Ego Identity Process Questionnaire (EIPQ)*

This is a tool by Balistreri, Busch-Rossnagel and Geisinger (1995) serving to investigate identity status development according to Marcia's Model. It is a scale constituted by 32 items that investigate the dimensions of exploration and commitment as distinctive elements. The Exploration level is measured through the analysis of four ideological domains: occupation, religion, politics and values. The Commitment level is investigated through four interpersonal domains: family, friendships, gender roles and capacity to enter into sentimental relationships.

Balistreri and collaborators (1995) report the estimates of internal validity of the tool: .80 for the results that indicate commitment, and .86 for the scores that indicate exploration; the scores that indicate reliability are .90 for commitment and .76 for exploration; the internal consistency is .72 and .71 respectively for commitment and exploration.

### *General Decision Making Style (GDMS)*

The General Decision Making Style (Scott & Bruce; 1995), constructed for detecting individual decisional style, is a questionnaire consisting of 25 items grouped in five subscales corresponding to five decisional styles: Rational (deep search for information and systematic evaluation of alternatives), Intuitive (confidence in one's own intuitions and feelings), Dependent (search for advice and opinions from people that are considered competent), Avoiding (attempt to avoid decision making), and Spontaneous (making the choice in the shortest possible time).

The Italian version of the tool of Couyoumdjian, Baiocco and Del Miglio (2005) presents good reliability (average Cronbach alpha values above .75). A subsequent Italian version by Baiocco, Lagli, D'Alessio, Guerrieri and Di Chiacchio (2007) shows that the Cronbach alpha reliability coefficients with reference to the different styles examined vary from a minimum of alpha .68 for the Rational scale to a maximum of .83 for the Avoiding and Spontaneous scales (average alpha .75)

### *Coping Orientation to Problems Experienced (COPE-NVI):*

The Coping Orientation to Problems Experienced - New Italian Version (Sica, Magni, Ghisi, Altoè, Sighinolfi, Rocco, & Franceschini) represents an improvement of the previous Italian version of the COPE, a measure originally developed in the United States.

The COPE-NIV was administered to 458 individuals (50% females) belonging to the general community, together with various measures of psychopathology and a measure of psychological well-being.

The questionnaire is formed by 60 item, grouped into 15 coping mechanisms: a) Activities: take some kind of action to eliminate stress or dampen the effects; b) Planning to overcome the problem; c) Deletion of competitive activities; d) Containment of stress; e) Finding information; f) Researching moral support; g) Expressing emotions; h) Reinterpretation positive and growth, developing the critical experience in positive terms; i) Acceptance of the situation; l) Devoting himself to religion; m) Humor taking; n) Negation; o) Behavioral detachment; P) Mind detachment; q) Use of drugs or alcohol. These coping mechanisms are being grouped into five large essentially independent dimensions: a) Social support, b) Avoidance strategies, c) Positive attitude, d) Problem solving and e) Turning to religion.

The COPE-NIV can be considered a useful and psychometrically valid tool for measuring coping styles in the Italian context.

## *1.4 DATA ANALYSIS*

The Univariate Analysis of Variance one way (ANOVA) is used to verify the hypothesis that students with a low-profile status tend to use a dependent and avoiding style; The Pearson's correlation is used to investigate the relation between decision making style, locus of control and identity status.

To verify Predictors of success at school we are used the analysis of Hierarchical Regression.

### 1.5 RESULTS: PRELIMINARY ANALYSIS

The objective of the research was to investigate the relationship between development of the identity status, decisional styles and level of locus of control in a group of university students.

From the analysis of the frequency distribution on the basis of identity development, the following emerges: 34.1% of the students are going through the Achievement identity status, followed by 23.2% with a Diffusion status; 22% with a Moratorium status; and 20.7% with a Foreclosure status. There are significant differences due either to the age variable with  $X^2 (15N= 82)= 25.60, p = .04$ ; but there aren't differences due either to the gender variable with  $X^2 (3 N= 82)= 2.43$ .

A design was done of type 2 factorial multivariate variance (Gender) X 2 (Age; 19-22 vs. 23-27 years), to verify the influence of the independent variables on exploration and commitment, but MANOVA emphasises no effect of gender x age interaction (Wilks's Lambda = .96; F = .52;  $p = NS$ ).

The type 2 factorial MANOVA (Gender) X 2 to verify the influence of gender and age on the ideological and interpersonal domains emphasises the following the main effect of age and gender; the breakdown of the univariate effects shows differences compared to the gender variable in the dimension of value ( $F(1,81) = 5.54$ ;  $p < .05$ ), and differences compared to the age variable in the dimension of politic ( $F(1,81) = 2.87$ ;  $p < .01$ ): in detail girls present higher average scores in the domains of value, and older students show higher average scores in the domain of politic than younger students.

The Univariate Variance analysis stresses the influence of age on the use of rational decision making style ( $F(8,81) = 4.23$ ;  $p < .001$ ) and spontaneous style ( $F(8,81) = 3.71$ ;  $p < .001$ ); the post hoc analysis (Tukey's method) shows the following: older individuals (23-27 years old) used more the rational style than younger students (19-22 years old), who had higher mean scores on the spontaneous style.

The type 2 factorial MANOVA (Gender) X 2 to verify the influence of gender and age on coping strategies emphasises the following the main effect of gender; the breakdown of the univariate effects shows differences in the dimension of social support ( $F(1,81) = 11.98$ ;  $p < .01$ ), and in the dimension of problem solving ( $F(1,81) = 4.51$ ;  $p < .05$ ): in detail girls present higher average scores than man.

#### 1.5.1 Influence of Identity Status

The objective was to investigate whether there is a relationship between Identity Status and Decisional Styles, in the hypothesis that students with a low-profile status tend to use a dependent and avoiding style. The Anova one way shows the significant linear effect on the avoiding styles due to identity development ( $F(3,81) = 5.23$ ;  $p < .01$ ): the breakdown of the univariate effects shows that subjects with a Diffusion status obtain the highest scores in the avoiding choice modalities ( $M = 14.73$ ;  $S.D = 5.61$ ), in comparison to individuals in Achievement status ( $M = 9.32$ ;  $S.D = 4.94$ ). Thus the initial hypothesis appears to be confirmed, according to which students with a low-profile status manifest a tendency to assume avoiding or procrastinating behaviours when faced with a choice; however, the hypothesis that students with a low identity profile also have a preference for a dependent decisional style is disconfirmed.

#### 1.5.2 Correlation between decision making style, locus of control and identity status

Pearson's correlation show that: a) spontaneous style is positively correlated with relationship dimension ( $r = .31$ ;  $p < .01$ ) and negatively with the gender role variable ( $r = -.22$ ;  $p < .05$ ); b) avoidant style is positively correlated with the importance of gender role ( $r = .23$ ;  $p < .05$ ) and relationship ( $r = .35$ ;  $p < .01$ ); c) rational style is negatively correlated with the relationship dimensions ( $r = -.26$ ;  $p < .05$ ) and positively with the work ( $r = .22$ ;  $p < .05$ ).

The decision making avoidant style is positively correlated with the use of avoidance coping strategies ( $r = .54$ ;  $p < .01$ ) and negatively correlated with the problem solving coping strategies ( $r = -.25$ ;  $p < .05$ ).

### *1.5.2 Predictors of success at school and decision making style*

In reference to school performance, the analysis of Hierarchical Regression with separate blocks shows that bringing the decision making style into model has no significant effect, although 20% of the variance is accounted for by the remaining variables, which in order of importance are exploration ( $\beta = .30$ ), and commitment ( $\beta = .36$ ).

In reference to decision making process, the analysis of Hierarchical Regression show that the age ( $\beta = .46$ ) and level of exploration ( $\beta = .21$ ) can be considered predictive variables to the use of rational decision style.

The avoidant ( $\beta = .63$ ) and dependent ( $\beta = -.21$ ) styles are predictive variables to the avoidance coping strategies; the level of self exploration can be considered a predictive dimension to the problem solving coping strategies ( $\beta = .42$ ).

## *1.6 DISCUSSION*

The present work, starting from the limits and the external validity of Marcia's model, has explored the relationship between the development of identity statuses and the modalities used to face the process of vocational choice, through the use of a particular decisional style (Model of Scott & Bruce, 1995). The results of the research show that, for classification of identity statuses, a higher percentage of adolescents goes through the status of Foreclosure, followed by those in Diffusion and Moratorium; these data confirm that, consistently with the average age of the group, most adolescents still cling uncritically to the first identificatory models without experimenting with possible alternatives; others make superficial explorations not oriented towards a choice and a future commitment.

The results obtained also point out the main effect of the gender variable on some domains: boys express greater predilection for the area of politics, compared to girls, who attribute greater importance to the dimension of value. These results are in line with the literature, which stresses the presence of gender differences in friendly relations: while relations between girls are based on the sharing of interests and values, those between boys are based on personal experience and feelings (Garelli, Polmonari, & Sciolla, 2006; Tani, Rossi, & Smorti, 2005).

The analysis of decisional styles shows that girls have a greater propensity to make choices linked to other people's advice and suggestions, a datum in agreement with the literature (Gati, et al. 2010); younger people use a spontaneous decisional style significantly more than older ones. The latter datum confirms the traditional theories on development, which maintain that there is progressive evolution of the modalities of choice, from a

more instinctive style or one linked to the desire for immediateness to more logical and rational decisional modalities.

The correlations between GDMS and EIPQ confirm the initial hypothesis, according to which adolescents with a low identity profile (Diffusion Status) tend to procrastinate the most important choices for their life, as confirmed by the literature (Luyckx *et al.*, 2009; Wigfield, & Wagner, 2005); although the assumption appears to be disconfirmed that a low-profile identity status is also associated with use of a dependent decisional style.

The subjects with the propensity to use avoidant style, during decision making process, have recourse to avoidance coping strategies, but they haven't the tendency to use problem solving strategies to resolve their problems. The avoidant and dependent decision making styles are predictive variables to the avoidance coping strategies; the level of self exploration can be considered a predictive dimension to the problem solving coping strategies.

### 1.7 CONCLUSION

The research investigated the relationship among development of identity, coping strategies and decisional style in university students during the process of vocational decision making, in an endeavour to confirm some fundamental theoretical assumptions, to offer interesting suggestions and useful implications for the application of vocational planning actions.

The initial assumption was that today's assessment procedures should not be used for the purpose of classifying the personality, but to furnish the adolescent with useful information to stimulate in him or her self-discovery and the capacity to ask himself or herself some questions. In this connection, the method of quantitative investigation was backed up by an idiographic procedure helping to favour an analysis of the roles taken on by adolescents faced with the decisional process and of the modalities with which it is possible to express self-concepts and identity development in the transition towards integration in the labour market.

In this connection, economic changes and changes in the labour force of today's society, which often limit the vocational decisional process, stress the fact that not everyone can always make training or professional choices on the basis of their interests; in this case Holland's theory and the application of the model can only help students to explore career choices within those professional alternatives that are feasible and available.

Hence intervening in the development of the adolescent identity process proves to be fundamental for the purpose of improving the level of school performance, but above all the decisional process, since adolescents with a more evolved identity use a multiplicity of decisional styles that are well suited to contextual situations.

In conclusion, considering the importance of the decision-making for the present and future life of every individual, it is a topic which remains to be studied in depth.

# Impact (s) of doctoral degrees held by faculty members in Portuguese higher education

João Carlos Pereira Mira Leitão\*

*Instituto Politécnico da Guarda, UDI – Unidade de Investigação para o Desenvolvimento do Interior, Guarda, Portugal*

---

## Abstract

In order to verify the impact(s) of doctoral programs processes of faculty members in higher education in Portugal, we applied a questionnaire survey to the completed PhD of teachers. This study is based on a questionnaire survey to the doctoral degrees of faculty members in Portuguese higher education, completed between 2007 and 2012, the survey was held between April 16 and May 6, 2012, to all teachers in Portuguese higher education having quickly reached 1001 answers that we briefly analyze here. It appears that in this period of analysis, there were many faculty members who have successfully completed their doctoral process, meeting the quality standards that enable the integration of higher education in the Portuguese panorama of internationalization, especially in view of the requirements of the Bologna process.

Keywords: Education, Qualification, Higher Education

---

## INTRODUCTION

The conducted questionnaire survey was sent electronically to all teachers in Portuguese higher education, which corresponds to a universe of 25849 faculty members, distributed by public University and Polytechnic higher education and private University and Polytechnic higher education. As already mentioned, 1001 valid responses to the survey questionnaire were obtained.

In the sampling calculation, it was decided to use the method of "simple random sampling is a method characterized by giving the same probability of selection to all" (Vicente, 2012) the elements that make up the sample, considering a universe of 25849 (Ciência, 2012) faculty members that integrate the Portuguese higher education system, it would be necessary to receive 647 valid questionnaire surveys for a 99% confidence interval with a maximum error of 4.93%. Since the number of teachers who completed the doctorate between 2007 and 2012 is certainly less than the number of teachers that are a part of the system (25849) and with the number of valid questionnaires reaching 1001 questionnaire surveys, it was thus possible to be considered that the results are

\* Corresponding author. João Leitão Tel.: 00351966503989.  
E-mail address: jcleitao@yahoo.com

very reliable, since it is a randomly selected representative sample that meets the characteristics necessary to meet the objectives set for the study – to have held a doctorate between 2007 and 2012 - and the sample (647) far exceeded its size (1001 valid questionnaires), allowing to obtain estimates with the imposed level of accuracy and reliability.

## 1. Results Analysis

University faculty members represented 553 (55.2%) of the respondents and the polytechnic faculty members 448 (44.8%) of which 126 of these are linked to the universities' polytechnic subsystem. The effort of holding a doctoral degree by the polytechnic faculty members had already intensified, as it is now clear, even before the revision of the proper Career Statute. Demonstrating that the teaching staff of our higher education institutions always regarded their qualification, as its fundamental concern, as a way to ensure that the education given to students is, for their part, as best and most appropriate as possible.

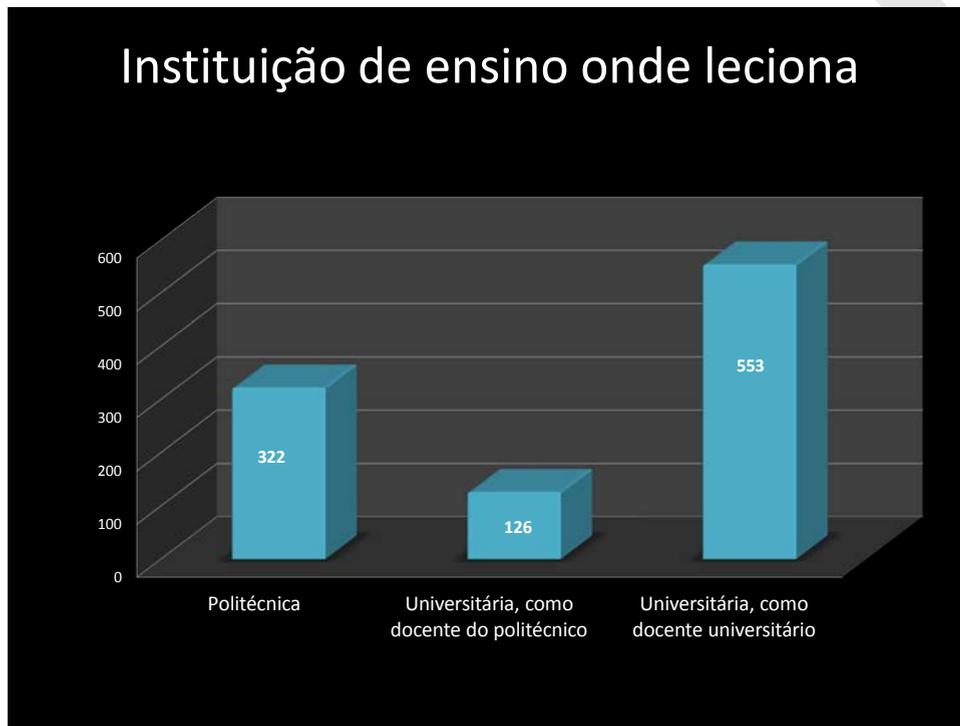

Figure 1 Institution where one teaches

Respondents report a mean of 13.6 years at the institution where they teach that is, they already held a significant teaching experience before moving towards a doctorate degree. In general the teachers who do the PhD do not have had experience at another institution, since the average length of teaching in higher education is 15.6 years, in other words, only slightly higher, corresponding to only two extra years. Demonstrating that these faculty members are far from meeting transient needs of the higher education system, although many of them have had and still have precarious contracts for many years with little or no guarantees, despite their effort and

commitment in both seeking permanent qualification and cyclically spreading an understanding of excellence with a strong impact on the economy and society among their students. It is not determined the effect that the unceasing pursuit of knowledge by teachers in higher education, has in the transfer of knowledge that is done by teachers at various levels within and outside higher education institutions, on a daily basis, whose preferred recipients are their students.

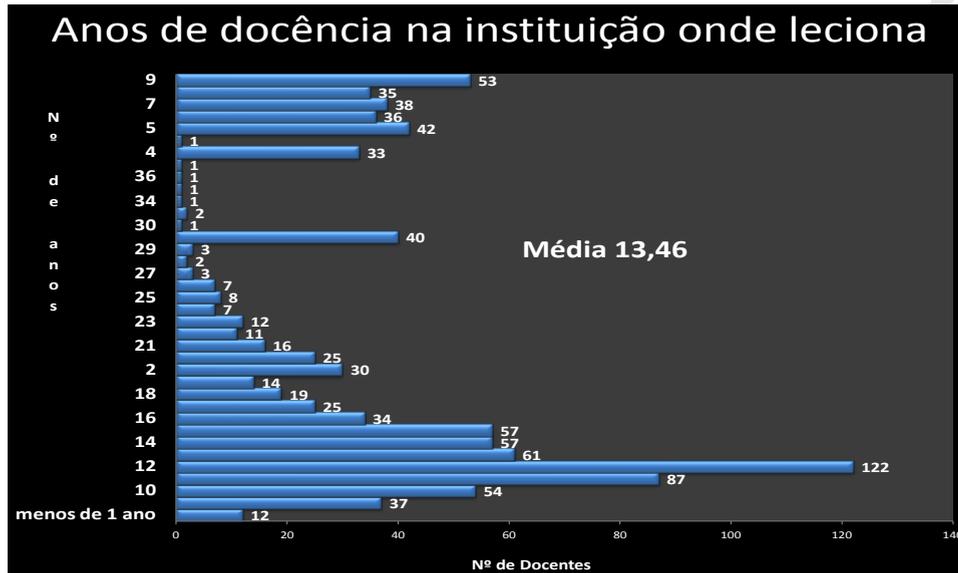

Figure 2 Years of teaching at their institution

The vast majority of teachers, that is, 712 (71.2%) when joining their present institution only had a graduate degree and 218 (21.8%) already held a master's degree. Only 51 have joined the institution with a doctorate degree. Since then the pursuit of higher qualifications, has been a constant goal by the faculty members of our higher education institutions, whose importance of skills and the impact it would have and has in the Portuguese social and economic fabric, deficient in higher qualifications, has always been understood by them.

Figure 3 Degree with which one has integrated the institution

The start of the PhD is dated before 2007, in most cases, which is before the adoption of a legal statute by institutions, and 2006 is the year with the highest number of early doctoral degrees.

Figure 4 - Start of doctoral degree (year)

Of the respondents, 461 (46.1%) did not receive any leaves to undertake a PhD, a number that clearly shows the lack of conditions that many faced. Although there weren't encouraging conditions to a good performance in

the doctoral process, considering all the psychosocial involvement that this type of stages in the lives of faculty members requires, the same motivation in actively contributing to the development of their country and its institutions, demonstrates a remarkable sense of responsibility and citizenship, still ensuring a competitive higher education at European and global level, in a very global market.

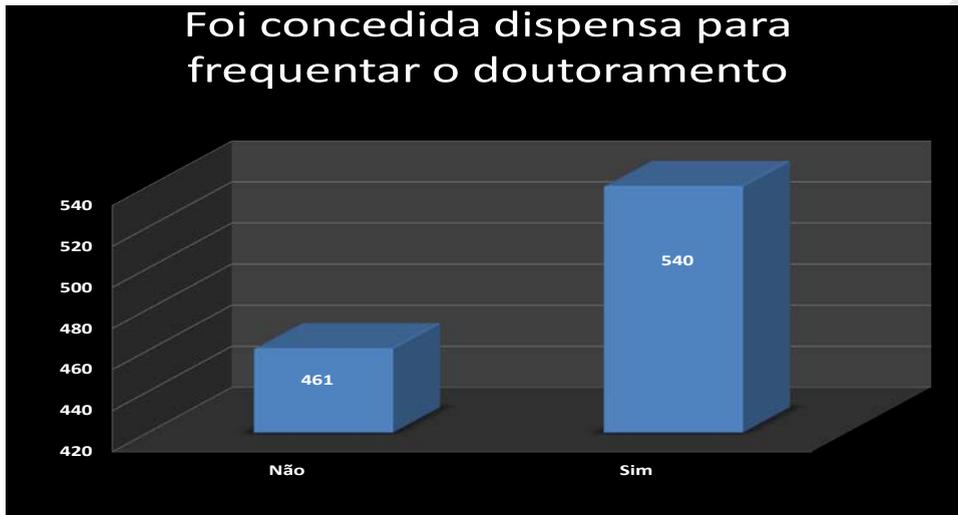

Figure 5- a leave was granted to undertake the doctoral degree

389 (38.9%) of respondents did not apply to any system of financing for their research project. Bearing all inherent costs in the process of doctoral programs, that are not depleted in fees, since they imply the constant need for updating literature, traveling to conferences, among others. Still they have taken up these costs, no doubt explaining their motivations and success in their doctoral project. However the impact of this education par excellence is directly and cyclically reflected in their students having a strong weight in the economy and society but also in the institutions where they work as faculty members, becoming more competitive and credible in attracting a greater number of students given the qualification of its faculty staff.

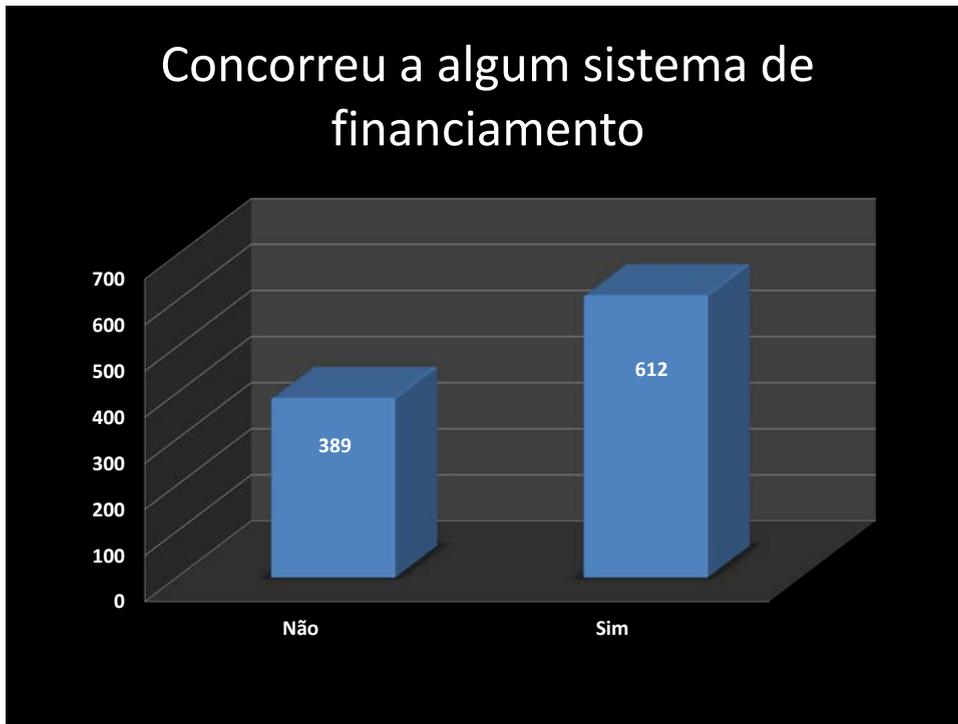

Figure 6 - Applied to any system of financing

Not only providing support falls far short of what is expected, as we have seen, but inbreeding is much more limited than what is suspected. 653 (65.2%) of respondents did not attend the Masters at the institution where they work and 544 (54.3%) did not undergo a doctorate program in their institution.

It is noted that in most cases teachers seek other higher education institutions, than their own, to make their doctoral programs, an issue that can relate to the educational offer by the institution where they teach (do not forget that only recently polytechnics have master programs to offer), freedom of decision, complement to the future educational offer of the institution where they teach, providing the institution with other future educational opportunities.

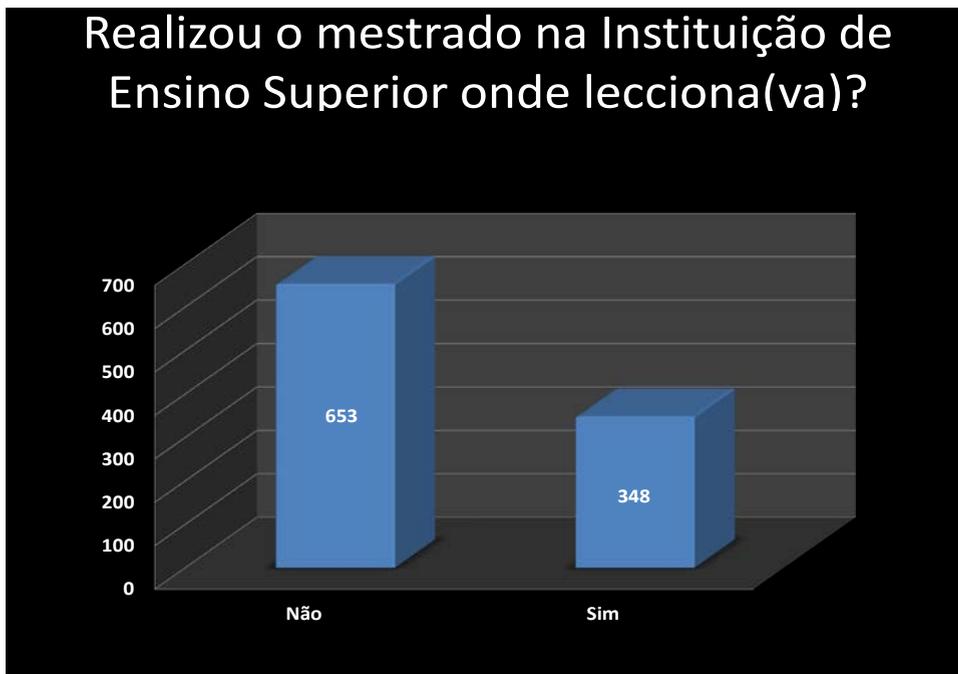

Figure 7 Carried out a master's degree in the Higher Education institution where they teach (taught)

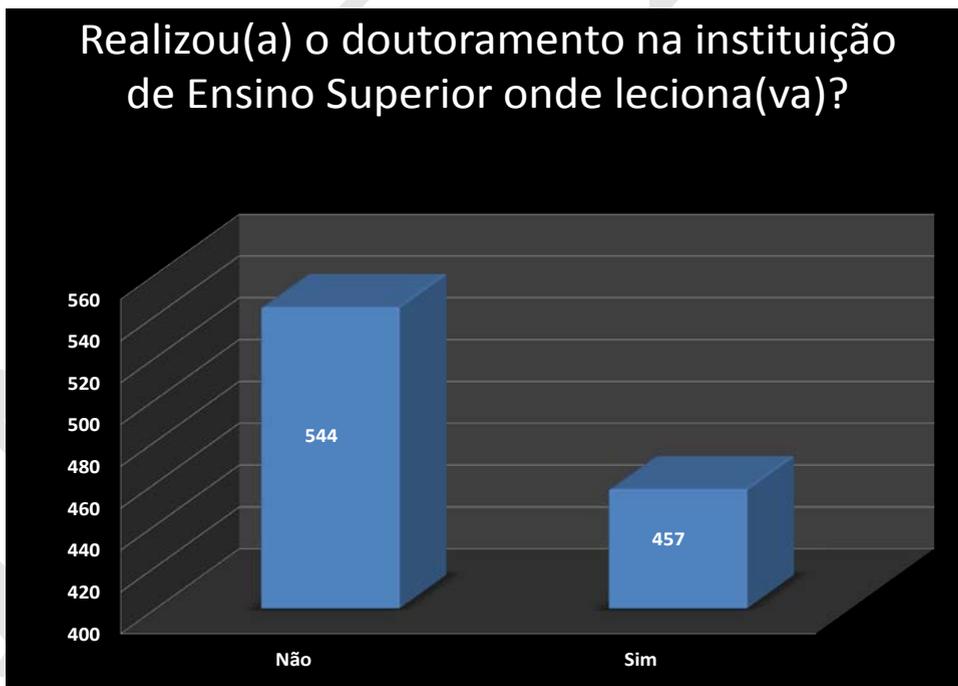

Figure 8 Carried out a Ph.D. in the Higher Education institution where they teach (taught)

However it is also worthy understanding that achieving a PhD by lecturers that is still the case of 473 (47.3%) of respondents, even it is still important; it is not yet a majority.

In the polytechnic, 123 of doctorates already belonged to "the permanent staff" on the date on which they got their doctorate, without it bringing them security or additional revenues. That immediately deflates the idea that the direct passage to associate professors or assistant professors that would heavily penalize the financial stability of the institutions, on the contrary he teachers are the first to understand that a quality higher education goes unequivocally through their qualification and nothing more because only then are they able to meet the international standards that govern these institutions. It is awkward if institutions whose core is based on skills and knowledge transfer, keeps the costs of human resources invariably low, it could mean two things: either they had not allowed intensive qualification the of their faculty members, or they didn't have the ability to maintain the most qualified resources, in both situations there would be a loss, since the differentiating character in these institutions is precisely the strong investment in knowledge capital.

And in the remaining cases of teachers of polytechnic Institutions and university lecturers, when respondents began their doctoral program, they lacked any guarantees in terms of career integration. Lecturers even today do not have that, that is, despite the precarious career of teachers in higher education, They will do whatever they can in favor of the institution where they work, enhancing it with their academic performances and the whole setting that results in the transfer of knowledge for their students.

Figure 9 Professional category at the date of completion of the Ph.D.

## 2. Conclusão

Most teachers in Portuguese higher education responded affirmatively to the challenge of the Bologna process and to internationalization of our higher education institutions, having initiated and completed their doctoral projects before the approval of the institutions' legal statutes, which allows the transition of teachers with a PhD to a less precarious contractual relationship.

On average teachers integrate their higher education institution for thirteen years, which is a considerable time, taking into account the inertia of the system to generate conditions for carrying out the processes of doctoral programs by faculty members, aimed at attaining the standards required to our higher education system.

The overwhelming majority of teachers, who are part of the Portuguese higher education system, integrated the system with a graduate degree regardless the education subsystem where they provide service.

A significant number of teachers did not receive any type of leave of absence, to perform the demanding qualification process of a PhD, with which one aims to respond to the clear need for quality and internationalization of Portuguese higher education in accordance with the best international standards.

More than half of the faculty members did not apply for any source of funding to carry out their research project, which makes us question the expectation of teachers in relation to financial support systems for existing qualifications.

The vast majority of teachers choose other higher education units to carry out their doctoral program, than that where they teach, registering the same trend as it was verified when obtaining a master's degree.

## Impact of EU education programmes on challenging “otherness”: Turkish case

Dr. Mehmet Nurettin Alabay<sup>a</sup>, Melih Rüştü Çalikoğlu<sup>b\*</sup>

### Abstract

“Otherness” is one of the main challenges for European Union project that aims to bring different cultures together in a war thorn continent. To achieve these goals, the Union had developed and implemented various programmes, like the Lifelong Learning and Youth in Action. These programmes bring the pupils, students, teachers and trainers within a multinational context. In the case of Turkish - European relations, each side had always been at the edge of the spectrum of otherness. In that case as a full member to the EU education and youth programmes, Turkey has become a prominent example of how well defined educational and social activities can help to close the gap of the spectrum.

## INTRODUCTION

In these days we are uncovering the inner workings of societies and especially understanding the mechanisms of interaction between individuals and groups. Still we are far away from understanding the larger picture, especially solving the mysteries on how the societies themselves as bigger entities interact with each other. Do societies act on some kind of reason, or do they act on some kind of social instinct? How do societies interact with their surroundings? “Otherness” as a term reminds us, the people who are different from what we are today. It includes a state of distance, generally based on lack of the first hand information. As individuals we define the outer world according to the magnitude of distances to our own entity. We classify them trying to understand if they pose a threat to us, or would they be good allies.

This continuous effort in our lives that is shaping our relations with others, might have a correspondence at the larger level. When it comes to otherness, it is generally not the individual experiences that create the distances, but rather the recollection of memories buried deep inside the culture and history, which they are generally relates to the society. There must be a broader picture, awaiting us to resolve.

Carl Sagan (1997) said after seeing the famous picture of the earth from 6 billion kilometers away taken by the Voyager spacecraft that:

“From this distant vantage point, the Earth might not seem of any particular interest. But for us, it's different”.

When we have the possibility to look from a further distance, the picture changes and the possibility to understand the broader picture rises. As observing galaxies from a distance allows understanding how they interact, it is also possible to have a broader look on to societies. The rules of interaction should be different from the individual where short term becomes a few dozen years and long term becomes centuries. It becomes harder to explore and comprehend to the full extent. In that regard it is not a surprise that famous social scientists have a bigger tendency to understand the macro-scale.

Otherness is defined by difference, typically difference marked by outward signs like race and gender. As such, otherness has also been associated predominantly with marginalized people, those who by virtue of their difference from the dominant group, have been disempowered, robbed of a voice in the social, religious, and political world (Onbelet, 2013). A cultural difference also contributes to otherness.

This article doesn't aim to discuss the identity and otherness at the sociological level, but trying to understand how intercultural education programs like the ones within the European Union impacts the collective identities. European identity is also one of those collective identities with an reflective appraisal of the “other”, as well as its internal dynamics.

### Identity

Persons have an identity by positioning themselves relative to other persons and by giving to these relations a meaning that is fixed in time. An identity guarantees the being a person in the flux of time. The same holds for groups: a group has an identity if it succeeds to define itself vis-à-vis to other groups by attributing meaning to itself that is stable over time. (Eder, 2009)

Personal identity helps individuals to define their daily relationship with their outer world. They acquire their identity while they grow up in a community. In short it is the society that creates and defines individual identity. The information to create a self-identity comes from the data produced from the relations with a persons close community. Thus personal identity is in the form of reflected appraisals. We are not born with an identity—others give it to us. Our parents, our friends, and our teachers all tell us who we are through reflected appraisals—messages we get about ourselves from others (Hybels and Weaver II, 2004).

Since it is the social setting where identities are forged, lack of social interaction during the infancy and early childhood may cause some critical loss in the process of creating a self-identity. For example feral children, who

were somehow separated from a human community during their infancy, are observed to neither being able to establish the social connections nor being able to learn any human language.

Feral children lack the basic social skills that are normally learned in the process of enculturation. For example, they may be unable to learn to use a toilet, have trouble learning to walk upright and display a complete lack of interest in the human activity around them. They often seem mentally impaired and have almost insurmountable trouble learning a human language ([http://en.wikipedia.org/wiki/Feral\\_child](http://en.wikipedia.org/wiki/Feral_child)). Thus, being a part of the community has a major role in creating individual identity.

Besides the individuals, social groups and communities also have their own collective identities. To understand the behaviors of social entities, like nations, belief groups, races etc. collective identities should be put into focus.

Collective identity can equally refer to cities, to regions, or to groups such as political parties or even social movements. Since some years collective identity has also become an issue with regard to Europe where public debate is increasingly concerned with the problem of a European identity that is seen as lacking or as needed. But why do societies, groups and even a union of nation-states such as the EU need an identity? For a person an identity allows being recognized as something particular vis-à-vis the others. But why do groups up to nation and even transnational phenomena such as the EU need an identity? (Eder, 2009)

It is almost obligatory for any intelligent being or organization to have an established identity. Just like the individual identity, “others” are pretty important in the establishment of collective identities. It is not a coincidence that a community of the European Union having a hard talk on what defines the European identity.

Collective identities reflect the way individuals and groups internalize established social categories within their societies, such as their cultural (or ethnic) identities, gender identities, class identities, and so on. These social categories shape our ideas about who we think we are, how we want to be seen by others, and the groups to which we belong.

Ideas of similarity and difference are central to the way in which we achieve a sense of identity and social belonging. Identities have some element of exclusivity. Just as when we formally join a club or an organization, social membership depends upon fulfilling a set of criteria. It just so happens that such criteria are socially constructed (that is, created by societies and social groups). As such ‘we’ cannot belong to any group unless ‘they’ (other people) do not belong to ‘our’ group. Sociologists set out to study how societies manage collective ideas about who gets to belong to ‘our group’ and which types of people are seen as different – the outsiders of society (<http://othersociologist.com/otherness-resources>). “Otherness” is the key to understand the interaction between collective identities.

## **Otherness**

### *Natural and Constructed Identities of Europeanness*

East and West are not only the names of directions, but also the names of a cultural spectrum. A spectrum of distance defines that the level of “otherness”. This distinction has a historical background. Although Europe and Asia are geographically one single continent, the real distinction comes from cultural background rather than a geographical one (<http://en.wikipedia.org/wiki/Eurasia>). Defining the European peninsula, not bigger than another one India, as a separate continent should be regarded as an effort of the establishment of the “European” identity. First written usage of the names as Europe, Asia with Libya (Africa) dates back to Herodotus (5th century B.C.).

European Union should be considered as a continental peace project with global effects. Uniting Europe under one umbrella is not a new idea. Interestingly, it was the Turks, who emerged as a non-Christian social entity caused the first discussions of uniting the continent against the common enemy “the others”. The effort of defining the European Union project, according to a 15th century enemy is ironic in itself. Still identities and

concepts like “otherness” are written deeply in the public consciousness and culture of the respected societies. This is why the concept of “otherness” should be considered as an important factor in the European integration processes.

European Union web site defines the entity as a unique economic and political partnership between twenty seven European countries that together cover much of the continent. It is defined as a political and economical union. Defining the union depending on “otherness” is carefully avoided, as it would be politically not correct. Although it is a structure of the union of states and their political and bureaucratic integration EU has a social level. For the ordinary citizen EU has cultural and social meanings. Being a “European” can be considered as a cultural identity, a definition to separate the individual from others. EU citizens rarely define their identity separately from their national identity.

In a world where social communities are governed, there will always be identity constructionism. In this regard the programmes and activities introduced by Brussels, could also be understood as an effort to construct a new identity. Smith (1997) defines national identity as a product of both “natural” continuity and conscious manipulation. Cerulo (1997) defines Smiths approach to national identity as a middle-ground solution, linking social constructionism to more essentialist views. According to Smith (1997) natural continuity emerges from pre-existing ethnic identity and community; conscious manipulation is achieved via commemoration, ideology, and symbolism. In that regard there should be distinction between the constructed European identity and the newly constructed and constructed European identity.

According to Euro barometer 77 (Spring, 2012), 54 % of the citizens of the EU mainly define themselves with both their own nationality and being a European. 3 % of the population defines themselves as Europeans without mentioning their nationalities. Still 38 % of the Europeans tend to define themselves as only with their national identity not mentioning being a European. UK citizens holding the upper hand with 60 % as defining themselves as only with their nationality (Eurobarometer, 77). On the other side of the story and according to another survey made in 2009, only 30 % of the Turks think they are Europeans (Eurobarometer, 71).

### *Interaction between identities*

Europe is a large continent with a population exceeding half a billion people. There are dozens of nations, races, beliefs, sub-cultures and other kind of social groups consisting the European community. Putting this social complexity besides its rich and deep history, it is not easy to understand the interactions of those social groups. Historically, Europe has been the stage of continuous turbulence, barbarian invasions, religious struggles, two major world wars etc. The idea of uniting Europe had never been easy. Since its first introduction in the 15th century as a solution against the Turks, dozens of millions of lives were lost. It should be said that Second World War became the eye opener for the most. For the last 60 years, the union emerged as a common market first, later turning into a political union. Still the competing national identities are still a concern for the Union, with its advantages on creating a dynamic and diverse society.

European identity is still competing with the national identities. Still EU is aware of the hardships of establishing a multinational entity and making half a billion people to believe its values and to accept its identity. Therefore EU has been working on fostering intercultural dialogue and European integration with various programmes for the last 30 years to help the construction of a new collective identity.

“Otherness” is like a measurement tool, defining the distance to different people or social groups. Some might be close and some might be at the far end of the spectrum. So we can observe different levels of “otherness” within the EU itself. It has not been long when some of the older member communities to the EU, reacted to the accession of the Eastern states, like Poland. That reaction was characterized with the famous “Polish Plumber” case.

After the rejection of European constitution in 2005 former Polish dissident Adam Michnik bitterly remarked during an interview with L'Express: "In your eyes, we don't belong to the family of Western states: we are

barbarians. Paradoxically, the Poles were more accepted in France before enlargement." Even though he was referring to the Franco-Polish relationship, which had been damaged in particular by the referendum, the Polish intellectual was at the same time expressing the more broadly shared frustration of former Eastern states with what was seen as the unenthusiastic welcome that had been extended to incoming EU members by France and many other member states (Capelle-Pogacean, 2011).

On the spectrum of "otherness" where Christian European communities stand at one end, Muslim communities sit clearly on the opposite. Although European Union is a modern political initiative, the European communities are mainly happy with the contrast between them and the Muslim world.

As Stråth mentions the meanings of Europe are a discourse of power on how to define and classify Europe, on the frontiers of Europe, and on similarities and differences. In many versions the emphasis is on Europe as a distinctive cultural entity united by shared values, culture and identity. References are made to Europe's heritage of classical Greco-Roman civilization, Christianity, and the ideas of the Enlightenment, Science, Reason, Progress and Democracy as the core elements of this claimed European legacy. There are subtexts of racial and cultural chauvinism, particularly when confronted with Islam. Europe acquires distinction and salience when pitted against the other. When the differences within Europe are emphasized, it is often in the form of unity in diversity (Stråth, 2002).

Interestingly with a continuous and uninterrupted existence of Muslim communities on the European continent since the beginning of the 8th century A.D and their contribution to the birth of modern Europe, Islam had always been the "Other". It was the reflected appraisal of European collective identity. Muslim population in continental Europe exceeds 38 million of which 16 million as actual EU citizens (more than 7 %) ([http://en.wikipedia.org/wiki/Islam\\_in\\_Europe](http://en.wikipedia.org/wiki/Islam_in_Europe)). Still Islam is not accepted as a part of the contemporary European culture. In Europe as general more than 140 million people within a population of 800 million, define themselves as Muslims. That equals to almost 18 % of the total population of the continent.

Turkey is the biggest of all of the Muslim communities in Europe, not only by its population of 74 million but also with almost 9 million immigrant Turks living in various EU countries. Perceived, as the biggest archenemy of Europe in history, Turkey and its interaction with European communities deserves a better look. Being across the farthest side of the spectrum Turkish case is also like a litmus paper on the possibility of challenging otherness for a peaceful and united Europe.

During the identity creation process of the new united Europe, a modern approach was chosen to define the genetic codes of being a European. Therefore the new European identity relies on the universal values such as human dignity, freedom, democracy, equality, the rule of law and the respect for human rights. These were the core values of the EU, which are set out at the beginning of the Treaty of Lisbon. They are common to all Member States, and any European country wishing to become a member of the Union must respect them ([http://europa.eu/lisbon\\_treaty/glance/rights\\_values/index\\_en.htm](http://europa.eu/lisbon_treaty/glance/rights_values/index_en.htm)). Still European communities have an unwritten identity code, which also includes the other as its reflected appraisal.

There has to be a clear distinction between the natural identity of Europe perceived by the society, and somewhat ideal and constructed identity that the EU tries to create. The latest economic crisis created a lot of tension on the societies and put the European project into a test. There have always been EU skeptics. There are people like Francis Fukuyama who define the current crisis as not only being a financial one, but a glimpse of a deeper identity crisis. In his talk given at Geneva University in November 2011 he depicts the problem of failing to create a European identity. In his words:

There is a deeper failure at the European level, a failure in European identity. That is to say, there was never a successful attempt to create a European sense of identity and a European sense of citizenship that would define the obligations, responsibilities, duties and rights that Europeans have to one another beyond simply the wording of the different treaties that were signed. The EU in many respects was created as a technocratic exercise done for purposes of economic efficiency.... Wealthy Germans feel a sense of noblesse oblige towards poorer Germans; this social solidarity is the basis of the German welfare state. But they do not feel similar obligations towards the

Greeks, whom they regard as being poor disciplined (<http://blogs.the-american-interest.com/fukuyama/2012/01/12/european-identities-part-ii/>).

So, is it possible to overcome those “otherness” issues when it comes to accepting Turkey and its people as a partner or colleague? Is it possible to help challenging that otherness with the help of educational support programmes like Comenius, Leonardo da Vinci and Erasmus?

### Perceived Image of an “Other”

Creating a union, in a war thorn continent was never an easy task. There will always be challenges a head. As Fukuyama underlines the technocratic and political grounds of the union, will only be sustainable if a common European identity would have been created. Hardships impose a level of threat to the creation of a modern European identity, but they also create a chance for the societies to blend in as they have to display solidarity.

Turkey, is an important figure on the identification and clarification of identity problems in Europe. Although it has almost been 2 hundred years, that Turkey choose to become a part of the European system, things are different on the “other” side. In political terms Turkey was a part of Europe since mid 14th century. The feeling of “otherness” for both sides is the main reason that divides both sides of the spectrum. After becoming a official candidate country to the EU, the discussion within the other European societies increased. Turkey has adapted the Copenhagen and Maastricht criteria long ago, which theoretically let her become a part of the EU. Still the real European identity which depicts the Turk as the other keeps on discussing.

The quoted text below is from the web site of the British National Party and reflects one of the most extreme and negative perceptions of the “Other”, it can be valuable for reflecting the driving forces of the interaction between the EU and Turkey.

EU membership will grant all 71 million Muslims in Turkey the right to settle anywhere in Europe. This can only speed up the mass Third World invasion of Europe, which is already underway. In addition, the Muslim population has a birth rate three times higher than native Europeans, tripling in the last 30 years and accounting for 85 percent of Europe’s total population growth in 2005 (<http://bnp.org.uk/2009/04/barack-hussein-obama-demands-eu-welcome-71-million-muslim-turks/>).

These are the views of a Nationalist party, which might be accepted as an extreme example. But even at the most liberal view against the accession of Turkey into the EU, one might easily observe the pattern of “us” and “them”.

The idea of Islamic or Turkish threat has historical roots. European fears, and stereotypes of Islam as “violent, fanatical, expansionist and anti-progressive” (Hafez, 2000), have been reinforced following the 9/11 incident. It seems like that there is a common public opinion in Western societies that Islamic values are “incompatible with ‘modern’ values. In effect, Islam and the Islamic Other are socially constructed as being in opposition to liberal values central to European identity (Flood et al, 2007).

Flood, Hutchings, Nickels and Miazhevich also reaches to a conclusion that Western media (French and British in that regard) plays a major role in defining Islam as the ultimate “other” of Europe. The language used by the media carries four important dimensions:

- Their violent, anti-liberal Islamism vs. our peace-building, liberal values.
- Their intolerance of free speech vs. our respect for free speech.
- Their racial hatred vs. our respect of diversity.
- Their sectarianism and mutual loathing vs. our secularism and respect for one another (Flood et al, 2007).

Ruiz-Jimenez and Torreblanca argues that Turkey’s accession to the European Union is one of the most controversial and divisive topics the EU faces. Underlining the deeply divided environment within European governments and societies on whether Turkey should become a member or not they divide the problem of objecting its accession in three different approaches as utilitarian, identitarian and post-national hypotheses

(Ruiz-Jiménez and Torreblanca, 2007). They reach a conclusion that supporters for Turkish accession are mostly counted among the ranks of those having a post-national vision of the EU, which relates Turkish accession to EU's values rather than their national stand point. Conversely, those against Turkish accession are more likely to be so departing from identity-related arguments. We also find that the utilitarian dimension is the least important of the three which means the benefits of Turkish accession is the least of the public concern (Ruiz-Jiménez and Torreblanca, 2007).

Cultural entities whether a nation or a multinational union, moves and interacts slowly but with a huge power. This huge power produced by the interaction of the societies or cultures lead to further merges or splits to form new cultural entities in the course of history. The power of interaction becomes at full height when it is about the separate end of the spectrum.

### **Effect of EU Programmes on “Otherness”**

#### *EU Programmes and Turkey*

European Union community programmes are between some of the tools to speed up the integration process within the member states and tools for the introduction of new member societies to the community. Lifelong Learning Programmes, one of the largest in the EU, has a specific objective of reinforcing the role of lifelong learning in creating a sense of European citizenship based understanding and respect for human rights and democracy, and encouraging tolerance and respect for other peoples and cultures (Strategic Priorities, 2012). With uncountable human cost of previous struggles, fighting against discrimination, racism and xenophobia is a priority for a more coherent European unity in the future.

Considering the deep and continuous historical and social relations between these two entities -where both define itself mostly by defining who the other is- we are now capable of measuring the possibilities for further interaction and cooperation. Although Turkey is not a member of the Union, it is a member of some of the EU Programmes like Lifelong Learning (LLP) and Youth in Action (YiA) Programmes since 2004. Turkey became a leading country after becoming the 3rd biggest programme country as of 2012 in terms of budget and number of beneficiaries. This success is remarkable as a candidate country, since there are 31 member countries to the community programmes in which 27 of them are EU member states. As of 2010 there were already 175.000 Turkish students, teachers and professionals benefited from the programmes and had cultural contact with their European counterparts and more than 100.000 Europeans visiting Turkey to share a similar cultural interaction with their Turkish counterparts (Çalikoğlu, 2011).

With priorities like fighting with discrimination, helping the establishment of a European identity and fostering EU citizenship and more, lifelong learning and youth in action programmes became an important tool for challenging the “otherness” in and around of the EU. What makes the Community Programmes a unique facilitator for developing the relations between two cultural entities is that for the first time, people from the different sides of the “otherness”, came together? Teachers, pupils, students and other professional found the chance to work together on social and cultural issues at local, regional, national and European level. They created a great synergy between identities and raised a new understanding of the “other”. Prior to the EU programmes, the contact between Turkish and other European societies were mostly based limited mediums of interaction, like tourism activities. Most of the European participants had only connected with immigrant populations in their country, where “otherness” was felt at its height.

Between 2004 and 2010 Turkish beneficiaries managed to complete 8.540 projects under both the LLP and YiA programmes. In just 2010, they managed to create around 13.000 partnerships from all over Europe. Of the 175.000 Turkish beneficiaries 42 % of the beneficiaries are students (mainly beneficiaries of the Erasmus programme), 30 % of them are young people (mainly beneficiaries of the YiA programme), 19 % are teachers and trainers, 5 % are academic staff and 4 % are from other professions. (Çalikoğlu, 2011).

*Cases on Positive Impact on "Otherness"*

Turkey, being on the other side, EU programmes gives a rare opportunity to observe how different identities interact and how the distance of "otherness" is effected. The following examples are derived from different interviews with the participants of LLP and YiA activities. They resemble how the perceived distances can easily be shortened during short activities and how prejudices break down.

"It must be the immigration and the Euro..." said Clara a young girl from Catalonia, Spain during the summary presentation of their Comenius project. They were talking about the growing poverty across Europe. The crowded group of teachers and students were gathered from 5 different European countries Germany, Hungary, Spain, France and Italy were discussing the European identity. The title of the project was "Eutopia: The identity of Europe". It has been a very common exercise to have teachers and students as visitors from all across the EU under the umbrella of the Community programmes. The host school named after the famous Turkish sociologist Prof. Dr. Erol Güngör Social Sciences High School in Konya as the sixth partner of that project. The participation teachers were admitting that Turkey and a social sciences high school was the right place to discuss the identity of Europe. Also for the first time in their life times they were facing the real "other" Europe from such a close distance. They all underlined the differences and the value of these differences that should be added to the bigger European picture.

Most of the visitors, especially the students were hosted by Turkish families where they were expected to have a full intercultural week, at home and at the school. During our visits to the classes we listened to the personal experiences of the Turkish teenagers during the project activities. There were cultural shocks for sure, but overall opinion was in favor of such intercultural activities.

Although a few hundreds of thousand participants might seem to little within a population of 600 million, each personal experience creates a social impact, preached by each participant in their own social setting. It is obvious that if a multinational entity as EU, aims to improve social cohesion, it should give reasons to people to gather. This kind of activities strengthens the ties at the street level, between different communities, that in turn help the political unity to flourish.

LLP and YiA activities are great places to talk with people on culture, identity and others. A young Italian girl, who became a volunteer in Turkey under the European Voluntary Service (EVS) shared her thoughts about her recent contact with the Turkish society in a meeting in 2009. She clearly defines the size of the division between communities and depicts the perceived other before she came to Turkey.

"Unfortunately the Italians know very few about Turkey and they consider it as an Arabic country which means they think that the all the women are all in veil and the men with long beards in the ordinary thinking. Actually they also know very few about the Arabic culture too."

Since in this article main issue was the perception of "other" in the EU communities. Still "otherness" has two sides and just like the Europeans feel themselves distant to the Turkish, Turks also feel the same way. Leyla -an art student from Istanbul- who accomplished her dreams by visiting Florence as an artist by taking part in a Leonardo da Vinci Project.

"The vision of "That arrogant smile" -which kept coming in front of my eyes since my childhood, while I used to think that the Europeans always had the best school, best roads, best houses and etc. - faded away in a short time and replaced by a more real smile of the people who actually have similar hopes and troubles in their lives. It was like a feeling of becoming equal, making me think that I am neither below, nor superior to anybody on this blue planet (From Anatolia to Europe, 2007).

The image of the “other” rarely depends actual facts, but mostly on unconfirmed perceptions. The imaginative depiction of the “other” generally disappears with interaction. In that regard Stintan, a Swedish teacher, writes back to her new Turkish friend after a Comenius in-service training activity in Bartın, Turkey.

I am telling my family, my friends, my colleagues and almost anybody I meet about you. I put up the posters about Bartın, which you gave to me, in my class and at my school. They will think that I have spent 3 or 4 months in there. I still cannot believe the things I have experienced in just 4 days. They were like a dream (From Anatolia to Europe, 2007)..

Kazım, a Turkish teacher, who attended an in-service training course in France with other teachers coming from all around Europe:

At the last day of the seminar, which took only 7 days, everybody was trying to do his/her best to be polite to each other. The goodbyes started as our certificates were being distributed. Our eyes were glistening with the tears that we were trying to hold. But our female friends were unable to stand and let themselves crying in tears. We were all in a great surprise and unbelieving. How was it possible to build such big friendships in just 8 days? In just one week ... (From Anatolia to Europe, 2007). This positive pattern repeats itself with every individual on both side of the “Otherness”.

### **Conclusion and Suggestions**

The real challenge during the establishment for a multicultural Union with multi identities is still fighting discrimination, xenophobia which has its historical roots. The subject is a serious issue to be concerned with. Creating a multicultural, multi-linguistic society is a much harder task, which needs more to be done. EU Community programmes seems to be the real tool that really makes a difference, which have some real impact on the ground.

As we have claimed in the beginning, cultural entities are like huge entities that constantly interact with each other. The idea of creating a European Union which will bring together some separate chunks is one of the biggest projects of the human kind. It is a completely new paradigm, trying to utilize the human knowledge to structure massive social entities within a new modern European identity based on universal values like democracy, dignity, freedom etc. rather than religious or racial ones.

“Otherness” will continue to be a major issue for the EU in the future. European Union has put various actions and programmes to foster the new European identity. The solutions to fund and help intercultural activities under programmes like LLP and YiA are going to be playing an important role in the struggle with xenophobia, racism, exclusion or in short “otherness”. Our field experiences and the data that have been collected clearly shows that international and intercultural programmes have a sound effect and social impact on the people in terms of tolerance and intercultural dialogue. In a study carried out by RAY (A network established by YiA National Agencies), 66.4 % of young participants told that they felt more European after participating to the projects (Youth in Action makes a difference, 2012).

As stated above the natural and constructed identities of Europeanness are in a continuous competition. There is a similarity between the construction of a European identity and nation building efforts of the 19th and 20th centuries. Despite the sophistication of the complex relations between dozens of identities, the interaction between natural European identity, constructed European identity, national identities of Europe and the “other” identities should be studied.

There must be further studies to understand if the positive impact on the participants are permanent. Does the old and ever existing identities will really turn into a new and modern collective “identity”. And does too much intercultural activity creates exhaustion in time? At what scale does this kind of programmes should be supported to create a critical mass to further improve the new European identity?

## Abstract

Sitting for the Examination for Admission to Higher Education (YGS) is the first phase of the university entrance examination process in Turkey. High school teachers have raised concerns regarding the inconsistency between the content of the YGS mathematics tests and the content of the 11<sup>th</sup>- and 12<sup>th</sup>-grade mathematics curricula. Document analysis of the content of the 2010–2012 YGS mathematics tests and the content of 11<sup>th</sup>- and 12<sup>th</sup>-grade mathematics textbooks revealed that the content of these tests is 89% to 93% inconsistent with the content of the 11<sup>th</sup>-grade mathematics textbook and 98% to 99% inconsistent with the content of the 12<sup>th</sup>-grade mathematics textbook.

*Keywords:* external exams; curriculum; high schools; qualitative; content analysis; consistency.

## 1. Introduction

In the Turkish Republic of Northern Cyprus (TRNC), 17- and 18-year-old Turkish Cypriot students sit for the Examination for Admission to Higher Education (YGS), the first test in the university entrance examination process in Turkey. Those who earn the passing score of 140 can sit for the Examination for Placement for Undergraduate Studies (LYS), the second test in the process. Thus, these two examinations are crucial for students aiming to attend higher education in Turkey. As they are administered by the Student Selection and Placement Center (ÖSYM), which works under the Board of Higher Education (YÖK) in Turkey, these two examinations are considered external examinations for Cypriot students. In the TRNC, the curricula and the text-books used in public high schools are prepared by the Ministry of National Education (MEB) of Turkey.

As stated by Fırat and Yaratan (2013), teachers and students, as well as the TRNC media, have expressed disappointment regarding the poor scores of Cypriot students on the YGS and LYS, and many teachers and leaders in the education system have been reprimanded for these low scores. Kelecioğlu (2002) reported that teachers and students in Turkey have in turn complained about the inconsistency between the content of the YGS and LYS and the content of the curricula implemented at their schools. Research by Fırat and Yaratan (2013) revealed that not only teachers but also students have observed inconsistency between the content of the YGS and the 12<sup>th</sup>-grade curricula in public high schools. Baykul (1990) and Kelecioğlu (2002) also identified a lack of

\* Hicran B. Fırat. Tel.: +90-392-630-2560; fax: +90-392-630-3055.

E-mail address: hicran.firat@emu.edu.tr

parallelism between the contents of the matriculation examinations (both the YGS and LYS) and the 12<sup>th</sup>-grade curriculum. In their report, the Turkish Academy of Sciences (TÜBA, 2004), which referred to the high school curricula revised in 2003 as the “new curricula” (p. 3), asserted that the lack of coordination between the MEB and YÖK has led to inconsistency in the alignment between “the required skills in the university entrance exams and the skills aimed in the new curricula,” and argued that this inconsistency results in rote learning.

In the 2005–2006 academic year, the TRNC education system was reconstructed to include three main periods: “Basic Education” from play-class to Grade eight, “High School Education” from Grades 9 to 12, and “Higher Education” (DEPPD, 2005, p. 8). In their high school education, students can choose to attend one of the following schools: “Fine Arts High School,” “College,” “Anatolian High School,” “Multi-program Modern High School (MPMHS),” “Modern Vocational Technical High School,” or “Apprenticeship Education.” At the end of the Basic Education period, students choose a school based upon consideration of their interests, preferences, success, and skills, and are usually advised to attend a MPMHS. At one of the twelve public MPMHSs in the TRNC, students can participate in one of the following programs (DEPPD, 2005): the Science Program (SP), the Turkish-Mathematics Program (TMP), the Social Studies Program (SSP), or the Foreign Languages Program (FLP). The following courses are given priority in each program: physics, chemistry, and biology in the SP; mathematics and Turkish language and literature in the TMP; history, geography, and philosophy in the SSP; and English, German, and French in the FLP.

Higher education in the TRNC begins at the age of 18 and is generally for those aiming to earn a Bachelor’s Degree. As the scores on the YGS and LYS are the main criteria for acceptance, students who wish to attend universities in Turkey must earn at least passing scores on these entrance exams. Since 1974, nearly all universities in Turkey have been admitting students through the Student Selection and Placement Center (ÖSYM). The structure and content of these exams have been revised since then, with the last revision occurring in 2006. In 1981, the ÖSYM introduced a two-stage examination and began adding the candidates’ high school grade-point averages to the calculation of the composite score. Initially referred to as the Student Selection Examination (ÖSS) and the Student Placement Examination (ÖYS), since 2010 the two examinations that constitute the exam process have been referred to as the Examination for Admission to Higher Education (YGS) and the Examination for Placement for Undergraduate Studies (LYS), respectively.

A 160-minute test, the YGS is usually administered to all students on one date in March at 167 centers throughout Turkey and the TRNC. The distribution of the 160 questions in the test is as follows: 40 questions in the Turkish Language section, 15 in the History section, 12 in the Geography section, 8 in the Philosophy section, 5 in the Religious Culture and Moral Knowledge section, 40 in the Mathematics section, 14 in the Physics section, 13 in the Chemistry section, and 13 in the Biology section. After the sums of correct and incorrect responses in all the tests are separately calculated, the raw score is obtained by cancelling one correct answer for every four incorrect answers (ÖSYM, 2013).

The YGS is a criterion-referenced test (CRT), a type of test that aims to determine how well one has learned a specific body of knowledge and skills (Oliva, 2005; Worthen, Sanders, & Fitzpatrick, 1997; Cronbach, 1970; Glaser, 1963). In view of the fact that over a million of students take the YGS simultaneously, the ÖSYM set 140 as the passing or “cut-off” score for the YGS such that students who earn a score of 140 or above can take the second-stage LYS, while those who do not can take that exam again the following year. As the YGS is the first exam in the university entrance exam process, it is a significant external examination that can affect various elements of the curricula. Research into the effects of external exams has revealed that external exams can be indicators of school and college performance (Golstein & Thomas, 1996) and teacher professionalism (Runté, 1998), and may affect content, methodology, and teachers’ attitudes (Wall, 2005) on curriculum development (De Luca, 1994) as well as learning and school priorities (Bishop, 1995).

As indicated by Firat and Yaratana (2013), university entrance exams are not only essential to students for admission to higher education but also important to teachers and the majority of Turkish society (Ekici,

2005). For that reason, several studies have investigated them, among which those relevant to this study, as identified by Firat and Yaratana (2013), are those that investigated the relationship between the items in examinations and the achievement of students (Çepni & Kaya, 2002; Yılmaz, Atav, Erökten, & Morgil, 2000) and those that conducted item analysis of ÖSS questions (Doymuş, Canpolat, Pınarbaşı, & Bayrakçeken, 2000). Being indicators of success, external exams and their results are also a focus of the media. For instance, the TRNC media announce YGS and LYS results school by school and compare them to the test results of students in Turkey, and then place the blame for low scores on the education system. This displeasure, together with teachers' grievances about the inconsistency between the content of the YGS and the content of the school curricula, grievances supported by Firat and Yaratana's (2013) identification of inconsistency between the content of the YGS and the 12<sup>th</sup>-grade curricula in public high schools, indicates the need for further research into this inconsistency.

To fill this research need, this qualitative study conducted document analysis to determine the extent of consistency between the content of the 2010–2012 YGS mathematics tests and the content of the 11<sup>th</sup>- and 12<sup>th</sup>-grade mathematics textbooks, which the majority of teachers perceive as setting the curricula for their classes (Firat & Yaratana, 2013). The following research questions were addressed to meet the study aim:

1. In which content areas does consistency exist between the content of the 11<sup>th</sup>- and 12<sup>th</sup>- grade mathematics curricula and the content of the YGS?
2. To what extent does the content of the YGS correspond to the content of the 11<sup>th</sup>- and 12<sup>th</sup>-grade mathematics curricula?

## 2. Method

Using a qualitative research paradigm and a purposive sampling method, the content of the three YGS mathematics tests administered in 2010, 2011, and 2012 and the content of the two mathematics textbooks used to teach Grades 11 and 12 were analyzed using a conventional content analysis technique (Miles & Huberman, 1994; Marshall & Rossman, 2011). The data obtained were presented in accordance with Miles and Huberman's (1994) *category-based data display approach* and used only to reveal and generalize the phenomenon as it exists in the TRNC. The main topics of the textbooks were used as elements for the content analysis and as the codes in the analysis (Miles & Huberman, 1994, p. 56). The content of the three YGS mathematics tests administered in 2010, 2011 and 2012 were analyzed in terms of their agreement with these topics and the frequencies and percentages were then calculated accordingly.

During the design phase, the coding of the topics and exam question topics was performed by two field teachers from different schools. After these codes had been compared and any differences identified, the codes were modified to ensure consistency in the reliability of the subsequent analysis (Sanders, 1994, p. 153). After one exam question set had been analyzed by the researchers, two field teachers and an expert from a private teaching institution were consulted regarding the content validity of the analysis (Sanders, 1994, p. 145). Finally, content analysis of the content of the 2010–2012 YGS mathematics test was performed.

### 3. Findings

*Consistency between the content of the 2010 YGS mathematics tests and the content of the high school mathematics curricula*

Of the 40 questions in the 2010, 2011, and 2012 YGS mathematics tests, 5 pertained to geometry in the 2010 and 2011 tests and 6 to geometry in the 2012 test. The distribution of the 35 questions in the 2010 YGS mathematics test according to topic and grade(s) covered is shown in Table 1.

*Table 1. Distribution of Mathematics Questions on the 2010 YGS Mathematics Test*

Topic	Number of questions <sup>†</sup>	Grade
Rational numbers	3	9
Square roots	2	-
Factorization	2	10
Exponential numbers	3	-

<sup>†</sup> Throughout the paper, this column is provided in all tables to show the number of questions on the tests. These numbers were not considered while calculating the frequencies or the extent of consistency between the content of the tests and the content of the textbooks.

As seen in the above table, the 2010 YGS mathematics test covered 19 topics, of which 6 were covered in the 9<sup>th</sup>-grade mathematics textbook, one in the 10<sup>th</sup>-grade textbook, and one in the 11<sup>th</sup>-grade textbook. Although three of these topics were common topics for Grades 9, 10, and 11 and one a common topic to all high school mathematics textbooks, 7 were among the middle school mathematics textbook topics. The extent of consistency between the content of the 2010 YGS mathematics test and the content of the Grades 9, 10, 11, and 12 mathematics textbooks was found to be 37%, 14%, 11%, and 1%, respectively. The content of the 2010 YGS mathematics test was found to be 37% inconsistent with the Grades 9, 10, 11, and 12 mathematics textbooks.

### 1.1. Consistency between the content of the 2011 YGS mathematics tests and the content of the high school mathematics curricula

Table 2 shows the distribution of the 35 questions in the 2011 YGS mathematics test according to topic and grades covered.

Table 2. Distribution of Mathematics Questions on the 2011 YGS Mathematics Test

Topic	Number of questions	Grades
Rational numbers	2	9

Reading tables and graphics	1	-

Similar to the YGS 2010 mathematics test, the 2011 YGS mathematics test covered 19 topical categories, of which 8 were covered in the 9<sup>th</sup>-grade mathematics textbook, one in the 10<sup>th</sup>-grade textbook, and one in the 11<sup>th</sup>-grade textbook. Although two of these topics were common, of which one was a topic in Grades 9 and 10 and the other a topic in Grades 9, 10, 11, and 12, eight were among the middle school mathematics textbooks topics. The extent of consistency between the content of the 2011 YGS mathematics test and the mathematics textbooks for Grades 9, 10, 11, and 12 was found to be 41%, 9%, 7% , and 1%, respectively. The content of the 2011 YGS mathematics test was found to be 42% inconsistent with the contents of the Grades 9, 10, 11, and 12 mathematics textbooks.

## 1.2. Consistency between the content of the 2012 YGS mathematics tests and the content of the high school mathematics curricula

Table 3 shows the distribution of the 34 questions on the 2012 YGS mathematics test according to topic and grade(s) covered.

Table 3. Distribution of Mathematics questions on the 2012 YGS Mathematics test

Topic	Number of questions	Grades
Rational numbers	2	9
Square roots	2	-
Operations	2	-
Exponential numbers	3	-
Absolute value	1	9
Divisibility rules	1	9
Functions	2	9,10,11,12
Sets	1	9
GSD-LCM	1	9,10
Ratio	4	9
Probability	2	11
Basic topics	5	-
Speed and motion problems	1	-
Age problems	1	-
Number-fraction problems	2	-
Percentage-interest problems	3	-
Reading tables and graphics	1	-

As shown in Table 3, the 2012 YGS Mathematics test covered 17 topics, 5 of which were covered in the 9<sup>th</sup>-grade textbook, one in the 11<sup>th</sup>-grade textbook, and 2 were covered in the 10<sup>th</sup>-grade textbook. Nine of these topics were among the middle school mathematics textbook topics. The content of the 2012 YGS Mathematics test was found to be 34% consistent with the content of the 9<sup>th</sup>-grade textbook, 3% consistent with the content of the 10<sup>th</sup>-grade textbook, 8% consistent with the content of the 11<sup>th</sup>-grade textbook, and 2% consistent with the content of the 12<sup>th</sup>-grade textbook, but 53% inconsistent with the content of all high school mathematics textbooks.

## 2. Conclusion and Discussion

The extent of consistency between the content of the 2010, 2011 and 2012 YGS mathematics tests and the content of the 11<sup>th</sup>-grade mathematics textbook was found to be 11%, 7%, and 8%, respectively. The reason for the variation in this percentage was the variation in the number of topics covered in these exams. The same reason is valid for the variation in the consistency between these tests and the 12<sup>th</sup>-grade mathematics textbook, which was found to be 1%, 1%, and 2%, respectively. The analysis also revealed a 89% to 93% inconsistency between the contents of the 2010–2012 YGS mathematics tests and the 11<sup>th</sup>-grade mathematics textbook and a 98% to 99% inconsistency between these tests and the 12<sup>th</sup>-grade mathematics textbook.

In education, *alignment* refers to “how well all policy elements in a system work together to guide instruction and, ultimately, student learning” (Webb, 1997, as cited in Rothman, Slattery, & Vranek, 2002). In this study, *consistency* was used to mean a state of “being in agreement” or existing in “a condition of close cooperation.” To address the large inconsistency between the YGS mathematics tests and the mathematics

textbooks, teachers must revise the curricula to instruct students in topics not covered in the 11<sup>th</sup>- and 12<sup>th</sup>-grade mathematics textbooks or, if teachers cannot do so due to time constraints, students must attend private institutions for further instruction. Thus, this inconsistency can cause students to put pressure on their teachers to revise the instruction that they provide in their classes.

Research has shown that many teachers revise classroom instruction to align it with the content of university entrance tests, leading to a focus on not only test content but also test-taking skills, to the detriment of topics not covered in the tests (Firat, 2013). According to Stecher and Barron (as cited in Abrams et al., 2003), use of standardized examinations can limit teaching and learning in undesirable ways. For instance, teachers may place more focus on the test content and teach toward the tests, leading some teachers to feel that their know-how is not being used to its utmost capacity and that “their ideas of valid education for students” (Ballard & Bates, 2008, p. 564) cannot be put into practice. On the other hand, these tests can cause great anxiety among students, who must perform well in order to enter universities.

Research by Firat (2013) revealed that both teachers and students perceive much inconsistency between the content of school curricula, specifically that which is covered in the textbooks, and the content of university entrance exams. As indicated by Kırkgöz (2009), textbooks may become “potential agents for change” according to their suitability in meeting “curriculum goals and objectives, and learner needs” (pp. 79-80). Essentially, the content of the YGS mathematics tests should be much more consistent with the curricula used for instruction in each grade, or these tests should be administered at the end of Grade 10 instead of at the end of Grade 12, as the majority of the YGS content was from middle school, and Grade 9 and 10 contents.

# Impact of mobile technologies at the University in Argentina

Alejandro Spiegel, Georgina Rodríguez\*, Melina Salviolo, Alicia Peña, Susana Ferrarasi

*TecMovAE– Facultad Regional San Nicolás – Universidad Tecnológica Nacional  
Colón 332 – San Nicolás – Prov. Buenos Aires – República Argentina*

## Abstract

The spread of mobile devices in Argentina, emphasized by the Conectar-Igualdad program, motivated the research of the impact of this available equipment at the university. A number of issues arise. For example: Do university professors plan their lessons including these devices? Do they suggest the use of these devices to the students?

From some data built from surveys and interviews conducted during 2012, attitudes and social practices of professors and students in the first year of university are analyzed, and possible explanations related to the use of mobile technologies are shown, together with expectations and suggestions made by both professors and students in this new environment.

*Keywords:* mobile devices; teaching; University

## 1. Introduction

The technological equipment that teachers and students that enter the Public Argentine University have, has substantially changed in recent years: there was a time in which technological devices were concentrated inly in technological labs and informatics centers. Nowadays, almost all students and teachers have mobile technological devices such as notebooks, netbooks and smart phones, that they carry or may carry with them across the different contexts they pass through. This change has been produced by the combination between the Conectar Igualdad Plan –the state program for the distribution of technological equipment to high school students, that has already delivered more than 2.500.000 netbooks ([www.conectarigualdad.gov.ar](http://www.conectarigualdad.gov.ar))– and the proliferation of mobile devices in daily life.

In this context it is worth asking:

- Which usage does this equipment have at university?
- Do university professors include these devices in their lesson plans? How do they do that? Do they suggest the use of these devices to students for activities within or outside the classroom?
- Do students carry these devices to university? Do they use them for academic purposes? What does this use consist of?

Besides, beyond the reference or the specific instruction for the use of these technologies, one of the most frequent social practices in the academic commonness is the access to the information, to the accumulated knowledge. In this regard, the new screens offer new supports, formats and paths for the information, and for social practices related to communication. In this way, there are a number of questions that arise: What format do

\* Corresponding author. Tel.: Tel.: +54-336-4425266; fax: +54-336-4420830  
E-mail address: [tecmoveae@frsn.utn.edu.ar](mailto:tecmoveae@frsn.utn.edu.ar); [www.frsn.utn.edu.ar/tecmoveae](http://www.frsn.utn.edu.ar/tecmoveae)

the study materials have in the first year of university? How are these formats related to the students' preferences and their social practices in everyday life? Moreover, How do they read with these technologies? How do they look for information? Where did they learn? Are these issues addressed in the first year of college?

This paper, which is framed within the research being conducted by the Tecmovae group, "Mobile Technologies Applied to the Education" at the National Technological University of Argentina, presents some responses related to the use of mobile technologies at university, and the expectations formulated by teachers and students in the different stages of data gathering planned within our project.

## 2. Theoretical approaches

The issue addressed in this article fits within a context in which further changes are seen as a logical step forward for university. Some authors, such as Platini and Mengual (2008), even talk of new educational institutions where Information and Communication Technologies (ICT) are recognized as a key enabler for innovation. Other writers like Dondi and Moretti (2007), Martines (2011) and García Peñalvo (2008), provide useful clues on how to carry out this process of change. García Peñalvo (2008) describes a methodological shift: learner-centred instruction. ICT are central to this process as this author says, because students will have mobile devices that would help them to take autonomous decisions during their learning experience. Instead, Dondi and Moretti (2007) are more concerned about –and thus they give greater relevance to– the adaptation of “Technology Platforms” and the design of new learning approaches. Accordingly, Martinez (2011) asks for the adaptation of existing methods to the new era determined by the proliferation of mobile technology.

According to Goodyear (2011) and Ng and Nicholas (2012) the potential of these modern tools would probably have significant impact as they can, for instance, facilitate the learning experience in different settings of students' working, academic or daily life. Nevertheless, Ng and Nicholas (2012) examine and present different dimensions of sustainable development to achieve these potentials.

Conversely, instead of this critical approach of “activating” (Spiegel, 2013) ICT in higher education institutions, the “obvious” and “automatic” need to respond to the changes that the new generation of digitally empowered students' demands is appealed frequently (Pedró, 2012). Generally, these changes are expressed more significantly at the levels of infrastructure, rather than at pedagogical levels. Within this framework, it is not surprising that, for instance, Conole, De Laat, Dillon and Darby (2008) argue that there are few if any teachers' directions that involve the use of mobile technologies in the first year of English Universities. Moreover, at a global level, “not all teachers are eager to incorporate ICT into their teaching” claims Pedró (2012). In this regard, it is interesting to ask these issues in a context in which the demands are much clear than the ways to bring them into concrete actions.

### 3. Analyzing of some results of the research of the project UTN1612

#### 3.1. Students and their access to the information

In the first survey made in 2012, the students who had just enrolled the engineering careers in “Facultad Regional San Nicolás”, were asked about their daily use of technology, their experience of using it in high school, and their expectations for their first year of college.

One of the issues being investigated was how students learnt to use the Internet. From the data shown in Table 1, it can be seen that 80% of the students learnt mostly on their own, and 12% did it by means of some relative or friend. Only a 5% reported having learnt from the teachings of a teacher.

Table 1. How students learnt to use Internet

Who has taught you to use Internet?	%
A friend	7 %
A family member	4.5 %
A teacher	5.5 %
I learnt on my own	80 %

They also expressed that these abilities to use the Internet helped them to satisfy their own needs related to the material search in Internet. This can be seen in Table 2.

Table 2. How comfortable do the students feel performing different tasks using their mobile devices.

How comfortable do you feel with your skill to....	My skill satisfies my needs	I'd like to know more about its use	I don't know about it	No answer
find in Internet what I am looking for	85%	12 %	0 %	3 %
use libraries online	50 %	41 %	6 %	3 %
use e-books	14 %	39 %	43 %	5 %

Here we can also see that students are not practical in the use of e-books, but some of them are interested: four out of ten students want to learn about their use.

On the other hand, from surveys completed about the end of the year, it could be seen that 8 out of 10 students sought information on the Internet related to their academic work during 2012 ie, during their first year in college. The 84% of them were satisfied with their ability in performing these searches, only 12% would like to know more about the subject and a 1.2% admitted not knowing. However, through interviews with teachers, it came out that they believe that students do not know how to search; they have no criteria for doing so. However, in the interviews was not seen as a concern the improvement of this habit: professors do not guide, or teach information literacy skills to students.

With regard to the searching resources best known by students, according to surveys data, 73% use search browsers like Google, 81% wikis, and 62% state they do it by instinct.

### 3.2. *Choosing a screen instead of paper for reading*

In students' survey, data on the reading habits of students were also collected: why they read, and what kind of format they use for reading. 71% of the students surveyed cited comfort as the great advantage for reading and searching for information on the Internet. As it can be seen from the data summarized in Table 3, whatever the purpose or motivation of reading is, students choose screens instead of printed materials for reading.

Table 3. Reading habits of students

Regarding to your reading habits...	In books	In Internet	Others
Because I like it, I enjoy it	39%	54 %	13 %
Because it is more convenient	37 %	55 %	4 %
So as not to get bored	24 %	55 %	13 %
To complete work study	42 %	75 %	7 %
Because I have to	30 %	11 %	17%

Nevertheless, from the analysis of interviews done to teachers, they expressed that from their point of view, students prefer to read on paper, and also they said that most of the materials offered to students in college are printed notes. According to some teachers, the "official materials" of the subjects are printed, but sometimes they add extras and they send them in digital format.

### 3.3. *Students' expectations versus their first year of university experience*

The poll conducted on students at the beginning of first year at the college, also enquired about students' thoughts regarding to the use of mobile devices in the year coming. It was found that students expressed great expectations for this fact: the vast majority imagined that teachers would use these devices as resources for teaching, and that they would recommend them to use these technologies to help their learning processes, and also that they would use to communicate with them. Figures 1 and 2 show the survey's results on these topics.

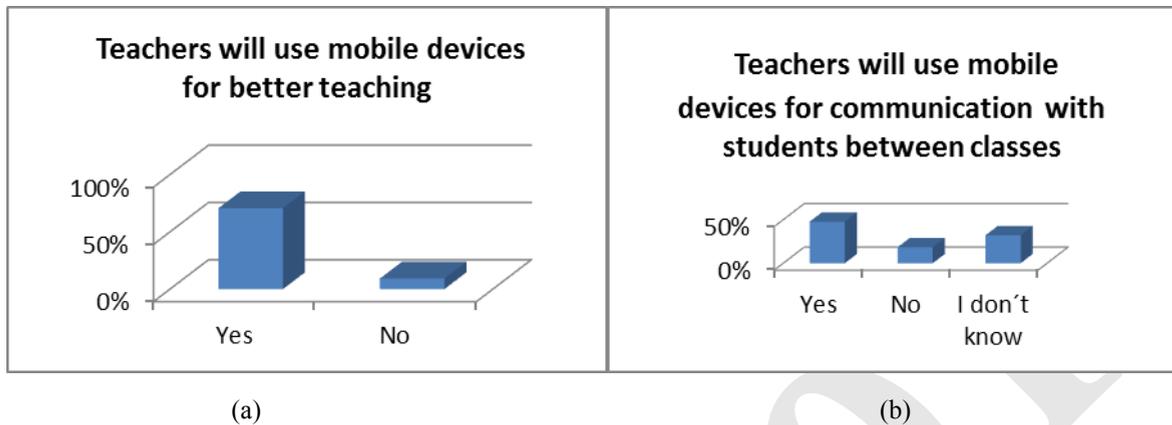

Fig. 1. Students' expectations about teachers' use of mobile devices

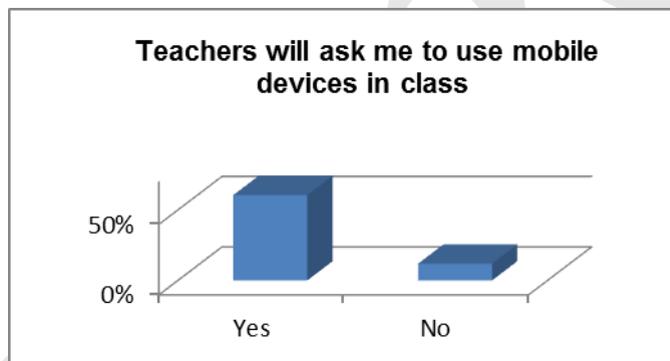

Fig. 2. Students' expectations about whether teachers will ask to use devices in class

As it is shown, the high expectations of students are not mere wishful thoughts; they involve the display of very concrete scenarios of application, where mobile technology has an important place as regards to the update expected at university.

Nevertheless, the results shown on Figure 3 revealed a different reality. A remarkable 71% of students said they had never used the netbook on a teacher's indication. This was also shown in the teachers' interviews: from there we could see that, in general, there was no initiative from the teachers to make the students carry their devices to the class. The 13% obtained in "sometimes" could be interpreted as: an isolated course, in one subject, once a teacher asked his/her students to bring computers for working in class, or to perform some extra activity outside the classroom.

However, when students were asked if their teachers had used netbooks/notebooks for teaching, 48% said "sometimes", as shown on Figure 3. This may seem contradictory to what is shown in Figure 1, but it is not quite so. Taking into account the records of request of computer equipment, it appears that "mobile technology" may

have been the projector and the teacher's netbook (or the one provided by the department), for example, for PowerPoint presentations.

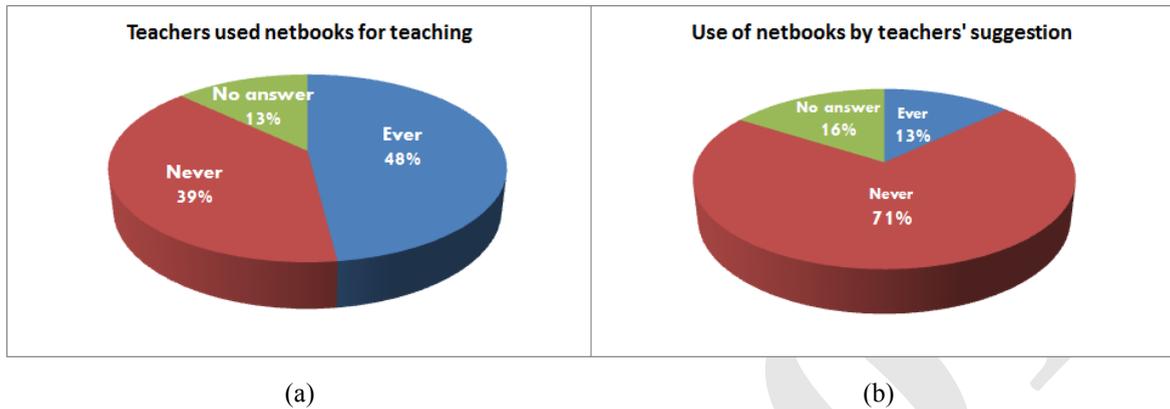

Fig. 3. (a) Teachers' use of devices for teaching; (b) Use of devices by students by teachers' suggestion

In this scenario, what did students do? Did they stop using the mobile devices they had? At the end of the year, students took part in another survey, where they answered several questions as regards their usage of mobile technology during their first year of college. The results can be seen in Table 2. It is shown there that a significant percentage of students used their mobile devices on their own initiative: 70% said they have done Internet researches, 47% said they have studied using the netbook, and also 56% said they have used information from online libraries and encyclopedias.

Table 4. Students' use of devices

Did you use your netbook for...	Ever	Never	No answer
doing your homework	47%	39%	13%
searching in Internet about the issues being developed	82%	5%	13%
communication so as to coordinate study meetings with peers	63%	18%	18%
studying	58%	24%	18%
using specific engineering software	58%	29%	13%
finding information from on-line libraries	63%	18%	18%
using Facebook or Twitter	63%	16%	21%
using online programs	42%	37%	21%

In other words, despite the lack of teachers' instruction, students decided to use these technologies for academic life, as they do in the rest of their daily lives.

#### 4. Conclusions

The students that begin first year at university have mobile devices. Furthermore, they frequently carry them to university in their backpacks, and use them during the breaks. However, the majority of teachers do not

instruct students to use these devices either inside or outside the classroom. Likewise, students – as part of the social practices they develop in the rest of their daily lives – use them to communicate and to search information in the network.

As regards this last activity- the most frequently quoted when referring to the use of technology at university – as it is previously said, students are able to perform these activities because they learnt on their own or with the help of their peers. They do not recognize formal learning at this respect. Moreover, there are no teachings of these specific issues at university, as it is assumed that they are “dominated” by the new generations. This assumption probably comes from the confusion between the knowledge about how to handle technologies (Bilbeny, 1997) and the knowledge related to clicking and typing, with the others, related to the logical or intellectual access (Spiegel, 2013) to these technologies. Equally, this presupposition is not confirmed: It is assumed that students have “sufficient” intellectual tools to seek and to select information, assumption that is often incorrect. Students’ reading habits and the information support they use or prefer are not assessed or contrasted, either. Moreover, the majority of the consulted professorships continue offering the materials of study and consultation in printed format.

Therefore, the statement about the massive availability of mobile technologies potentially used for the teaching and learning process in the first year of college, coexists with some "negatives" (in terms of non-visualization of):

- the existence of this equipment, that is expressed by the absence of concrete usage in the classroom and/or instructions for the academic utilization of its potential.
- about the expectations of use of this equipment that the students bring and that might be capitalized in the shape of genuine motivation for the learning;
- the need to qualify students in the search, in the access to information, in the management and the utilization of the information published in the Network, as part of the instances of the new 21<sup>st</sup> century professionals’ formation.
- about the new learner’s preferences and reading habits, that implies new cognitive overloading (Spiegel, 2013, Perkins, 1995) for students.

Thus, it can be said that although there is already an ongoing process of change, it is still incipient; it still requires management policies that facilitate the overcoming of this situation. In these terms, for instance, it would be interesting to design teacher training instances and ways of pedagogical support for teachers to recognize the ways of knowing of the new subjects of learning and more easily tap the potential of new mobile equipment inside and outside the college classroom.

# Improving the quality of disabled people's life at work via iso 9001 standard

Martin Fink, Libuše Ludíková\*

*Palacky University, Žižkovo nám. 5, Olomouc, 77140, Czech Republic.  
Palacky University, Žižkovo nám. 5, Olomouc, 77140, Czech Republic.*

---

## Abstract

The quality of life is influenced by many elements. One of them is employment. People with disabilities have a lot of problems at work (if they are so lucky to get one) – starting with adaptation to a workplace and team, through difficulties during the working process or communication between them and the employer. The aim of this paper is to introduce ISO 9001 standard as a suitable element that positively influence the quality of life of disabled people.

This paper represents one of the outputs of sub activity of the project called The Research on Quality of Life of People with Special Needs (IGA\_PdF\_2013\_006), which was realised by Students grants contest of Palacký University in Olomouc.

*Keywords: person with disabilities, quality of life, satisfaction, employment, ISO 9001 standard.*

---

## 1. Introduction

The current economic situation in the Czech Republic is not ideal for employing people. There is no need to emphasize, that various specifics of people with disabilities makes this category of our fellow citizens (as for as searching for a job and keeping it) very „vulnerable“. If this person is so lucky to be exercisable in the job market, there comes in many cases certain disillusionment on both sides (employers and employees). So the question is, weather there are any procedures or methods to eliminate the eventual disproportional expectations of both sides. If so, there comes another question. Can there be, as one of the option of elimination or lowering the negative factors influencing the quality of working life, the implementation of ISO 9001 standard? The following text can be understood as a way for searching for the answers.

## 2. The quality of life

\* Corresponding author: Martin Fink, Tel.: +420 604 489 285  
E-mail address: martin.fink@mvso.cz, martinfink107@gmail.com

The issue of quality of life infiltrates in the last decades a lot of science disciplines e.g. medicine, psychology or sociology, but the look back to modern history says, that the term quality of life was first used in economy. It was in 1920, when Pigou in his work *The Economics of Welfare* mentions this term for the first time. In this work Pigou also deals with the role of state as a provider of subsidies for underprivileged. It is obvious, that each science discipline applies different point of view to the term quality of life and its use. It makes it then difficult to summarize one universally binding definition of this term. This estate illustrates very well Payne, who says: „There are a lot of definitions of the term „quality of life“ in the literature. But none of them was in the last 30 years generally accepted“ (Payne, 2005, s. 207). From the aforementioned is clear, that the quality of life is a multidimensional category, containing both the objective and subjective perspective of this phenomenon. That is why the approach containing many concepts (theoretical frameworks) of quality of life, with all its dimensions, is the most suitable for description of the topic. One of the most quoted frameworks is the Conceptual QOL framework of Centre for Health Promotion, which works with quality of life in complex. It divides it to three basic and particular domains.

**Picture no. 1 Conceptual QOL framework of Centre for Health Promotion, University of Toronto**

<b>Being who one is</b>	
<b>Physical Being</b>	physical health , personal hygiene, nutrition, exercise , grooming and clothing, general physical appearance
<b>Psychological Being</b>	psychological health and adjustment , cognitions , feelings, self-esteem, self-concept and self-control
<b>Spiritual Being</b>	personal values, personal standards of conduct, spiritual beliefs
<b>Belonging connections with one's environments</b>	
<b>Physical Belonging</b>	home, workplace/school , neighbourhood, community
<b>Social Belonging</b>	intimate others , family, friends, co-workers, neighbourhood and community
<b>Community Belonging</b>	adequate income, health and social services, employment, educational programs, recreational programs, community events and activities
<b>Becoming achieving personal goals, hopes, and aspirations</b>	
<b>Practical</b>	domestic activities, paid work, school or volunteer activities ,seeing to health or social

<b>Becoming</b>	needs
<b>Leisure Becoming</b>	activities that promote relaxation and stress reduction
<b>Growth Becoming</b>	activities that promote the maintenance or improvement of knowledge and skills, adapting to change

### 3. The quality of working life and the Quality management system

Even though we can see, thanks to research and application of acquired knowledge, the positive move in the area of quality of life (thereinafter QOL) of people with disabilities (particularly in relation to health or provided services), there is none or barely some move in the area of quality of working life (thereinafter QOWL) of those persons. One of the limiting factors is limited resources (e.g. financial or human). This fact forces us (willingly or not) to find new innovative approaches, which have, without the need of subsequent expenses, the potential to improve the QOWL of people with disabilities. One of the rather perspective options, how to improve the QOL at work, is the usage of quality management system (thereinafter QMS). QMS is „*a system by which an organization aims to reduce and eventually eliminate nonconformance to specifications, standards, and customer expectations in the most cost effective and efficient manner*“ ( [www.businessdictionary.com](http://www.businessdictionary.com)). There is no space to follow the economic influence of the implemented QMS in the organization like competitive advantage, customer's satisfaction etc. in this paper. It focuses only on expected impact of the implemented QMS on the employees, on their QOWL.

#### 3.1 People with disabilities and the quality of life

„*Person with disabilities is a person, whose physical, sensual and/or psychical abilities or sanity is different from the typical estate of appropriate age and therefore it is legitimate to assume that this unfavourable estate lasts longer than 1 year. The difference from the typical estate according to appropriate age must be of that kind or range, that it usually makes barriers or even makes it impossible to socially assert the person.*“ (Novák, Kalnická, 2008, <http://panda.hyperlink.cz/cestapdf/pdf08c6/novak.pdf>). This definition was determined by the interdepartmental working group in connection with the first statistical survey about people with disabilities in the Czech Republic (2007). Its aim was to find out, what kind of barriers in the process of improvement of QOL is possible to eliminate. The health handicap influences not only the daily life of the person, but also the process of education, self-realization and last but not least his/hers professional assertion (Finková, 2012, s. 44). Even though Finková deals in her work only with people with visual impairment, it is possible to generalize this thesis to most of other disabilities.

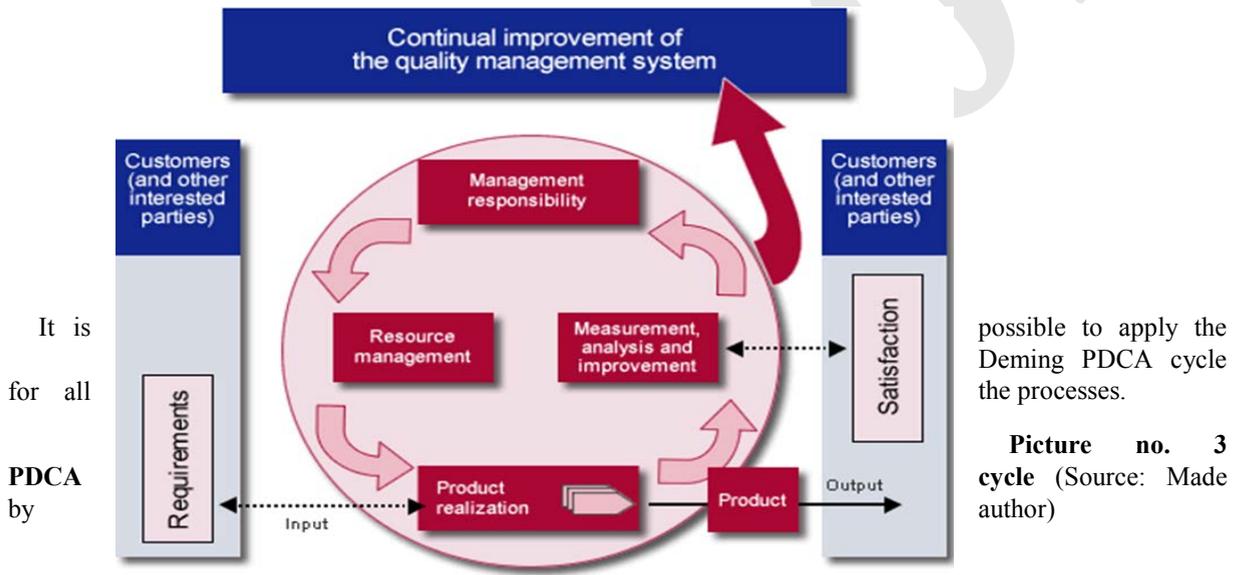

#### 3.2 ISO 9001 Standard

This standard is not the only way to implement and maintenance QMS, but it was chosen by the author on purpose. It is the most used one. There is no need to know the standard in details, only the basic principles of it for a better orientation will be described in the paper.

One of the crucial attributes of the standard is the accent on procedural approach: „An advantage of the process approach is the on-going control that it provides over the linkage between the individual processes within the system of processes, as well as over their combination and interaction (ISO 9001, 2009, s.11) For a better illustration, there is a model of the procedurally oriented QMS in the picture no. 2

**Picture no. 2 ISO 9001:2008 Model – The Systems Approach (QMS)**

(Source: [http://www.technopeers.co.uk/?page\\_id=246](http://www.technopeers.co.uk/?page_id=246))

It is possible to apply the Deming PDCA cycle to the processes.

**Picture no. 3 cycle** (Source: Made author)

**Plan:** Recognize an opportunity and plan a change.

**Do:** Test the change. Carry out a small-scale study.

**Check:** Review the test, analyse the results and identify what you’ve learned.

**Act:** Take action based on what you learned in the study step: If the change did not work, go through the cycle again with a different plan. If you were

successful, incorporate what you learned from the test into wider changes. Use what you learned to plan new improvements, beginning the cycle again. (ASQ, 2013:<http://asq.org/learn-about-quality/project-planning-tools/overview/pdca-cycle.html>)

The advantage of the standard is its universality: „*All requirements of this International Standard are generic and are intended to be applicable to all organizations, regardless of type, size and product provided*“ (ISO 9001, 2009, s. 15).

Basically, the standard provides „manual“ how to maintain through the process management the best results. When first seen it could be said, that the standard focuses only on outside, on customers. But when we look deeper, we can see the cohesion of all processes, so it is only logical, that the standard deals also with inner area of the organisation.

The standard is formally divided into eight chapters; in most of them the links on activities that directly influence the employees could be found. Chapter no. 6. 2, Human resources, apply itself on employees directly:

#### *„6.2.1 General*

*Personnel performing work affecting conformity to product requirements shall be competent on the basis of appropriate education, training, skills and experience.*

#### *6.2.2 Competence, training and awareness*

*The organization shall*

- a) determine the necessary competence for personnel performing work affecting conformity to product requirements,*
- b) where applicable, provide training or other action, to achieve the necessary competence*
- c) evaluate the effectiveness of the actions taken,*
- d) ensure that its personnel are aware of the relevance and importance of their activities and how they contribute to the achievement of the quality objectives, and*
- e) maintain appropriate records of education, training, skills and experience“ (ISO 9001, 2009, s. 20-21).*

The standard, particularly its requirements makes it easier for the employee to orient him/herself in the organizational structure (supervisor, colleagues, and responsible person) or communication thanks to perfectly described situations. Without the standard the employee would be forced to improvise. And it is not the only advantage of this standard.

The aforementioned facts implies, that the employee in the organization, where the standard ISO 9001 is implemented, could be in his/hers job more satisfied so there is an assumption, that his/hers QOWL could be also higher. The question, whether is this assumption corrects, remains. The next lines are dedicated to show the planned research on the topic.

#### *3.3 Research*

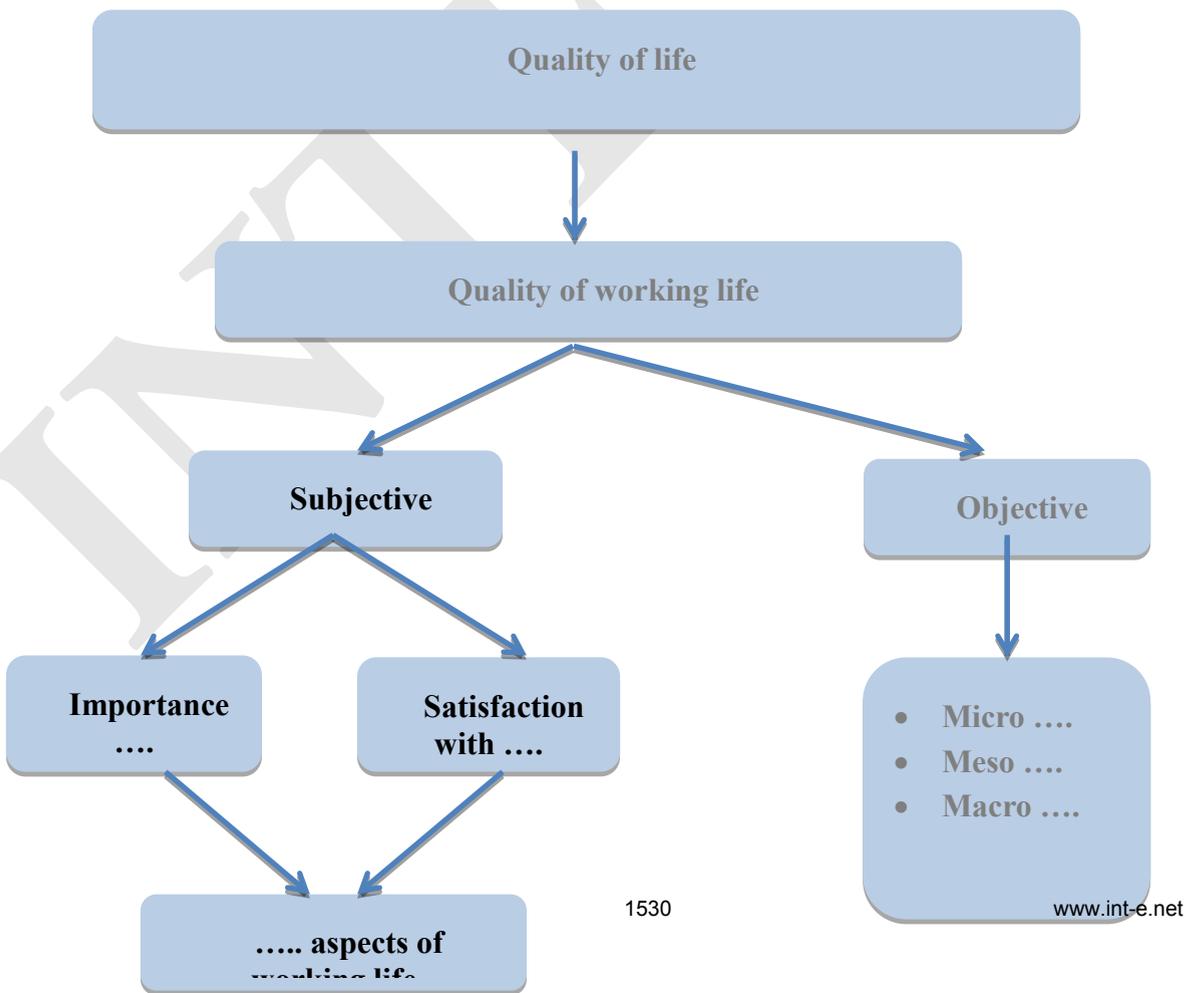

The design of the research, or more precisely its pilot phase, is not difficult. The needed data would be achieved by a questionnaire. There will be two respondent groups. The first one will contain people with disabilities working in organizations, where the standard is not implemented. The second one will contain people with disabilities working in organizations, where the standard is already implemented. The results will be compared.

The complicated phase in the described survey was the search for an appropriate tool – questionnaire. There was a discussion, whether to trace both levels of the QOL, which means the subjective and the objective one, or to focus only on one of them.

According to the range of various specifics resulting from various types of health disabilities, we decided to use only the subjective QOWL level for the survey. We assume that this approach would better illustrate the given estate. To explain it, we introduce here a practical example. The lightening in the workplace corresponds with all the legislative requirements – objectively we can say, it corresponds with quality standards. But the person with visual impairment can subjectively perceive this situation as not sufficient – he/she is not satisfied, which implies lower QOWL. For the questionnaire, the concept of subjectively perceived QOWL designed by the Institute of Sociology of the Academic of Sciences of the Czech Republic was chosen.

**Picture no. 4 The conceptualization of subjectively perceived quality of working life**

(Source: Made by author, inspired by Vinopal (Vinopal, 2011, s. 943))

The concept for measuring the subjectively perceived QOWL is based on three basic pillars: (1) Dual conception of QOWL, (2) the conceptualization of subjective perceived QOWL as a combination of two dimensions – importance and satisfaction, (3) the definition of structure of material domains and aspects of quality of life and its coverage by adequate indicators (Vinopal, 2011, s. 939). The questionnaire itself consists of two batteries containing 18 questions. In the first battery the respondents evaluate the satisfaction with existing aspect, in the second one its importance. The aspects by detail are written in the picture no. 5.

**Picture no. 5 The questionnaire**

DOMAINS	ASPECTS
SALARY	<ul style="list-style-type: none"> <li>• salary</li> <li>• justice</li> <li>• nonfiscal benefits</li> </ul>
SELFREALIZATION	<ul style="list-style-type: none"> <li>• independency</li> <li>• education</li> <li>• interesting rate</li> </ul>
RELATIONS	<ul style="list-style-type: none"> <li>• with colloquies</li> <li>• with supervisors</li> <li>• bully</li> </ul>
TIME	<ul style="list-style-type: none"> <li>• distribution of working hours</li> <li>• time demandingness</li> <li>• Reconciliation with free time activities</li> </ul>
Conditions	<ul style="list-style-type: none"> <li>• equipment</li> <li>• cleanness</li> <li>• safety</li> </ul>
Assurance	<ul style="list-style-type: none"> <li>• type of employment</li> <li>• assurance of having the work</li> <li>• chances on the labour market</li> </ul>

Source: Made by author, inspired by Vinopal (Vinopal, 2011, s. 945)

Data from each battery could be evaluated separately, or together as an overall QOWL index. (If you are interested in getting more information about construction of this empirical tool see Vinopal 2006, 2009, 2011). The comparison of obtained data (the organization with and without implemented standard) should confirm the assumption of positive influence of the standard on employees or more precisely on their satisfaction (subjectively perceived QOL). But the validation of this assumption (in which we hope) is not enough from the point of view of usage of this fact. It is completely legitimate to ask, whether the expected results of the survey have also the potential of practical use. The answer to this question is, by our meaning, positive. One of the options of the practical use of our surveys results is to create methodics (based on the standard) that would help the current or future employers of people with disabilities in various areas of working life to increase the satisfaction of their employees (and with that also better the production rate of their own company). The second and even more important option is to refer to readiness of the organizations with implemented standard to employ people with disabilities. The provable data can help to break the barriers and stereotypes in the mentality of employers, who are afraid to employ person with disabilities. For a lot of organizations it would be contribution disabilities without the need of significant changes and to satisfaction of both sides. This approach than makes the to get to know, that by implementing the standard and its adherence to it, they would be able to employ the person with need of special programmes, customization of a work place, specialized experts on communication etc. irrelevant.

#### 4. Conclusion

Today's dynamics forces us to think in wider circumstances. It forces us to search for innovative solutions, to use the synergy of seemingly not connected science fields. This paper works on the same bases. Its aspiration is to search for new methods and approaches to increase the QOL of people with disabilities. Limited fiscal resources give us no other chance. Even though the most of the text is focused on subjective perceive of QOL, it would be a mistake not to mention in this conclusion also the point of view respecting the objective dimension of QOL. „The only scale of QOL (observed in general macro social point of view – not seen the subjective factors of experience) of a group or a single person with disabilities is the ability and willingness of the major society to redistribute a piece of produced social product for saturation of the objective needs of this group of people!“ (Michalík in E-pedagogium, 2009, s. 96). So there we are, back in the level of resources and still searching for a solution – not only flashy, but particularly effective.

---

### Abstract

**Background:** Anxiety and apprehension have been observed in beginning nursing students as a recurrent pattern, particularly when students are entering upper level foundational nursing courses. This anxiety contributes to increased withdrawals from nursing programs and decreased satisfaction in retained nursing students.

**Purpose of Study:** To determine the effect of an e-mentoring program that pairs junior and senior level undergraduate nursing students on student satisfaction and student retention.

**Methods:** This mixed methods design utilizes an online peer mentoring strategy. 20 junior mentees and 20 senior level mentors participated in the study. Students completed surveys after one semester of participation, to evaluate the success of their mentor-mentee relationship, and gauge student satisfaction with the program. All information was utilized to assess retention implications, and implement changes with the e-mentoring program for future nursing students.

**Results and Conclusions:** 14 mentors and 16 mentees returned surveys. The majority of students felt that they had benefitted from participation after one semester. Students indicated they preferred the online format to in-person meetings. Mentors were able to share studying tips, time-management skills and organizational strategies. Responses to open-ended questions indicated that the success of the mentor-mentee relationship depends on the mentee communicating with the mentor.

**Implications for Practice:** While preliminary data suggests that promising results in student satisfaction, retention rates of students will be determined after one year of the mentorship program. An e-mentoring program could be a necessary component to foster relationships between excelling senior nursing students and junior nursing students, and allow for support in class load, coursework, school, and outside stressors. This relationship allows for collaboration of ideas, and provides perspective for the senior mentor in terms of growth and knowledge base.

Keywords: Mentoring, nursing student, undergraduate, education, innovation

## 1. Introduction

Anxiety and apprehension have been observed in beginning nursing students as a recurrent pattern, particularly when students are entering upper level foundational nursing courses (Giordana & Wedin, 2010). This anxiety, coupled with an increased amount of information that the student must retain in order to be successful in didactic and classroom experiences, contributes to increased withdrawals from nursing programs nationwide and decreased satisfaction in retained nursing students.

The baccalaureate nursing curriculum is designed to prepare students for work within the growing and changing health-care environment (American Association of Colleges of Nursing, 2013). With nurses taking more of an active role in all facets of health care, they are expected to develop critical-thinking and communication skills in addition to receiving standard nurse training in clinics and hospitals. In a university or college setting, the first two years include classes in the humanities, social sciences, basic sciences, business, psychology, technology, sociology, ethics, and nutrition. In some programs, the nursing classes start in the sophomore year, whereas others have students wait until they are juniors. Many schools require satisfactory grade point averages before students advance into professional nursing classes. On a 4.0 scale, admission into the last two years of the nursing program may require a minimum GPA of 2.5 to 3.0 in pre-professional nursing classes, but the cutoff level varies with each program. The pressure to succeed is thus very high in such nursing programs, and there is great concern for the need to retain nursing students throughout the program.

In the junior and senior years, the curriculum focuses on the nursing sciences and emphasis moves from the classroom to health facilities (Warren, 2010). This is where students are exposed to clinical skills, nursing theory, and the varied roles nurses play in the health-care system. Courses include nurse leadership, health promotion, family planning, mental health, environmental and occupational health, adult and pediatric care, medical and surgical care, psychiatric care, community health, management, and home health care. Such courses starting in the junior year have high levels of knowledge and critical thinking, and are dense in theory and information. This is often the time when there is an increased need for support.

### 1.1. *Peer mentoring*

Mentoring early in a nursing program has been shown to reduce student anxiety, provide a positive learning environment, boost self-confidence and lessen confusion (Davison & Williams, 2011; Dennison, 2010). Improved retention rates and satisfaction among first semester clinical nursing students have also been observed with early mentoring (Colalillo, 2007; Dorsey & Baker, 2004). Dennison also notes that mentors benefit from the mentoring experience by incorporating new perspectives into their practice; demonstrating improved leadership, coaching, and listening skills; and becoming more engaged in their work.

Because mentoring is actually about process rather than product, certain key elements need to be in place at the outset of a mentoring program. This includes commitment by both mentor and mentee to the work of the relationship that is grounded in mutual respect, trust, and comfort (Bierema & Merriam, 2002). The ability for the pair to develop “just in time” strategies to answer questions and solve problems by e-mail or telephone is also essential to accomplishing the agreed-upon outcomes, which in turn, moves the relationship forward (Dahl, 2005). (Giordana & Wedin, 2010).

Although there is positive research on the impact that a peer mentoring program can have on nursing program outcomes, there are many challenges to instituting such a program. Among the challenges cited by students, it is evident that the most common issue was finding the time to meet with the student’s mentor, on top of studying and preparing for such a heavy course load (Giordana & Wedin, 2010; Warren, 2010). An online peer mentoring program, however, could be a potential solution to this issues. There is a dearth of research on the impact that an online peer mentoring program can have specific to nursing students.

### 1.2. *E-Mentoring*

Although electronic communication technology has grown rapidly and globally, literature related to e-mentoring is limited. A working definition of e-mentoring is that of Bierema and Merriam (2002) “computer mediated, mutually beneficial relationship between a mentor and a protégé which provides learning, advising, encouraging, promoting, and modeling, that is often boundary-less, egalitarian, and qualitatively different than face-to-face mentoring” (p. 212). Unlike web-based instruction, e-mentoring is sharing information with the goal of mentee growth. The virtual nature of the e-mentored relationship allows online conversations that may not take place in face-to-face relationships and give a degree of objectivity to the relationship. E-mentoring offers flexibility within a school setting, allowing the mentor and mentee to blend routine work and mentoring during school time. However, there are risks associated with e-mentoring programs. A loose, unstructured relationship and insufficient administrative support for the mentoring commitment can lead to mentoring problems early on (Akin & Hilbun, 2007). Miscommunication is also a common issue. More serious is the opportunity for disengagement by either the mentor or the mentee, often resulting in forfeiting the relationship (Bierema & Merriam, 2002). Nursing literature has typically focused on attributes of a positive mentoring relationship and its benefits to individual professional development within the organization (Hayes & Sexton Scott, 2007; Heller et al., 2004), essentials of novice-expert models for student clinical experiences and new staff orientation (Andrews & Wallis, 1999; Butler & Felts, 2006), and the use of mentoring for nursing research. There is no known research, however, exploring the effect of an e-mentoring program on nursing retention in a baccalaureate nursing program.

## 2. Purpose of the Study

The purpose of this study is to examine the effect of an e-mentoring program on nursing student satisfaction and nursing retention in a baccalaureate nursing program. Specifically, it aims to answer the research question: *Does implementation of an e-mentoring program increase nursing student retention and nursing student satisfaction in a baccalaureate nursing program?* It is important to note that this report reflects preliminary results of this 2-year online mentoring program.

## 3. Methods

This pilot study utilizes an explorative mixed-methods, convergent parallel design, which involves simultaneous collection of qualitative and quantitative data, followed by subsequent merging of multiple data sources (Creswell, Klassen, Clark, & Smith, 2011). A pilot study is designed to preliminarily explore a topic or phenomenon, with a limited sample size (Leon, Davis, & Kraemer, 2011).

### 3.1. *Online Peer Mentoring Intervention*

To reduce student anxiety and empower senior nursing students to acknowledge their own growth as a nursing student, an online peer mentoring strategy was developed, pairing junior level nursing students with senior nursing students in a baccalaureate nursing program. Outcomes include nursing satisfaction, acceptability, and nursing retention rates. There are major objectives of instituting this e-mentoring program. Firstly, it is necessary to foster relationships between excelling senior nursing students and junior nursing students, allowing for the support with regards to class load, coursework, school and outside stressors. This relationship will allow for collaboration of ideas, and also provide perspective for the senior mentor in terms of growth and knowledge base. It will also foster the service component that is a pinnacle of the institution’s mission.

Because of the challenges of a remote e-mentoring program, it was extremely necessary for faculty to closely monitor and support this mentor/mentee relationship to ensure appropriate usage of the relationship. Two nursing faculty served as coordinators for student learning to facilitate the mentorship process.

### 3.2. *Setting*

This e-mentoring program takes place in an undergraduate baccalaureate nursing program at an East Coast private college.

### 3.3. *Sample selection and mentor program*

The investigators recruited 20 junior level student mentees and 20 senior-level student mentors during the beginning of the Fall semester. All students enrolled in the junior-level nursing foundations course were eligible to participate. Junior-level students who were identified as high-risk for failure based on previous GPA were strongly encouraged to participate. All senior-level students enrolled in the senior-level foundations course were eligible to participate as a mentor, but were selected based on GPA, collegiality, and past clinical evaluations. Students were excluded that were on a leave of absence from the program, or that had a GPA below 2.5.

Once mentors and mentees were selected, they were paired up and contact information distributed. Faculty will met with the mentors initially to detail responsibilities, expectations, and provide tips and skills important in the mentorship process. Literature was provided to show evidence of successful mentorship and potential benefits of the program. Faculty also described successful mentoring and establishing boundaries of the mentor-mentee relationship.

A forum on the distance education site was created to facilitate the mentor/mentee relationship. This forum was only be open to mentors and mentees within the e-mentoring program, with the facilitation of the faculty members. Participants will be required to correspond at least weekly with their partner, in order to create continuity within the program and successfully attain program goals. Semi-monthly postings by faculty regarding issues in nursing programs and professional nursing can help generate discussion among pairs, and stimulate the relationship to start. In addition, students will be asked to complete monthly online surveys to evaluate the success of their mentor-mentee relationship, and gauge student satisfaction with the program.

After graduation of the senior nursing student mentors, the relationship was encouraged and fostered as well, as new graduate nurses can be very valuable mentors to their nursing student mentees. Graduates are encouraged to discuss NCLEX preparation, securing first nursing jobs, transition from student to professional nurse.

### 3.4. *Study Duration*

In order to allow for implementation of this program, the duration of this study will be 2 years long, with 2 separate cohorts of mentees. It is important to note that, when possible, the junior nursing student mentees will transition into mentors when they enter their senior year.

### 3.5. *Outcome Measurement and analysis*

This study will begin to compare retention rates of nursing students from 1-5 years prior to institution of the e-mentoring program to retention rates of the junior level nursing student cohorts participating in the program. In addition, student satisfaction among participants was gauged by utilizing anonymous online surveys with Likert-type and open-ended questions. Student satisfaction was analyzed using descriptive statistics (Likert-type questions) and thematic analysis to report common themes (open-ended questions).

### 3.6. *Informed Consent*

Each participant was aware of the purpose of study and intended data collection. Students were aware that their consent was implied upon participation in the mentor program, and completion of online surveys. Potential participants were made aware that there was no benefit to taking part in this study, and that choosing to complete or not complete this study would have no effect on the ability to successfully complete the nursing program. There would be no direct benefit to a student's grades or GPA by participating in this program and/ or study. All surveys were completely anonymous and distributed via Survey Monkey. It is also important to note that both

investigators did not have any of the students in class, so there was no risk of grade inflation or deflation based on participation.

#### 4. Preliminary Results

Twenty junior-level mentees and twenty senior-level mentees participated in the first year of this online mentoring program. Two mentees lost due to student attrition and specific reasons are unknown. The sample was predominately female (85% female mentees, 80% female mentors). The report of preliminary results from this online mentoring program will only include nursing student satisfaction, as it is premature to report student retention rates at this point. Qualitative and quantitative data are integrated in the results presentation below.

##### 4.1 Nursing student satisfaction

The majority of mentors (77%) indicated they felt they had a lot to offer their mentee. All of the pairs were able to communicate at least once per week, often utilizing cell-phone texts, emails, or phone conversations. The majority of mentees (74%) considered the mentee relationship to be positive, and the most useful information provided by mentors was study habits, stress relief, and time management strategies.

It is important to note that there were some challenges noted by the mentors. Some mentors (46%) felt that the relationship was dependent on the initiative of the mentee; that they need to be open to learning, and ask questions often. At least one mentor felt that he could have been utilized more by his mentee, and was disappointed because he felt he had a lot to offer.

Select quotes from open-ended responses of the mentees demonstrate the preliminary success of the program: *"Very helpful for first tests/study hints"*; and, *"You did a great job matching us up; better than some dating services!"*. The mentors also noted positive aspects of their role as mentor: *"It brought back memories of the first time going to clinical"*; and, *"It made us realize how much we have actually grown as students"*.

#### 4. Discussion

The preliminary findings from this study indicate that an online mentoring program could offer the support that undergraduate nursing students need. The benefits of this program from a qualitative perspective indicate that there was reduced student anxiety, a positive learning environment, increased self-confidence, and increased student interaction among peers. From a faculty perspective, the investigators gained significant insight into the role of an online mentoring program in this population. Mentors benefited by incorporating new perspectives into their practice, demonstrating improved leadership, coaching and listening skills, and becoming more engaged in their work. This supports the findings of Giordana and Wedin (2010), who studied peer mentoring in multiple levels of nursing students. It was also evident that support of the organization was critical, giving permission for the mentoring interaction to occur on work time and allowing use of agency resources. This idea is also supported in the literature (Dennison, 2010).

The format of the online-mentoring program was ideal for all of the students, which is supported in the literature (CITE HERE). The virtual nature of the e-mentored relationship allows online conversations that may not take place in face-to-face relationships and give a degree of objectivity to the relationship. In addition, e-mentoring offers flexibility within a school setting, allowing the mentor and mentee to blend routine work and mentoring during school time.

The challenges of the peer mentoring program include time and effort needed to facilitate the relationship. The investigators also noted that collaboration must occur from both mentor and mentee, and when the mentee is not likely to seek out help, it is necessary for the mentor to step up and offer more often. In addition, it was evident that weaker students seek out less help from mentee, and that encouragement from faculty was essential.

#### 5. Limitations

Because this was a preliminary report of a pilot study, results are not generalizable nor transferrable to other populations. Although all efforts were made to match students according to gender and interests, this was

not always possible, and it is likely that one or more of the pairs may have had personality differences that affected the relationship. In addition, the small sample size limits the inferences that can be made from the findings of this pilot study. The aims reflect the exploration of the intervention itself; thus analysis for effect size is not appropriate (Leon, et al., 2011), 2011). There are several potential moderating and mediating variables present within the sample. It is not possible with this small sample size, however, to control for these variables or perform regression analysis.

## 5. Conclusion

It appears that the research on mentorship during nursing school demonstrates potential benefits to students' learning and success throughout nursing school. Through ongoing investigation and continuance of this program, it will be possible to investigate nursing retention rates and continued satisfaction of nursing students. While it is evident that mentoring programs have the potential to be of marked benefit to the participants, there remain issues which need to be further explored.

# Infidelity as a Threatening Factor to the Existence of the Family

Irena Loudová<sup>a\*</sup>, Kamil Janiš<sup>a</sup>, Jiří Haviger<sup>b</sup>

<sup>a</sup>University of Hradec Králové, aDepartment of Pedagogy and Psychology, 500 03Hradec Králové, Czech Republic

<sup>b</sup>University of Hradec Králové, Institute of Social Work, 50003, Hradec Králové, Czech Republic

## Abstract

One of the numerous factors affecting family stability is undoubtedly the infidelity of one of the partners. This contribution comprises a personal definition of infidelity, including the most common practices and ways, which in the minds of adolescents are influenced by the subjective "definition" of infidelity. The research contains the results of the quantitative investigation shown in the sample of adolescents (n = 796). This is the view of individuals who are currently in their first partnerships and establishing a system of values concerning their relationship to the partner, to love, to loyalty, and to infidelity. Additionally, they form their image of a well-functioning family. The results of the research point to a growing tolerance towards infidelity. The focus of this paper is on responsible partner selection in the context of fostering stable partnerships, marriages, and parenting skills with the aim to eliminate the negative factors involved in infidelity, particularly concerning the spread of sexually transmitted diseases (especially HIV/AIDS) and other accompanying socially undesirable phenomena in order to contribute to the stability of the family.

Keywords: family, infidelity, partnership, sexually transmitted disease

## 1. Introduction

Partnership and family life are inseparably connected with the danger of the situations when the written or unwritten rules of coexistence are being broken and the relationship is ailing. One of the phenomena causing such a situation is infidelity and the related problems, such as divorce and others.

Everyone has undoubtedly personally encountered the issue of infidelity, either in his/her own life or in the life of one of his/her friends or relations. This issue is a matter of personal life as well as the legal system, although infidelity is not a legal term. Infidelity has its own history, it is a frequent motive in literature, it is a prominent issue in psychology and it has an important place in education towards marriage and parenthood as well. One of its consequences is divorce, which is reflected in demographic statistics, becomes a topic of political campaigns and a part of the value system etc. Whatever is our perspective of looking at infidelity, it is the definition of the term which becomes the first obstacle.

This article presents suggestions for discussion over a current topic.

Recent discussions often focus on the various forms of socially undesirable coexistence, arguments and examples are searched for not only in the above-mentioned areas but also e.g. in nature. *"Nevertheless, infidelity is not an actual primary cause but a consequence of another cause or causes which arose in the marriage or even before it."* (Havlíček, 1992, p. 79).

It is the responsible choice of a partner, which is the crucial step leading to the socially desirable model of a family which does not fall apart. The time of the emergence of long-term partner relationships being usually the period of professional preparation at secondary schools or universities, the choice is influenced by a number of factors with a more or less positive (or negative) impact. Using a gross simplification, we can describe these factors as certain limits restricting our chance to succeed, resp. to have a long lasting relationship and later a functioning family, just as the society expects. What can such limits be?

### *1.1. The limits of infidelity*

#### **Demographic limits**

If we work with the prevalent European model of family based on the Christian tradition, it means that there is always one man and one woman, i.e. the typical monogamous model. However, the number of women in population becomes higher than the number of men with rising age. Various calculations show that in the age group above 30, every 7th – 8th woman is “free”, having no stable partner (we have to differentiate between the so-called singles and the impossibility to live with a partner permanently).

#### **Educational limits**

The issue of infidelity has to be included in different school subjects at primary and secondary schools, primarily in moral education, but also in education towards partnership, marriage and parenthood.

#### **The limits of social and sexual maturity**

Women become socially “mature” much sooner than their male peers, they have clear priorities, value system, life strategy etc. This is firmly connected with sexual maturity as well. On the other hand, the traditional idea of every woman’s dream “to have a baby” is being continuously disrupted. The number of women who find the sense of life in things utterly different than the mother role is increasing. It has not been long since such women were unanimously thought fit to be treated by a psychologist, however this is no longer the general view. It is true that besides a number of subjective reasons of the women’s choice, there is often the objective reason – the continuously rising infertility.

#### **Family limits**

The view of family as a social institution is conditioned by a number of factors, the most dominant ones being stability and fidelity. They determine the ethical quality of the relationship. An adolescent often experiences a pre-crisis situation or even the crisis itself and s/he carries this negative experience into his/her adult life. Since the divorced parents usually enter into another relationship, the child loses one of the many certainties – family stability and s/he takes the loss with him/her into his/her future partnership, marriage and parenthood

#### **Historical conditioning**

The attitude to infidelity was constantly changing throughout the history. It usually consisted in double approach (double morals). Men were allowed to have a harem or a great number of lovers, while the position of women was completely different. A woman was basically untouchable, being a possession or even a piece of goods belonging to the man.

#### **Media limits**

Few television series are completely unconcerned with infidelity, relationships outside marriage or partnership, including the birth of a child outside family environment. At the same time, it is mass media, which have a strong impact on the opinions, attitudes and the value system of adolescents.

### Medical limits

One of the important things connected with infidelity is sexual intercourse, which is often unprotected. This makes infidelity one of the causes of the spread of sexually transmitted diseases, which can happen in geometric progression. Worries about the woman becoming pregnant are no longer the chief factor here.

#### 1.2. An attempt to define infidelity

The definition of what is infidelity and what is not provokes violent quarrels between partners, while none of them admits that there is no universal answer. The generally accepted definition of infidelity as sexual intercourse with a person outside one's current relationship does not hold against the voices of those who become jealous and accuse their partner of infidelity because of a kiss, a glance or a mere thought of someone else.

Christian environment identify infidelity with adultery. See e.g. Riegerův slovník naučný (Rieger's Dictionary) (1862, volume 2, p. 145) which defines adultery as "*deliberate sexual converse of a married person with another not married to him/her as well as the converse of a single person with a married one. The breach of conjugal fidelity, but also of chastity connected with adultery made it a crime punishable by the most severe punishments.*"

Ottův slovník naučný (Otto's Dictionary) (1882) does not contain the word infidelity, however it gives an extensive definition of adultery. The same dictionary (1892, volume V., p. 418) defines adultery as "*extramarital intercourse of a husband or wife or intercourse with one of the married couple*". Furthermore, it differentiates between simple adultery (jednoduché cizoložství) involving just one married person and double adultery (dvojnásobné cizoložství) involving two married persons. In historical context, the term "cizoložství" (adultery) was originally equivalent to "nevěra" (infidelity), while adultery was defined as extra-marital intercourse of a husband or wife. Another source identifying infidelity with adultery is Masarykův naučný slovník (Masaryk's Dictionary). Besides adultery, there are other terms connected with infidelity. As we have already written, there is no precise definition of infidelity, however, using a simplification we may say that infidelity is the opposite of fidelity, which represents one of the conditions of a well-functioning marriage as well as one of the elements of prevention of sexually transmitted diseases, domestic violence, failure of some functions of family etc.

Logically, every individual in the social environment experiences uncountable social contacts necessitated by his/her duties at work, family relationships, ways of spending free time etc. One of the possible beginnings of infidelity is the so-called flirt and possibly virtual infidelity.

The issue of infidelity appears in a number of studies dealing with the different inclinations to infidelity in men and women, the appropriate reactions to learning about infidelity, the means of prevention of infidelity etc.

#### The means of prevention

- responsible choice of a partner proving his/her worth during the relationship before marriage
- open communication between the partners
- sexual life without problems and adequate emotional satisfaction
- happy and full life together, common interests etc.

Our society is unusually tolerant to infidelity. Numerous surveys realized by the authors of this text showed that 25 % of partners approximately are willing to tolerate infidelity. 33 % on the other hand, consider infidelity an insoluble problem resulting in the disintegration of the relationship and, in the case of marriage, divorce.

#### The most common motives and causes of infidelity:

- momentary diversion,

- search for a new experience (adventure),
- a means of revenge to an infidel partner,
- unfulfilled wishes and desires in the current relationship (the search for a prince/princess),
- the desire to “go for the better”,
- escaping a stereotype,
- sexual dissatisfaction in the current relationship,
- permanent presence of children (unsatisfactory housing conditions),
- models of behaviour from adolescence.

In practice, we differentiate mainly between two types of infidelity:

- **physical infidelity** – extra-marital or extra-partnership relationship which involves sexual intercourse;
- **mental infidelity** – emotional separation from the current partner/husband/wife, gradual disappearance of common activities, the absence of imaginations concerning common future and last but not least the decrease of the interest in sexual life. Mental infidelity develops into physical infidelity in most cases, which means that the new relationship is sooner or later connected with intercourse.

Some authors, mainly those from the past, distinguish between several types of infidelity Capponi and Novák (1995, p. 47) give the following types:

1. Odskok (bounce): one-time, usually accidental, without emotional ties, use of or submission to an opportunity unaccompanied by emotions.
2. Dobrodružství (adventure): motivated mainly by the desire to have a new sexual experience, diversification of life. Purely sexual motives can be accompanied by emotional ties.
3. Vztah (relationship): long-term affair having certain stages similar to the stages of married life

Various definitions help us to differentiate between two elements of infidelity:

- mental-erotic activities (they play an important role at the beginning of the relationship, but they also have their place in more advanced age),
- sexual activities (they play the crucial role in most relationships).

**The disintegration of the traditional idea of family is related to the rising tolerance of some risk phenomena threatening the family**, mainly infidelity. A society based on institutional monogamy must have the concepts of institutional form of adultery (prostitution) and of infidelity. Compared with the past, modern science and technology offer far more means and conditions resulting in risk situations (we speak about mobile phones, PCs and the increased mobility of persons).

Moreover, there is no ideal image of fidelity in nature, though many will argue that there are enough examples of long-term or lifelong fidelity. It can be claimed that fidelity in nature can become an obstacle to natural selection of partners. Various codes appeared throughout the history (e.g. The Old and New Testaments), they described mutual relationships and in the case of the choice of a partner they practically allowed for no changes.

Men are generally more promiscuous than women, they are programmed to maximize the transmission of genes and their genitals enable them to transmit the greatest number of genes possible in a short time to their descendants.

Recent research (e.g. Weiss, Zvěřina, 2001) points to the generally known fact that women tend to enter longer extra-marital relationships than men.

To make the overview of problems complete, let us notice that infidelity is usually discussed in connection with marriage. Considering that more and more people prefer partnership to marriage, it would be appropriate to focus not only on infidelity in the context of marriage, but mainly in the context of partnership.

Table 8: Reasons of divorce on the part of man (%)

<i>Prevalent reason of divorce</i>	19 60	19 70	19 80	19 90	20 00	20 05	20 06	20 07
infidelity	29, 4	15, 7	18, 3	14, 9	7,9	5,8	5,5	5,2
differences in natures, opinions, interests	10, 6	19, 9	26, 0	40, 5	47, 0	52, 1	54, 6	65, 9
<i>total</i>	40, 0	35, 6	44, 3	55, 4	54, 9	57, 9	60, 1	61, 1

(Source: Czech Statistical Office)

Table 9: Reasons of divorce on the part of woman (%)

<i>Prevalent reason of divorce</i>	19 60	19 70	19 80	19 90	20 00	20 05	20 06	20 07
infidelity	28, 6	12, 4	16, 9	13, 2	5,6	3,7	3,3	3,3
differences in natures, opinions, interests	10, 9	21, 7	26, 0	40, 5	49, 1	50, 5	52, 7	64, 5
<i>total</i>	39, 5	34, 1	42, 9	53, 7	54, 2	54, 2	56, 0	67, 8

(Source: Czech Statistical Office)

The data given in the tables makes it clear that infidelity ceases to be the cause of divorce for both men and women in the last decades. One of the possible explanations could be the fact that at the end of the partnership/marriage both mates are usually in new relationships already, which means that the stress is on the differences in natures, opinions and interests rather than on the infidelity itself (see Table 2). The increasing number of divorces caused by differences in nature, opinions and interests is a sort of warning. It is undoubtedly an argument for paying special attention to the choice of future partner at school.

Kinsey's (1948, 1953) reports in sexual behaviour state that about 33% of men and 20 % of women have extramarital intercourse some time in their lives. Czech research on sexual behaviour conducted by Weiss and Zvěřina (2001) suggest that almost 66 % of married men had extramarital intercourse during their marriage. (64

% in 1993 and 63 % in 1998). As for women, 46 % admitted to have had extramarital intercourse in 1993 and 42 % in 1998. The average number of partners given by men was 6,4 (50 % had 3 partners or less) and the same number for women was 3,9 (more than 50 % had one or two partners). Furthermore, women tend to have long-term extramarital relationships, while men have rather occasional ones. The authors believe that the greater number of infidel men is the result of their greater sincerity or the possibility that they often had intercourse with unmarried women. They also explain the greater number of infidel persons in comparison with foreign studies by the more liberal attitude of the Czech population to infidelity. The data presented in the CVVM report from 2003 are no less interesting: 32 % of respondents believe extramarital relationships to be “always wrong” and 38 % believe them to be “almost always wrong”. 21 % consider them to be “sometimes wrong” and 4 % “never wrong”. Another survey of the same agency (CVVM) from 2012 shows that infidelity of the husband is judged morally unacceptable by 60 % of female respondents, while 63 % of male respondents have the same opinion of the infidelity of women. 11 % of men and 8 % of women regard it as morally acceptable.

## 2. Method

### 2.1. Research objective

The aim of the research was to identify the trend in the attitude of young girls to infidelity. We addressed two groups of respondents and asked them to express their opinions of problems in partner relationship. One part of the research was concerned with the comparison of the opinions of secondary school students and university students, all the respondents being female.

### 2.2. Method

The research is based on quantitative survey using a questionnaire of our own making consisting of 22 items. 2 items were open questions and 20 were answered on a five point scale (yes, rather yes, rather no, no, I do not have a decided opinion). Respondents were further asked to put the items in order according to their preferences.

### 2.3. Research sample

The respondents were secondary school students (aged 16-19, n=548) and university students of the bachelor program (aged 20-22 let, n = 248) in the Czech Republic.

Table 10: Structure of the research sample (N=796)

n = 548		n = 248	
age	%	age	%
16 years	22,8	20 let	33,5
17 years	29,8	21 let	31,8
18 years	26,3	22 let	34,7
19 years	21,1	-	-
<i>Total</i>	<i>100,0</i>	<i>Total</i>	<i>100,0</i>

## 3. Results

One of the first questions was whether the respondents are currently in a relationship and, if not, whether they have recently been in one. It is reasonable to suppose that their experience can affect their view of the issue of

infidelity, especially in respondents whose relationships fell apart. We may also expect the experience with a partner relationship to increase with age. At the given moment (n = 248) 198 of university students were or had been in a relationship (i.e. 79,8 %). As for secondary school students (n = 548) 280 of them had a relationship (i.e. 51,1 %) mainly those in the final year. Respondents were not asked to indicate how many relationships they already had before the current one.

The obtained data can be compared with the results of many similar studies, mainly the research conducted by P. Weiss and J. Zvěřina (2001) concerned with sexual behaviour of the citizens of the Czech Republic. This research shows that men tend to regard extramarital intercourse as natural and normal, while women do not denounce it but they are not interested in having it themselves.

Table 11 of infidelity: What is the respondents' idea

	n = 548 (age 16-19)	n = 248 (age 20-22)
	%	%
tentative flirt, chasing	12,3	11,3
mutual touches and fondling with another woman	15,1	13,7
kissing a stranger	14,8	5,6
written communication over the Internet, SMS	5,8	6,0
meeting another woman – walks, dinners etc.	13,2	14,1
accidental intercourse	28,5	19,4
parallel relationship with another woman	48,0	38,3
contact with ex-girlfriend without sex	4,0	6,0
sleeping over in a friend's house	8,2	6,3
forced intercourse under threat	-	1,6
watching porn movies	1,2	1,6
repeated infidelity	24,2	12,7
using the services of a prostitute	-	2,8

There were interesting attempts to define infidelity claiming that it is **deliberate and intentional disrespect for the fixed limits and rules between partners given beforehand**. The definition has to include also: scorn, neglect, ridiculing, using another girl's name in an intimate moment, finding of another girl's underwear etc. The results make it clear that the range of indications of infidelity according to the respondents is extremely wide. They show that women perceive flirt as well as situations connected with intercourse as infidelity

Table 12: What can be tolerated?

	n = 548	n = 248
	%	%
tentative flirt	17,0	14,1
mutual touches and fondling with another woman	20,0	18,1
kissing a stranger	15,9	15,3
written communication over the Internet, SMS	19,8	16,6
meeting another woman – walks, dinners etc.	15,8	14,1
accidental intercourse	78,5	7,3
parallel relationship with another woman	58,8	38,3
contact with ex-girlfriend without sex	30,8	14,1
sleeping over in a friend's house	15,9	4,8
forced intercourse under threat	2,0	1,6
watching porn movies	22,5	25,0
repeated infidelity(exceptionally)	48,2	7,3

Some items raise the question why the respondents are willing to tolerate some activities which can threaten their current relationship (e.g. accidental intercourse, which is connected with the risk of contracting a venereal disease).

The results show that **younger girls are more tolerant of infidelity than older girls**. We believe that liberal education, the influence of media and high divorce rate are conducive to the general tolerance of an undesirable social phenomenon. That is an appeal for all individuals responsible for education. It is desirable that young generation builds its future on good foundations, which include the following terms: fidelity and commitment.

#### 4. Conclusion

The research showed that similarly to the term “family”, which is difficult to define precisely (Havigerová, Haviger & Truhlářová, 2013), the term “infidelity” is not only difficult but essentially impossible to define, since it has a different meaning for every one of us. That is why it is important for partners to clarify their idea of infidelity at the beginning of their relationship and to agree on what they consider (will consider) to be infidelity and what are the limits. The influence of their environment must necessarily be taken into account as well, since it is one of the factors affecting the relationship of partners (Levická a kol., 2012).

Trust is the basis of all good relationships. A breach of mutual trust (by word or deed) creates an opportunity for infidelity. If one of the partners continuously suspects the other of infidelity the natural result is jealousy.

It is surprising that despite the extensive and long information campaign many say that it is impossible to tolerate accidental intercourse, while a third of the respondents admits that such an activity exists. The risk is high as it is improbable that reliable barrier contraceptive is used during accidental intercourse.

Infidelity is connected with the danger of disturbing the mental well-being, deterioration of family climate and consequent negative impact on children. Another danger seems to be the spreading of sexually transmitted diseases. It suffices to realize that every intercourse with a new partner is that a pyramidal increase of potential transmission of some sexually transmitted disease occurs.

The most important finding of this research is the **need to pay increased attention to the education towards partnership, marriage and parenthood**. Another important point is the responsible choice of a partner. The space for education in this area could be found in the subjects **Basics of Social Sciences and Ethical Education**.

## Abstract

The investment climate is influenced by different factors: political, economic, social, juridical, ecological, etc. The present article represents the analysis of the higher education influence on the country's investment climate, expressed by the rank of the indicator of investment attractiveness by materials of "Doing Business". The authors of the article suppose that a greater number of students, acquiring the higher education favours the investment climate of the country. This hypothesis was proved using correlation method on the basis of Eurostat data by countries of the Central-Eastern Europe.

Keywords: investment climate, human capital, higher education

---

## 1. Introduction

The problem of attracting investments is one of the key problems of the modern society. Investment resources are limited, and it is impossible to fully satisfy the existing necessity in them. The investment climate plays a significant role in activation of investment activity in the region. According to the World Bank data by the investment climate they mean the set of local factors, which form abilities and incentives of firms for productive investment, creating new working place and expansion of operations (World Development Report, 2005).

One of the most important factors more and more influencing the economic growth and directly the investment climate is human capital. Scientists having assessed the ration of human capital, natural and production resources of countries came to a conclusion that the part of human capital in developed countries constitutes up to 80% of potential of countries, developing up to 70% (Where is the Wealth of Nations: Measuring Capital for the 21st Century, 2004).

The roots of human capital idea lie in works of W. Petty, A. Smith and A. Marshall. Schultz, Mincer and Becker (Schultz 1961, Mincer 1962, Becker 1964) formulated this theory more clearly in their generally known works in the frame of human capital theory (Stiglitz 1975). It was projected that education increases human productivity. The additional limit productivity obtained in the training process is paid in the labour market as an addition to a salary.

G.Stigler and M.Spence (G.Stigler 1962, M.Spence 1973) also have contributed to the human capital theory. These authors with K.Arrow, J.Riley (K.Arrow, J.Riley) have explained connections between the level of the market participants' education and incomes.

\* Corresponding author. Tel.: +37129868004.

E-mail address: [alina.ohotina@du.lv](mailto:alina.ohotina@du.lv)

According to A. Ciccone and G. Peri (A. Ciccone, G. Peri 2006) the influence of human capital can be explained due to interstate differences in economic development, insufficient flows of capital into poor countries, and other macroeconomic phenomena.

In this connection the authors estimate that the issue of the presence of macro-level connection between definite indicators of human capital and investment climate in countries of Central-Eastern Europe, characterised by the recent transfer to the market type economy.

The authors in the present research answer the question how such a component, characterising human capital, as a percentage of students acquiring the higher education by types of programmes and spheres influences the investment climate.

## 2. Method

In order to check the hypothesis about the connection between the percentage of students acquiring the higher education and ranks of investment climate of countries the authors used a correlation analysis.

*The correlation analysis* is a method of statistical data processing, the essence of which is the study of correlation coefficients among variables. The study of correlation dependences is based on the study of such connections among variables, at which the value of one variable-dependent alters on average depending on which values are taken by other variables. The mathematical correlation measure of two random quantities is correlation coefficient (Ефимова, Петрова, Румянцев 1998). Correlation connection reflects the tendency when one variable quantity with the growth of another variable quantity correspondingly either decreases (negative correlation), or increases (positive correlation).

*Spearman's correlation* is of rank-type, i.e., for estimation of connection strength scientists use corresponding ranks, but not numerical values. The coefficient is an invariant in relation to any monotone measurement scale transformation.

As an operational indicator, characterising the investment climate of countries, the authors used the ranks of the ease of doing business index according to annual surveys of the World Bank „Doing Business” (Doing Business 2011: Making a difference for entrepreneurs, 2010).

One of the human capital components is the part of population acquiring the higher education (according to International Standard Classification of Education it is the 5<sup>th</sup> and the 6<sup>th</sup> stage of the higher education). *The authors have made the analysis of the connection degree between ranks of the ease of doing business indices and the part of people studying in different programmes: theoretical (stage 5A of the higher education) and professional, technical bachelor and master programmes (stage 5B), and also doctor programmes (stage 6).* The authors have made a more detailed analysis of the connection degree *between ranks of the ease of doing business and the part of people studying in different fields of the higher education: teacher training and pedagogical science; humanities and art; science (life sciences, physical sciences, mathematics and statistics, computer studies); engineering, manufacturing and building sector; agriculture and veterinary medicine; public health and social maintenance; services (consumers services, transport, environmental protection, security services); social sciences, entrepreneurial activity management, law (International Standard Classification of Education, 1997).* The research information basis was the *Eurostat basis of statistical indicators.*

The analysis was made by countries of Central-Eastern Europe: Estonia, the Czech Republic, Poland, Lithuania, Latvia, Slovenia, Hungary, Bulgaria, Slovakia, Romania, and Croatia for the period of the year 2010. The data correlation analysis was made in the programme SPSS 17.

### 3. Results

As the correlation analysis shows in general in countries of Central-Eastern Europe the investment climate is influenced by the part of students acquiring the higher education including bachelor, master and doctor programmes (Spearman's correlation coefficient -0,430,  $p < 0,01$ ). *It means the bigger is the part of students, the lower is the investment climate rank, and correspondingly, the region is more attractive to investors* (Table 1).

Table 1. Correlation matrix of rank of the ease of doing business and the part of all students in countries of CEE, year 2010.

The part of all students in country population	The rank of the ease of doing business
<i>The part of students studying in bachelor, master, and doctor programmes</i>	$r$ (Spearman's) = -0,430**

Note \*\* significance value 0,01

Source: authors' calculation according to the data of rating of the ease of doing business and statistical base of the European Statistical Office – Eurostat

As a result of the conducted research it was stated that the investment climate is influenced by the part of students studying in **professional**, technical bachelor and master programmes (Spearman's correlation coefficient -0,343,  $p < 0,01$ ) and **doctor** programmes (Spearman's correlation coefficient -0,291,  $p < 0,01$ ), but not influenced by the part of students, studying in **theoretical** bachelor and master programmes, giving either preparation to the scientific work or access to professions, requiring the high qualification (Spearman's correlation coefficient -0,191,  $p > 0,05$ ).

However, the depth and breadth of knowledge, acquired in professional, technical programmes in their quality differs from knowledge, acquired in theoretical programmes. Professional programmes concentrate on professional knowledge and skills, connected with the entrance to labour market. The successful graduation of such programmes usually gives for students a qualification, which is in demand in the workforce market (Table 2).

Table 2. Correlation matrix of rank of the ease of doing business and the parts of students in different programmes in countries of CEE, year 2010.

The part of students in different programmes	The rank of the ease of doing business
The part of students studying in theoretical bachelor and master programmes	$r$ (Spearman's) = 0
<i>The part of students studying in professional, technical bachelor and master programmes</i>	$r$ (Spearman's) = -0,343**
<i>The part of students studying in doctor programmes</i>	$r$ (Spearman's) = -0,291**

Note \*\* significance level 0,01

Source: authors' calculation according to the data of rating of the ease of doing

business and statistical base of the European Statistical Office – Eurostat

The research has revealed the influence of the part of students by different fields of the higher education on the investment climate of a country. It established the medium degree linear connection between investment climate indicators and the part of students, studying in programmes of such sectors of education as **public health and social maintenance** (*Spearman's correlation coefficient* -0,547,  $p < 0,01$ ); it also established the weak linear connection between investment climate and the part of students, studying **humanities and art** (*Spearman's correlation coefficient* -0,281,  $p < 0,05$ ); and also **natural sciences** (*Spearman's correlation coefficient* -0,284,  $p < 0,05$ ); **engineering, manufacturing and building sciences** (*Spearman's correlation coefficient* -0,304,  $p < 0,05$ ); and also **social sciences** (*Spearman's correlation coefficient* -0,334,  $p < 0,01$ ). There was no influence revealed on the investment climate of the part of students, studying **pedagogy** (*Spearman's correlation coefficient* -0,239,  $p > 0,05$ ); **agriculture and veterinary medicine** (*Spearman's correlation coefficient* 0,180,  $p > 0,05$ ).

Table 3. The correlation matrix of ranks of the ease of doing business and the part of students by different sectors of education in countries of CEE, year 2010.

<i>The part of students, studying in bachelor, master and doctor programmes by sectors</i>	The rank of the ease of doing business
teacher training and pedagogic science	$r$ (Spearman's)= 0
humanities and art	$r$ (Spearman's)= -0,281*
science (life sciences, physical sciences, mathematics and statistics, computer studies)	$r$ (Spearman's)= -0,284*
engineering, manufacturing and building sectors	$r$ (Spearman's)= -0,304*
agriculture and veterinary medicine	$r$ (Spearman's)= 0
public health and social maintenance	$r$ (Spearman's)= -0,547**
services (consumers services, transport, environmental protection, security services)	$r$ (Spearman's)= 0
social sciences, entrepreneurial activity management, law	$r$ (Spearman's)= -0,334**
<b>Note</b> ** significance level 0,01 * significance level 0,05	

**Source:** authors' calculation according to the data of rating of the ease of doing business and statistical base of the European Statistical Office – Eurostat

#### 4. Conclusions

According to results of the conducted research we can make the following conclusions:

One of the factors influencing the investment climate of countries of Central-Eastern Europe for 2010 is such a component of human capital as the degree of population participation in the higher education.

The part of students in population of CEE countries studying in programmes of the higher professional education and doctor programmes attracts investors. *However, the research has not revealed the influence of the part of students, studying in theoretical bachelor and master programmes, on the investment climate. Probably, this influence does not have a linear character, which requires a more deep separate research. And also it has more likely an indirect influence, because students graduating these programmes do not have a professional qualification unlike professional programmes, in which the direct customer of the level and type of acquired knowledge and skills is an employer (firms, enterprises and others). The possible explanation of the influence of the part of doctoral students in country population on the investment climate is the fact that doctoral students usually are excellent specialists in definite narrow area and constitute the basis for development of innovations in country economies.*

*Concerning the influence of the population participation in the higher education by fields on the investment climate, we can state that investors are attracted by the presence in countries of potential engineers, specialists in manufacturing and building sector, and also professional specialists in sector of natural and social sciences and in sector of humanities and art. The established connection of medium degree between the participation of population in the education field of public health and social maintenance and entrepreneurial climate probably can be explained in the following way – as the specialists of these fields are in demand in labour market, the expression of care about public health and welfare promotes the improvement of the human capital quality in CEE countries. The established absence of linear connection between the participation of population in pedagogical training and investment climate can be explained by the fact that the number of personnel for preparation of population with secondary and primary education does not directly influence the investment climate of CEE countries. However, in authors' opinion the latter requires a separate research. The established absence of linear connection between the participation of population in acquiring education in fields of agriculture, veterinary medicine and entrepreneurial climate possibly can be explained by the low added value in this field, which correspondingly influences the investors' interest.*

# Innovations in seniors' education at the Czech Technical University in Prague Faculty of Transportation Sciences

Lucie Krcalova<sup>a\*</sup>

*<sup>a</sup>Czech Technical University in Prague, Faculty of Transportation Sciences, Department of Applied Informatics in Transportation, Konviktska 20, 110 00 Prague 1, Czech Republic*

---

## Abstract

The paper discusses the education of seniors at the University of the Third Age at the Czech Technical University in Prague Faculty of Transportation Sciences. It analyzes the current situation of the offered courses and proposes a new approach to training for older people. It focuses on the need to educate seniors on modern information technologies and security technologies. As an example, it states the seniors' education in the field of identification and verification using biometrics.

*Keywords:* seniors; education; modern technologies; identification; verification; biometrics

---

## Introduction

The Faculty of Transportation Sciences was founded in 1993 after the break-up of Czechoslovakia. It became part of the Czech Technical University in Prague. In the first academic year 1993-1994, 200 students enrolled in the day-time study in the engineering programs. In the subsequent academic year 1994-1995, the Faculty opened also the bachelor's program in Decin in northern Bohemia. In 1998, the first 70 students graduated in the engineering studies, while the first 15 students graduated in the bachelor's program. In March 2000, the Institute for Bachelor Studies was founded at the Faculty of Transportation Sciences in Decin. In the academic year 2003-2004, a new form of study – the so-called “structured study form” – was launched. The aim of this method was to reflect contemporary European trends in education.[1][6]

## Education at the Faculty of Transportation Sciences

Currently, the Faculty of Transportation Sciences offers a three-year bachelor's program “Technologies in Transportation and Connections,” divided into seven subjects fields. Further, it offers a two-year master's program in the same field, divided into eight subject fields. It is also possible to study in three different doctoral programs: besides “Technologies in Transportation and Connections” (divided into three subject fields) also “Engineering Informatics” and “Logistics.” Table 1 shows complete study programmes, which Faculty of Transportation Sciences has accredited.[1]

### Continuing Education

Besides the above mentioned study programs, the Faculty of Transportation Sciences also offers possibilities for continuing education. This program is divided into three parts: entrance exams preparatory courses, career courses and the so-called University of the Third Generation.

The entrance exams preparatory courses are intended for prospective students and they focus on providing coherent knowledge of high school level mathematics and physics. They prepare the applicants not only for the entrance exams, but also for the studies at the Faculty, since mathematics and physics are an integral part of technical training and can pose difficulties to some incoming students.

The career courses are intended for the graduates of technical and natural sciences schools, who want to expand their knowledge by the newest findings, hereby keeping up with the latest scientific developments and increasing their attractiveness on the job market. Table 2 shows the offer of preparatory courses and career courses in the spring semester 2012 – 2013[2].

Table 2. Spring Courses, academic year 2012-2013

Preparatory courses	Mathematics Physics Mathematics and Physics
Career courses	Management Course to obtain basic theoretical knowledges for aircraft maintenance technician European aviation law commission regulation (EC) number 2042/2003 Electrical wiring interconnection systems (EWIS) Continuation courses from human factors and human performance Safety of fuel tank

### University of the Third Generation

University of the Third Generation is intended for senior citizens, who seek to expand their knowledge and professional skills. A senior citizen is eligible to enroll upon presenting a proof of collecting a pension. The courses of the University of the Third Generation are offered both in Prague and Decin. The following tables (table 3 and table 4) show the courses currently offered [3].

Table 3. Spring Semester 2012-2013

Courses in Prague	Exploring of Prague 2
Courses in Decin	Work with computer – basic course Work with computer – advanced course Multicultural Communication

Table 4. Fall Semester 2013-2014

Courses in Prague	Revamp your Russian
Courses in Decin	Work with computer – advanced course English – intermediate course Man and society – sociology of everyday life

As apparent, the offer of courses for senior citizens at the Faculty of Transportation Services is limited. In addition, it focuses on instruction of foreign languages and computer skills. This focus prevails at other departments of the Czech Technical University, as well as some other universities in the Czech Republic. Technical subjects comprised only 11,6% out of the entire offer of subjects at the University of the Third Generation at the Czech Technical University in Prague in the spring semester 2012-2013 and 20% in the fall semester 2013-2014[3]. The Faculty of Transportation Sciences offers no specialized technical subject, despite the fact that it is a technical school and should expand the education for seniors in these very subjects. According to my survey, seniors are interested not only in foreign languages or computer studies, but also in specialized subjects focused on new technologies, which they encounter in their daily lives.

As the life expectancy is constantly increasing, more and more seniors wish to spend their retirement years in an active and meaningful way. They are interested in current events and often also in new trends and modern

technologies. Since they are increasingly also users of these technologies, they want to gain a more profound understanding of them beyond the mere use. It would therefore be a mistake to limit the education in modern technologies only to the knowledge of computers and other contemporary devices.

### **Biometrics and seniors**

In my opinion, it is highly desirable to offer to seniors technical courses, which will allow them to familiarize themselves with modern technologies, which are commonplace today, for example problems of departure vehicles from light-controlled intersections [4] or problems of authentication in ITS applications [5], etc. Biometrics is one of such next technologies. As a result of constant advancement in research and development in the area of modern technologies, their financial accessibility, as well as increased security risks worldwide, biometrics has been gaining a lot of attention and finding new possibilities for application in the last several years. Identification and verification of individuals by utilizing biometric features used to be the domain of criminologists or organizations requiring high degree of security for its operations. Today, however, all the segments of the population, including seniors, are exposed to different biometric applications in their daily lives. A good example of this trend are biometric passports, which are gradually replacing the former types of passports. The use of biometric features for verification of customers paying with a credit card is less used as of yet. Within a couple of years, however, the use of biometric data can be expected to find its way into more and more areas of our daily lives – they are unique, untransferable and inalienable for each person and since they are derived from different body parts, we are carrying them with us all the time.

Given this trend, the Faculty of Transportation Sciences wants to offer such courses in the context of the University of the Third Generation to seniors, which would provide them with the basic knowledge and understanding of biometrics, such as methods for identification and verification of individuals: fingerprints, geometry of hand, geometry of face, and the vein structure in the retina, back of the hand or a finger. They would also become familiar with both the advantages and disadvantages of these individual methods and their suitability for practical purposes. Practical demonstrations would be part of the course.

The Czech Technical University has been conducting research in the area of biometrics for some time now. The staff and students at the Faculty of Transportation Sciences examine different biometric indicators, such as geometry of an ear, structure of veins on a retina, fingerprints, and structure of the bloodstream of the palm and wrist. In a biometric laboratory, seniors can become familiar with the newest research and the laboratory apparatus used for biometric data collection. The laboratory is equipped with a thermocamera by Fluke, electronic fingerprint scanner by Hitachi, apparatus PalmSecure by Fujitsu for scanning of the bloodstream, apparatus for scanning of the retina and by a camera with infrared additional lighting used for research into scanning of the geometry of the ear and structure of veins of the wrist by Nikon. Part of this research is designed specifically to study collection of biometric data from senior citizens, since it analyzes the influence of age and medication intake on biometric indicators and examines possibilities of compensation of possible negative quality of the scanned sample. Attention is paid particularly to scanning of the structure of veins of the wrist, so that this biometric indicator would be used without any negative influences that diminish clarity of the collected data. Seniors could become part of this research by providing their samples to the database of the biometric laboratory and participating in their analysis.

### **Conclusion**

The Faculty of Transportation Sciences at the Czech Technical University offers, along with the bachelor's studies programs, subsequent master's studies programs, and doctoral studies programs also possibilities for continuing education, which includes also studies for senior citizens at the University of the Third Generation.

Unfortunately, the range of courses offered for this type of studies is currently narrow and focuses only on broadening of the computer literacy of seniors and study of foreign languages and humanities. Considering that the Faculty belongs the oldest technical university in central Europe, such a situation is neither satisfactory nor sufficient. The Faculty should be able to offer also specialized technical subjects, so that seniors would receive education in the area of modern technologies (transportation, security information) to become familiar with the latest trends and their applications. Such understanding would enhance their acceptance of use of the modern devices. With some dedication, this is certainly within the reach of the Faculty. The benefits for the entire society are clear – participation of seniors in both active life and university research has a significant potential. The article cites as an example courses for seniors focusing on the principles of biometrics and their involvement in the research in the biometric laboratory at the Faculty. Gaining knowledge and understanding of the many applications of modern technologies, such as biometry, in the daily lives, makes the users, particularly the senior citizens, less apprehensive about using them and helps them to fully participate in the modern society.

# Innovative course for future math teachers

Natalia Cheredeko, Zohreh Shahbazi

*Senior Lecturer, 1265 Military Trail, Toronto, M1C 1A4, Canada*

*Senior Lecturer, 1265 Military Trail, Toronto, M1C 1A4, Canada*

## Abstract

Future teachers need to advance their conceptual understanding of mathematics, ability to think mathematically and learn how to convey these skills to high school students. In the innovative course “Mathematics for Teachers” these goals are attained through developing specific types of knowledge (basic concepts in education, knowledge of mathematical proof and reasoning, process of mathematical thinking, mathematical language), skills (problem-solving, interpersonal) and ability to see connections within mathematics to other subjects and to the real world. Future teachers explore concepts by “doing mathematics in a similar way, as their own students” and by working on topics connected to the school curriculum through tasks that are challenging at a university level. Student have the unique opportunity not only to learn basic educational concepts, but also apply them to teaching mathematics to freshman university students in the form of review modules, seminars virtual tutorials and lectures on history of mathematics.

Keywords; Future Teachers, Mathematics, Active Learning, Reflection

## Introduction

The course Mathematics for Teachers (MATC82) in University of Toronto is designed for students enrolled in the Concurrent Teacher Education Program (CTEP) and aiming to teach mathematics at K-12 level. The course gives students an opportunity to form their views of mathematics and attitude to the subject for the purpose of teaching. Recently developed, CTEP is the strongest undergraduate teacher preparation program in Ontario. It integrates the study of education across the province and focuses on the improvement of teacher education.

Students of the Mathematics for Teachers course have the unique opportunity to practice teaching mathematics under the supervision of the course instructor and the coordinator of the Math & Stats Learning Centre (MSLC). MSLC is designed as an innovative support system that helps freshman students to overcome challenges of transition from high school to university. The Centre offers various programs that encourage the students to learn mathematics on a deeper level. Participation in these programs helps CTEP students to understand the difficulties they can face as teachers and simultaneously master their individual approach in a supportive educational environment. Close collaboration between MSLC and CTEP resulted in the creating of new type of University course that dramatically enhances the learning experience of future teachers.

### 1. Effective Teaching Requirements

In order to become a successful and productive high school teacher our student have to develop a strong understanding of the historical background of mathematical concepts and their connections to each other. It is also necessary for the prospective teachers to practice teaching of problem-solving skills to the students with different learning preferences and has an opportunity to apply various teaching strategies in

order to learn how to meet needs of students on all stages of their cognitive development. It is important that these teaching opportunities be designed in a way that prospective teachers work with real students looking for assistance in learning certain topics.

## 2. The Aim of the Course and the Course Objectives.

The *overall Aim* of the course is:

- to further student's understanding of teaching and learning,
- to form their views of mathematics and attitude to the subject for the purpose of teaching,
- to improve student's conceptual understanding and ability to think mathematically,
- to teach them on how to convey mathematical ideas to high school students.

In the course Mathematics for Teachers these goals *are attained* through:

- developing specific for educators types of knowledge: basic concepts in education, types of learning styles, nature of a process of mathematical thinking, high school curriculum, creating and maintaining lesson plans, mathematical language,
- pedagogical skills: problem-solving, interpersonal, organizational, technological (document camera, smart podium, transparencies/overheads, etc.),
- ability to see and convey connections within mathematics to other subjects and to the real world.

In order to reach all the above aims, students of the course are being introduced to several learning style models and taught how to use these models in their teaching under supervision of the course instructor. Future teachers unfold the processes of logical thinking and experience “doing mathematics in a similar way, as their own students will, and reflect on the learning experience at the same time” (Watson and Mason, 2007). Students learn how to be teachers by conducting lessons on advance level of school curriculum related topics (peer teaching) and by overcoming public speaking anxiety through delivering open lectures in History of Mathematics to the university students and staff.

The learning experience is enhanced by writing weekly journals, discussing the methodology used and by analyzing the pros and cons of chosen strategy in small groups.

Students of Mathematics for Teachers extensively apply newly acquired skills by teaching and instructing freshman students in Teaching and Learning Centre (MSLC).

Traditionally the *Objectives* of the course can be divided into two following categories: *understanding* and *skills*.

By the end of the course students **shall understand**:

a) different learning styles (auditory, visual, kinaesthetic) and how to use Myers–Briggs, Colb’s and Felder–Silverman models in their teaching. They will also see the rational of alternate approaches to teaching and their impact on selection of a material for lesson planning.

Attaining this objective helps students to cross a bridge between traditional math courses (*Analysis, Algebra, Geometry, etc.*) and methods course *Curriculum, Instruction and Assessment in Mathematics* that they will take later in their studies. We believe that there is no exact boundary between subject knowledge and methodology and “rather than ignore the overlap, it is better to include it in both courses” (Reka Szasz, 2009) with emphases on practical aspects. Future teachers are interested in learning more about teaching and eager to apply the methodology during their peer-teaching lessons. The instructor of MATC82 distributes topics for the peer teaching at the beginning of the course. During first two weeks of classes, when learning styles are being introduced, the students of the course work on lesson plan incorporating methods of presentations that address all learning preferences.

b) the processes which lie at the heart of mathematics.

Unfolding the processes of mathematical thinking is achieved by formalization of logical process that stands behind every mathematical problem. George Polya’s techniques of modern problem solving are used to connect all areas of mathematics and systematize general approach to problem solving. In Mathematics for Teachers course students learn problem-solving techniques by applying them to math problems appeared to be challenging at university level. Schoolteachers have much more difficult task than their university colleagues: they have to help their students not simply develop logical (mathematical) way of thinking but also encourage them to pursue a career in the area of sciences.

By the end of the course students **will be able to**:

a) connect, extend and relate mathematical ideas to each other. And analyse common problems of high school mathematics from a deeper mathematical level.

All educators agree that active learning is the most effective, but most university courses cannot afford to learn the whole material actively due to time limitation. This course focuses mostly on profound understanding of chosen topics rather than large variety of material, which enables active learning. Active learning is traditionally preferred at school level, which is another reason to use these methods as a model for future teaching. Problem solving activities, group work, peer-teaching sessions, discussions and hands–on group activities are building blocks of the course.

b) to discuss topics in historical context.

This objective is attained through public lectures in History of Mathematics, prepared by groups of 2-3 students and delivered by means of extensive use of modern teaching tools such as: animations, Power Point presentations, and video and sound recordings.

The list of objectives for Mathematics for Teachers explains the reason for creating this course and justifies the use of methods foreign for university education.

### **3. The Structure of the Course and the Assessment.**

Unusual goal of the course gives rise to application of different assessment components.

#### **Teaching done by Students (30%)**

##### Peer-Teaching

Peer-teaching lessons are students to students teaching sessions. Each session is prepared by two students and consists of preparation of precise lesson plan, extensive (no less than three) consultation with the instructor of the course and one 'rehearsal' followed by the 50 minutes lesson. The name 'peer-teaching' reflects the nature of the task: engaging students in active learning by means of hands-on activities, problem solving assignments and games that foster intensive small group communication.

Topics for the lessons are chosen from the school curriculum, but presented in great depth in order "to form students' view of mathematics for the purpose of teaching: their conceptual understanding, their ability to think mathematically and their attitude for the subject" (Cooney, 1999; Gadanidis & Namukasa, 2005)

Teachers need deep understanding and advanced knowledge of all curricular topics, but a one-term course cannot (and should not) cover the whole curriculum. The extensive learning of a new material is not the goal of the course. We are focusing on understanding of the importance of multicomponent structure of school teaching. The textbook used for the course is *Mathematics for High School Teachers* by Usiskin, Peressini, Marchisotto and Stanley, offers eleven 'in depth' topics that cover the whole high school curriculum. Such variety of the material allows changing the set of topics from year to year.

The evaluation of peer-teaching lesson consists of two parts: peer evaluation and instructor evaluation.

##### Lectures in History of Mathematics

Unlike peer-teaching sessions, lectures in History of Mathematics are full scale presentations which are focused on use of modern technology (Power Point, animation, incorporate live on-line examples, performance art and even videotaping). The course instructor provides a list of topics for the lectures but students are also encouraged to choose their own topics. The evaluation of the presentation takes into consideration several parameters and is being prepared by the course instructor.

### Math & Stats Learning Centre

Conducting Math Modules, providing assistance and helping first year students in Math and Stats Learning Centre is the third component of the teaching assignment in the course. (See section 4 of this paper) The coordinator of the Centre provides the evaluation of students' performance in MSLC.

### Assignments and Quizzes (10%)

Students are responsible for the mathematical content of the course. 'Hand in' assignments alternate with 'in class' quizzes and cover the set of topics chosen for the course.

### Weekly Journals (5%)

Students of the course write and then hand in journals during all 12 weeks of classes. Students are learning to record all knowledge significant for them and reflect on their ideas and individual feelings about what they have learned. Such journals are helping future teachers to learn more about themselves and their personal way of thinking. Journals also promote the development of individual teaching style. On the other level, writing one page per week prevents new experiences from being lost. The Journals are collected by instructor at the end of every week and returned to the students at the beginning of next class with comments and analysis that can be studied later by students. Journals are unique tools for cognitive development of future teachers. Evaluation of every entry is done by instructor in a friendly fashion. The marks and comments of the instructor are guiding students through new experiences and teaching them to pay attention to their personal feelings instead of focusing on description of what has been done in the class.

### Midterm Test (20%) and Final Exam (35%)

Both Midterm Test and Final Exam test methodology (about 1/3 of the content) and deep knowledge of mathematics (about 2/3 of the content).

## **2. Math & Stats Learning Centre**

Many first year students face serious challenges to successfully finish their first year university math courses. At MSLC various programs are offered in order to help students to adopt effective learning strategies and learn concepts on a deeper level. One of the most effective and popular strategies that have been employed for designing MSLC programs is the use of peer mentors. MATC82 students are given the chance to be leaders of these sessions and to discuss their understanding of the topics to their freshman counterparts, as well as to share effective learning tools with first year students. These sessions can considerably enhance the first year students' learning experience (Holton, 2001) and proficiency in challenging topics by providing a comfortable and engaging atmosphere. Many first year calculus courses are taught to a large group of students (often more than 200), thus course instructors are not able to create the necessary interaction for a rich learning experience during the lectures. As well, it is often the case that few students who dominate the class discussions intimidate the rest of the class. Mainly due to these facts, many students report their learning experience in mathematics as unpleasant and their confidence level as low. . Students enormously benefit from small-group consultations where they freely discuss challenging topics and ask questions in a non-threatening environment. This experience

not only enhances students' study skills and knowledge of subject material, but will also aid in developing confidence and interest in mathematics.

These small-group consultations also confer benefits to the MATC82 students who act as group mentors, providing them with an opportunity to practice the role of teachers. As prospective teachers, they must be able to examine deficiencies in the math and statistics education curriculum in preparing students for university, and to design the appropriate solutions. Mentors are able to deepen their own understanding of subject material during each session through the reiteration of concepts using techniques such as on-the-spot examples. Mentors will be able to develop their oral and written communication skills, as well as to learn about the important social factors that enable them to become better teachers. In these sessions the learning is a two way process; both the students and mentors benefit from the interaction. (Figure 1)

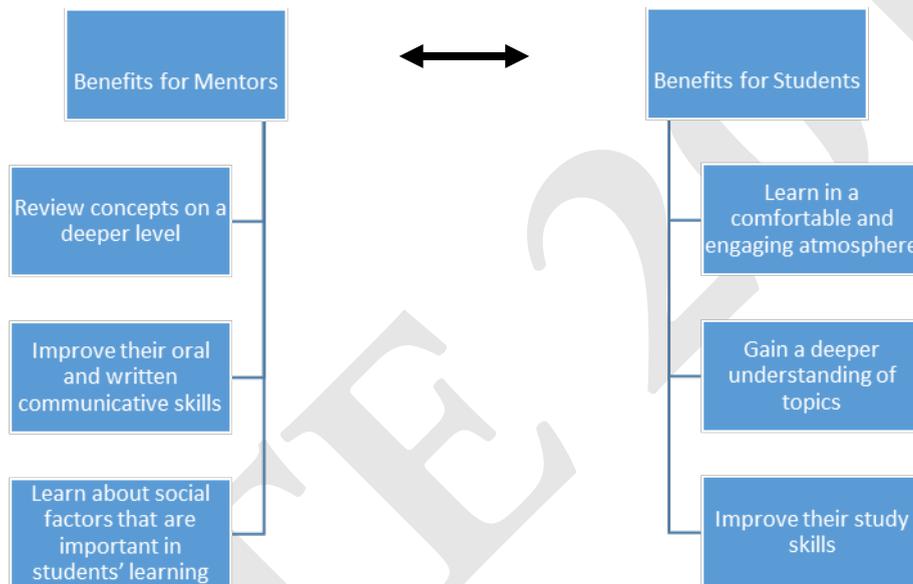

Figure 19: Benefits of small-group consultations for both first year university students and MATC82 mentors

### 3. Review Modules and Seminars

Review modules are eight two-hour sessions which have been constructed to help incoming UTSC students to experience a smoother transition from high school to university calculus. The sessions focus on the students' background and confidence in math concepts by covering algebraic manipulations, inequalities, and functions including trigonometry functions and inverse functions. Seminars are interactive sessions that help boost students' knowledge of and interest in challenging topics such as Intermediate Value Theorem and its application, application of derivatives, integration techniques and applications.

The MSLC coordinator trains MATC82 students to run these sessions as mentors. Training involves the discussion of topics and related assignment questions in order to deepen the understanding of the mentors and improve their teaching skills. In addition, effective teaching techniques, such as collaborative learning and the

promotion of creativity in the classroom, are introduced to the mentors to maximize student engagement in learning (Barkley, Cross & Major, 2005).

Each mentor needs to record his/her experience in the teaching of the review modules and seminars, and explain which techniques worked and which needed to be modified. The MSLC coordinator meets with the mentors after each session and provides them with feedback. Mentors are guided to assemble a teaching portfolio as an effective tool for reflection and to ultimately identify areas of improvement. (Figure 2)

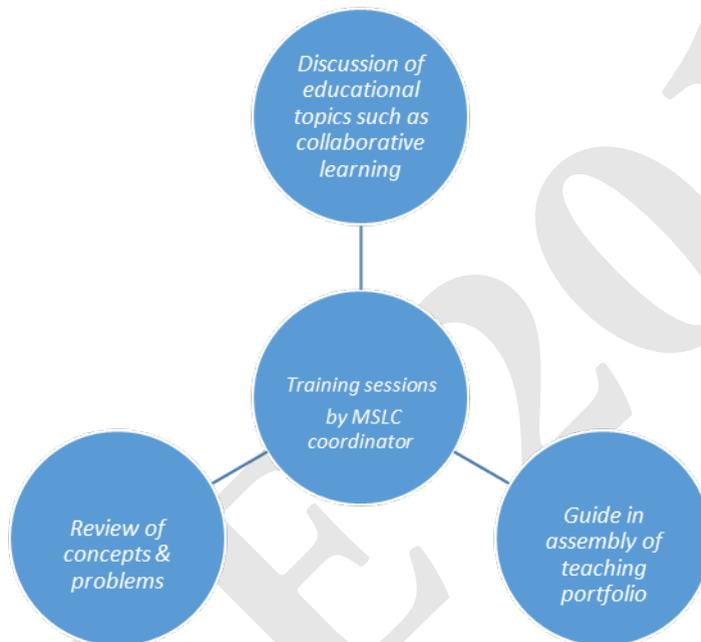

Figure 20: Training mentors (MATC82 students) by MSLC coordinator

#### 4. Virtual Tutorials Virtual Tutorials

In order to open another avenue for student engagement in their studies and for the purpose of extending MSLC services to afterhours Virtual Tutorial Service (VTS) is offered. These online help sessions which are basically questions and answer sessions utilize a chat room (MathIM) which is equipped with a tool set for typing mathematics notation. Students mentioned that VTS was able to enrich their education and engage them successfully. Here are few comments from students about VTS:

*“There will always be those seeking an alternative method to a math problem that best suits their style of learning. The introduction of VTS provides an avenue of such learning.”*

*“Bridging the world of mathematics and the vanguard of social networking, VTS adds a new dimension to*

*mathematics courses that caters to the non-conventional learning methods of many students.”*

MATC82 students are provided with the chance to interact with first year university students in the virtual tutorials as mentors. Mentors help with promotion of the service and with the enhancement of the quality of the sessions. In return they are trained to teach mathematics in virtual environments. With the proliferation of online university classes, it is important for the educators to have a good understanding of online education. Mentors with this unique training could contribute in mathematics e-learning in the future job market. In addition to all the above mentors and students are able to learn basic typesetting rules in LaTeX in the online chatroom. (Figure 3)

**MSLC-UTSC**

15:49:08 \* Amy has joined the channel.

15:49:19 <Duy Minh (TA)> Recall that  $0 = x_0 < x_1 < x_2 < \dots < x_n = 1$ , so

$$\sum \Delta x_i = (x_1 - x_0) + (x_2 - x_1) + \dots + (x_n - x_{n-1})$$

So it is just 1.

15:49:36 <Amy> I see now.

15:49:39 <Duy Minh (TA)> So you see that we got two different values for

$$\lim_{n \rightarrow \infty} \sum_{i=1}^n f(x_i^*) \Delta x_i$$

. This means that the limit does not exist. So we can not attache any number to  $\int_0^1 f(x) dx$ . That is, why we say this

$\int_0^1 f(x) dx$

Preview:  
Thank you so much.

## 5. Presentations and MSLC newsletter

MSLC organizes one day conference that MATC82 students are able to present their papers and interact with faculty members and other students. This opportunity will allow MATC82 students to explore different areas of math education and improve their presentation skills. In addition, some of the students' papers get published in the MSLC newsletter. Sample topics together with a paragraph from students' papers are listed below:

- **Mathematics and Culture, Michelle H.** *“The cultural differences and mathematics learning is crucial in the language being used. Numerous studies have shown that students in Asia seemed to have outperformed their counterparts in Europe and North America. Thus, many cross-cultural studies have therefore suggested that language and cultural differences may very well be the*

important factor in mathematics achievement and teaching. As for the question why Chinese speaking children seems to have better mathematical skills than English speaking children, there is a general thinking that it is because of the difference in the numbering systems, often known as the counting systems. English speaking children seems to have the most difficulty in learning the numbers of 11 to 19, as it is totally different than the rules that other numbers follows. The number 11 is pronounce as eleven but not ten-one, where starting from the number 13 to 19, it is pronounce as thirteen, where the “teens” are different than the normal idea of ten-three as in the number 23 is pronounce as twenty-three. Only if a child can get over this bump in the road of counting, they are basically count numbers as large as it can get. On the other hand, Chinese adopt a concept of ten-one, ten-two to represents the numbers 11 and 12. In comparison, the Chinese counting system is easier to learn since there is not much of a discrepancy from numbers to numbers.”

- **Teaching Gifted Students, Judie S.** “Most of these kids were admired by their intelligence and specialness during their childhood, however they encounter a lot of emotional and factual problems while them growing older. One of the common observations of these kids is that they are emotionally sensitive – high level of self-criticism, low self-concept and poor peer relations. Because they spent most of their childhood in developing their intellectual skills they missed out the chance to well develop self-concept or relationships with other people. While them growing older they start to ask questions like who I really am, what I want or what I want to be. At the same time the competition among their peers grows, and some start to fail because they can’t accept the fact that they are not as recognized as they were used to be, and some can’t bear high level of competitions.”
- **Math with Abacus, Manal H.** “During the abacus training students are encouraged to explore a different and unique style of math, where the students are temporarily weaned off the abacus board and are encouraged to perform the mathematical operations mentally by visualizing the abacus board without actually manipulating one with one’s hands. As a student graduates from each level successfully, students are given classes on performing mental calculations corresponding to that level. Likewise, the student is moved on to the next level only when the student performs better on the mental calculations. The mental math part of abacus is in my opinion the strongest aspect of learning abacus. Again students are never forced to participate in mental math classes but are given a choice of whether or not to learn mental calculation appropriate to each level.”
- **Using Technology in the Mathematics Classroom, Nathan E.** “Finally, a third technological tool which is commonly used to teach mathematical concepts is a program called *The Geometer’s Sketchpad*. This is a program commonly used in classes discussing geometry, including investigating lines, circles and triangles. More advanced concepts such as trigonometry and calculus can also be tackled using the software. Similar to the TI-83, the *Geometer’s Sketchpad* allows students to directly manipulate mathematical constructs and view ideas and concepts as tangible and concrete. The *Sketchpad* offers greater functionality in its software however and can be used to construct geometric figures, take midpoints and angle bisectors, ratios of line segments and sums of angles, among other things.”
- **Math and Art, Rebecca N.** “In the past, math was used as a tool for creating art. There were certain ideas about what was considered beautiful and mathematical concepts were used to judge

*this beauty. Math was seen as something uniformly beautiful and perfect. Certain shapes, lines, ratios and patterns were seen as aesthetically pleasing. These things were used to create art works and judge them to determine if they were beautiful or not. For example, one very popular thing that was used to determine beauty amongst multiple cultures was the golden ratio."*

- **Bringing the Real World into the Mathematics Classroom, Ritu G.** "Wolfram (2010) discusses that math is made up of four components: posing the right questions, real world to math formulation, computation, and then math formulation back to the real world. Wolfram (2010) further argues that we spend about 80% of the time in mathematics classrooms teaching step 3, computation, when computers are able to do this faster than anyone else. Thus, he argues, that we should be spending more time on teaching steps 1, 2, and 4. Calculation by hand isn't just tedious; it is mostly irrelevant to real mathematics and the real world. It is true, after all, that in the real world, such as in the work place, calculations are handled by computers. Wolfram (2010) pushes for the curriculum to stop teaching calculating and start teaching math."

## Innovative curricular change and contextual factors

Metin Timuçin\*

*Sakarya University, Foreign Languages Department 54187, Sakarya-Turkey*

---

### **Abstract**

Within the last decade, mainly due to the technological advancements, educational institutions have witnessed a great deal of change. In a constantly evolving environment, all stakeholders have felt a kind of urge to invest in new technologies to provide a better learning/teaching environment for their prospective students and therefore innovation and innovative curricular change has become a fundamental issue in educational institutions. However, while some innovations flourish in some institutions, they simply turn out to be epic fail in some others. This paper argues on the importance of acknowledging the fact that innovative change - especially when it involves technology - is shaped and influenced by contextual factors such as leadership, teachers' attitudes, institutional policies and context specific norms and values. The current paper firstly aims at focusing on "change" phenomenon and its friction generating nature, and then proposes – and – argues on the relevance of a certain model for the sustainability of classroom innovation.

Curriculum; Innovation; Teaching and Curriculum Management.

## Introduction

Research studies have revealed that understanding the nature of change and developing adequate change management strategies is a necessary condition for an effective curricular change in educational institutions. Drawing upon the change management strategies, this paper tries to describe how these strategies may facilitate diffusion of a curricular innovation that involves use of technology for teaching/learning purposes.

### 1. Change and educational context

We all live in a world of relentless change. As far as teaching and learning context is concerned, in its simplest definition, change denotes a difference in the state or quality of teaching/learning practices. Strangely enough, we both embrace change and resist it. We acknowledge its inevitability, and yet a profound conservative impulse governs our psychology, making us naturally resistant to change and leaving us chronically indecisive when confronted with innovation (Evans, 2001, p.21).

Change urges us to come to terms with and master new knowledge, skills and experiences. Since it means letting go of old routines and attachments in order to acquire new ones, it would be suffice to say that change also involves loss (Hargreaves, 2002).

In education arena, change tends to fail mainly because individual change efforts are poorly designed. According to research literature the reasons might be as follows:

- The goals of the change may be unrealistic or unclear (teachers cannot achieve what is expected of them),

- The perpetrators of change may have low credibility ( their reasons may raise questions and suspect; the intensions regarding real improvement for students may be in doubt),
- Changes may be too complex and overwhelming (requiring teachers to work on too many fronts at once).

### *1.1 Contextual levels that affect pedagogical innovation*

As is noted by Owston (2007), innovative pedagogical practices are affected and mediated by three contextual levels. First is the micro level, consisting of such factors as classroom organization and personal characteristics of the teachers and students. Proceeding the micro level is the meso level, which includes the school organization and personal characteristics of administrators and leaders. If administrators and leaders involved in the process display a positive attitude towards change and their staff who are supposed to adopt to change in question, the innovation stands a better chance to make the desired impact. Third is the macro level, which encompasses the previous two levels, and concerns state and national policies and international trends. At this level, classroom practices can be influenced by national policies and international trends in areas such as curriculum and assessment or professional development.

Evans (2001) emphasizes the importance of helping the teachers during the transition phase by focusing on four dilemmas that the teachers are likely to experience. These are helping them to move:

- from loss to commitment
- from old competence to new competence
- from confusion to coherence
- from conflict to consensus

I will get back to these issues after explaining use of technology in TEFL context and why we need implementing change theories to be able to make best use of information and communication technologies in TEFL classes.

## 1.2 Technology in TEFL class

Recent advances in Information and Communication Technologies (ICT) forces all teachers and administrators to reshape their teaching methods and curricula. In this sense, EFL teachers and programme administrators are no exception. Every passing day the number of EFL professionals who are seeking possible ways of incorporating technology into their existing curricula increases. Computer Assisted Language Learning (CALL) seem to offer certain solutions for more communicative and more student-centred classes, however, some caution must be exercised and CALL on its own can not be considered as a “silver bullet”.

Alongside use of technology in the form of computers, CALL also involves a transformation process in the educational context where it is implemented. Therefore, as is argued elsewhere by Timucin (2006), CALL should be perceived as an interdisciplinary issue demanding change management strategies as well as the knowledge of the use of computers and relevant language teaching methodologies.

Since the primary aim of the current paper is to argue on the relevance of the readiness of “change management” strategies, I now want to focus on tasks of TEFL administrators who are supposed to integrate use of technology into their existing curricula and offer a model that is hoped to ease the transition.

## 2. Tasks of transition

On the issue of implementing change, Evans (2001) argues on “unfreezing” approach, which I personally find extremely relevant. Evans (2001, p.56) posits that innovation requires the learning of something new, usually in place of something old, which unavoidably makes people anxious. And when people are informed about change, they naturally cling to their current skills and are afraid to try new ones, especially when the changes involved are large and complex, here as an important note, I must say that CALL implementation is by all means large and complex issue since it requires changes in teaching materials, alterations in teaching approaches and beliefs. This is even more prevalent when the time frame is short or the tolerance for error is low. *Unfreezing* is a matter of lessening one kind of anxiety, the fear of trying.

*Unfreezing* is the start, after this start, the change agent must enable the teachers to move from loss to commitment, from old competence to new competence, from confusion to coherence, from conflict to consensus. I will be elaborating on each of these tasks during the rest of my paper presentation.

The goal of each task and the key factors involved are shown in the table below:

Tasks of Change (Evans, 2001)

Task	Goal	Key Factors
<i>Unfreezing</i>	Reduce the fear of trying	Appropriate anxiety and guilt Psychological safety
<i>Moving from loss to commitment</i>	Make change meaningful	Continuity Time Personal Contact
<i>Moving from old competence to new competence</i>	Develop new behaviours (skills), beliefs, and ways of thinking	Training that is coherent, continuous, and personal
<i>Moving from confusion to coherence</i>	Realign structures, functions and roles	Clarity regarding responsibility, authority, and decision making
<i>Moving from conflict to consensus</i>	Generate broad support for change	A critical mass Pressure Positive use of power

### 3. Conclusion

This paper argues that as far as managing innovative changes in the form of technology integration in TEFL context is concerned, it is of vital importance to come to terms with change management theories and develop context specific change management strategies before and during the implementation process. The model proposed in this paper for sustainable innovations should not be considered as definitive. Nevertheless, it can be said that the model provides a base for discussion about the reasons why some curriculum innovations fail while others hit the target.

### Abstract

In the Lisbon Summit (2000), the European Commission adopted the triangle of knowledge (education, research, innovation). These three concepts are fundamental “ingredients” of the European educational policy. In today’s societies, education is the tool leading to research and then, to innovation. Thus, institutional repositories play a key role here. They represent a major and an alternative gate of knowledge. In conclusion, this paper will examine relevant and current initiatives (open access initiatives) and policies among European countries.

*Keywords:* institutional repositories; information society; open access; research; innovation; educational politics

---

### 1. Introduction

At both the European level, within initiatives, programs, decisions, directives, recommendations, cooperation and partnerships, and the international level, there is a steady increase of interest in the development of open access repositories (Koutras, 2012). There is today no doubt that information, theoretically and practically, should always be open and accessible to as many users as possible.

The European Union, a loyal host of the Information Society, is keen to implement educational politics that will assist to overcome current and forthcoming obstacles as regards means of entry. Information ought to be reached conveniently. Access should not be restrained by unjust legal rules nor bureaucracy. Therefore, institutional open access repositories come to play a crucial role in offering open access publications to researchers, scientists etc.

However, the current controversy as regards Institutional Repositories is characterized by an unbalanced mixture of technology push, a discussion on the level of academic autarchy and the debate on the role of (commercial) publishers (Kircz, 2005).

## 2. Historical overview and definitions

### 2.1. Open access as a term

The term ‘learning object’ (a collection of content items, practice items and assessment items, combined, based on a single learning objective, providing smaller, reusable units of learning) originates from Wayne Hodgins in 1994. It rapidly became one of the important aspects of higher education and scientific research. The full concept of a ‘learning object’, though, was first described by Gerard in 1976 (Polsani, 2003). Learning object repositories are similar to digital libraries, and enable the sharing and managing of educational resources, in an open content model (like the Orange Grove, Florida’s digital repository for instructional resources, such as open textbooks). A main feature of Open Educational Resources (OERs) is the dissemination of the idea that information may be designed and promoted in such way it may be easily re-used within various educational forms (Makridou, Araka and Koutras, 2011).

In 1998, David Wiley coined the term ‘open content’ by analogy with open source. ‘Open content’ targeted the educational community, but the term quickly entered the vernacular of internet users. One role of the open content in the history of OERs is the popularization of the idea that the principles of the open source can be productively applied also to content. Hence, the creation of the first widely adopted open license for content (Open Publication License).

Indeed, open access can be defined as the practice of providing online access to scientific content that is free to charge to the reader. In the context of research and development, open access typically focuses on access to ‘scientific information’, which refers to two critical categories:

- Peer-reviewed scientific research articles (published in academic journals);
- Scientific research data (data underlying publications and/ or raw data)

It is imperative to stress that:

- Open access publications follow the same peer review process as non-open access publications;
- As an open access requirement comes after the initial decision to publish, there is no obligation to publish anything as open access: it depends upon the researchers whether they want to publish their work or not under open access;
- As the decision on whether to commercially exploit research outputs (for instance through patents or otherwise) is made after the decision to publish (open access or not), open access does not interfere with the commercial exploitation of research results.

### 2.2. Open access models

There are two open access models:

- ‘Green’ (self-archiving) open access means that the published article or the final peer-reviewed manuscript is archived by the researcher in an online repository before, after or alongside its publication. Access to this article is often delayed (‘embargo period’). Publishers recoup their investment by selling subscriptions and charging pay-per-download/view fees during this period during an exclusively period. This model is promoted alongside the ‘Gold’ route by the open access community of researchers and librarians, and is often preferred.
- ‘Gold’ open access (open access publishing or the author pays for publishing costs) means that a publication is immediately provided in an open access mode by the scientific publisher. Associate costs shift from users to

the university or the research institute to which the researcher is affiliated, or to the funding agency supporting the research. This model is usually the one promoted by the community of well-established scientific publishers in the business.

Most well-established publishers have adapted to the research community's interest in publishing in open access mode, yet usually in favor of 'Gold' open access. Nevertheless, a large number of journals, including those with high prestige and/or high impact factors have also developed self-archiving policies ('Green' open access) that are compatible with the policies of research funding bodies such as the Commission for Horizon 2020.

### 3. Institutional repositories nowadays—their significance

The initial point of the usual debates on institutional repositories is the assignment of the universities and other institutions of higher education and/or scientific research. In particular, the center of the discussion is scientific research and education, as well as the kinds of communication regarding these activities via the institutions and towards society at large.

The organization, the management and the operation of an institutional repository consists on a complex set of actions which contains various initiatives such as: data collection and digitization, appropriate forms and subject matter of archives, adherence to a legislative framework on intellectual property and correct determination of rules and standards on scholarly communication, metadata and development of repository infrastructure (Barton and Waters, 2004). Institutional repositories should aim at specific targets in order to work efficiently.

Therefore, institutional repositories, as an innovative model of knowledge dissemination, reform the whole educational framework on research methods, information management and education alike. Under these circumstances, it is necessary to keep a rational eye on all processes, stakeholders and governmental decisions about educational politics. Definitely, effective interaction is a crucial as regards education politics with great efficiency.

To sum up, an institutional repository is an online resource for the storing (in digital form) of academic materials, such as theses, dissertations and research articles, in the setting of a university or other institution. The institutional repositories' history, starting from the early 1990s, is a relatively short one. The average 'age' of a repository in 2010 is about six years. Such materials, which would once only have existed in print format, and secreted in basements and other more primitive storage facilities, are scientific, technological, artistic, cultural or historical and other.

#### 3.1. Education and open access initiatives

The movement of open educational resources is rising in the higher education environment. Throughout the world there are presently more than 2.500 open access courses (opencoursewares) from over 200 universities (Wiley, 2007).

- In the United States 1.700 courses have been made available by seven university-based projects (<http://ocw.mit.edu>, <http://cnx.rice.edu>, <http://ocw.jhsph.edu>, <http://ocw.tufts.edu>, <http://www.cmu.edu/oil>, <http://ocw.nd.edu>, <http://ocw.usu.edu>).
- In China, 451 courses are offered to 176 university members of the China Open Resources for Education (CORE) consortium ([http://www.core.org.cn/cn/jpkc/index\\_en.html](http://www.core.org.cn/cn/jpkc/index_en.html)).
- In Japan, 350 courses are offered by ten universities participating in the Japanese OCW Consortium (<http://www.jocw.jp>).
- In France, 178 courses are offered by eleven universities, members of the ParisTech OCW project (<http://graduateschool.paristech.org>).

There is a vast amount of educational resource projects underway with targeted external funding in support of their realization. Particularly, the William and Flora Hewlett Foundation has put millions of dollars into university-based open educational resource projects around the world.

### 3.2. *European perspectives on institutional repositories of open access*

There is constant rise of scientific information and its' use in the European Union (Koutras, 2010).

A communication issued on 14<sup>th</sup> February 2007, regulates access, dissemination and preservation of scientific information among European Union members. Thus, open access institutional repositories can be used as an alternative means in relation to additions and changes regarding the European educational framework.

Access, dissemination and preservation of information have acquired intense attention among member-states of the European Union. The outcome of this focus is the creation of a specific operational framework which would include the crucial parameters described above.

In recent years, rising subscription prices for scientific journals have put a strain on university library budgets and research institutions. Businesses also experience problems in accessing scientific information. According to a 2009 UK survey, a significant share of Small and Medium sized Enterprises (SMEs) (55%) said that they had recently experienced difficulty accessing a research article (against 34% in the case of large companies), with the cost reported as the key difficulty (Publishing Research Consortium, 2009).

Two recent European Commissions public consultations show that researchers, libraries, research funders and businesses believe that there is a problem with access to scientific information and that this is a major barrier to the optimal circulation of knowledge in Europe, affecting both academic research and industrial intake of research results. Respondents to these consultations indicate that open access is a very important tool to overcome access limitations (European Commission, 2012). Over 90% of respondents expressed the view that publications resulting from publicly funded research should, as a matter of principle, be available in open access mode.

Open access is backed by a growing number of universities, research centers and funding agencies in Germany, UK, the Nordic countries and all across Europe as well as beyond. National initiatives and practices are still fragmented, thus preventing the European Union from realizing its full research and innovation potential.

## 4. Conclusion

There are no national policies encouraging institutions to maintain publicly accessible websites gathering information concerning their admissions policies, available facilities and services.

Open access educational resources offered by institutional repositories become an alternative service of education. This invaluable service needs to be founded upon an effective *equilibrium* between copyright law and open access. It can also be seen as another way realizing the potential of the Lisbon Strategy and its 'triangle' of knowledge: education-research-innovation.

To sum up, institutional repositories offer an innovative platform of education and research. Education combined with research leads to innovation-this is the triangle of knowledge we need to have in mind. Therefore, there should be adequate and constant interaction between information scientists who are responsible for the services of the institutional repositories, and scholars or end-users, interested in collecting and studying further informational resources.

# Integrated enterprise management system for higher education institutions based on strategic and process management: the case study of Sakarya University

Tuba Canvar Kahveci<sup>a\*</sup>, Harun Taşkın<sup>a</sup>*<sup>a</sup>Sakarya University, Faculty of Engineering, 54187, "Sakarya", Turkey*

---

## Abstract

Today, the higher education institutions should consider multiple concepts to manage in an integrated manner such as strategy, quality, process etc. to confront the challenges. Especially, strategic and process management in the higher education have recently been considered in many universities over the world. Strategic management serves as a mechanism to provide long-term direction of the higher education institutions and at the same time to allocation of resources in line with this direction. Furthermore, the process management provides the necessary mechanisms to achieve the vision of the higher education institutions and disseminate the approaches through the whole enterprise. The main purpose of this study is to develop the model which integrates the strategic management and process management to administrate the higher education institutions. Also, the institutional management system which is designed as the information support system to manage the higher education institutions is presented with the case study of Sakarya University.

Keywords: Strategic management, process management, higher education.

---

## 1. INTRODUCTION

The higher education institutions (HEI) should contribute to the development and support of economic, social and cultural progress for countries in everywhere, as they are among the oldest institutions in the world. The HEIs have to respond to the demands of changing and evolving conditions of society, and have to develop the internal structures in order to accomplish their visions. These conditions cause the challenges for the HEIs which include the Bologna Declaration and the European Higher Education Area, a mixed profile in the student population, the emergence of new competitors, the global knowledge economy, a technology-driven society, the new horizons in education, increasing external demands, accountability and transparency. Addressing these changes and challenges has meant finding ways to align organizational capacities with environmental demands and opportunities, as well as a big responsibility for governance and management at the institutional level (Taylor&Machado, 2006). The strategic management approach can help to prepare HEIs to face these emerging challenges.

Strategic management is a tool to forecast the future and place the institution in the best possible position for future success (Van Niekerk et.al, 2006). Furthermore, it allows the institution to analyze the present conditions and to take personnel, students and other stakeholders into account in order to create and sustain competitive

\* Corresponding author. Tel.: +90 264 295 50 41; fax: +90 264 295 50 31.  
E-mail address: tcanvar@sakarya.edu.tr

advantages. By implementing the strategic management, the HEIs focus on strategic and operational goals, objectives and strategies based on organisational policies, programs and actions designed to achieve the institution's aims and desired results. The success of the institutions is derived from the correct implementation of strategic plans. Therefore the strategic management becomes an extremely important tool for organizational effectiveness.

On the other hand, the desired new outcomes of strategic management cannot be reached without renewed actions. The institutions need to determine and monitor the short-term action plans at the operational level in order to implement the strategic plan successfully. The process management is the most effective way to implement the necessary tools and to disseminate developed approaches to accomplish the strategic targets in the enterprise. Business process management has taken hold in private companies, but recently process management has reached higher education institutions (Kettunen, 2012). Also, the integration of information systems to quality assurance is another main driver to describe processes in higher education (Kettunen&Kantola, 2005).

As a result, the strategic and process management approaches provide necessary managerial tools for the HEIs to manage the institution effectively and efficiently. However the implementation of both two approaches together emergence the other challenge of the HEIs. So the main purpose of this study is to integrate these two approaches as a management model for the HEIs. The integrated enterprise management model and the information support system are presented by the case study of Sakarya University. The strategic management is explained in the first section and the process management is presented in the second section of the paper. After that, the integrated university management model is presented as the proposed model with the Sakarya University case study. Finally, the results of the study are discussed and summarized in the conclusion.

### *3.3. Strategic management for the HEIs*

Strategic management is concerned with the character and direction of the enterprise as a whole. It is concerned with basic decisions about what the enterprise is now, and what it is to be in the future. It determines the purpose of the enterprise. It determines what the enterprise should be capable of achieving, and what it will not choose to do. It will determine whether and how the organization will add value, and what form that added value should take. It is also concerned with management planning and decision-making for the medium to long-term future. It is concerned with the anticipation of that future, and while the establishment of a vision or view of how the enterprise should develop into the future that it must face (Morden,2007) Strategic management is a holistic process with many components that must effectively interact and execute together (Taylor&Machado, 2006).

Since the good management makes a difference to the quality schools and colleges and the educational outcomes of their students, strategic management is getting important for the higher education institutions. The main benefits of the strategic management for the HEIs can be summarized such as (Lerner, 1999):

- Creates a framework for determining the direction a university should take to achieve its desired future,
- Provides a framework for achieving competitive advantage,
- Allows all university constituencies to participate and work together towards accomplishing goals,
- “Raises the vision of all key participants, encouraging them to reflect creatively on the strategic direction” of the university,
- Allows the dialogue between the participants improving understanding of the organization’s vision, and fostering a sense of ownership of the strategic plan, and belonging to the organization,
- Aims to align the university with its environment,
- Allows the university to set priorities.

Generally, the strategic management process is accepted as consists of three phases such as strategy formulation, implementation and control. In the other perspective, the strategic management is regarded as a two-step process consisting of strategy formulation and strategy implementation. However, the strategic management process consists of assessing environmental opportunities and threats, determining organisational direction, strategy formulation, strategy implementation and strategic control. These three steps of the strategic management process is also named as environment analysis, strategy formulation and strategy implementation (Van Niekerk et.al, 2006). It has become generally accepted over the years by both academics and practitioners that a vital starting point for these strategic considerations is the formulation of a mission statement, a vision for the future. After that, the self-assessment and external analysis are executed. The strategies involves consideration of this analysis are determined and implemented.

Strategic management has been implemented by the HEIs for the different purposes (Penbek et al.,2011; Letturen,2012; Taylor&Machado,2006) by using several framework and techniques (Kaplan&Norton, 1992; 1993,1996; Cullen et.al.,2003; Shawyun, 2005; Asan and Tanyaş,2007).

#### *3.4. Process management in the HEIs*

Processes are generally defined as "a set of interdependent tasks transforming input elements into products". A process generally comprises the following elements: a purpose; the responsibilities of the participants in the process and their duties; the entrance criteria for the elements or conditions needed to begin the process; the inputs (artifacts, information or material) needed to perform the process; the activities, tasks or actions which make up the process; the outputs (artifacts or assets) that result from produced or modified by the process; the exit criteria (elements or conditions) needed for process completion; the process measures that support the process performances or future performances; tools, techniques and knowledge used in enactment the process; the adaptation patterns for tailoring the process in several contexts; the interfaces with others processes; and, records of information to future use (Llamosa-Villalba&Mendez,2010). A process comprises the network or a series of value-added activities performed by the collaborator to accomplish the assignment.

Process management is an approach that has been becoming more popular recently and gets increasingly implemented in more and more companies. Process management can be understood from two perspectives. One is the process management as a managerial discipline. The second aspect understands the process management as a technology that supports process-oriented management. Process approach allows organizations to eliminate the biggest disadvantage of the traditional functional approach that cannot be considered as an approach

appropriately flexible for changes in the corporate environment, variety of procedures, or excessive substitution of workers. Processes are always understood in relation to the customer. Only if the management processes are effective, then the companies can effectively manage, modify, improve efficiency, improve performance, identify and resist market risks (Tuček&Basl,2011).

Process management has taken hold in private companies, but recently process management has reached the higher education institutions (Kettunen,2012). For example, El-Sharef and El-Kilany (2011) used the business process modeling and analysis to identify the process needed for a Quality Management System in the HEIs. Tucek and Basl (2011) presented the business process management for process analyses of the HEIs.

**2. INTEGRATED ENTERPRISE MANAGEMENT SYSTEM FOR THE HEIs**

The HEIs are responsible to implement the education policy, their own strategic objectives and quality assurance. Therefore, they have to implement the several management approaches together such as strategic management, process management, total quality management, quality assurance etc. On the other hand, the implementations of these approaches cause the great challenge for the HEIs. It’s obvious that there is a need to a framework for the integration of these approaches, especially a strategic management and a process management to augment their benefits.

So, the main goal of this study is to develop this framework for the management of HEIs to realize the strategies, improve the processes and ensure the quality assurance as an integrated model. The proposed model is based on both the strategic management and the process management, as shown in Figure 1.

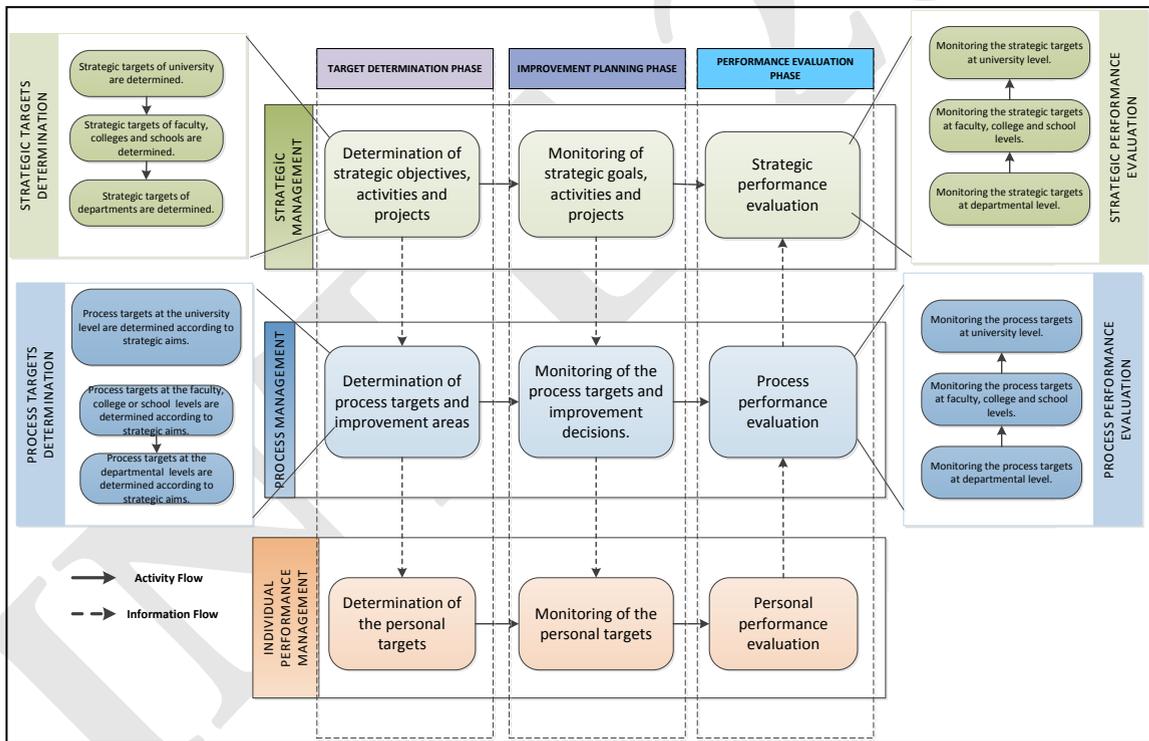

Fig 1. Integrated Enterprise Management (IEM) Model for HEIs.

The Integrated Enterprise Management (IEM) Model has got three dimensions which are strategic management, process management and individual performance management, and three phases such as target

determination, improvement and performance evaluation. These phases are executed for the each dimension for the HEIs in interrelated manner. In the other words, after the institutional goals are determined by strategic management, the necessary mechanisms and tools are implemented by the processes to achieve these strategies. Essentially, the integration of this model is structured into three phases:

- *Target determination phase*: After the targets of the process are derived from the strategic goals, the individual targets are determined according to these process targets.
- *Improvement planning phase*; the individual progress plans are determined from the process improvement plans which are comprised according to the strategic plans.
- *Performance evaluation phase*; the performance evaluation process is executed from by monitoring the performance results of each dimension. For instance, the process results comprise the institutional performance results.

The other integration issue of the model is the performance indicators of the institution. The performance indicators are named in accordance with these integration dimensions such as strategic performance indicators and process performance indicators. While the strategic performance indicators are used for measuring the achievement of the institutional goal, the process performance indicators can be used to monitor the processes which are executed in the institution. Furthermore, the strategic performance indicators consist of the process performance indicators, as shown in Figure 2.

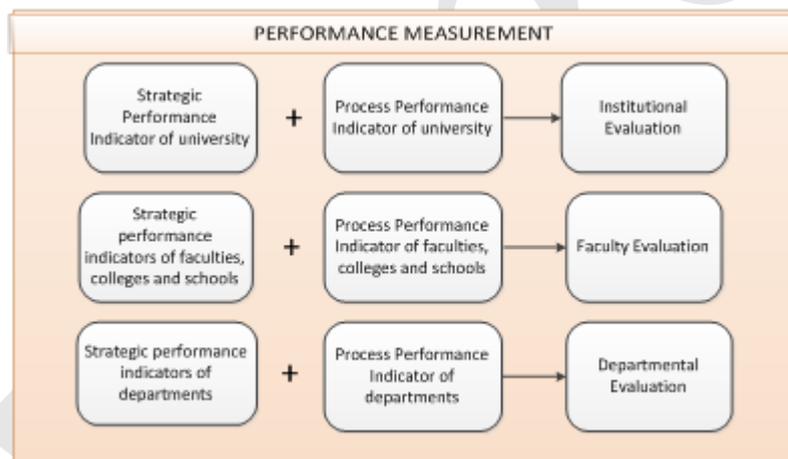

Fig 2. Enterprise Performance Measurement Model.

On the other hand, the HEI has got so many and different kinds of departments, faculties and schools. So each dimension must be executed at the each units of the HEI. This means the huge amount of information which must be obtained, used and evaluated to manage the HEIs effectively. This necessitates that the model must be supported by the management information system for the HEIs, as shown in Figure 3.

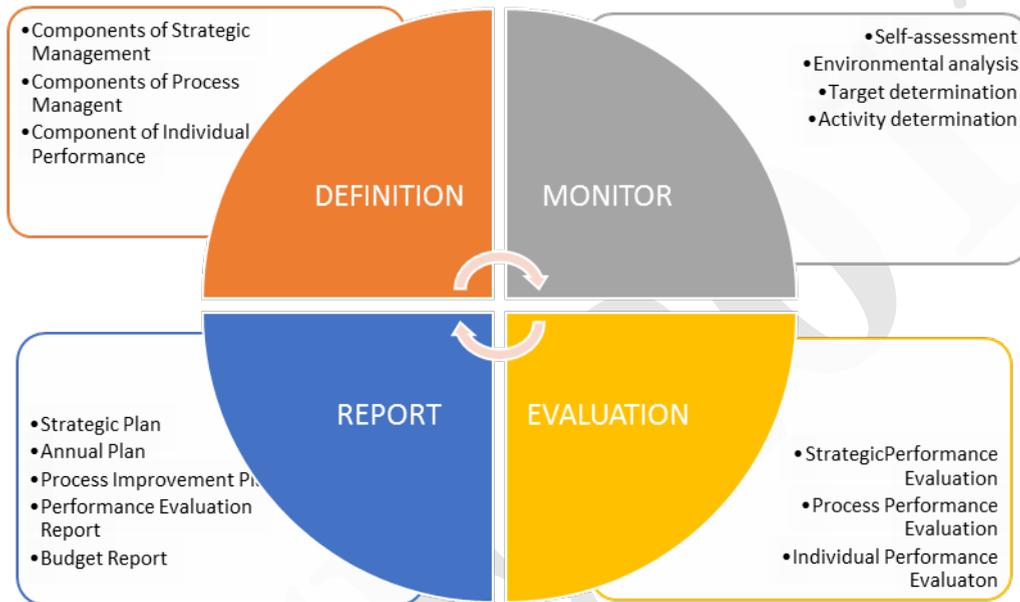

Fig 3. Integrated Enterprise Management System for the HEIs.

Thence the additional dimension is put into the model. This information system consists of four modules such as definition, monitor, evaluation and reports. In the definition part, all component of the system and concepts of the management model are identified by the users. The monitoring part is based on the activities of each dimensions of the IEM Model. The performance results are obtained for each units of the HEI by use of the evaluation part. As final part is for reporting which is suitable for each dimension of the IEM Model.

### 2.1. The Case Study of Sakarya University

In this section, the proposed model is detailed by using the Sakarya University Case Study. Sakarya University has been implemented the strategic management and process management separately since 2003. The strategic management process of Sakarya University is summarized in Figure 4.

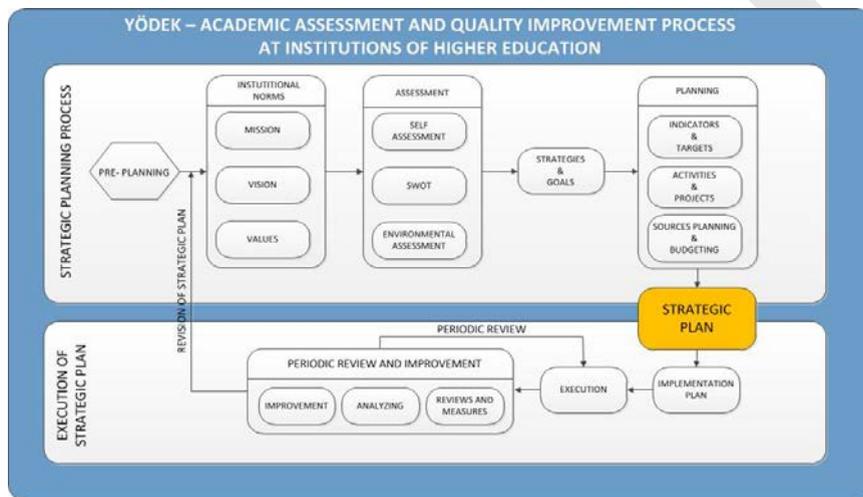

Fig 4. Strategic Management Process of Sakarya University.

Especially the target determination phase of the IEM Model is exemplified by using the values belong to the Sakarya University, as shown in the Table1. Each process targets are determined according to the related strategic objectives. For example, if the institutional objects are to get the higher score in the university rankings, HEI has to increase the number of papers as a process target.

Table 1. Performance Indicators Examples of Sakarya University based on the model.

ENGINEERING FACULTY					
STRATEGIC PERFORMANC INDICATORS					
	2014	2015	2016	2017	2018
Number of accredited programmes	4	5	6	7	8
Rank among the university ranking	54	50	45	40	35
Satisfaction rate of the society	%67	%70	%72	%75	%78
PROCESS PERFORMANCE INDICATORS					
	2014	2015	2016	2017	2018
Ratio of revised courses according to the accreditation criteria	%60	%70	%80	%90	%100
Number of published paper per faculty	1,5	1,8	2	2,2	2,4
Number of activities carried for social benefits	120	150	170	200	220

### 3. CONCLUSION

The higher education institutions can respond to the changes in its environment, demands of partnerships and developments in the related areas including education, technology, social etc. through strategic management. Strategic management adapts to a rapidly changing environment and provides the strategic themes and objectives for the desired future of the HEIs. On the other hand, the process management provides the necessary mechanisms to achieve the vision of the higher education institutions and disseminate the approaches through the whole enterprise. It is a great challenge to conceptually integrate strategic management and process management in higher education institutions to ensure high quality outcomes.

The main purpose of this study is to develop the model which integrates the strategic management and process management to management the higher education institutions. Also, the institutional management system which is designed as the information support system to manage the higher education institutions is presented with the case study of Sakarya University.

# Integrating learning technologies and autonomy: a CLIL course in Linguistics

Elisa Pellegrino<sup>a\*</sup>, Maria De Santo<sup>b</sup>, Giuseppina Vitale<sup>c</sup>

<sup>a,b,c</sup>University of Naples "L'Orientale", Via Nuova Marina 59, Naples 80133, Italy

## Abstract

The project we intend to present arises from the need of enhancing the process of teaching and learning academic disciplines through and with an additional language. In this paper we shall describe some online modules of a CLIL course in Linguistics dedicated to foreign students of L2 Italian. The modules are part of a course delivered both in presence and at a distance with a dual focus: learning a content - Linguistics - through a foreign language - Italian - in an integrated dimension. The online course, inspired by constructivist and learner-centred approaches, presents a series of collaborative and communicative technology-based activities developed in a virtual classroom and structured around three main sections: thematic, social and linguistic. The first presents the contents of the course (Morphology) through a video lesson with a series of interactive multimedia activities, the second promotes interaction between teachers and students through forums and chats, the third offers a virtual self-access centre with pathways and resources that students can choose, according to their levels and needs, to learn the Italian language.

*Keywords:* CLIL; technologies; autonomy; blended learning; Linguistics

## 1. Introduction: the blended course in Linguistics

In this paper we shall look at how learning academic disciplines through a CLIL (Content and Language Integrated Learning) approach might be enhanced integrating face-to-face classroom instruction and online learning in a virtual classroom. Our aim is to present some online CLIL modules developed to help foreign students of L2 Italian study academic disciplines, such as Linguistics, which require the development of some complex cognitive processes that are scarcely activated in language courses. The Language Centre of the University of Naples "L'Orientale" (CILA), on the basis of its long experience in teaching Italian language and culture courses to international exchange students, has recently developed a blended CLIL course in Linguistics addressed to Erasmus students with a B2 level of competence in Italian.

The course lasts 75 hours and consists in a 50-hour course in Linguistics in presence addressed both to Italian and foreign students of Italian Studies and a 25-hour online course. Classroom learning is articulated in five 10-hour modules dealing with the fundamentals of General Linguistics, with particular attention to the following areas "Phonetics and Phonology", "Morphology", "Syntax", "Linguistic Typology" and "Pragmatics". Every module delivered in presence is accompanied by a supplementary online module, developed with CLIL methodology and hosted in the e-learning platform of the university, CILA MoUVE. Each online module lasts 5 hours and aims at expanding a specific topic of the modules in presence. The module dedicated to "Phonetics and Phonology" is accompanied by an online module dealing with the International Phonetic Alphabet (IPA) and with phonetic transcriptions. The classification of morphemes and immediate constituent analysis are instead the

\* Corresponding author. Tel.: +390816909013 fax: +390815630220.

E-mail address: epellegrino@unior.it

foci of the supplementary modules dedicated to “Morphology” and “Syntax”, while the typological and genealogical classifications of world languages and speech acts are linked to the modules of “Language Typology” and “Pragmatics”.

In this paper we shall describe the online CLIL module on Morphology. It focuses, in particular, on the classification of morphemes according to their position in the word (prefix, root, suffix, infix, circumfix, transfix) and to the type of affixes (derivational or inflectional) in order to enable foreign students with mother tongues distant from Italian to recognize and use the most common Italian morphemes.

## **2. Creating a virtual CLIL learning environment: a framework of reference**

The blended course in Linguistics was developed combining face-to-face classroom instruction with technology-enhanced activities, delivered through the Moodle platform of the university, CILA MoUVE. The online CLIL learning environment was created to offer students a scaffolding structure (Wood, Bruner & Ross, 1976) where they could learn specific contents, specific vocabulary and improve their competence in Italian. The core of this online environment was a virtual classroom whose structure and activities were planned integrating the resources available on MoUVE, and other open source software: eXeLearning, HotPotatoes, Skype, Survey Monkey. This online environment was implemented on the basis of a theoretical and technical framework and developed according to the main tenets of the CLIL approach.

“Content and Language Integrated Learning (CLIL) is a dual-focused educational approach in which an additional language is used for the learning and teaching of both content and language. That is, in the teaching and learning process, there is a focus not only on content, and not only on language. Each is interwoven, even if the emphasis is greater on one or the other at a given time. CLIL is not a new form of language education. It is not a new form of subject education. It is an innovative fusion of both” (Coyle, Hood & Marsh, 2010:1).

To integrate content and language and to balance the focus between them, we planned some learning units responding to Willis’ task-based methodology (1996). Each unit of the course is organized in three phases: pre-task, task-cycle and language focus (Figure 1).

The pre-task phase is aimed at activating students’ expectations about the theme of the module and their prior knowledge. Support is also provided to make subject matter comprehensible to students and to help them perform the task. Vocabulary explanations, texts and references about the topic of the task, links to online language tools such as dictionaries, grammars are indeed available in the classroom.

The central phase, task-cycle, starts with a video-lesson, followed by a series of interactive activities intended to improve oral comprehension and lexical competence. These exercises were created with the authoring tools provided by MoUVE and with the Hotpotatoes suite. Each activity offers students a feedback and a link to online resources useful for further readings.

Central to the task-cycle stage is a forum where students perform a task-based activity designed on the basis of Jonassens’ concept of meaningful learning: “in order for meaningful learning to occur, the task that students pursue should engage active, constructive, intentional, authentic, and cooperative activities” (Jonassen, 2008). Tasks have to be guided, provide clear instructions and feedback, focus both on content and language.

### Unità 1: Morfologia

In questa unità lavoreremo sui diversi tipi di morfemi e sul riconoscimento del loro valore all'interno delle parole italiane. L'unità presenta una videolezione che ripropone alcune parti fondamentali della lezione in aula. La videolezione è accompagnata da attività ed esercizi.

Vi preghiamo di svolgere le attività rispettando l'ordine proposto.

Buon lavoro!

#### 1. Attività da svolgere prima della visione del video

Fig. 1. The learning unit on Morphology

The language focus-phase presents language and vocabulary activities with a section dedicated to autonomous learning: the online Self-Access. In this area students are offered language learning pathways, guided activities aiming at enhancing language abilities and at improving specific vocabulary (Figure 2).

In each phase, all materials were planned to engage students in active learning. Particularly in this section students could perform both tasks guided by the teacher and autonomous activities proposed by the language counsellor. In such a structure, the learning materials were considered as potential resources that students could use according to their preferences (Holec,1987).

To enhance a learner-centred environment and to foster the development of autonomy, particular attention is also given to meta-cognitive reflection. According to Nunan (1988) self-assessment provides "one of the most effective means of developing both critical self-awareness of what it is to be a learner, and skills in learning how to learn", therefore students are invited to reflect both on learning outcomes and on their learning process. Through Survey Monkey, tutors prepared a set of resources aimed at helping students self-evaluate their learning in terms of both content and language. For example, students are asked if they are able to understand the difference between words and morphemes or if they are able to classify their mother tongue according to morphological criteria. As regards language, they have to reflect about the aspect that has caused them more difficulties: listening, reading, writing, speaking, vocabulary or grammar. This self-assessment is also useful to tutors as it provides additional feedback about learner outcome in terms of both contents and language.

**Self-access online**

Questa sezione è dedicata all'apprendimento autonomo dell'italiano L2.

**Per elaborare il tuo percorso di apprendimento autonomo puoi:**

- chiedere un percorso di apprendimento autonomo al consulente linguistico;
- lavorare utilizzando un percorso già pronto;
- scegliere da solo le risorse da utilizzare.

**Per iniziare il tuo percorso autonomo scegli tra le opzioni seguenti e segui le istruzioni.**  
E non dimenticare che puoi comunicare con il consulente linguistico sia nel forum sia nella chat.

Buon lavoro!

 Self-Access online  
 Self-Access

**a) Chiedi un percorso personalizzato al tuo consulente linguistico**

Fig. 2. The Self-Access online

Since language learning strategies are a key element promoting autonomy and meaningful learning (Oxford, 1990), in the virtual classroom there are some questionnaires designed to investigate how students use these

strategies and how they are useful in the process of learning a content through and with a foreign language (Figure 3).

6. Quali strategie hai impiegato durante le attività di questa unità?  
(Puoi scegliere anche più di una strategia per ogni tipologia)

	Strategie affettive	Strategie sociali	Altro (specificare)	
	Ridurre l'ansia Incoraggiare se stessi Misurare le proprie emozioni	Chiedere chiarimenti e verifiche Chiedere correzioni Cooperare con parlanti esperti nella L2 Sviluppare una comprensione culturale		

Fig. 3. Learning strategies questionnaire

Another main feature of this online environment is the interaction among the members of the virtual classroom. In order to avoid the typical constraints of online learning environment, such as lack of guidance, support and interactivity (White, 2003), synchronous and asynchronous communication tools (chat, forums, wiki, Skype) are used to create a learning community where students can interact both with peers and tutors. In this kind of environment tutors acted as facilitator not only providing students with activities designed to learn language and content but also giving advice, providing explanations, suggesting methods and techniques.

### 3. Focusing on Morphology: activities, tasks and teacher-students interaction

As stated previously, the module is organized in three phases: pre-task, task-cycle and language focus. The pre-task phase is composed by three brain storming activities designed firstly to stimulate students' expectations about the contents of the module and secondly to activate the basic notions of morphology acquired during the classroom lesson. In detail, this preliminary phase consists of two thematic forums, "Parole e Morfemi: discutiamone insieme" and "Classifichiamo i morfemi", and one matching exercise "Termini e Definizioni". Recalling the contents of the classroom lesson, in the first forum students are asked to explain and exemplify the differences between morphemes and words. In the second forum, instead, they have to describe the possible criteria for classifying Italian morphemes (according to their position in the word, type of affixes, whether they are free or bound).

The matching exercise was designed to make them work on meta-linguistic terms and their referents. In order to verify whether students had actually acquired the target notions, the definitions provided in the activity were the results of a rewriting of the definitions drawn from other linguistics textbooks and dictionaries and the online Treccani Vocabulary (Treccani.it). Every definition is also provided with examples which serve to facilitate the comprehension of the metalanguage.

The central phase, task-cycle, is centered on a video-lesson "La classificazione posizionale dei morfemi e dintorni" that focuses on the position of morphemes in the word. In the video, the native-speaker teacher, who is

expert in the target subject, presents the derivation process, and the kinds of affixes by whose means languages can enrich vocabulary. It is important to underline that since the lesson is addressed to non-native speakers of Italian, the kinds of morphemes provided are not only those used in Italian (prefixes, suffixes, infixes) but also the affixes that are peculiar to other languages such as circumfixes and transfixes. Before watching the video, students can read the True-False questions related to the reading comprehension quiz in order to help them focus their attention on specific contents during the vision of the video. After watching the video, the students do the True/False exercise designed to test the general comprehension of the video-lesson. The T/F test is followed by a Cloze with a pull-down menu. Unlike the matching activity “Termini & Definizioni” of the pre-task phase, in this case the students have to complete definitions, with the corresponding lemma, choosing between three alternatives.

The language focus-phase was the section of the unit where students can reflect upon language and vocabulary. It consisted of a set of five exercises and one thematic forum. In one of the activities, “Diamo ordine ai morfemi”, students are asked to order the given morphemes to create Italian words. This exercise enables them to practise the order of morphemes in Italian words (prefix, root, suffix, inflection) and the process to derive adjectives from noun and verbs and adverbs from adjectives.

The following three activities are part of sub-section entitled “I trabocchetti dell’italiano” specifically designed to have students reflect on some pitfalls of Italian. In the first exercise, “Caccia all’intruso” (Figure 4), students have to find the intruder in a list of four words ending with the same three letters. For example in the sequence “sdegnoso, miracoloso, lamentoso e riposo”, they have to choose “riposo” where its “-oso” was not a denominal adjective suffix. Since prefix and suffix in Italian can modify words to express a particular quality (large, small, pretty, ugly), a specific exercise was planned to help student recognize diminutive, augmentative, ameliorative and pejorative suffixes.

#### Trova l'intruso

#### Trova l'intruso sulle parole derivate

[Show all questions](#)

1 / 7 =>

Sdegnoso, miracoloso, lamentoso, riposo

A.  sdegnoso

B.  miracoloso

C.  lamentoso

D.  riposo

Fig. 4. “Caccia all’intruso” - Multiple choice exercise

The following two exercises “Occhio ai sinonimi” and “Occhio agli omomorfii” were based on the lack of 1:1 correspondence between the *signifiant* and the *signifié* of Italian morphemes.

In the first activity, “Occhio ai sinonimi”, students are required to match words, whose prefixes were in synonomical relation, though they were different in their superficial form, (vice-presidente/ex-marito). In the subsequent exercise the opposite condition is presented. Students were asked to determine whether the word pairs presented homomorphs or the same kind of morpheme (ex: a. “gatt-ino”/ b. “ragazz-ino”: the suffix -ino is a diminutive both in “a.” and “b.”; a. “cavall-uccio” / b. “avvocat-uccio”: the suffix “-uccio” is ameliorative in “a.”

but pejorative in “b.”). After the exercises students can study derivational morphology in depth visiting some web pages dealing with all the issues regarding word-formation and alteration in Italian.

The last activity consists of a thematic forum, where students are invited to use the knowledge acquired in the module to compare Italian to their L1 from a morphological point of view.

The effectiveness of this online collaborative classroom is based on the interaction between students and tutors. Tutors in particular have the role to foster the study of Linguistics and Italian engaging and motivating students in meaningful communicative practice and content exchange. The asynchronous exchanges were designed to have students recall the contents of the lesson in presence and to transpose in written form the acquired notions according to their level of communicative and academic skills. The forums also serve to favour high quality group interactions. Under the guidance of the tutor, or in collaboration with peers, less experienced students are shown how proceed before they engage in the learning task. They receive hints, cues and feedback to help them use the most suitable strategy for the tasks. However, since the course participants belong to *i*Generation, that is young adults, born in the 1990s or later characterized by their consistent and simultaneous use of technology (Mills, 2011) they are also encouraged to perform the task seeking and retrieving information from various online sources.

Once students start to post their comments in the forum, the tutor intervenes with revisions, feedback, answers to the questions posted. As regards corrective feedback (Long, 2006), in this course the tutor does not provide negative evidence in the form of error deletions and corrections. On the contrary, given the important role of errors in the acquisition process, the tutor answers in a new post with interventions always aimed at encouraging students to reflect on their language errors or content misunderstandings. Additionally, when the tutor, on the basis of the most common mistakes, realizes that a specific issue of the lesson in presence need further attention she posts further explanations of metalinguistic terms, gives other examples and suggests other online resources for self-study (Figure 5). Moreover, as regards Language focus phase, the tutor provides additional explanations and examples.

**Parola e morfema**  
di Marilena De Santo

Qual è la differenza tra parola e morfema?

**Re: Parola e morfema**  
di Emre Aydin

Ciao a tutti 😊

Il morfema è il suono che ha un significato e la parola è fatta di un morfema o anche di tanti morfemi.

Emre

**Re: Parola e morfema**  
di Martin Levesque

Professoressa buongiorno! Confermo le parole di Emre sulla parola.

Per il morfema penso chi è la combinazione del suono e del significato.

M. Levesque

**Re: Parola e morfema**  
di Pina Vitale

Salve ragazzi!

Rispondo in questo post ai messaggi di Emre e di Martin.

La definizione di morfema che ha dato Martin è più completa. Infatti, il morfema è l'associazione minima di **significante** (termine più corretto di suono) e di significato.

Per la parola, è importante ricordare prima di tutto che è difficile dare un'unica definizione che si può applicare per tutte le lingue del mondo. In generale è la minima combinazione uno o più morfemi.

Esempio: gatto. La parola "gatto" è composta da due morfemi: gatt- con il significato di "animale felino" e -o con il significato di "maschile, singolare". Volevo ricordarvi che per controllare se le vostre risposte sono giuste potete ascoltare la spiegazione del docente e dopo scrivermi di nuovo le definizioni più complete.

In particolare, vi chiedo di ascoltare soprattutto la parte relativa ai criteri di definizione di parola.

Buon lavoro!

**Re: Parola e morfema**  
di Emre Aydin

Ho sentito la spiegazione della professoressa e ora ho capito bene le differenze tra le parole e i morfemi, grazie. Quando la professoressa parla dei criteri, ho capito bene che primo nella parola c'è un ordine fisso dei morfemi. Poi che la parola è separata da una pausa nel discorso o anche nella scrittura.

Emre

Fig. 5. Corrective feedback: an example of interaction

#### 4. Conclusions

In this CLIL environment, we integrated some of the most recent learning methodologies, techniques and resources with the aim of developing an online environment where meaningful learning of both content and language could occur. Collaborative and communicative activities were developed according to task-based learning and learner-centred approach. Autonomy and awareness were promoted offering students the faculty of choice, that is the opportunity to select the resources according to their needs and to self-assess their progresses. The materials used to develop resources and activities were mostly authentic, based on multimedia and Web 2.0 communication tools.

All the actions presented in this course sustain the learning process and give learners increasing accountability for the task itself and take place in what Vygotsky (1978) called Zone of Proximal Development. This concept refers to “the distance between the actual developmental level as determined by independent problem solving and the level of potential development as determined through problem solving under adult guidance, or in collaboration with more capable peers.” The blended course accomplishing scaffolding and working in the zone of proximal development leads learners to improve their actual level. Additionally, it enables students to reach beyond what they could have achieved alone, and gives them the opportunity to participate in new situations and deal with new tasks (Gibbons, 2002).

Moreover, in structuring such a virtual environment we had the possibility of responding to what McLoughlin and Lee (2008) define the “challenge for educators” that is to “enable self-direction, knowledge building, and learner control by providing options and choice while still supplying the necessary structure and scaffolding”.

# Integrating mobile setting into modern classroom: a multi-user, platform-independent, mobile content management system

Hasan Can Saral<sup>a\*</sup><sup>a</sup> Sabanci University, Faculty of Engineering and Natural Sciences, 34956, "Istanbul", Turkey

---

## Abstract

Following the act of Turkish government for lending students tablet PCs during their elementary school education, emerged the importance and need of development of a mobile supported e-learning software platform. The main motivation of writing this paper is 1) to pinpoint key characteristics of a possible software to be developed to achieve the integration and 2) to discuss the effects of the created environment.

Mobile devices, such as tablet PCs and smartphones, when supported with software developed uniquely for e-learning purposes, introduce limitless advantages. An open-source example of such software, which will also be referred throughout the paper, is developed in Sabanci University under the supervision of Cemal Yilmaz, Ph.D., during Spring 2011-2012 and Fall 2012-2013 semesters. The main purpose of the development of this platform is to demonstrate the increased efficiency of integrating mobile environment into educational setting when supported with targeted software.

The paper also addresses specific uses of mobile devices for educational purposes that can be mainly divided into two: Distant learning and in-class usage. Distant learning usage features live video streaming of the classroom environment for absent students and homework / grade tracking topics whereas in-class usage represents the migration of quizzes, exams, etc. that are held in a classroom to a mobile integrated environment. In addition, more offerings of mobility, such as push notification feature of smartphones, identification, and communication are topics addressed in context of education throughout the paper.

Keywords: mobile; iphone; ipad; ios; android; tablet; cell; smartphone; platform; software; distant; e-learning

## 1. Introduction

The Fatih Project, in its current status, is not making use of a software system that can potentially increase its benefits both to teachers and students. Certain technologies and devices, such as smart boards, electronic versions of textbooks on tablet/mobile devices, can be used in a class even without the existence of Fatih Project. As Fatih Project sets regulations on the usage of such services and moves e-learning towards a more centralized approach,

\* Corresponding author. Tel.: +90-212-356-7070; fax: +90-212-356-7069.

E-mail address: hcsaral@sabanciuniv.edu

we believe that a dedicated software can add meaning to the rapid advancement of infrastructure in schools and the technologic devices that are being introduced to the classrooms.

This article discusses the rationale behind and development of a software system that can be used together with the Fatih Project. The advantages and additions of the proposed system are explained with specific references and examples. The lack of content, in terms of unavailability of electronic teaching resources (currently) and a practical data management system, is addressed.

The paper starts by discussing the positive effects that the proposed content management system will have and how it can fill some of the existing gaps. It then describes the possible involvement of already-existing technologies (smart boards and mobile devices) with the Fatih Project. Design choices and decisions regarding the development of the client software are explained. In addition, implementation details are demonstrated for a better understanding and evaluation of the software. These are backed up by the database and software design patterns, which include conscious choices made by the developer to achieve some of the desired functionality.

## **2. Mobile Supported Content Management System**

### *2.1. Content is the key, the king*

According to the documents released on the Turkish National Assembly's official website (2012), Fatih Project received a budget of USD 766 million only for 2013 and expected budget in total is estimated at USD 4.4 billion while the infrastructure is still being rapidly established. On the contrary, there does not exist a complete and comprehensive integrated software that can be used for the system. In order to increase the efficiency and usability of the system in the long run, there should be a software that takes full advantage of the infrastructure built in schools.

To be more specific, let us consider a case where an instructor has just finished a course and wishes to share the smart board content with the students. We argue that the instructor's job should be just to enable this content for the viewing of a certain student group. This should be a completely automated process that can be achieved effortlessly.

It would be beneficial to relate the advantages and usefulness of such a software in the context of Fatih Project. The benefits of developing this system that would accompany the Fatih Project can be examined under three discrete categories, as follows:

- **Migration of in-class activities to an electronic setting:** These activities include sharing course-related material with students in an automated fashion. An instructor can create an item and determine its content. The content could be smart board notes, presentation files or any other course-related document. The instructor chooses when to release these items to the class, i.e. when the items will be visible to the students. Another usage of this type would be streaming the course online, for absent students, for instance.
- **Facilitation of in-class activities in an electronic environment:** Quizzes, questionnaires and exams. These can also be treated as content and can be made visible (enabled for interaction) to certain classes/groups. The students can then submit their answers through the software. Since the questions and answers are already in

an electronic environment, analysis of data is much easier. If applicable to the type of questions asked, grading can be done automatically. Results and feedback can be provided to both the students and teachers instantly. For example, after halfway through a topic, a teacher can ask a question to the class and depending on the percentage of correct answers, s/he can see whether the students have grasped the topic or not.

- Migration of out-of-class activities to an electronic setting. Instructors may decide to schedule events such as field trips or exams outside of regular class hours. The scheduling functionality in the software can greatly ease this process due to easier data collection. Also, homework can be given using the software as well.

All of the functionality explained above is achieved by using a “simple”, yet sophisticated software. The lack of such software will stop the project from reaching its true potential and using every advantage that the infrastructure can possibly bring. The software can of course be modified or enhanced to meet new requirements and demands of the Fatih Project, as time passes.

### *2.2. Previous technology integration: Smart boards*

Educational use of smart boards has been an existing trend, before and without the introduction of Fatih Project. Smart boards offer a dynamic learning environment, while enabling its users to take the full advantage of computers, appropriate software and the Internet.

However, most instructors and teachers have not undergone any training to use the designated devices at all. This means that they cannot be expected to create useful and unique content that capitalizes on the advantages of smart boards. Instead, they will be tempted to use templates and content that is already available online. There are already some websites (forums) in which smart board documents are being shared (e.g. SMART Exchange, SMART Board Revolution, Fatih Projesi Paylasim Platformu, etc.) Although this sharing is not necessarily a bad thing, the most important issue that should be addressed is the necessity of examination of the content found online. More importantly, we argue that the instructors who are intended to use such devices provided in the scope of Fatih Project should be trained accordingly. Because, the content reachable via the Internet is not unique and only the instructors can be capable of providing course-specific content.

With the current state of the Fatih Project, we fear that there is not enough content that can fully utilize smart boards. We also argue that an integrated software that will eventually enable the devices (smart boards and tablets) inter-communicate and share the content in between devices is lacking. For example, a smart board content created during the class can be made reachable via the tablet PCs that students take home to repeat in-class content. Or else,

### *2.3. Why native application?*

Throughout the paper, our focus will be on the mobile software side of the software to be developed in order to maintain a viable interactive learning environment. Therefore, we should mention the mobile application concept at this very point of the paper.

Mobile applications are software capable of providing certain intended functionality on mobile devices. Mobile application developers can choose between mainly three development approaches: native application approach, web application approach or a hybrid approach. In very basic terms, native applications are those applications that you download and run on your mobile device, such as the software you get from Apple’s App Store. Such applications run only on the platforms that they were developed for. On the other hand, web applications are the applications that run on the websites you visit, and in order to use these you only need a web

browser. With the emergence of HTML5 for web applications, there is an on-going debate regarding which development approach is better and will be more prominent in the long run. The client software that this paper is concerned with was developed using a native approach, due to the shortcomings of HTML5 in key areas.

Despite the presence and popularity of HTML5 for web-based applications, native applications are still advantageous in certain ways. Currently, most developers accept that in terms of performance, speed, internet connectivity, device specific features and monetization, native applications are far better than web applications (Mudge, 2012). Furthermore, native applications are known to be better in using device-specific hardware such as the camera, microphone etc. It is very much desired that the application supports multimedia input and output, in case that students are engaged in creative activities that might include audio or video recordings. Such activities may later be integrated into the system as parts of coursework or assignments.

#### *2.4. Platform independency*

Platform independence is a software development technique that implies that the developed software is independent of the technology used to implement it. The more specific occurrence of this methodology is the cross-platform applications that are highly preferred by developers who aim a larger audience. Usually hybrid development approach mentioned above is used to achieve this quality. However, we argue that this is not the proper way to establish an interconnected software platform.

Instead, we suggest that by developing native clients for each platform that we would like to provide our software's functionalities, we achieve:

- 1- Non-restricted user experience,
- 2- Faster and smoother user interface,
- 3- Efficient and reusable code for each project,
- 4- Platform improvements and updates are effective immediately.

### 3. Sample Software Design

#### 3.1. Purpose

Purpose of the sample software developed in Sabanci University by the author, Hasan Can Saral, B.Sc. under the supervision of Cemal Yilmaz, Ph.D., is to demonstrate the increased in class efficiency of the tablets distributed in the scope of Fatih Project. We also would like to encourage the development of such a system by professional developers under the supervision of governmental relevant authorities.

#### 3.2. Demonstrated functionalities

Demonstrated functionalities among the full scope described above include:

- Questionnaire
- Scheduler

applications.

A sample usage of questionnaire application is to collect in class data, which is to be evaluated later. Scheduler application is used to determine a mutual available time for an actual event among a group of users.

#### 3.3. Design concerns and project structure

The demonstrated part of the system can be divided into two:

- ASP.NET project
- XCode project

Again, the ASP.NET project is composed of 2 parts:

- Project core
- User interface project for web application

XCode project is a simple client for iOS environment.

Client – server interactions are handled using XML via web services.

INTE 2013

3.4. UML (Class diagrams) and classes

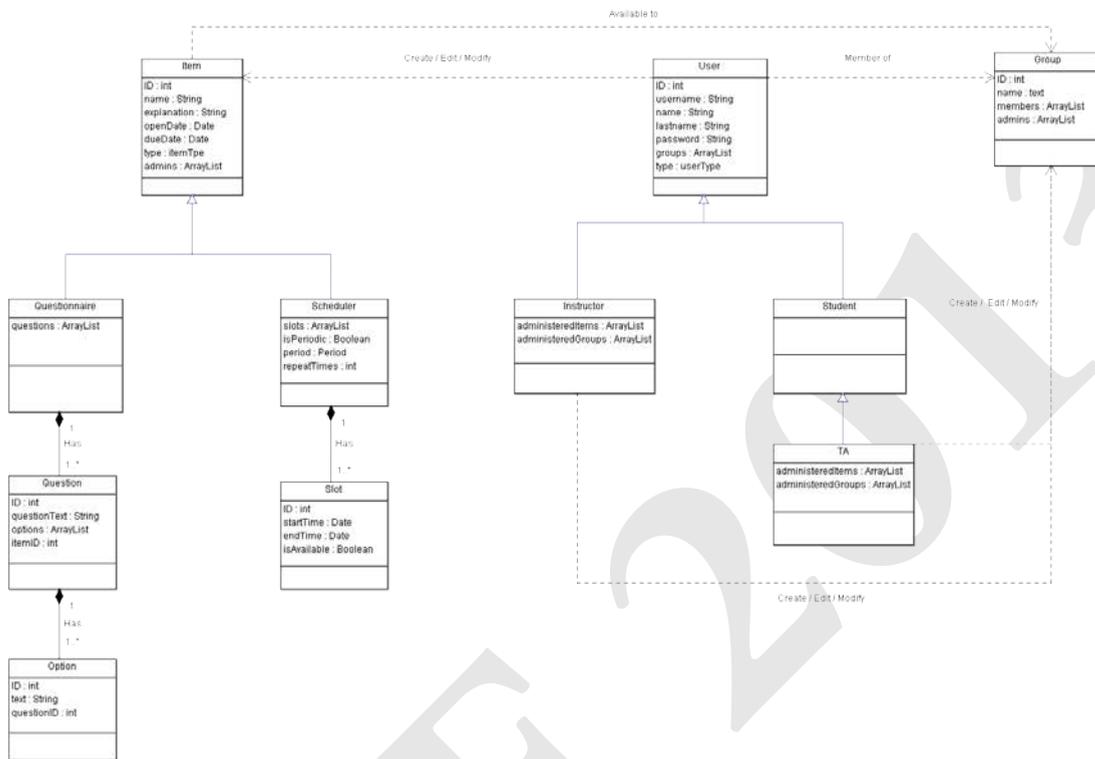

Fig. 1. class diagram

Following classes, which are represented in Fig. 1 are created in order to obtain a proper data representation:

- User
- Instructor
- Assistant
- Student
- Group
- Content
- Questionnaire
- Scheduler

3.5. Database diagram and tables

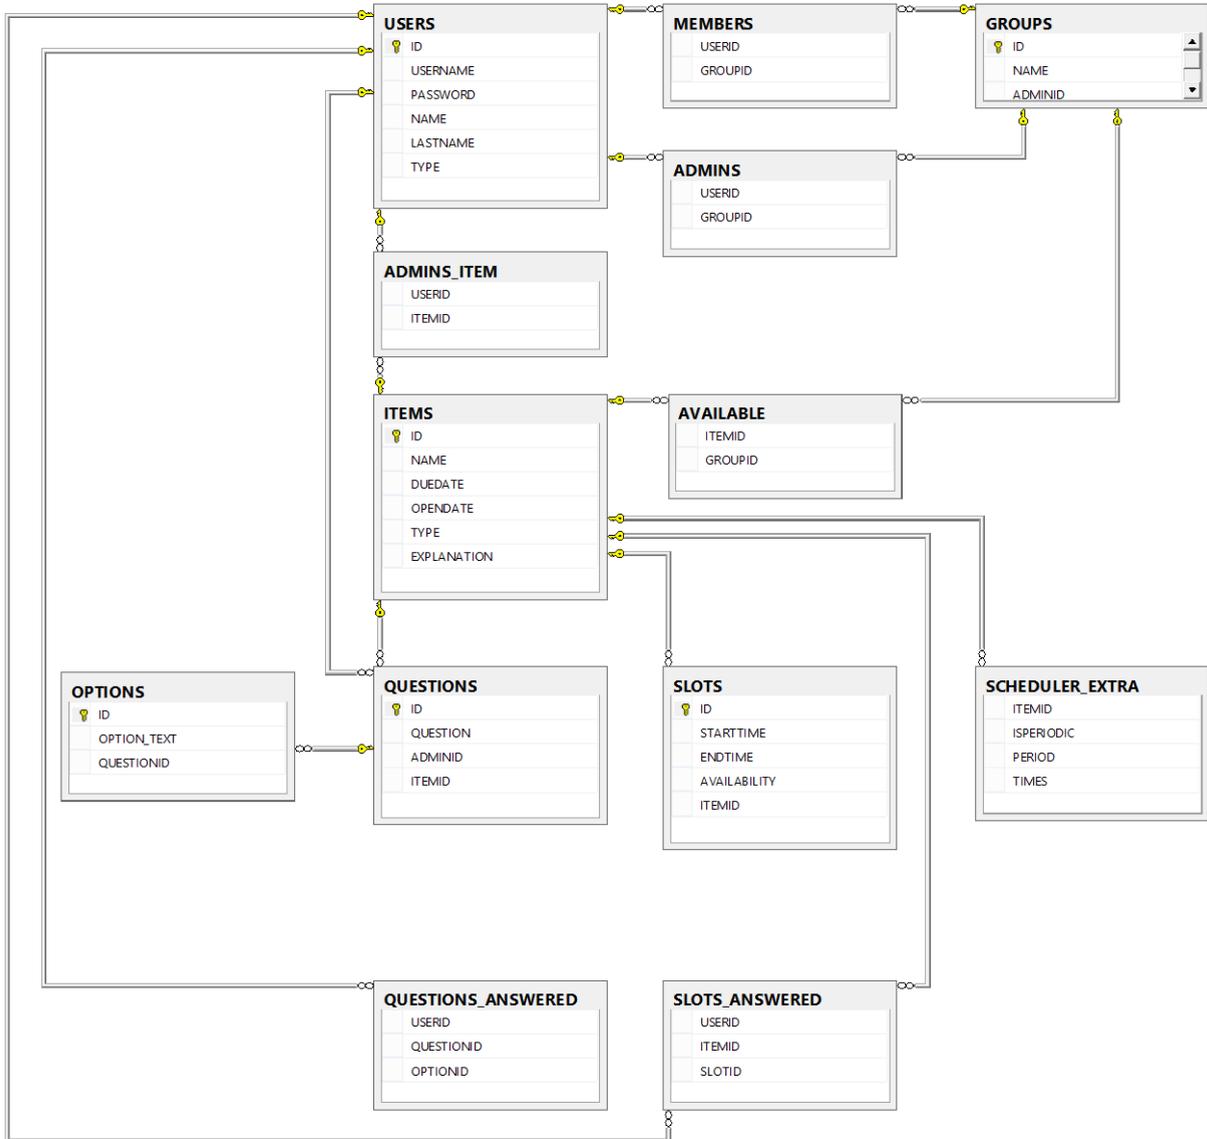

Fig. 2. database diagram

Following tables are created using Microsoft SQL Server 2008 R2:

- USERS
- GROUPS
- MEMBERS
- ADMINS
- CONTENT

- ENABLEDFOR
- QUESTIONS
- SLOTS\_ANSWERED
- QUESTIONS\_ANSWERED
- SLOTS\_ANSWERED

For every single table created in the database, primary keys and foreign keys are clearly defined. ID property is also assigned to ID columns, which increases automatically when an entry is added to the table. With the unique constraints and primary / foreign keys defined, “on delete” and “on update” cascades are introduced and established.

As a good software engineering practice and to establish a new layer of abstraction, a layer responsible for database connection is introduced to the project from the beginning. The inputs for the classes of the layer are the database connection string and using the functions of the class the programmer can retain information from the database.

### 3.6. Source code availability

The source code of two solutions, with a total of three projects is available under Github repositories:

- For the ASP.NET solution: <https://github.com/hasancansaral/B49AA7>
- For the Xcode solution: [https://github.com/hasancansaral/B49AA7\\_iOS](https://github.com/hasancansaral/B49AA7_iOS)

For any supporting material, please check:

- [https://www.github.com/hasancansaral/B49AA7\\_Support](https://www.github.com/hasancansaral/B49AA7_Support)

### Acknowledgements

To Cemal YILMAZ, Ph.D., for his great efforts of supervising and leading me to accomplish my work.

To Mehmet Emre GURSOY, B.Sc., for being a second eye and helping me establish the final form of this paper.

To my friends and family, they were a great source of support, encouragement and love.

To every person who helped me to ship my work out, I thank them for believing in me.

## Abstract

Teaching methods on concept of sustainability are frequently searched in the interior architecture education. The purpose of this study is to propose a model for integrating sustainability in interior design studio. In this context, the first part of the research defines relationship between sustainability and interior architecture and determines sustainable interior design principles. In the second part, an interior design studio model is proposed and principles determined in the first part are used in this model as a design check list. The final part of the research analyzes a case study where this model is implemented and discusses the conclusions.

*Keywords:* Interior architecture; Sustainability; Design studio; Design education; Case study

---

## 1. Introduction

Interior architects are responsible for the interiors of the constructed environment which consumes energy and resources and damages the biodiversity and produces wastes. Within the past 25 years the designers come to understand the complexities of their role and environmental consequences of their decisions. These decisions affect the health of current and future generations and the planet on which they live and work (Jones, 2008). In this context, the instructors of interior architecture started to study on how to educate the interior architects of the future that sustainability will not be an option but will be a standard practice. Many interior architecture schools have already included some theoretical sustainable design courses in their curriculum. However, theoretical courses alone are not enough to teach how to apply sustainable design in professional life. In this frame, this research aims to propose a model for integrating sustainability in interior design studio which is an initial-experience for real life situations and it is also the core of interior architecture education. In this context, the first part of the research defines relationship between sustainability and interior architecture and determines sustainable interior design principles entitled such as energy, material, water and health. In the second part, an interior design studio model is proposed and the principles determined in the first part and requiring features for sustainable interiors according to these principles are used in this model as a design check list. In the process of developing the model, environmental performance analysis models of BREEAM (Building Research Establishment Environmental Assessment Method) and LEED (Leadership in Energy and Environmental Design) have been examined as preliminary data. Implementation of the new model has been performed in an interior design studio case study and the outcomes are discussed in the final part of the study.

## 2. Sustainable interior design principles

The sustainable interior design is defined as design and practices that significantly reduce or eliminate the negative impact of interiors on the environment. In other words, it is an approach that recognizes environmental impacts of the entire life cycle of interiors. In this research, 4 sustainable interior design principles are determined and design measures for sustainable interiors evaluated with the help of these principles are summarized below.

### 2.1. Energy

Energy conservation is the leading principle of sustainable interior design. Two main measures in energy conservation are “design and selection of energy-efficient equipment” and “use of renewable energy sources”. Energy conservation measures for reducing energy used for lighting are increase the natural lighting with sky-gardens, skylights or atriums; design interiors at optimum depth; use light shelves, energy-efficient lighting equipment and lighting control systems (Cole, 1996). Benefit from natural ventilation by using adjustable windows is the most important measure for reducing energy used for ventilation. Likewise, energy spent on cooling and heating can be saved by passive energy conservation measures like prevention of heat losses, using high insulation glass systems and solar shadings on facades and selecting systems with economizer cycles (free cooling, variable air flow systems, waste heat recovery system, etc.). Use of renewable energy sources (sun, wind, geothermal energy, etc.) which can be used partially instead of completely for facilitating all energy needs of buildings is very important in terms of practicing the sustainability concept (Morhayim, 2003).

### 2.2. Material

Material conservation principle concerns 3 main design measures: “flexible design”, “selecting eco-friendly materials/equipments” and “reducing waste”. The first step for material conservation is furniture and interior equipment design that have flexible, modular, demountable and expandable features. Modular walls, floorings and ceilings systems and using movable dividers and furniture systems are elements that earn interiors a sense of flexibility (Lehman-Smith, 2002). Similarly, important amounts of material can be saved by selecting materials such as long-lasting, durable, requiring low-maintenance, obtained from local resources. Measures which significantly reduce waste amount include manufacturing indoor elements at standard sizes, selecting recyclable material like wood, natural stones, steel, and aluminium or re-utilizing windows, door frames and steel beams from demolition sites plays a big part in reducing the amount of waste (Elias-Özkan, 2003).

### 2.3. Water

Water conservation measures in interiors are reuse of rainwater or gray water and selection of water-saving plumbing equipments. For example, sensed plumbing elements can be selected instead of manual plumbing or a reservoir that consumes water amount of 6 l. can be selected instead of standard reservoirs which consume 13.5 l. to save important amounts of water (Cole, 1996).

### 2.4 Health

Health conservation principle concerns 3 main design measures: “improving indoor air quality”, “providing thermal, visual and acoustic comfort” and “selection of non-harmful materials”. The steps to improve indoor air quality are avoiding the use of materials that emit pollutants like formaldehyde and radon into environment and designing adjustable windows for providing the necessary clean air to indoors. To provide thermal comfort it is suggested to use heat and humidity sensors which can sustain an environment of 21 °C and 50% of relative

humidity. For visual comfort, the use of solar shading elements and natural lighting with reduced glare effect should be provided and a visual connection with the exterior environment should be established. Measures for acoustical comfort include taking sound insulation measures for the exterior, floors and between spaces. Finally to avoid using materials emitting VOC's and which contain pollutant-emitting asbestos fiber in indoor environments are measures to take for protecting human health. In addition to these measures, it is recommended to use natural materials which protect the ion balance like wood and natural fabrics instead of synthetic material like polyester to provide the electroclimactic quality (Ersoy, 1994).

### **3. A model proposal for integrating sustainability in interior design studio**

Traditionally, the practice of interior design is learned through a project-based "studio" approach in departments of interior architecture. Whereas, in studio, students themselves generate and evaluate alternatives, make decisions and learn how to design. Therefore, for educating future interior architect generations with a high level of environmental awareness it is very important to integrate concept of sustainability in interior design studio. In this context, primarily the educational approach of interior design studio is generally defined then a model proposal for integrating sustainability in interior design studio is put forward.

#### *3.1. The educational approach of interior design studio*

The most common environment for teaching are classes where education practicers teach students by lecturing and assigning homework. Differently from this approach, in design studios, students are expected to offer solutions to design problems assigned by the instructor and they learn by working on projects (Oh et al., 2012). Interior design studio adopts a learned-centered, collaborative and experiential problem based educational approach. Each studio instructor is responsible from 10 or 12 students. These students develop their projects in parallel to instructor or jury's critiques. Roles of instructor and student can differentiate in these critiques. As Ciravoğlu (2003) indicates, in some studios, instructor is the "master" and student is the "apprentice". Another role undertaken by instructor and student is the "user-designer" role (Dutton, 1991). In this design studio, the instructor (user) critics student's (designer) project according to user demands. In the initial stage of the project, the instructors may establish the goals, general procedure and assessment criteria they will adopt. During the semester, instructors meet students either individually or in groups (desk or group critiques) for developing projects by comments. At the end of the project a final review or jury is commonly executed (Kurt, 2009).

#### *3.2. Sustainable interior design studio model*

The sustainable interior design studio model has a goal of experiencing an environmentally conscious interior design process. In this framework, the instructor undertakes the role of a user, demanding a sustainable interior from the designer (student). The group critiques are realized in order to share all documentation about the sustainability in addition to instructor's and students' comments. At the beginning of the studio, all students collect written and visual documents about sustainable interior design. In this stage, they prepare a presentation on sustainable interiors and make their presentation in a group critique session. After the research phase, the instructor submits a sustainable design check list which will guide students for creating sustainable interiors. The students develop their projects in the light of sustainable design check list and instructor's comments.

Table 1. Sustainable design check list performed in interior design studio model

<b>Energy</b>
Reducing the energy used for lighting
<i>At least 80% of spaces benefits from natural lighting and large surfaces are covered with light colour material.</i>
<i>Elements such as sky-gardens, skylights, atriums, light shelves are used to increase natural lighting.</i>
<i>Energy-efficient lighting equipment and lighting control systems are selected.</i>
Reducing the energy used for ventilation
<i>All spaces benefit from adjustable windows, air-holes or natural ventilation opportunities facilitated by channels.</i>
Reducing energy used for heating and cooling
<i>Passive recovery measures for reducing heating and cooling loads (thermal mass, etc.) are taken into consideration.</i>
<i>In order to reduce heating loads, measures are taken such as high insulation glass systems (low-e glass), double-wall applications.</i>
<i>In order to reduce cooling loads, measures are taken such as sunshades, movable blinds between glass layers, etc.</i>
Use of renewable energy sources
<i>Low emission but non-renewed energy sources or renewable energy sources like sun and wind are used in the building.</i>
<b>Material</b>
Flexible design
<i>Interior equipment elements are demountable, modular and expandable. Movable dividers are preferred instead of fixed walls.</i>
Selection of eco-friendly material/equipment
<i>Local materials are favored in construction instead of imported equipment with high energy of production and transport.</i>
<i>On large surfaces durable materials that do not require maintenance or replacement are selected.</i>
Reducing waste
<i>An existing structure is re-functionalized and redesigned.</i>
<i>Furniture used in interior is manufactured at standard sizes.</i>
<i>The doors, windows, insulation, and siding panels are mechanically inserted rather than cementing.</i>
<i>Recycled or re-utilized materials (glass, ceramics and steel recovered from demolition sites, wood etc.) are favoured in interior equipment.</i>
<b>Water</b>
Recollection and reuse of water
<i>Grey water and rain water is stored in the building, filtered and re-used in reservoirs or garden irrigation systems.</i>
Selection of water-efficient equipment components
<i>Local plants that require little water and water-saving irrigation systems are selected in interior and exterior landscapes.</i>
<i>Water-saving sanitary system equipments such as pressure reservoirs, waterless urinals, and low-flow photocell faucets are selected.</i>
<b>Health</b>
Improving indoor air quality
<i>Fresh air intake can be naturally facilitated via user-controlled adjustable windows.</i>
<i>Interiors are naturally ventilated; there is no need for an additional ventilation system as plan depth is not higher than 15 m.</i>
Providing thermal, visual, and acoustic comfort
<i>Interiors have the feature to manually control air movements and air temperature.</i>
<i>Depth of spaces are designed at max. 7m to benefit more from natural lighting.</i>
<i>The glare effect is diminished with measures taken on façade and at indoors (solar shading, glare-reducing glass, etc.).</i>
<i>Sound insulation measures are applied in order to reduce noise transmitted between floors and through installation systems.</i>
Selection of non-harmful material
<i>Materials like zinc, lead, wood preservatives containing formaldehyde or synthetic dyes which damage indoor air quality are not used.</i>
<i>Carcinogenic insulation materials like glass fibers, mineral fibers or asbestos fibers are not used in indoor.</i>
<i>In order to increase electroclimactic quality, natural material like wood and natural fabric are used..</i>

The design check list is primarily determined with the help of principles of sustainable interior architecture entitled such as energy, material, water and health and also required features for sustainable interiors according to these principles (Table 1). In the process of developing this design check list, environmental performance analysis models of BREEAM (Building Research Establishment Environmental Assessment Method) and LEED (Leadership in Energy and Environmental Design) have been examined as preliminary data. The implementation of the new model has been performed in an interior design studio case study.

#### **4. Implementation of the model on an interior architectural design studio case study**

##### *4.1. Method*

The sustainable interior design studio model is implemented in the third year of the Interior Architecture Department of Doğuş University. The studio includes the interior organization and design with environmental consciousness of an interior according to user identities, and requirements separately specified for each student. The purpose for the students is to experience the process of interior designing with the help of sustainable design measures. The design studio includes group (16 students and the instructor) critiques during the term and adopts a “user-designer” studio concept; the instructor (user) passes project critiques to the student (designer) through user needs and demands and the instructor undertakes the role of a user demanding a sustainable interior from the designer (student). During the first stage, the research-program phase, which is to be experienced by the students in the design studio, sustainable interiors were studied and examined; individual-measure-behavior researches and sample interior solutions were examined and a program was established. The second stage was the phase of design. In this phase, interior architecture students were asked to design their projects with the help of sustainable design check list submitted by the instructor. The students developed their projects in parallel of this design check list and instructor’s comments. At the end of the term, they submitted their sustainable interior design projects by two and three dimensional drawings, models and filled design check list forms (see Fig. 1.).

Fig. 1. Examples of submitted projects

4.2. Results

Submitted projects and design check list forms have been evaluated and analyzed for specifying students' sustainable interior design performance. As a result of this analyze it is determined that only 1 student has a performance lower than 50%, 3 students has a performance in the range of 50%-85%, however 12 students has a performance higher than 85%. The percentages are indicated in figure 2.

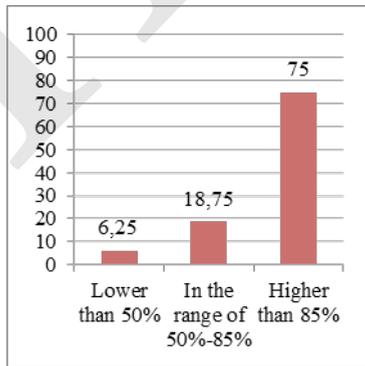

Fig. 2. The rates of the students' sustainable interior design performance

However, following the project submission, a survey is administered to the students in order to determine if the sustainable interior design studio model achieves one's goal or not. The survey includes 3 questions. The questions and students' responses to these questions are indicated below and the percentages of the responses are demonstrated in fig. 3 (a), (b) and (c).

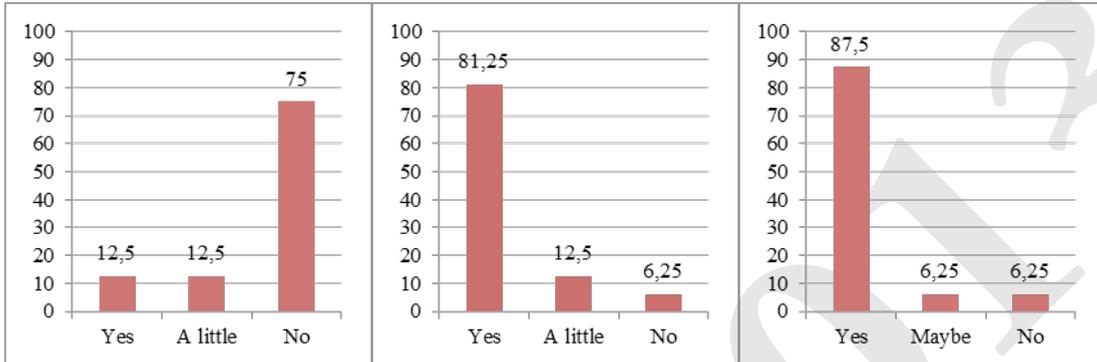

Fig. 3. (a) Percentages of responses of question 1; (b) Percentages of responses of question 2; (c) Percentages of responses of question 3.

- *Question 1: Did you have information about the sustainable design before this interior design studio?*

12 students had no information about the sustainable design, 2 students had a little of knowledge and 2 students said they were informed about the sustainable design before this interior design studio.

- *Question 2: After this interior design studio do you know about how to design a sustainable interior?*

13 students said “they know about how to design a sustainable interior”, 2 students said “they know but there are some unclear points” and only 1 student said “he doesn't know how to design a sustainable interior”.

- *Question 3: Will you practice sustainable design methods during your future professional life?*

14 students said “they will practice sustainable design methods during their professional life”, 1 student indicated “he will maybe practice” and similarly 1 student said “he won't practice sustainable design methods during his professional life”.

## 5. Conclusion

The start point of this study was the question “how to educate the interior architects of the future that sustainability will not be an option but a standard practice?”. In this framework study was performed to propose a model for integrating sustainability in interior design studio. As a result of applying sustainable interior design studio model, 75% of the students who had no information about the sustainable design before their experience in this studio, have performed projects according to sustainable design measures with a rate of higher than 85%. Similarly 81,25% of the students declared “they know about how to design a sustainable interior after this interior design studio experience”. The most important result of the survey is that 87,5% of the students indicated “they will practice sustainable design methods during their professional life”. This result significantly indicates that this

studio experience has developed an important awareness of sustainability and influenced the recognition of environmentally responsible design as an imperative in education.

## Acknowledgements

Author would like to thank all students of sustainable design studio of Doğuş University.

## Abstract

Interdisciplinary collaboration is defined as a knowledge view and curriculum approach that consciously applies methodology and language from more than one discipline to examine a central theme, issue, problem, topic or experience.

In this study, curriculums of Interior Architecture and Industrial Product Design Bachelor's Degree Programs in Turkey are examined and the courses that can be considered from the perspective of interdisciplinary collaboration are determined. Final results of the study are based on numeric data and analyzed the current situation and the situation envisioned as a result of interdisciplinary collaboration between Interior Architecture and Industrial Product Design Bachelor's Degree Programs in Turkey.

Keywords: interdisciplinary collaboration, education, industrial product design, interior architecture

---

## 1. Introduction

In the education field, interdisciplinary collaboration is a natural consequence of varying and developing knowledge areas and aims to provide students with multi-perspective way of thinking. This approach encourages students to improve their abilities, self-confidences and provides effective communication between the different disciplines (Masters, Baker and Jodon, 2012).

Interdisciplinary collaboration in the education field not only purposes the comprehensive and cooperative study of students from different disciplines for a common purpose (Dillon, Noble and Kaplan, 2009), but also aims to protect the disciplinary integrity of the participating disciplines (Lindeke and Block, 1998).

Although interdisciplinary collaboration in the education field is not a new approach, it is becoming an important approach in recent years. (Yıldırım, 1996). This approach provides proactive environment and wide information infrastructure for interaction, creativity and innovation. (Costa ve Scoble, 2006). "To make a difference", which is ensued from interdisciplinary collaboration is regarded as one of the most important components of the creative thinking process (Okada, Yokochi, Ishibashi and Ueda, 2009).

"Interior Architecture" is defined as a professional field that deals with interior spaces in terms of practical, aesthetic and symbolic functions and develops projects in accordance with people's physical and mental characteristics and actions (TMMOB Chamber of Interior Architects, 2011). "Industrial Product Design" is defined as a creative industrial discipline and profession that aims both fictionalizing the visual, physical,

E-mail address: ozgerkan84@gmail.com

cognitive and functional interface of product-human relationship and interpreting the limitations of today's technology on product or system basis (İTÜ, 2013). Both of these disciplines live on creativity and work on different scales in order to develop innovative projects. In the view of these factors, it is envisioned that interdisciplinary collaboration between interior architecture and industrial product design disciplines will provide procreative environment and wide information infrastructure for interaction, creativity and innovation.

## 2. Interior Architecture and Industrial Product Design Bachelor's Degree Programs in Turkey

It is determined that the number of universities offering Interior Architecture Bachelor's degree program in Turkey is 46 and the total quota of these programs is 3054. On the other hand, the number of universities offering Industrial Product Design Bachelor's degree program in Turkey is 23 and the total quota of these programs is 980.

In Turkey, The Council of Higher Education-YÖK, established in 1981, is responsible for the planning, coordination, governance and supervision of higher education. The higher education institutions have no autonomous structure. Table 1 shows the diversities of Interior Architecture and Industrial Product Design Bachelor's degree programs in Turkey in terms of "Program Names", "Student Selection Method" and "Type of University".

Table 1. Number of Interior Architecture and Industrial Product Design Bachelor's degree programs in Turkey according to the program names, student selection method and type of university

		Number of Interior Architecture Bachelor's degree programs in Turkey	Number of Industrial Product Design Bachelor's degree programs in Turkey
<b>Program Names</b>	Interior Architecture	28	-
	Interior Architecture and Environmental Design	18	-

	Industrial Design	-	6
<b>Student Selection Method</b>	LYS Exam	21	14
	Aptitude Exams	25	9
<b>Type of University</b>	State University	10	7
	Private Foundation University	36	16

### 2.1. Curriculum Analyses

When it comes to interdisciplinary collaboration between Interior Architecture and Industrial Product Design programs, it is necessary to examine the curriculum of these programs.

The courses that can be considered from the perspective of interdisciplinary collaboration can be determined as a result of curriculum analyses.

Bahçeşehir University, Doğuş University, İstanbul Technical University and Mimar Sinan Fine Arts

University are taken as a reference for the curriculum analyses. The diversities in student selection methods and university types are considered during the determination of these universities.

Table 2. Analyses of selected universities in terms of student selection method and university type

	<b>Bahçeşehir University</b>		<b>Doğuş University</b>		<b>İstanbul University</b>	<b>Technical</b>	<b>Mimar Sinan Fine Arts University</b>
<b>Student Selection Method</b>	LYS Exam		Aptitude Exams		LYS Exam		Aptitude Exams
<b>University Type</b>	Private University	Foundation	Private University	Foundation	State University		State University

Compulsory courses are considered and these courses categorized as five main groups during the curriculum analyses.

- Off-discipline Courses
- Professional General Knowledge Courses
- Presentation Techniques Courses
- Interdisciplinary Collaboration Courses: The courses that can be considered from the perspective of interdisciplinary collaboration
- Other Professional Courses

Table 3 shows the cumulative course lists according to these five categories.

## 2.2. The Analyses of Courses that can be Considered from the Perspective of Interdisciplinary Collaboration

The courses that can be considered from the perspective of interdisciplinary collaboration are determined in Table 3. It is envisioned that these courses can be classified as shown in Table 4.

Table 4. Classification of courses that can be considered from the perspective of interdisciplinary collaboration

	<b>Interior Architecture</b>	<b>Industrial Product Design</b>
<b>Category 1</b>	Interior Design Studio 1 + 2 + 3 + 4 + 5	Product Design Studio 1 + 2 + 3 + 4 + 5

<b>Category 3</b>	Furniture Design Introduction to Furniture Design Structures of Furniture Furniture Identity Experimental Furniture Furniture Practice Studio 1 + 2	New Product Development Product Design Researches Structure Modeling 1 + 2 Structure

Design and selection of the products, which take part in interior space are a particular concern to interior architects during the interior design process. On the other hand, during the industrial product design process, the product should be paired with the space that the product will take part in. In the view of these factors, interdisciplinary collaboration between design studio courses in category 1 will give opportunity to sharing knowledge and skills during design processes.

The courses in category 2 deals with the design process, theory and methods. It is envisioned that interdisciplinary collaboration between courses in category 2 will provide students multi-perspective way of thinking.

The courses in category 3 deals with new product design methods, furniture design, structure and modeling. Interdisciplinary collaboration between courses in category 3 is intended for encouraging the students to work together for a common goal.

## 2.3. The Analyses of Recent Situation and Situation as a Result of Interdisciplinary Collaboration

The result of the cumulative course analyses points out that there are 29 courses that can be considered from the perspective of interdisciplinary collaboration. Figure 1 shows, the recent scatter chart of courses in Interior Architecture and Industrial Product Design Bachelor's Degree Programs in Turkey. Figure 2 points out the envisioned scatter chart as a result of interdisciplinary collaboration between these two programs.

### Interior Architecture

### Industrial Product Design

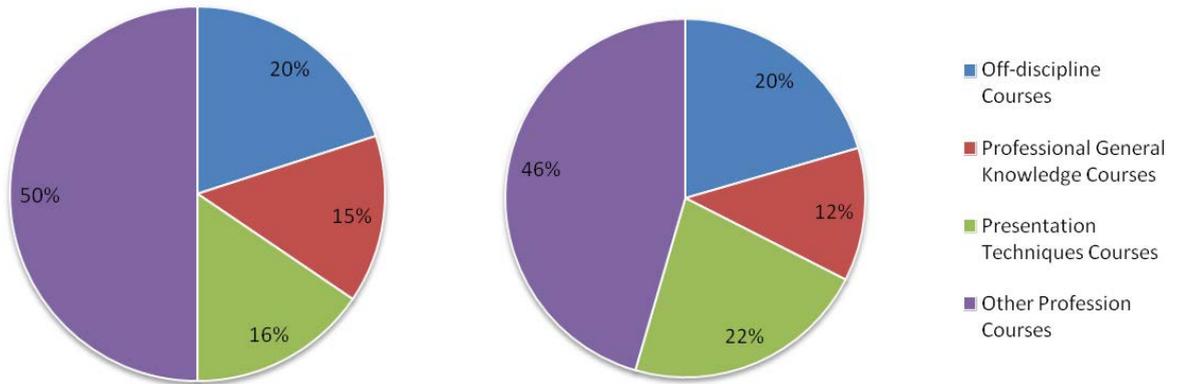

Fig. 1. Recent Scatter Chart of Courses

### Interior Architecture

### Industrial Product Design

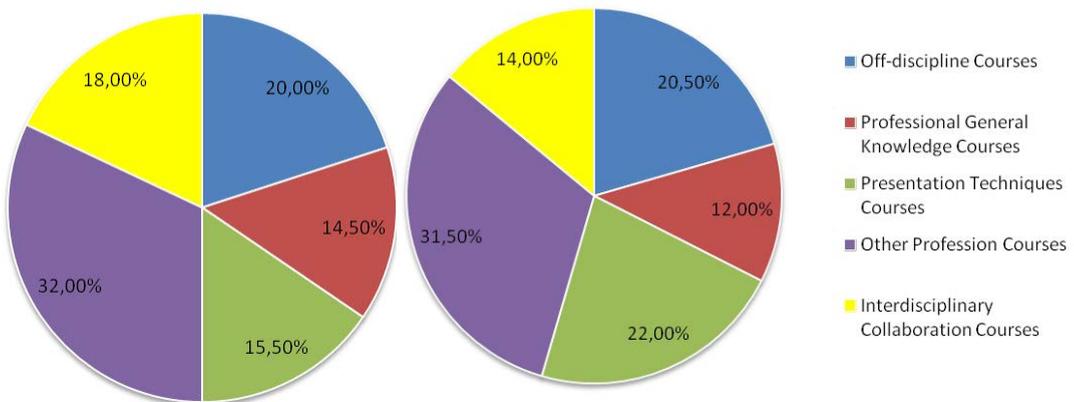

Fig. 2. Envisioned Scatter Chart of Courses as a Result of Interdisciplinary Collaboration

### 3. Conclusion

This study was performed to propose a new approach for the Interior Architecture and Industrial Product Design Bachelor's Degree Programs in Turkey from the perspective of interdisciplinary collaboration. Figure 1 shows that %50 of the courses in Interior Architecture programs and %45.5 of the courses in Industrial Product

Design Programs are “Profession Courses”. Figure 2 points out that the courses that can be considered from the perspective of interdisciplinary collaboration corresponds to %18 in Interior Architecture programs and %14 in Industrial Product Design Programs.

Despite the fact that these disciplines work on different scales, interdisciplinary collaboration on issues such as design studios, basic design, new product design, furniture design, structure and modeling are envisioned to be beneficial.

# Intergenerational programs implemented in the Czech Republic

Jana Kitlinska\*

*Tomas Bata University in Zlin, Faculty of Humanities, 761 01 Zlin, Czech Republic*

---

## Abstract

It will be necessary to cope with actual social changes, all parties involved - between generations will need to build new forms of solidarity based on mutual support and the transfer of skills and experiences. Intergenerational programs could be an instrument of mutual exchange and bridging of generational gap. This paper will provide information about the status of intergenerational programs in the Czech Republic. Crucial intergenerational programs will be those involving multiple generation but include at least two nonadjacent (as a rule interaction between the very young and very old) and non-familial generations.

*Keywords:* intergenerational programs, young, older, elderly

---

## 1. Introduction

In recent years, there has been increasing interest in developing initiatives that seek to bring the older and younger generations together. This interest arises from changes in society. The population in the Czech Republic is getting older. According to the population forecast of EUROSTAT, the Czech Republic will rank among the oldest populations worldwide. In 2009, there were 18% of people above the age of 65 and the trend of the aging population is going to continue. The latest population forecast of the Czech Statistical Office estimates that 32% of the population will be elderly (65+) in 2065. That is a serious number calling an attention. In the European Union, 2012 has been designated as the European Year of Active Ageing and Intergenerational Solidarity with the overall aim of achieving a Europe friendly to all ages by 2020.

Strom and Strom (in London, 2011) indicate that it will be necessary to ensure that all age groups can recognize and respond to the needs of a cohort other than their own. They point out that many nations are experiencing social transformation, acknowledges the need to develop a broader vision of education for social evolution and also to modify some traditions so that they can be maintained in respect of a modern lifestyle and current values. Kaplan (2001) calls for increased intergenerational involvement coming from many directions, he calls for publishing evidence and suggests that such efforts directed at increasing the quality of people's lives, strengthens communities and contributes to the necessary level of social change.

Cultures where filial relationship was characterized by great respect to elders (eg China, Japan, Palestine) used for a long time terms such as intergenerational learning, intergenerational exchange or intergenerational communication interchangeably (Hatton-Yeo and Ohsako, 2000). While in foreign countries attention has been paid to intergenerational interaction for several decades, in the Czech Republic this area is quite neglected. In the Czech Republic, Rabusicova with her colleagues (Rabusicova, Kamanova and Pevna, 2011) from the Masaryk University in Brno focuses on the intergenerational learning. This is the first research published in the Czech

\* Corresponding author.

*E-mail address:* kitlinska@fhs.utb.cz

Republic. The main attention is focused on intergenerational learning within families (among children, parents and grandparents) and intergenerational courses are conceived as a meeting place of different generations of family members (it corresponds to our concept of multigenerational courses). Radvakova (2010) summarizes that in the Czech Republic there are three major problems in all parts of lifelong learning: ambiguity of competence, non-existent or ineffective motivation, and the absence of mechanisms for the systematic development of this type of education.

Although the context of considering intergenerational learning is mainly about the family, this concept can be used in other social groupings (from schools within various levels of the educational system, through work, to civic (community) organizations). Despite the growing interest in shared learning experiences, to date no attempt has been made to draw enough information about the nature of intergenerational exchange outside the family. And here is the space and the need to implement intergenerational practice (incl. programs).

## 2. Definition of Intergenerational programs

In general an intergenerational practice can be best understood as any activity which aids to bring people together in purposeful, mutually beneficial activities which promote greater understanding and respect between generations and contribute to building more cohesive communities (Finn, Scharf, 2012). In the literature on intergenerational interventions, the concept of intergenerational transmission has been defined in a number of different ways (one such a definition targets specific programs, namely intergenerational programs, and another definition is derived from explorations of all intended intergenerational transmissions) (Bostrom, 2003). Some authors (or institutions) do not specify intergenerational practice. For the purpose of this paper it is essential to differentiate the concept of "intergenerational" as an interaction between younger generations (children and youth) and older people, and the term "multigenerational" including several generations (not just young and older). This differentiation corresponds to the concept in the international field examining the issue of intergenerational interaction. This paper is approaching the concept in research reports eg. UNESCO (Hatton-Yeo, Ohsako, eds.: *Intergenerational Programs: Public Policy and Research Implications an International Perspective*, 2000, Kaplan, ed.: *School-based intergenerational programs*, 2001), EU (Fischer, ed.: *Intergenerational learning in Europe: Policies, Programs & Practical Guidance*, 2008), international project European Network for Intergenerational Learning (periodic *Intergenerational learning*), international network The European Map of Intergenerational Learning (EMIL), Centre for Intergenerational Practice (Hatton-Yeo, ed.: *Intergenerational Programs: An Introduction and Examples of Practice*, 2006) etc.

The broad definition of intergenerational programs encompasses the different developmental status and cultural context of each country.

The program is then more than scheduled activities for the population served, it is planning of activities and the interaction that takes place among individuals when they participate in it (Newman, Brummel, 1989). According Newmann (1997) intergenerational programs have been emerging as a new form of human service that provides for systematic a deliberate interaction between persons at the opposite end of the human age continuum. Newmann (1997) aids that intergenerational programs are designed to engage nonbiologically linked older and younger persons in interactions that encourage cross-generational bonding, promote cultural exchange, and provide positive support systems that help to maintain the wellbeing and security of the younger and older generations.

Intergenerational program involves ongoing, organized, activity between members of younger and older age-groups for the benefit of all participants (Kuehne, 1999).

In a nutshell, it is about "intergenerational engagement" – the full range of ways in which young people and older adults interact, support, and provide care for one another (Kaplan, 2001).

Sanchez (2007) see and define three aspects, however, are found as the common denominators of intergenerational programs: a) people from different generations participate in all intergenerational programs b) participation in an intergenerational programs involves activities aimed at goals which are beneficial for all those people (and hence to the community in which they live) c) thanks to intergenerational programs, participants maintain relations based on sharing.

The conceptual definition (most important and widely used) it is general accepted since 2000: *Intergenerational programs are vehicles for the purposeful and ongoing exchange of resources and learning among older and younger generations for individual and social benefits* (Hatton-Yeo and Ohsako, 2000). For example Sanchez (2009) adopted this definition of intergenerational program by the International Consortium. This definition have evolved over time, without been severely renewed (Pinto, 2011).

Nevertheless countries are not following identical courses of intergenerational programs development (Hatton-Yeo, Ohsako, eds. 2000). Otherwise, intergenerational programs vary widely: the organizers, content, form, time, participants, etc.

### 3. Methodology

Therefore, the aim of this research is to determine what intergenerational programs in the Czech Republic have been implemented. The research method used in this paper is a descriptive analysis. To analyse the programs implemented in the Czech Republic, we checked information posted on the website. Exploiting the data stored in search logs of Web search engines and Web sites can provide important information about intergenerational programs implemented in the Czech Republic. The Internet (World Wide Web) provides access to a wealth of information across a multitude of subjects. Programs can be very different. So intergenerational programs may be categorized according to type of intergenerational interaction (simplified: young for older, older for young or young and older together). Programs may include educational activities, mentoring, volunteering, etc. Therefore it is important to set sampling criteria. Sampling criteria are the list of characteristics of the elements that we have determined beforehand and that are essential for eligibility to form part of the sample.

We determine what these criteria (or essential characteristics) are as a result of the research problem – or the purpose of the research. A program is not something that appears in front of us but rather it is something that we must look for and pursue (Sanchez, 2007).

Sampling criteria:

- Program is deliberated, managed activity (with organisation and goals).
- Participants from several generations – it must include at least two nonadjacent and non familial generations. It represents „intergenerational" as an interaction between younger generations (children and youth) and older people.
- Ongoing exchange: All intergenerational programs pursue certain goals that are beneficial to the participants as well as other people in their surroundings (whether personal, family, community, etc.).
- Realization in the Czech Republic.

#### 4. Situation in the Czech Republic

In gathering information about on-going intergenerational programs, we are aware of the limitations of our approach to collecting details of relevant programs.

The first result of the analyse shows that the interest in intergenerational programs in the Czech Republic depends on multigenerational approach (often with family bonds) or on the one generation exclusivity than on the connection of younger and older generations.

According Hatton-Yeo and Ohsako (2001) some countries acknowledge that they have not yet developed recognised “models” of IP but are able to identify programs from other areas that have intergenerational dimensions. This is true for the Czech Republic. The formal concept of intergenerational programs, as such, is not used.

We found programs implemented in the Czech Republic that are designed just for elderly. These programs provide a variety of services to older adult. These are services such as care (home, health and social care), protection (safety home, self-defence) and development, including education (eg. U3A, civic and recreational programs, so many programs aim to develop computer skills). In recent years, the programs are also abounding in the e-environment (website about and for seniors, blogs, special e-shops, discount servers). Special categories are programs that focus on reminiscences (books and creations of memories), thus transmission of the culture and of the cultural heritage. These are primarily the programs of the European Grundtvig project (eg. ME(U)MORIES, TOYS OF MY GRANDPARENTS, VIRTUAL EUROPEAN CULTURAL CENTER). But the above activities explicitly do not express focus on multiple generations. Another category are programs to support families (under the auspices of the NGO's family centres and foundations – for example project PARENTING FROM A TO Z with five special programs, program WEEKENDS MOTHER-DAUGHTER-GRANDMOTHER, program DOX gallery organizes regular art exhibitions for all family members, program Every Czech Reads to Kids, and many others).

Programs for the young generation with an emphasis on intergenerational relationships are particularly part of the implementation of educational policy (as a part of educational goals, and implemented in a school environment). So these programs do not meet the specified conditions. Typically, these programs cover only one generation (peers), these programs are not deliberated and are not managed activity (with organization and goals). It should be mentioned also programs that fall under the family policy and the protection of children.

Following are some descriptive results obtained from a sample of 33 identified intergenerational programs:

Generally there are four fundamental types of intergenerational programs: (1) older adults serving children and youth; (2) children and youth serving older adults; (3) the old and the young together serving the community; (4) older persons, youngsters and children provide a mutual service in informal activities which, among others, can involve learning, entertainment, leisure or sport. Although this classification is still valid, it has been questioned because it is difficult to clearly distinguish between who provides the service and to whom (Sanchez, 2007). Nevertheless, we try similarly to classify the programs in the Czech Republic. In the Czech Republic most intergenerational programs are based on the first model: older adult serving children and youth.

Most frequently seen model involving older adults serving the young in childcare in which older adults work (as volunteers) with young children in hospital, residential care or older adults create a product for facilities for children. These are programs: SENIORS SEW DOLLS FOR CHILDREN; SENIORS MANUFACTURE TOYS FOR CHILDREN FOR FUN; BABIES IN THE BEDROLL; SENIORS MANUFACTURE TOYS. Specific is program GRANDMOTHER READ TO CHILDREN (old pedagogical workers read books to hospitalized children – one day, one grandmother). Little different is the program SECOND LIFE OF CHILDREN'S BOOK – seniors gather old children's books. Seniors distribute these books in vulnerable children or in family centres. We could say there are special types of volunteering (or donation). But we identified directly to specific volunteering programs. The most widespread intergenerational volunteering program is 3G PROGRAM. This program is implemented by organization Hestia, but other organizations have taken it (ADRA, ELIM, TOTEM).

The 3G Program is similar to the Big Brother in the US, this social prevention program promotes the exchange of experience between young and older people by voluntary work: One adult establishes a mentoring relationship with a child (between 6 and 15 years) that comes from a problematic environment and spends the free time once a week with the child. Similar is program THE SHAMROCK – older adults are as foster grandmother in vulnerable family. A third group of programs has been based on the creativity to use the experiences and knowledge of older people in settings such as exhibition, libraries and museums and other cultural settings. For example program: INTERGENERATIONAL DIALOGUES (project audiovisual workshop). In this program young people recorded interviews with seniors and while seniors advising young people with the use of audiovisual and film equipment. Two programs have organized an art contest for children (LIVE WITH SENIOR; HAPPY AGE THROUGH THE EYES OF CHILDREN). Another program is WORKSHOPS OF SENIORS FOR CHILDREN in which seniors prepare four different workshops: photo exhibition, a chronicle of travelling etc. And in the capital works program, in which seniors help maintain safe pedestrian crossing in front of schools (SAY STOP TO AGGRESSIVE DRIVERS).

The second intergenerational program model that is evident throughout the Czech Republic involves youth serving older adults. Most of the meetings between participants from different generations took place in spaces designed for older people (residential homes or day-care settings). Young people visiting older people in residential homes to provide communication support and to share activities, i.e. music and crafts. Most of these intergenerational programs are based on volunteering (GABRIEL; ADRA VOLUNTEERING IN HEALTH AND SOCIAL CARE FACILITIES; CHILDREN OF ERKO GO TO HOSPITALS FOR REWARD eventually CHILDREN READ TO SENIORS). In one program school children drew and then they organized an exhibition for seniors (SENIORS IN OUR HEARTS). School environment supports the following programs: when children teach PC skills INTERGENERATIONAL ITC SKILLS and INTERNET CONNECTS GENERATIONS. Both are international and supported by EU. We like program in high school of gastronomy INTERGENERATIONAL CLUB OF GASTRONOMY HIGH SCHOOL: students provide services as café, senior travel agency and senior academy exclusively for older adults.

And finally the third intergenerational program model where older adult and young share activities. One of the most interesting is program SENIORS FOR JUNIORS, JUNIORS FOR SENIORS. First, seniors taught children of traditional dances. Then the children taught of Roma dances. Also, another program was artistically oriented. In the program THINK BING young and older adults have painted the wall as a symbol of connection and solidarity. The National Library has organized a program TOGETHER – TOGETHER WITH SENIORS AND CHILDREN IN THE LIBRARY. The conference was output of this program. The organisation Chaloupky o.p.s. realises just two projects under one program NATURE BRIDGE BETWEEN GENERATIONS. Within the same project, the organization held a conference on the establishment of gardens and intergenerational learning, sense of stimulation of seniors. Chaloupky o.p.s organizes two-days or one-week trips for school children. These are the ecological and scientific topics (seniors are there as teachers) trips. For a long time was prepared implementation of programs GRANDMA, GRANDPA, TELL. Initially children sent pictures related to aging. One day took place an event where children and seniors met together. Seniors teach children traditional arts and children show seniors contemporary art. Program INTERGENERATION RECIPE BOOK – RECIPE FOR A LIFE. School children visit seniors and they tell them different stories. The result of this program is a recipe, which includes these stories. The Czech Republic has involved into program LITERARY AWARD CHRONOS. Seniors are visited by children in their homes. These seniors read specially selected books about lifelong journey. The art gallery GASK is very creative in organization of intergenerational program. For example one exhibition was implemented directly in a residential home for seniors (showed pictures were painted in senior's birth years). Children went to see this exhibition.

Very special is a program called INTERGENEACTION, which is international. Professionals learned about intergenerational practice especially in the educational area. Questionable is the inclusion of the program

implemented of CEZ company. Yet mention it because it helps intergenerational practice. The program called WE FULFILL A DESIRE, WE THINK OF OTHERS.

It should be noted that the above classification may be misleading. Both generations are always influenced by intergenerational program.

Intergenerational program is described as being implemented in a wide variety of settings schools, universities, the community, youth organisations and industries are just some examples (Hatton-Yeo, Ohsako, 2000). Programs in the Czech Republic are separate from one another with limited opportunity for collaboration. Most of the programs are locally organised with support by one of the existing local organisation. In relation to the types of organisation organising these intergenerational programs, 7 are public and 24 are private. The 1 program uses of public private partnership. One program has not been identified. Government partnership, cooperation or benefits is very minimal.

Another characteristic about which information is available is level of implementation. Most programs are local/community's (24). Programs that are national (5) and transnational / international (4) is almost identically.

In terms of time scale and duration, most of the intergenerational programs were (are) one-off endeavours. Programs are occurring on an annual basis. Only few programs are continuously on-going (especially voluntary programs). It is questionable if this programs lead to other development in the terms of intergenerational activity.

Intergenerational Programs in the Czech Republic are not evaluated. Therefore it is not possible to assess their effectiveness and accessibility at this current time.

## 5. Conclusion

This paper offers an overview of intergenerational programmes implemented in the Czech Republic, but makes no claim about being comprehensive. This research is as an initial attempt to assess intergenerational programmes in the Czech Republic. In time, as awareness of intergenerational practice in the Czech Republic spread, it might be possible to provide a more comprehensive overview.

An interesting fact is that the identified intergenerational programmes in the Czech Republic are inextricably bound up with the European policy. Programs that are marked as intergenerational and satisfy the definitional criteria were set up at the time of the European Year of Volunteering 2011 and the European Year of Active Ageing and Solidarity between Generations 2012. At this time Czech government is becoming interested in its implications for policy. Politicians have been starting to discuss possibilities that reflect this developing interest. There will be necessary to establish a common understanding of intergenerational programs and intergenerational dialogue as so.

We hope that this paper will contribute to rising of interest about this topic. We expect that this contribution will complement the existing overview and knowledge of intergenerational programs.

4<sup>th</sup> International Conference on New Horizons in Education

# Internationalization and Quality Control of Education in TEI of Athens. Evaluation of the Erasmus Programme.

Panagiota Pappa<sup>a\*</sup>, Konstantinos Sflomos<sup>b</sup>, Georgios Panagiaris<sup>c</sup>

<sup>a</sup> External Associate- —Quality Control Expert, Technological Educational Institute of Athens Athens, Greece

<sup>b</sup> Professor/ Institutional Coordinator of LLP/LdV, Technological Educational Institute of Athens, Athens, Greece

<sup>c</sup> Professor/ Institutional Coordinator of LLP/Erasmus, Technological Educational Institute of Athens, Athens, Greece

## Abstract

*The international student appeared the last decades in the educational vocabulary in order to reveal a new aspect of Higher Education, that of internationalization. Towards this direction, mobility programmes such as Erasmus have a significant impact and revealed the desire of European students and the intention of HE Institutions to become international, as far as curriculum and studies are concerned. TEI of Athens has also endorsed this new profile and adapted in its academic life. The results of a self assessment process are witnessing this initiative and support the existence of the student “universalis”.*

Keywords: Internationalization of HE, Quality, Self Assessment

## 1. INTRODUCTION

Higher Education has become increasingly international during the last decades as more and more students choose to spend a period of their studies abroad or to enrol in foreign educational programmes and institutions in their home country. Traditional study programmes has been partly replaced by these alternatives, which substituted them for an important period of time. The notion of the international student has appeared in the educational field in order to define the embryonic shape of the new species of global citizens.

This phenomenon of cross-border education is the result of several driving forces from different perspectives. Amongst them, a strong desire to promote mutual educational, cultural and linguistic understanding, the move of skilled workers in the current globalised financial environment, the need of HE Institutions to generate additional revenues by setting up annexes in foreign countries and the importance to build a more educated work force that will reinforce national economies have been significant factors.

Apart from some social-cultural perspectives and economic reasons that are directly linked with the promotion of internationalisation of Higher Education, the development of European Higher Education Area and the Bologna process have an important impact towards this direction. They created the demand for degrees to be internationally recognised, they promoted the interchange of skills, the training and educational experience through the interconnection of education and market, the student preparedness and the internationalization of the student's curriculum. The Institutions themselves have turned towards this trend and gave high importance at

\* Corresponding author. Tel.: +306946568444

E-mail address: panagiota\_pappa@hotmail.com

their international character, aiming at enhancing their international profile, strengthening the research and knowledge production and diversifying their faculties and staff.

Over the years the internationalization of education has been transformed from reactive into proactive and its content has evolved dramatically. The increased competition amongst Higher Education Institutions has challenged the existing forms of educational cooperation and has become an indicator for quality in higher education.

## 2. RESEARCH METHODOLOGY AND RESULTS

Quality is not just for manufacturers. The internationalization of higher education seems closely related to improving educational quality. It is unquestionable that quality is an elusive and complex concept, difficult to measure but mostly noticed by its absence. Although the Maastricht Treaty provided the basis for action in the European educational field, the notion of quality in the education has mostly gain significance in the Bologna process. "In the decade up to 2020 European higher education has a vital contribution to make in realising a Europe of knowledge that is highly creative and innovative ... Europe can only succeed in this endeavour if it maximises the talents and capacities of all its citizens and fully engages in lifelong learning as well as in widening participation in higher education." (Ministers responsible for Higher Education in the countries participating in the Bologna Process, Leuven/Louvain-la-Neuve Communiqué, April 2009). In the Higher Education sector, the word of quality exceeds the traditional idea of excellence or outstanding performance. The most commonly now accepted is "fitness for purpose". This interpretation allows Institutions to define their purpose in their mission and objectives and leads to educational differentiation. Their policies, attitudes, actions and procedures necessary to ensure the quality set are predefined and constantly checked. The quality attributes in each Institution should be defined and closely stated.

According the comprehensive approach derived from West, Noden and Gosling (2000)'s viewpoint of quality in higher education, the framework called "the Input-Process-Output (IPO) framework" (in which 'Input' refers to the entry requirements, 'Process' refers to the teaching and learning process, and 'Output' refers to the employability and academic standings) may be used in accordance with the institution's operation system of converting the inputs (e.g. Selection of Students, Entry requirements) into outputs (e.g. Placement, Academic performance, international curriculum) via the process (e.g. teaching and learning, exchange of students, bilateral agreements, European knowledgeability, learning mobility). In this way, the quality improvements could be associated with the operating system of any organization, including those from the education sector. This framework may also be used for assessing the international quality strategy of the Institution in a simple basis.

If a critical and reflexive analysis is applied to evaluate the international dimension of an Institution, this should be made mostly through benchmarking (comparison made with other institutions abroad or at home) and secondly through a self-assessment process guided by the Institution itself. Of course, the latter is a useful tool of evaluation, which may reveal the weaknesses and the strengths of the strategy followed, but it requires time, commitment and the right preparation steps to be taken in advance.

The notion of internationalization in the educational sector focuses mainly on Europe, as this continent has been a magnet for students' educational mobility. In national and institutional approach, mobility - either as part of the home degree or for a full degree abroad - has been dominant. The European countries are topping the list in this regard, via Erasmus programme (under Lifelong Learning Programme), which "fosters internationalization at Europe" since its launch in 1987. In the Communiqué of the Conference of European Ministers Responsible for Higher Education, Leuven (28-29 April 2009, point 18) on the Bologna Process, there

is an ongoing strong emphasis on the importance of mobility: “in 2020, at least 20% of those graduating in the European Higher Education Area should have had a study or training abroad”. Nowadays around 90% of European Universities in 31 countries are taking part in it, helping students to go abroad for studies and company placements. Learning mobility is the primary goal of the programme, ensuring that young people in Europe develop the skills and competences they need for today’s rapidly evolving market. The Erasmus Programme proved to be a significant tool for a student in order to gain vital assets (new skills, wider perspectives, European experience) through studying or training in Europe whose future will depend on them as future working force. It caters not only for students, but also for professors interested in teaching in another country, as well as university staff who appreciate the benefits of being trained abroad. Exchanges have beneficial effects, both for the beneficiaries and for the home and host institutions. Through the years mobility via Erasmus became the most useful element of internationalisation, aiming at preparing the students (being national or foreign) for their future career and life in a constantly changing social and financial environment. Thus, mobility is no longer an objective in itself but one of the intermediates to attain the future individual and professional preparation. The international is linked with the multicultural flexibility and efficiency. Mobility is a prerequisite so as to get an international and intercultural experience, a new characteristic that will differentiate the individual, an added value to his/her curriculum putting emphasis in quality.

TEI of Athens joined the Erasmus programme in 1987. During this period, internationalization, and especially actions related to the Erasmus programme, are and will remain an important part of its strategy. Its mission in the field of international student exchange is summarised in allowing its students to compete on the international market, respond to the requirements of globalization and facilitate the creation of a platform of ideas and experiences exchange. Moreover, priority is given to the development of modern educational studies in accordance with European market requirements. As TEI of Athens is placed in the first rank amongst Greek Technological Institutes as far as student and human power are concerned, high importance is attributed to educational cooperation through the establishment of bilateral agreements, which allow mobility and ensure the intereducational dialogue. The existence of more than 300 agreements and the every year increased number of placements in European companies are sufficient evidence for the Institute’s desire to enhance internationalization.

Being Institute of Technological direction, TEI of Athens has a special international focus which is depicted in its mission adopted and is defined according the challenges of the international market. It has been realised that the need to understand how other young people live and work beyond the limited borders of the Institute and to coexist and compete with them requires the existence of an international dimension in a student’s academic experience. Internationalizing each student remains the primal key, the educational goal that may be accomplished only through internationalised curricula and faculty, through study abroad programmes and student exchanges. That goal was attained via Erasmus Programme. The Institute has undertaken a comprehensive strategic process for its international education, which is included in its overall strategic thinking. All decisions are made in that context. The current strategy includes increased participations in recognised exhibitions and for a, increased level of communication, direct contacts and promotion of relationship with similar Institutions, “word of mouth”, encouraging Institute’s exchange programmes with other institutions, arrange agreements with foreign HE Institutions, encouraging the idea of studying abroad, updating publications and web page information to make information easily accessible world-wide.

However, Erasmus in TEI of Athens has been revealed not only beneficial. Linguistic obstacles, the barrier of understanding and been understood in a foreign country, the recognition of the study/training period, the learning outcomes are some of the common difficulties that should be faced. Through the years, some of them have been discussed and partly resolved. As the Programme evolves, the appearance of problems is evident, due to the significant demand that has been noticed.

A self assessment process of internationalisation with respect to students has been especially revealing for the Erasmus impact in TEI of Athens. The evaluation of anonymous questionnaires structured in adequate way to be suitable for statistical elaboration and answered by students of the Institute who participated in Erasmus Programme from 2004-2009 (Panagiaris G. et al., 2009) has shown that the results verify the general findings of the evaluation of the students' mobility under the LLP /Erasmus programme in European level (M.S.Otero and A. McCoshan -2006) and support them at a great extent. More specifically, the proportion between male and female students who participated in the Programme during the aforementioned period was 3:1. In addition, the proportion of the students who participated in the mobility programme for studies against those who moved under the framework of work placement was again 3:1.

In the question: "Were you satisfied with the support/information/advice offered by the sending institution during your stay abroad?" there has been a graduation of answers from 1 to 5, where 1 stands for "very satisfied" and 5 for "completely dissatisfied". The difference in scale of students' satisfaction, regarding the support offered by TEI of Athens was focused on the following areas:

- Academic matters concerning their stay abroad
- Administrative matters concerning their stay abroad
- Information about the host institution and the country
- Accommodation matters
- Language preparation

Based on this statistical elaboration regarding the aforementioned question, the language preparation proved to be the main problem of the support we offer to our students (38% of completely dissatisfied students), while there is an important number of students who feel that they have not received the expected help in matters of accommodation. Regarding the aforementioned question, if we group the very satisfied students with the less satisfied ones, as well as the very dissatisfied students with the less dissatisfied ones, and we create three answering groups, the findings mentioned become more obvious:

- 51% of the students feel dissatisfied with the language preparation that we have offered them against a 34% of students who feel satisfied, and
- in matters of accommodation, 45% of the students feel dissatisfied with the support they have received by our Institution against a 42% who feel satisfied.

In the question: "Concerning the following areas, did you face any problems during your stay abroad?" in a scale of 1 to 5, 1 stands for "at a great extent" and 5 for "not at all".

The problems our students had to face were as follows:

- Credit Transfer and Accumulation (ECTS)
- Attending lectures in the foreign language
- Differences in the teaching methodology used
- Teaching staff availability
- Communication difficulties
- Administrative matters

From the statistical elaboration of the responders' answers it is obvious that our students do not face significant problems during their stay abroad, despite a certain deficiency in language preparation!

In the question: "Was the European Credit Transfer and Accumulation System applied to the study programme of the host Institution?" with the following preselected answers given:

- Yes, partially
- Yes, totally
- No

The most significant result is that an increased percentage (22,5%) of students does not answer at all.

Instead, from the answers given, the overwhelming majority (99%) answers that the ECTS was applied totally or partially at the host Institution. (Table 1)

<b>Table 1</b>			
ECTS in host Institution	Sample size	%	%
<b>Yes, partially</b>	55	28,21%	36,42%
<b>Yes, totally</b>	94	48,21%	62,25%
<b>No</b>	2	1,03%	1,32%
N/A	44	22,56%	
<b>Total</b>	195	100,00%	100,00%

Relating to the previous question, the preselected answers given to the following question "Were lessons, which you attended with a successful result, acknowledged by your Institution?" are:

- Yes
- No
- Partially

The percentage of the responders, who do not answer at all, is even more significant (36%), and this shows that the previous findings are not random. (Table 2)

<b>Table 2</b>			
Acknowledged lessons	Sample size	%	%
<b>Yes</b>	82	42,05%	65,60%
<b>No</b>	25	12,82%	20,00%
<b>Partially</b>	18	9,23%	14,40%
N/A	70	35,90%	
<b>Total</b>	195	100,00%	100,00%

It seems that a great number of students is not familiarized with and/or informed about the ECTS system.

Maybe of course, the most astounding finding of all, results from the students' replies in the question: "Has your stay abroad prolonged the total duration of your studies?", at which 1 out of 2 students answered that their stay abroad did indeed result in the prolongation of their studies! This factor in particular seems to be statistically independent from all the rest factors.

The results of the evaluation could be summarised in the following:

- The percentage of female students of TEI of Athens participating in the mobility programme is one of the highest in Europe (75%). The average ratio in Europe is 60% for female students against 40% for male students.

- The high percentage of students of TEI of Athens, who feel disappointed regarding the language preparation offered, reflects the programme's high demands for competences in foreign languages.

Based on the aforementioned report it is ascertained that "ERASMUS students are highly competent in foreign languages. As would be expected, the vast majority of them speak at least two languages (97%), three quarters (75%) had some competence in at least three languages and around a third (31%) in four languages."

- A great number of the students of TEI of Athens who participated in the LLP/Erasmus mobility programme would like to have received more information on accommodation matters. This is logical since it is true that "ERASMUS students have to make an important investment in terms of accommodation", according to the aforementioned report.

- The vast majority of the students who participated in the programme finally attended classes at the host institutions without problems.

- A high percentage of students of TEI of Athens have not understood/been informed of the use of the ECTS system at the home institution as well as at the host institution abroad.

- "Just over a quarter of ERASMUS students who replied to the survey, in European level, reported that their degree would take longer to complete, given their ERASMUS period abroad, due to time being added to their degree, problems adapting to the new system, problems of recognition or other factors". The relevant percentage amongst students of TEI of Athens is over 50%.

Based on this Executive Summary, TEI of Athens should prioritize support and materialization of the following categories of recommendations:

#### 1. Recommendations and innovations on the level of national authorities and agencies

##### 1.1. Support a uniform implementation of ECTS and the Diploma Supplement in higher education institutions.

##### 1.2. Stimulate language education in secondary education.

#### 2. Recommendations and innovations on the institutional level – Central management:

##### 2.1. Be active in creating a good service infrastructure for student mobility (such as public relations, international offices, professional internationalization staff) and in providing student accommodation (e.g. use of online booking systems through which mobile students can arrange their accommodation in advance) and other services.

##### 2.2. Provide more language training opportunities for mobile students and staff.

E-Cultural and Linguistic Guides that have been produced by our Institute, is one of our initiatives under this concept.

### 3. Recommendations and innovations on the institutional level – Academic departments

3.1. Give positive and objective information about student mobility and promote it as a part of the study programmes at an early stage.

3.2. Use mobile student's feedback (e.g. use Erasmus Ambassadors) to inspire potential new mobile students, e.g. through seminars and information fairs.

3.3. Increase the awareness of centralized actions amongst Erasmus coordinators.

3.4. Try to remove mobility barriers in areas such as recognition, language training and differences in the academic calendars.

3.5. Reduce the internal bureaucracy around student mobility and do not add unnecessary complementary information request to EU forms.

Furthermore, we should take into consideration on a central European level that:

1. the existence of a risk of setting mobility barriers to students who originate from countries of less spoken languages is eminent, and therefore initiatives should be taken for combating this risk,

2. it is important to investigate and to encounter the reasons for which Erasmus students tend to elongate their studies,

3. it is obvious that the solution to the aforementioned demands of an increased investment to human capital on behalf of the Institutions, as well as of a general increase to the programme's functional expenses.

Unfortunately, it has been evident for more than 10 years now that the ERASMUS programme is sub-financed (An. Barbian and Ul. Teichler, 1998). Delegating the responsibility for finding a solution to the problem mainly to the National Authorities and Agencies and secondly to the Higher Education Institutions with the recommendation to look for supplementary sources of financing (The Impact of ERASMUS on European Higher Education: Quality, Openness and Internationalization, Dec. 2008) is uncertain to bring the desired result.

Apart from the student part, the self assessment of TEI of Athens has shown that its International Office, although possess limited human and financial resources, has a high level of service. A steady improvement has been seen, and although there is still room for growth, the office is clearly moving in the right direction. Some points are of particular concern from the point of view of services to international students, such as the orientation procedures which allow international and domestic students to get to know one another before the start of classes (this is made with the aid of ESN of TEI of Athens), the academic advising before classes begin, the Greek Language courses, the Library subscription and the Food service. It is recommended that further recognition should be given to student participation and study abroad scholarship opportunities should be developed.

If we may use a SWOT Analysis in order to identify the success factors for a quality development of students mobility for placement in TEI of Athens and thus internationalization, the results are revealing (Sflomos K., et al. (2009) :

#### A. Strengths

- Strong European Environment
- Development of a reliable Network (home-abroad)
- Academic recognition of the practical training/period of study
- Extra support (residence, food etc.) from host enterprises
- Implementation of quality management philosophy and systems

#### B. Weaknesses

- Different structures established in each country (different bureaucracy in enterprises not only in the same country)
- Lack of sufficient financial support (avoid expensive cities)
- Coordinators not willing to provide continuous support to the students, in some Institutions (Departments)
- Deficiencies on surveillance on SMEs
- Insufficient language communication in very small Enterprises, in some EU countries

#### C. Opportunities

- European dimension / added value on studies. Knowledge of the European Labor Market
- Cross-country collaboration between Industry and University (research projects, technology transfer )
- “fermentation” of new projects (transfer of technology and expertise *via* beneficiaries)
- Improvement of language and cultural competencies
- Job opportunities in EU countries (potential employees)

#### D. Threats

- Economic barriers in living in expensive cities/countries
- Lack of interest of the training subject
- Poor communication outside the Company
- “Home – sickness”, sensitive students
- Not a very friendly environment in the host Enterprise
- Insufficient knowledge of the foreign language and the culture of the country (for a qualitative “reception-acceptance” of the trainee)

## E. Critical Success Factors

- Human resources (academics, administrators) committed to support students and inspired with the LdV philosophy
- Win-win situation for all three: students – Institutions – companies
- Clear understanding of mission
- Flexible administration at four levels (National Agency, Coordinating Institution, Sending Institution, Host Enterprises)
- Flexible and adaptable structures (office, telephone, internet, fax, PC and relevant facilities)
- Exciting subject of practical training
- Close supervision and on-going evaluation
- Development of a reliable NETWORK

## 3. CONCLUSIONS

TEI of Athens has established a comprehensive strategy for internationalisation and stated a clear mission to internationalise its students. While major development has been made during this time, significant challenges remain. These include the integration of the “international” students more into the TEI’s community, the improvement and better promotion of the international curriculum so that students will possess the appropriate knowledge for successful business careers in the 21st century and the introduction of new initiatives in the area of educational exchange. Further steps should be taken in European level, such as coordination and networking in mobility issues, harmonization of award criteria of ECTS, reinforcement of the countries with less spoken languages. National strategies are proved insufficient to deal with these points. Only if they are centrally dealt, internationalization could be better attained. Only then the notion of student “universalis” could be established.

## Abstract

The new 21st century with its global trends opened the arena for International Accreditation for business schools in the countries of CIS. The impetus for change in business education of CIS is coming from Kazakhstan that represents a benchmark for the business education in Central Asian region. The paper explores a transformation, experience and institutional change as a result of various international accreditations. It begins by examining the perception about the international accreditation of 12 B-schools of Kazakhstan where 6 schools already made their first steps towards applying for various types of external international accreditation. The second part of this paper is a case study of a leading B-school in Central Asia with its ambitious role to become a world class university and its strategy in approaching the world leading accreditations coming from AACSB, EFMD and AMBA. The scope and purpose of the change process, transformation of all business schools with its specifics in Kazakhstan, the strategy and a unique experience of a leading school on its path towards accreditation are shown based on the interviews with top-managers, questionnaire and reports for the period of 2011-2013.

*Keywords:* International accreditation; Institutional Change; Business schools; AACSB; EQUIS; CIS; Kazakhstan

---

## Introduction

The new emerging practices in various international accreditation schemes are growing globally. Academia is not immune to the phenomena underlying globalisation, and international business requires effective management across boundaries, within and between groups with different cultural norms and worldviews (Belevander, 2012). Accreditation is one of the recent phenomena that widely spread among the business schools (B-schools) over the last decade globally because of the association with "Quality label". However, in practice, the results based on 117 universities with international EQUIS and AACSB accreditations do not have a correlation with the implementation of a quality management system (Nigsch & Schenker-Wicki, 2013).

During the last four years, we can observe two trends according to Bisoux (2013, March-April): growth of global accreditation where number of B-schools with AACSB accreditation increased by nearly 17%; with EQUIS accreditation - by more than 15 %; and with AMBA - by 25%, and the number of schools with multiple accreditation between 2009-2012 increased by 34% (Bisoux, 2013, March-April). There are now a total of 173 B-schools worldwide with multiple accreditations, and of these, 57 are now holders of the so-called "Triple Crown," having gained accreditation from AACSB, EQUIS, and AMBA, and there are 4 schools with "Triple Crown" that hold additional seal of approval, or the quadruple-accredited schools (Nelson, 2012). This trend can

\* Corresponding author.  
Email address:

be perceived as a transformational change in business education. Definition of transformational change offered by Eckel, Hill & Green (1998) differentiates it from other types of institutional change, and it focuses on changes in institutional culture, its intentional nature, and its development over time.

Literature review presents a very broad area of practices for B-schools with accreditation in the US and Western countries, however, there are no evident research on the practices of accreditation from the transitional countries of CEE and CIS, and because this phenomena has also just started to emerge. Following the advice of Hazelkorn (2013, May), the need to assess Higher Education (HE) in terms of its quality and cross-national comparisons are inevitable by-product of globalisation that will be intensified in the future, where a certain balance should be made between new and emerging practices vs. existing strengths. It will be shown based on the case-study of one leading B-school in Kazakhstan. This paper addresses the following research questions: 1. How the decisions are made by B-schools about the international accreditation? 2. Why these particular accreditations have been chosen? 3 What are the main changes that occur as a result of accreditation?

In order to see how a change is occurring in terms of emerging practices of accreditation, we make a survey of business schools in 2011 from CIS region. First, the survey was implemented examining the practice of 15 business schools in accreditation and their perception about the international accreditation. The final sample of 12 B-schools of Kazakhstan shows that 6 schools (50% of our sample) already made their first steps towards applying for the various types of external international accreditation. The second part of this paper is a case study of the leading B-school in Kazakhstan that was chosen from our sample group. The motivation to select this school was based on the following reasons: 1. The B-school is an excellent example of successful schools in CA. 2. It was set up under the umbrella of University that launched its first western MBA programmes from 1992. 3. During the last 2 years it has already undertaken various international accreditation practices within the last 2 years and gained international accreditation. 4. It has an ambitious goal to be among the top-50 leading B-schools. 5. The analysis of its ambitious role to become a world class university based on its strengths and its strategy in approaching the world leading accreditations coming from AACSB, EFMD and AMBA represents a unique example for other B-schools not only in CIS, but also in other markets.

## **1. Transformation and change as a result of international accreditation**

According to the literature (Elliott, 2010; Heriot, Austin & Franklin, 2009; Kondakci & Van den Broeck, 2009; Lejeune & Vas, 2009; Onzoño & Carmona, 2012; Pomey et al., 2010; Romero, 2008; Zammuto, 2008, Nelson, 2011) the main changes affected by accreditation process are the following: review of the B-school's mission and strategy; increased focus on research and quality; gained reputation and leverage for change; creation of leadership for quality improvement initiatives; internationalisation of faculty members; attraction of international students to schools in destination countries; comparisons of learning outcomes and performance measures; an introduction of systematic process in curriculum management; improvement of the connections with business community and stakeholders; an introduction of continuous quality improvement programs; the acquisition of more resources; a better image and an increase in community interactions; legitimacy and improvement of the survival prospects; the changed structure and processes of B-schools, the ability to benchmark and network with their peers, marketing advantages. Do all these changes represent a transformation for the B-schools where the practices of international accreditations are less expected? We will look at the experience of one of the CIS countries where the practices of accreditation has recently emerged.

### *1.1. Business schools from CIS including Central Asia (CA): overview*

The system of higher education (HE) in Russia and many other CIS countries went through the process of considerable change over the last ten years. The higher education in the region has been going through a period of transition rather than of transformation (Scott, 2007).

Basically, there were the following observed changes in HE in terms of structure, content, autonomy, funding (according to <http://www.hse.ru/en/rus-ed.html>). First, compared to the previously centralised system, its structure was decentralised. Second, planning goals were reoriented towards the needs of the market, society, individuals. Third, autonomy of HE institutions was introduced with a private education. Fourth, diversification of financial sources took place instead of the only state funding. Fifth, content changed with the increased humanitarian component in the curriculum. Sixth, internationalisation of HE became a great challenge for CIS universities. Finally, different accreditation schemes started arising in CIS as a result of global trends.

### *1.2. Participation of B-schools from Kazakhstan in accreditation and comparisons with other CIS countries*

According to the official source, there are 9 B-schools in Kazakhstan that are located in the ex-capital of RK, Almaty (<http://www.bizlife.kz/article/show/id/104>). However, four more regions were included in this survey to expand its scope to 15 B-schools, and finally, 12 B-schools from 3 regions were selected with private, public and mixed types of ownership. The availability of Faculty of Economics or Management in Universities have been considered here as a B-school. One of the peculiarities is that there is no official definition of B-school, and it is used only in few cases (of B-schools like BCB, UIB, IAB) despite various business and MBA programmes launched in 1992. There are some more peculiarities in the business education of Kazakhstan listed below:

- Private business education is generally perceived as the best one in the private schools
- Majorities of B-schools are private, and they are mainly located in the ex-capital of Almaty
- Government still play the leading role for the HEIs including B-schools in regulating their environment
- There is a specific feature connected with the “Special status” of University which plays the key role under applying for the world top international accreditation (coming from AACSB and EQUIS)
- Internationalisation factor in business education is the weakest one in the CIS compared to CEE countries
- About 50% of private business schools started participating in different external accreditation schemes
- Kazakhstan is the only country in CA that is the member of the Bologna system (from 2010), and Russia is the first country that entered the Bologna process in 2003
- Kazakhstan is a second leading country after Russia in business education and represents a benchmark for CA
- There are some B-schools in Kazakhstan that have already been awarded with institutional accreditation (in 2010), as well as with the various international programmes’ accreditation

From the Table 1, we can observe that Russia is a leader in CIS in terms of different institutions that offer business degrees, and its membership in all leading top accrediting bodies: AACSB, EFMD and AMBA. The impetus for change in business education of CIS is coming from Kazakhstan that represents a benchmark for the business education in Central Asian region with various business degrees and a membership in both AACSB and EFMD. The other CA countries are far behind this process.

Table 1. Kazakhstan B-schools in comparison with Russia and other CA countries (by February, 2013).

CIS selected countries including Central Asia	Educational institutions offering B-degrees, 2013	AACSB member by country, 2013	EFMD member by country, 2013	Schools accredited by AMBA, 2013
Russia	586	5	15	9
Kazakhstan	92	3	2	0
Kyrgyzstan	27	0	0	0
Uzbekistan	26	0	0	0
Tajikistan	13	0	0	0
Turkmenistan	5	0	0	0

The interviews for this project were conducted at 15 B-schools from 5 regions of RK, but 12 B-schools from 3 regions are included in this sample. Data collection occurred during August-September, 2011.

### 1.3. Perception of B-schools about the top-accreditation coming from AACSB, EQUIS and AMBA

Three other schools were excluded out of 15 B-schools invited to participate in this survey from 5 regions of Kazakhstan. Accreditation manager from Nazarbayev University (Astana region) mentioned that since the University and its B-school were founded in 2010, it can apply for the external international accreditation in 3 years only. The Economics department's representative from Karaganda University (Karaganda region) answered questions, but officially couldn't represent the top-management's opinion. The Dean of KBTU B-school (private one, from Almaty region) has been replaced with the new person. The new comer explained that KBTU is only at the beginning stage of considering criteria for different accreditations, and it would be difficult to assess advantages and shortcomings. Thus, in the Summary table of Table 2 there are 12 B-schools of different types and categories, but all B-schools are predominantly the private ones (column 3). Column 4 shows which accreditation each B-school applies for.

Table 2. Summary Table: Transformation of B-schools due to the external accreditations and their perception

N	Name of Business Schools in Kazakhstan	Type	in 2011	Advantage of IA			Shortcomings of IA			Reasons
1	2	3	4	5			6			7
1	BCB, Bang College of Business KIMEP	mixed*	AFBE	C1_7	C1_1	C1_5	D1_1	D1_2	D1_4	
2	UIB, University of International Business	private	AQA	C1_1	C1_3	C1_4	0	0	0	
3	IAB (accredited with IQA from CEEMAN in 2010)	private	AMBA	C1_7	C1_6	C1_5	D1_1	D1_2	D1_3	
4	IBS KazEU Ryskulov	private	ACBSP	C1_7	C1_5	C1_6	D1_1	D1_6	0	
5	Kainar University	private								E1_1
6	Turan Dep.of MBA_DBA	private								E1_1
7	Academy of RFCA	public								E1_7
8	Higher School of E&B, KazNU	private								E1_7
9	Bizmaker	private								E1_1
10	Pavlodar State University Toraigyrov	public	ASIIN	C1_7	C1_5	C1_2	D1_2	D1_3	D1_1	
11	Jetysuiskiy State University Jansugurova	public	0	C1_7	C1_4	C1_5	D1_1	D1_3	D1_6	E1_7
12	Faculty of Econ&Bus, Almaty Technological University	private	ASIIN	C1_7	C1_1	C1_2	0	0	0	

In 2011 B-schools put in their strategic plans to seek accreditation coming from business accreditation bodies like AFBE, AMBA, ACBSP accrediting bodies that previously appeared in our graph 1. Accreditations like ASIIN

(the German accreditation agency) and AQA (Austrian Agency for Quality Assurance) were mainly promoted by the Ministry of Education and Science of RK for HEIs for quality assurance purposes. The answers for Advantages (5 column) and Shortcomings (6 column) are decoded in the Table 3.

Table 3. Perception about advantages/disadvantages of International Accreditation (AACSB, EQUIS, AMBA)

Sign	Stands for: Advantages of Int. Accreditation	Sign	Stands for Shortcomings of Int. Accreditation
C1_1	Improved reputation of the school on the domestic markets	D1_1	The process of pursuing IA is very time consuming
C1_2	Improved reputation of school on the international markets	D1_2	The process requires considerable HR to be involved
C1_3	Increased value of our assets and brand	D1_3	The process requires a considerable investment
C1_4	The competition on the markets on which we offer programmes is strong and IA will distinguish our school from competitors	D1_4	Accreditation requires very high standards of IA academic research which exceed the expectations of the school's stakeholders (students, business, government)
C1_5	Having an IA is a signaling strategy for the students that the school is of high quality, thereby attracting students	D1_5	The preparation stage of IA slows down the pursuit of other goals of the school
C1_6	Having an IA is a signaling strategy for the Faculty members that the school is of high quality, attracting qualified staff	D1_6	The process requires additional investments connected to technological process and changes in organizational structure
C1_7	Pursuing an IA is a way to introduce a quality improving strategy to the school, making it a better business school	D1_7	The process is long, but the outcome is uncertain

Majority of B-schools with the beginning experience on international external accreditation, already aware of "top-three" accreditation from AACSB, EQUIS and AMBA, and perceive them in terms of advantages, first, either as "improved reputation of the school on the domestic markets" or "a quality improving strategy to school", and second, as "a signaling strategy for the students that the school is of higher quality". Reasons that B-schools do not apply for any international accreditation are placed in the column 7. Disadvantages are listed in the order of as "a very time consuming" followed by that "the process requires considerable human resources to be involved", and "a considerable investment". The reasons (column 7) why B-schools do not apply for accreditation are divided between two groups: who "are not aware of benefits of those accreditations" and who "should first get the national accreditation, then pursue international accreditation".

## 2. Case study of B-school in Kazakhsan

It is an exploratory case study of the B-school in Kazakhstan which is moving toward the top-accreditation from AACSB and EQUIS. Semi-structured interviews, Questionnaire and official reports have been used to build an emerging picture of institutional change, and its transformation from being the best B-school in Kazakhstan and in the CA region, towards direction in becoming the top-50 global schools and the unique experience with various accreditation processes to gain the leading international accreditation either from AACSB or EQUIS.

### 2.1. Internal environment

**Profile.** B-school was founded in 2003 under the umbrella of the University with the first "western type" of MBA programme in English language that was launched in 1992 and it has grown steadily since its inception. College has more than 2000 undergraduate students, 350 graduate students and 20 doctoral students. The number of graduates is 3190 at undergraduate level and over 1700 at MBA level (over 60% of the University total since 1992). This B-school is the ideal candidate to become the first education institution in the CIS to receive the first AACSB International Accreditation because (1) it is the leader in CA business education; (2) the region's rapid emergence in the global stage; (3) this partnership will promote additional educational reform by providing benchmarks for CA B-schools; (4) from the very beginning of MBA programme it was run by the faculty members coming from abroad, and internationalisation factor for Faculty members was already in place prior to

the Bologna process. B-school became a member of AACSB in 2004, and in October 2010, membership was reinstated. The 61 faculty members are a well mix of professors who are either academically qualified (AQ) on the basis of terminal degrees and research output, or professionally qualified (PQ) on the basis of professional experience, activities and certification. Becoming a world Class University was announced as the primary goal in its strategy. The SWOT analysis of B-school (Table 4) and assessment of its programmes (Table 5) in terms of quality have been prepared in order to make a progress with accreditation.

Table 4. SWOT Analysis B-school

Strength		Opportunities	
A core of committed faculty; A core of quality students	Adequate library and technology resources; Modern facilities	Classify faculty in terms of AQ/PQ or other; Reclassify those faculty members in the other category	Develop a network of PQ adjuncts; Restructure college administration; Revise curricula to increase relevance and marketability
Weaknesses		Threats	
High academic attrition rate; Many faculty degree holders who are not active scholars; Many faculty without terminal degrees who are not professionally qualified	English deficiencies for some students; Lengthy MBA program with more course work than local competitors	Changing Ministry curriculum standards; Changing standards for nostrification of foreign faculty	Competition from local and foreign institutions; Adverse economic changes, unanticipated market changes

Table 5. Quality of the programs: Pros and Cons

Pros	Cons
Design, content, deliver, assessment, evaluation	Lack of institutional autonomy from government
Policy documents	Lack of research
Internship, Leadership development programmes	Academic staff profile and concern for quality
Student services	Sub-standard criteria for entry into fast-track MBA
Internationalisation of faculty	Inappropriate structure
Financial position	Inconsistent mission and core values
	Inadequate corporate connections and little service to the community

The Peer-Review Team (PRT) of the Asian Forum on Business Education (AFBE) visited B-school at the end of August, 2011. This audit was viewed as serving three purposes for B-school: an external benchmarking exercise measured against world best practice; an insight into the criteria leading to the potential for future AACSB, EQUIS, AMBA; a practice session of the process for future leading accreditations.

## 2.2. How the decision was made about accreditations

World Ranking methodologies take into account 6 indicators to form an international ranking of universities:

Table 6. World ranking methodology and its indicators

1	Indicators	Source	%	Importance
---	------------	--------	---	------------

1	Academic reputation	Global survey	40%	1
2	Citations per faculty	Sciverse Scopus	20%	2
3	Faculty/Student ratio		20%	2
4	Employer reputation	Global survey	10%	3
5	Proportion of international students		5%	4
6	Proportion of international faculty		5%	4

Source: table is compiled based on <http://www.iu.qs.com/university-rankings/world-university-rankings/>

The AFBE Dynamic model borrows from EQUIS, AACSB and AMBA. It is envisaged that AFBE may act as an intermediate step for those institutions which may seek full international accreditation from the internationally recognised bodies such as EQUIS, AACSB and AMBA. The objective of AFBE accreditation is to accredit business-degree programmes delivered by Operational Unit (OU) within an institution. There are 10 domains based on the close interaction between OU, and the program, students, and academic staff (priority domains). The next priority is personal development, and the third one – internationalisation, research and physical resources (weighted equally). It could be easily comparable with the world ranking in Table 6.

### 2.3. Experience with International External Accreditation and Change

Interviews took place during 14th to 30th January, 2013 at BCB KIMEP with the following representatives:

- A Dean of B-school (College)
- B Associate Dean (Academic Affairs and Accreditation)
- C General Director of Executive Education Center
- D Director of Accreditation
- E Accreditation manager

The key research questions are: (1) How decisions are made by business schools about the international accreditation? 2. Why this or that accreditation was chosen in its strategy towards the top class business schools? 3 What are the main changes that occur as a result of accreditation?

- A. Openly, it is not about accreditation, it is about “world class-stands” to eventually being ranked among the top 50 business schools we have to have either AACSB or EQUIS to be considered that high. But also to get so high you have to make the improvements that satisfy the conditions. Even we at the moment cannot pursue either AACSB or EQUIS because of the special status, we are still driven to make the improvements necessary that would qualify us, because it still can improve our ranking which is our real goal. More than other 250 B-schools with AACSB accreditation - obviously it does not get you in the top-50. Accreditation is not yet a means to automatically get you there. Even if we get accredited, we will still be working on making improvements. The value of AFBE is that it is moving us towards the main directions to pursue AACSB.*
- B. It was discussed at the business school’s level. For this level we gave our input. We started our accreditation two years ago with AFBE (Asian Forum for Business Education) and FIBAA (Foundation*

for International Business Administration Accreditation). *Why the decision has been made exactly about these two Accreditation...I can say only about AFBE, why FIBAA was chosen, it is better to ask the representatives of Executive Education Center. Now we start with AQAAA (Agency for Quality Assurance and Accreditation Austria). We also have in mind AACSB, but we have some technical issues – like independence from the government having the special status, and it was rejected on this ground, but it is our ultimate goal. ...Internally we went to our validation, but externally we got the competition.*

- C.** *We set up the goal to become a world-class university. It was decided by the President of KIMEP to improve the quality of KIMEP programme (Executive Education) to apply for FIBAA and AFBE. Since 2007, it is 5 years for EMBA programme. We decided to see what needs to be done to become the world-class. AFBE was first and FIBAA became the next that is why we were well prepared for both. What need to become the world class accreditation is to revise our programmes in order to tailor the programmes to become the world class. It took us one year to gain both accreditations. We realized that it is possible. Our faculty became dedicated for this task, and our students, our alumni, industry experts whom we usually to communicate to. Now we understand that we are committed. Both accreditation agencies are about how to improve our programme, and the next step is to implement these recommendation and revision that have to be done within 5 years.*
- D.** *I am the Director of Accreditation from the spring semester of the last year. I have to prepare all documents for accreditation by different agencies, including the national accreditation. I also have to go for ongoing process. Now we are on the 3rd stage of accreditation – we expect the PRT (Peer Review Team) in May. We have to be sure that all recommendations are met. The decision about AFBE was made at the top management. For AQA we were preparing our self-study report. AQA then had been restructured, and because our work have been preliminary done, we are trying to work with AQAAA. Initially – I think it is a competition, improvement of our business itself up to the international standards, quality assurance processes, and improving the image in the eyes of the Ministry.*

The second research question: Why this accreditation was chosen and how it is compiled with the main strategy towards the top class business schools? Advantages and disadvantages of the chosen accreditation?

- A.** *Advantages of AFBE – it really forces the school to rethink what it does, to be honest where we are weak and how to make an improvements. Disadvantages – it does create some disharmony that people do not want change. It is definitely a time consuming process: preparing documents... but it is an investment to improve our reputation. We are one of the best school in the region with AFBE accreditation. It gives you a signal on legitimacy, but it forces you to improve the quality. ...It was just our internal environment decision, to be the best B-school in Kazakhstan, then in Central Asia, and then – go globally. Business accreditation is just considered as a standard behavior, and then we will be in the world ranking. ...We have to put more emphasis on critical thinking, - there is no book that tells you step by step how to make a step by step process, to be able to look at this. One thing is that employers like about the graduates that they can do unplanned events better than other students. What we have to do is to comply with the Ministry's requirements. We are trying to explain it to the accreditation agencies. You should not write thesis for MBA in the US. Why you have MBA students to write the thesis? But we have a Ministry that say that they should write.*
- B.** *AFBE was chosen as “a stepping storm” towards greater accreditation – which would be AACSB or EQUIS. Obviously, we are in Asia, and first, we should get we have to get recognition at the level being legitimate at this level, and then to go for international level. Also AFBE has an explicit or implicit agreement with us – it is their norm that they prepare you for EQUIS or AACSB. AQAAA That was the natural thing for us – we go for smt. Intermediate, and then we have a preparation. AFBE was listed by the Ministry of Education. AQA was chosen because it was listed in the Ministry of Education, since we*

*live in RK, we should manage to comply with this requirement. In terms of advantages, obviously, the pros are that you formalize your quality, your reputation increase. Cons: it may limit innovation and diversity of thinking; to standardise, to rigid processes, it may be homogeneous.*

- C. *The President was recommended to start with these accreditations to prepare us for institutional accreditation, and that is why we decided to start from both accreditations in order to later get the institutional one. AFBE – because it is Asian and we are the part of Asia. We were very well prepared for FIBAA, because it was very clear. The reason for FIBAA, because it is a European accreditation, and we want to achieve mobility of our students in Europe. FIBAA is a high-level agency which is recognised by the European Universities Association. FIBAA's intention is to enter Kazakhstan. The goal for us was not only to gain and receive accreditation, but also understand accreditation process, and understand our deficiencies. We apply for consultancies, and we were able to revise. They applied for the Ministry for recognition, and we hope that it will be recognised by our Ministry. Through the consultancy process we also understood that we can do it. The other reason is that we have to be consistent with the Government policy. Whether we were eligible, and yes, we see that it is possible. Before we were not sure how well our programme is recognised in Europe. One of the reasons is to be consistent in our reasons' policy. FIBAA's requirements would be a bit more comprehensive; - while FIBAA would recognize EMBA to be different from other programme, AFBE would be probably more looking for more unified philosophy. In terms of disadvantages, you need to dedicate a lot of time, it is a time consuming, and a lot of paper work, while they call for flexibility, - we have to satisfy our executives' requirements. It looks sometimes as an obstacle – the recommendation to have a higher requirements, - both of them require entrance exams and strong criteria. I do not how it will influence. We did have an entrance criteria, but not exams for EMBA. The Executives that come to our programme do not want to be examined. ...It depends how you measure quality, because it is multidimensional model: future of employment, government, - when they all come up with the quality of programme, but customer – EMBA will notice a visible change. Some part of the programme will not be so practical...Customer would expect entertainment class, and more practical issues, while it is not always so. Thesis requirements became more rigorous, but it improves quality. Now EMBA students have to write thesis, and requirements are becoming more rigorous. As for legitimacy, yes, with accreditation we got it. With FIBAA, it is also a Diploma Supplement along with a degree, which has to be registered with the Ministry of Education. I know that the Ministry has not come up with the solution yet. We will see what will happen.*

The last research question is: What are the main changes that occur as a result of accreditation?

INTE 2013

- A. *I would say that going to AQ/PQ process and increase our research input will be quite a dramatic change over the next two years. ...the strategic plan was written to confirm changes, but we didn't deviate from our plans. When you pursue international accreditation and your work on quality, some people are disrupted...Unfortunately, some people were complaining about it. ...Changes are applied for better organizational efficiency. Change in the organizational structure was a management's decision, not as a result of accreditation. Instead of having Departments, we decided to have Programmes, but then after a couple of years later, we realized - we need to find the best partners. The efficiency on academic side, and the departments' chairs make curriculum decision. If we improve the quality of programme, it then will be a curricular programme's improvements...*
- B. *There were 60 recommendations made for our school. Have been any resistance? Absolutely, nothing is automatic. We have disagreements with some of the recommendations – and we came to the reasonable compromises. We have not just accepted that we have to do it We did not just accept their recommendations. For example, they recommended 3-4 assessment by course. We said – each course is different. The course of the Math requires every day work, whereas Management – does not. We cannot achieve one scheme's course. We required some flexibilities, and AFBE was opened for that. Ministry – if you are operating in Kazakhstan, you should first have a license from the Ministry. Also there were contradictions, and each recommendations was put, and some were modified.*  
*...There are **four major** changes. If we start from quality assurance, which is the most important - going through the accreditation helped us more to be concentrated on quality. **First**, we identified our set up learning goals and objectives more explicit. We started from programme level, and then we developed it at the course level. In one sentence, the quality assurance process became more formalized, better record keeping in terms of the structure of the syllabuses in the right way which is done by the completion of the programme. I think it has been a big improvement in quality assurance. **Second**, qualification for Faculty members becoming academically and professionally qualified. AQ/PQ now is a big emphasis to maintain this status. We have to meet this goal within the next 2 years. A Faculty Development Form AQ/PQ –is how many publications they want to have, how many conferences they should participate. We have to see how much target has been achieved. Faculty Development became more focus on research or maintaining their academic status. We have formally defined what kind of research they want to have to increase our research output. Within one year our input increased substantially. As we put more emphasis on AQ/PQ, it has helped us to point us that it is becoming more and more difficult to produce more research. We hope that we can get some assistance to reduce our teaching load. Our Faculty members have to produce research, and their work load has to be reduced or to be reasonable. **Third**, when it comes to accreditation it is becoming very important to have on records of documents, being more tedious about having accreditation. We always realize that it is important to have a liaison or getting input from the industry what quality they want from our graduates. There are different constituencies – future employers, international experts, students; ...When we go through accreditation process – we see more and more importance, we are changing ourselves and we are trying to activate, we are listening more our constituencies. **Finally**, the last thing is Internationalisation – from AQAAA that focus very much on exchange programmes, dual degrees...we are going to formalize and make more emphasis on dual degree programmes, faculty exchange... We are taking initiatives more and more.*
- C. *We switched to the ECTS credits. We also put in design of the course how many hours we should dedicate, and Faculty members are required to submit the curricular beforehand. We are the administrators in EMBA Oversight Committee for academic quality. Entrance criteria – our weak criteria; and we immediately receive the thesis criteria, and we improved the quality of thesis.*

### 3. Conclusion

B-schools from Kazakhstan represent the new phenomenon in regards to the recently emerging accreditation practices. From our sample group 50% B-schools already have some experience with various international accreditations, and as a rule, they are private institutions. The accreditation managers or Deans of the 50% of B-schools's sample are aware of some advantages and shortcomings of the leading AACSB, EQUIS and AMBA accreditations, and they already have some strategies or priorities in various accreditations (not necessarily coming from those top groups). Taking into account some factors and peculiarities described and their strengths and weaknesses, B-schools are trying to achieve the stage of being accredited with various external bodies after gaining the national accreditation. Basically, we can say that this accreditation is not only the new phenomena, but it is becoming the transformational change on the regional market of business education. The leading B-school is one of the examples of the transformational change, which was selected from the survey conducted in 2011. It has a unique experience with various accreditations, and its strategy is to pursue the top ones to become the top B-schools internationally. The case study of this leading B-school demonstrates the experience with 3 international programme accreditations on its path towards the leading accreditations from AACSB and EQUIS. B-school is well placed under the umbrella of University, and it is the leading western-style academic and the first and the most successful independent institution based in Central Asia with quite remarkable history. As the regional leader in transitional economy it remains entirely unique not only within CA, but also in CIS. The decision about accreditation is made by the top-management of B-school. First of all, AFBE accreditation was selected because it is an Asian accreditation, and B-school is located in CA, the Asian region. Another serious motivation for this accreditation was that it may acts as an intermediate step or "a stepping storm" towards greater accreditations. The reason for another accreditation of FIBAA was made, because it is a European accreditation, recognised by the European Universities Association, it accredits EMBA programmes and facilitates the mobility scheme. The choice then was made for AQAAA, because it is focused on international exchange programmes and dual degree programmes. It should be noted that the government still plays its role in quality assurance processes which accreditation bodies would be preferable. Thus, in order to gain the world's leading accreditations from AACSB/EQUIS, B-school has to apply for one Asian accreditation that provide it with valuable recommendations how to achieve it, then to increase mobility and meet the Bologna's requirements– it applied for two various European accreditations, where one of them was recommended by the Ministry. Besides, there are some major changes identified as a result of accreditation, first of all in quality assurance processes, internationalisation, Faculty qualifications AQ/PQ, the connections with different constituencies and record-keeping processes, introduction of ECTS, including the level of EMBA programmes. B-school envisages much more changes regarding AQ/PQ and the research input in the nearest 2 years. There are gaps in the literature related to B-schools with international accreditations located in the regions of CEE and CIS, how the decisions made about international accreditation and what are alternative strategies in achieving top accreditation, the issues on which grounds AACSB or EQUIS decline B-schools' application forms. In the region of CIS it is connected with availability of "Special status" which is granted by the Ministries of Education. The case study demonstrates one of the first interesting examples of B-school in CIS which is moving ahead towards the leading institutional accreditations from AACSB/EQUIS and its ambition role to be in the world ranking list with the strategy that was selected for achieving these goals through applying for various international accreditation programme schemes.

## Abstract

This paper discusses an approach to teaching programming that would allow elementary school children to adopt basic problem solving concepts. Adopting those concepts should help them in their further education, not only in programming but also in other areas that require logical thinking and problem solving.

Elementary school children are too young for traditional approach to teaching programming so in this paper we describe an approach appropriate for their age designed to avoid problems associated with young children such as short attention span.

Preliminary experiment with 30 elementary school children was conducted and details and results are presented in this paper.

Keywords: Education, primary school, programming, robot, simulation, basic concepts...

---

## 1. INTRODUCTION

In the recent years, computers have become a standard part of majority of households (Seybert, 2012). This has resulted with new generation of children that are already familiar with computers at the beginning of their primary school education (Palfrey & Gasser, 2008). They possess elementary knowledge of computers and are already familiar with basic concepts. This fact allows for a different method of teaching those children, one that was not applicable to the past generations. Proper usage of computers as addition to the standard teaching methods can help enhance the learning experience for children by presenting them certain problems in a way that is appropriate for their age. Basic idea is to incorporate learning into something that children perceive as fun (Meluso, Zheng, Spires & Lester, 2012). By doing that, problems with lack of interest or misunderstanding of a problem could be easily avoided. There are many different approaches for achieving that goal (Kirriemuir & McFarlane, 2004). This paper will present a brief review of some existing applications developed mainly for this purpose, and describe one approach that was designed specifically for primary school children. Purpose of that approach is to introduce basic concepts of programming and computer science to primary school children. There are two main reasons for selecting this kind of approach. First one is because recent studies have shown that children are able to learn while playing games (Prensky, 2008), both knowingly and unknowingly. The other reason is because children at this age, according to Piaget's theory of cognitive development (Wadsworth & Gray, 2004), are entering the concrete operational state of cognitive development. Concrete operational state is the third of four stages and it is characterized by development of logical thinking and problem solving skills which

\* Corresponding author. Tel.: +38521385286.

E-mail address: goran.zaharija@pmfst.hr

corresponds with skills and abilities we are trying to develop with described approach. To test this approach in real life conditions, preliminary experimental study was conducted in one primary school. Details and observations from that study are presented in this paper, as well as possibility for further experiments and improvement of that approach.

## 2. PROBLEM STATEMENT

Learning programming is considered hard. Programming courses in universities usually have highest dropout rates and are often regarded as most difficult (Yadin, 2011). This coincides with results available at our Faculty. There is still no clear understanding why some students learn to program easily and quickly while others have certain difficulties adopting this kind of knowledge (Wiedenbeck, LaBelle & Kain, 2004). In order to counter this, we propose that learning programming would be easier if students would already be familiar with basic programming concepts and it would be best if those basic concepts were taught in early age thus allowing students enough time to develop problem solving skills and logical thinking. As mentioned before, according to Piaget's theory of cognitive development primary school children are entering the phase in which they are beginning to develop logical thinking and problem solving skills. One of the difficulties regarding that development is that children at that age haven't yet developed abstract, hypothetical thinking. Because of that, they can only solve problems associated with the real world or something they can relate to. Programming implicitly requires high level of abstraction and thus is hard to introduce to primary school children. To counter that problem, it is necessary to develop an approach to teaching that would make programming more accessible to the primary school children and would encourage the development of their logical thinking and problem solving, but at the same time would still be appropriate for their age.

## 3. STATE OF THE ART

There are already some applications available that are intended for teaching elementary programming (Robins, Rountree, & Rountree, 2003). In this chapter, short overview of some of those applications and their advantages and shortcomings will be given and they will be compared to approach proposed in this paper.

### 3.1. *RoboMind*

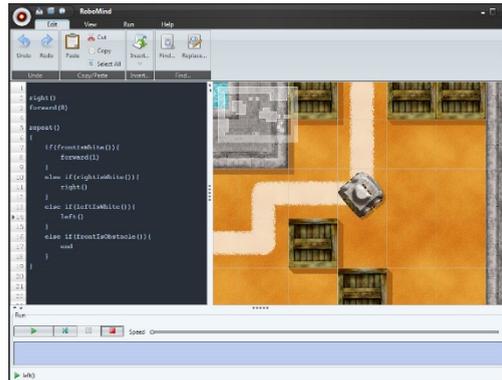

*RoboMind* is very simple educational programming language used for getting users familiar with the basics of computer science. It introduces popular programming techniques, and helps gain an insight into areas such as robotics and artificial intelligence. These skills are gained by creating programs for a robot.

The robot is capable of performing several actions. It can drive, look around, move items and paint. This can all be done in different environments that are made up of blocks.

*RoboMind* uses an imperative/procedural programming language. The language consist of a number of basic instructions to control the robot, repetition loops, conditional if-then statements, and it is also possible to define custom instructions by creating procedures. Procedures are allowed to be defined recursively.

*RoboMind* is meant to serve as a first introduction to automation and programming without prerequisites. Difficulty level can vary, depending on the intended audience. In primary education pupils can get acquainted to

Fig. 1. Example of Robomind program

writing commands to navigate the robot through its environment, on high school programming structures get more attention and universities focus on the theoretical aspects of automation theory like Turing machines.

### 3.2. NXT-G

NXT-G is a graphical programming environment that comes with the LEGO NXT Mindstorms robot, which is also used in one of our teaching phases. Programs in NXT-G are created with careful construction of blocks and wires, and can be used for real-world programming (Kelly, 2010). Each block corresponds to some sort of command regarding movement, sensors, logical operation etc. Most of those blocks have some additional parameters that can also be adjusted like the power of the motor or sensor sensitivity. NXT-G also supports complex functions like parallel threads and remote control. The language supports virtual instruments for a variety of sensors/components. Main advantage of this software is that is used in pair with an actual robot, so the users can almost instantly see their program in action.

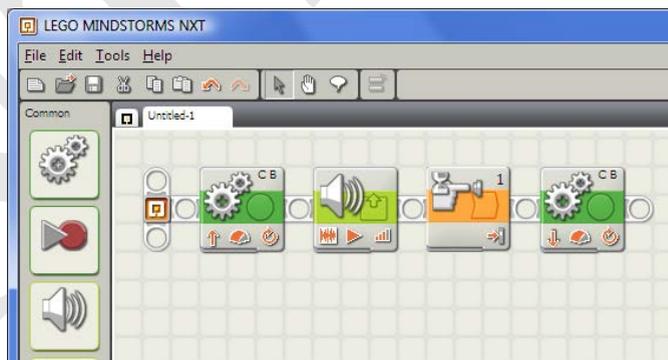

Fig. 2. Simple NXT-G program

## 4. SOLUTION

To counter problems with teaching programming described before, we are proposing an approach to that should help elementary school children in acquiring basic programming concepts. This approach consist of four different phases. Each individual phase is described in detail in following paragraphs.

As already mentioned, best results are expected if the learning process is hidden from children and instead they are presented with something that resembles some kind of a game. In our case, we decided to use the LEGO Mindstorms robot and NetLogo simulated environment to present the children with a simple problem of navigating a robot through a maze in order to find a hidden prize. This way children would be interested in a robot and simulation (presented as computer game), but they simultaneously adopt some specific knowledge and concepts.

### 4.1. First phase

First phase of our teaching process is done by conducting a verbal interview with the children. This phase corresponds with the lowest level of learning and its intended goal should be for children to familiarize themselves with some basic concepts - What is a robot? How is he controlled? Can you change his behavior and how? For best results this phase should be conducted with smaller groups of children (5-6) so that teacher can talk to each of them individually if necessary if they are not familiar with those above concepts. At the end of this phase they should be aware that they have the ability to control the robot and they are the ones that should provide him with the instructions required to solve a given problem.

### 4.2. Second phase

In second learning phase, children should be introduced with the rules of the system, what commands are made available to them and what is the goal of the game. They should comprehend that this specific problem has a set of rules and limitations, and in order to find a solution they should comply with these rules. If successful, they will transfer this knowledge to the other problems and learn that whenever presented with some problem they should first define the goal of the problem and examine all the options available for solving that specific problem.

In this phase, we decided to use “unplugged” programming (Bell, Alexander, Freeman & Grimley, 2009). We

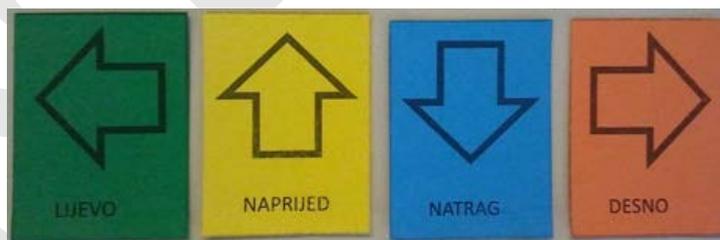

Fig. 4. Colour coded cards used in second phase.

have prepared a set of marked and color coded cards, each one representing a single command available to the robot for execution. Cards are shown in Fig.4. They are 4 basic commands available to children (up, down, left and right), each one corresponding to the movement of a robot in discrete space of a maze. Children are presented

with the multiple cards of each type and their task is, using those cards, to define a sequence of commands which, in their opinion, would lead the robot to the goal of the maze. By doing this, we are preventing them of abusing the "trial and error" method and instead encouraging them to visualize the problem and use their imagination in deriving the acceptable solution (Edwards, 2004).

This approach should demonstrate them that programming (and problem solving generally) consists of series of simpler steps that are combined into one greater program. It could also help them to notice that some steps (or a series of steps) can be repeated thus learning the definition and usage of "loops". Unlike previous phase, this phase is practical, not only theoretical as children themselves must try and produce a solution to the given problem. This is necessary because in order to learn some concepts it is not just enough to present the children with those concepts. Programming is not learned simply by knowing all the syntax and semantic rules, but it requires an active knowledge of different concepts which is achieved only by applying those concepts in specific, real world problems.

As this approach is focused on primary school children, they are not burdened with specify programming language and syntax learning. Instead, they are introduced to few simple concepts corresponding to the robot movement. These concepts should be fairly easy for them to comprehend as these are real world concepts that they already know, only applied to the robot instead of humans.

#### 4.3. Third phase

Third phase consists of displaying the robot in simulated environment using NetLogo, a multi-agent programmable modeling environment (Sklar, 2007). Robot is displayed as single agent. Simulated environment is depicted as a maze through which the robot must navigate in order to reach its goal (presented as the cake within the simulation). In addition to displaying the world, simulation includes controls for moving the agent that are corresponding to the cards used in previous phase. During this phase, children should make a logical connection between the physical (real life) robot and the agent presented in the simulated environment. This is very important as that introduces them to the basic level of abstraction.

Children should show their cards and each command should be entered into the simulation. Simulation is designed so that the each command is immediately executed but it also keeps a record of all given commands so

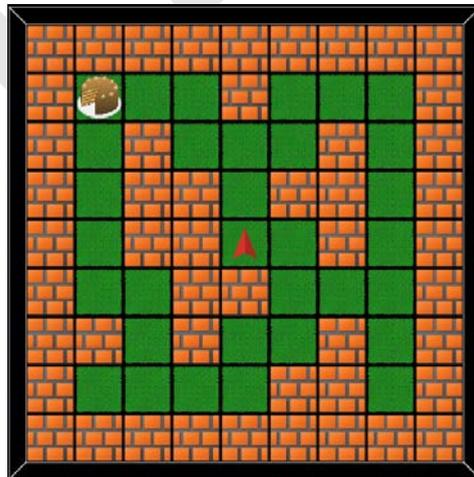

Fig. 5. Simulated world depicted within NetLogo simulated environment.

that they can later be reviewed. This enables children to see the results of each action, and also the completed set of commands i.e. their first computer program. During the input of commands into the simulation they should be allowed to make corrections to commands that haven't yet been executed if they think that is necessary. This should demonstrate them that there are often multiple ways of solving one problem and encourage them to make simple modifications to their programs as well as trying to find the best possible solution.

It should also familiarize them with concept of debugging i.e. testing the solution in controlled environment before marking it as final.

#### 4.4. Fourth phase

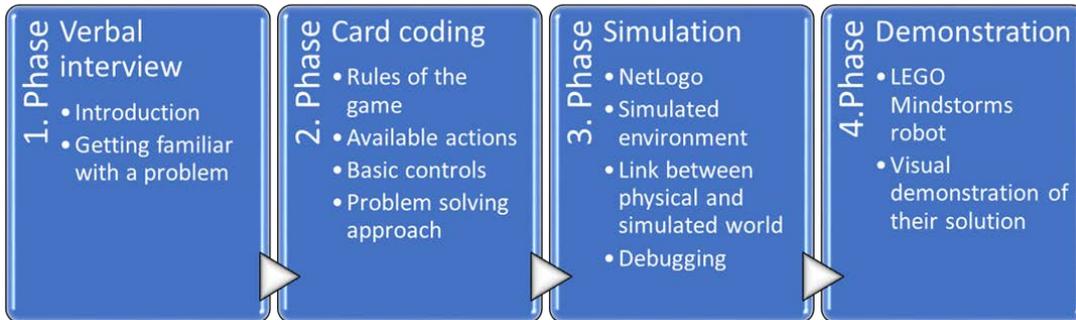

Final phase consists of executing the program developed in previous phase. NetLogo simulation keeps records of all entered commands and at the beginning of this phase those commands are sent to the physical robot for execution. As mentioned, a LEGO NXT Mindstorms robot is used and set in a maze that corresponds to the maze depicted in the NetLogo simulation. Communication between NetLogo and Mindstorms robot is done via Bluetooth, but that is not important for the teaching process alone. Goal of this phase is to further establish the link between real and simulated world, this time demonstrating to children that the actions they previously made have an impact in the real world and that their programs are put in use. This should hopefully cause immersion during programming i.e. children would be more likely to inadvertently put themselves into the role of a robot they are programming. By doing that, they would have greater insight about the capabilities and limitations of their program and that should result with better written programs.

## 5. EXPERIMENTAL STUDY

Preliminary experiment was conducted in elementary school with children from first grade. Children were divided in 6 separate groups, each group consisting of 5 children. There was no further division based on certain attributes like gender or previous knowledge. This was done because certain children were in need of individual attention and putting them in larger groups would prevent that. This also made communication with children easier.

During the experiment, children went through all 4 phases described in this paper, from verbal introduction to physical world demonstration of their program. Completion of those phases took approximately 40 minutes for each group which fits the time of one period in elementary school.

Fig. 6. Short overview of four different phases of teaching process.

Most of the children had very similar knowledge of computers. They were already familiar with basic computer concepts and have acknowledged using computers for both recreational and educational purposes. One thing we noticed is that gender does not affect their computer skills, both boys and girls were equally proficient with basic computer use. Their descriptions of the concept "robot" were very similar and fairly accurate, regarding their age.

They all described robot as metallic manlike thing that can move autonomously. All the children had clear understanding that some kind of electric power (batteries) is needed for robots normal operation. Most of them have recognized LEGO bricks as building elements of presented autonomous vehicle. They have also asked if our vehicle can transform into another shape, but they have also pointed out that we have to perform the transformation. This behavior is showing that there is a clear distinction made between cartoons and physical environment but it also shows that the expectations are big influenced by virtual worlds constructed in cartoon designer studio.

Most of them guessed that robot is controlled remotely by some sort of hand-held remote controller but they quickly grasped the concept of giving the robot a set of instructions that will be executed as soon as robot is turned on.

## 6. CONCLUSION AND FUTURE WORK

Children reacted positively to the whole teaching process and they expressed their pleasure with the whole procedure. After reviewing all the programs that children created for navigating the robot through the maze, it was noted that only one solution was incorrect. It was also very interesting to see that most of the correct solutions were also optimal solution for that particular maze, meaning that proposed solution was quickest way from start to goal (minimal number of actions). This is interesting because children were not presented with a concept of "shortest path" or "optimal solution" but they nevertheless displayed that kind of knowledge. Taking in account their age, it is more likely that they innately possess this type of knowledge, then they somehow previously learned it from their parents or surrounding. This is something that should be tested more thoroughly in future research.

As this was only preliminary research, obtained results were encouraging but for more concrete results it will be necessary to expand the research by using much larger number of children and programming concepts. That should produce more data necessary for testing the effectiveness of this approach.

# Investigation of Prep School Students' and Instructors' Preferences for Error Correction

Seçkin Can\*

*Namik Kemal University, School of Foreign Languages, 59100, Tekirdağ, Turkey*

---

## Abstract

This study investigated university prep school students' and instructors' opinions about error correction. One hundred and sixty prep school students and 18 instructors participated in the study. The results revealed that both instructors and students find error correction useful, but surprisingly students are more willing to receive error correction than instructors think. There are also big differences between students and instructors' opinions about frequency, method, timing and type of errors to be corrected.

Keywords: error, correction,

---

## 1. INTRODUCTION

To date, the role of corrective feedback in language acquisition has been a highly controversial issue. Some researchers believe that exposure to naturally occurring samples of a target language is all that learners need to develop their second language (L2), and error treatment is harmful rather than helpful. According to Krashen (1982), the teaching of grammar should be abandoned because it interferes with the natural course of L2 learning. Krashen's comprehensible input hypothesis proposes that language acquisition occurs when learners receive comprehensible input slightly more advanced ( $i+1$ ) than their current level of interlanguage development.

Although a great deal of L2 learning takes place through exposure to comprehensible input (e.g., Krashen, 1998), learners may need feedback on errors when they are not able to discover the differences between their interlanguage and the target language. In other words, form-focused instruction induces learners to pay conscious attention to forms in the input and thus aids interlanguage development.

\* Corresponding author.  
Email address:

Allwright and Bailey (1991) point out that only the learner can do the learning necessary to improve performance, regardless of how much error treatment is provided. Inevitably, most teachers have experienced the frustrations of correcting the same mistakes over and over instead of listening to a student's flawless English speaking. Teachers, however, need to be careful when providing corrective feedback because error corrections have both negative and positive effects. The positive effects of error correction can make language learning more effective since it helps L2 learners notice the gap between their utterances and the target forms, which elicits uptake or repair. This can promote changes in their interlanguage systems and lead them to the next linguistic developmental stage. Moreover, when learners understand that making mistakes is a part of the learning process, and that their teachers try to help them learn target forms, they are likely to take risks and build up confidence through practice.

This study examines teachers' and students' preferences for error correction and compares the differences between them, suggesting more effective ways of treating students' spoken errors in ESL settings.

## **2. METHODOLOGY**

### **2.1 Participants**

The participants in this study were 160 students who were taking oral skills classes in School of Foreign Languages at a State university in Turkey, and 18 EFL instructors who were teaching the oral skills classes at the same university. The student participants' proficiency levels varied from A2 to B1 according to CEF. Their English proficiency was assessed by the placement tests, which included reading, writing, grammar, and oral interview components. All student participants were adult Turkish EFL learners. 67 male and 93 female students participated in the survey and the ages of the students ranged from 17 to 20. They have been studying English more than six years on average, and most of their English education was received in their native countries, in EFL settings.

### **2.2 Instrument**

Two different questionnaires were used in this study: one is a questionnaire for students, and the other is a questionnaire for teachers. Each questionnaire has two sections. The first section includes twenty-two questions investigating teachers' and students' perceptions of the necessity of error correction and frequency of error correction, preferences for timing of error correction, types of errors that need to be corrected, types of corrective feedback, and delivering agents of error correction. The second section is designed to collect participants' demographic information, including their genders, native languages, the length of English teaching/learning, and students' proficiency levels. Therefore, the demographic section consists of four question items for students and three items for teachers.

### **2.3 Data Analysis**

The collected data were analyzed in order to answer the following question: Are there any differences between teachers' and students' perceptions of effective error correction practices?

In order to answer this question, two questionnaires were implemented, a questionnaire for teachers and a questionnaire for students. The students and teachers were asked to rate each item on a 5-point scale, from "strongly agree" to "strongly disagree." "Strongly agree" was worth 5 points, and "strongly disagree" was worth 1 point. The items were divided into six categories: necessity of error correction, frequency of error correction, timing of error correction, types of errors, methods of corrective feedback, and delivering agents of corrective feedback. The six categories marked by the participants were tallied. In scoring the questionnaire on preferences for error correction, the data were simplified by collapsing the 5-point scale used to elicit responses (strongly agree, agree, neutral, disagree, strongly disagree) into a 3-point scale (strongly agree/ agree, neutral, disagree/ strongly disagree). A t-test was performed to determine if there were statistically significant differences between students (Ss) and teachers (Ts)

## **3. RESULTS AND DISCUSSION**

### **3.1 Necessity of Error Correction**

In Question 1, the students were asked to respond to the statement, "I want to receive corrective feedback."

Teachers were asked to respond to the statement, “Students’ spoken errors should be treated.” Findings indicate that the students wanted to receive more error treatment than their teachers provided.

Ninety-four percent of the student participants and 88% of the teacher participants responded “strongly agree” or “agree” on Question 1. Interestingly, 54% of the students strongly agreed that they wanted their errors to be corrected by their teachers, whereas only 11% of the teachers strongly agreed with the statement. None of the students and teachers disagreed with the statement. The findings indicate that both the students and teachers think students’ spoken errors should be corrected, but the students believe in the necessity of corrective feedback to a much greater extent. As previous studies have shown, the students wanted their errors to be treated more than the teachers thought.

### **3.2 Frequency of Error Correction**

Question 2 asked students, “How often do you want your teacher to give corrective feedback on your spoken errors?” and teachers, “How often do you give corrective feedback on students’ spoken errors?” Responses to the question were also on a 5-point scale with “Always, Usually, Sometimes, Occasionally, or Never.” “Always” was worth 5 points, and “never” was worth 1 point. A significant discrepancy between the students and teachers was found. According to results, thirty-eight percent of the students thought that their spoken errors should be “always” corrected, whereas none of the teachers always corrected their students’ errors. Almost the same percentage of the students and teachers agreed that students’ spoken errors should be “usually” corrected, 41% and 44% respectively. There was 1% of the students who thought that their errors should “never” be corrected while no teachers thought so.

### **3.3 Timing of Error Correction**

Questions 3 to 6 are related to the appropriate time to correct students’ spoken errors. The category consists of four questions for students: (3) As soon as errors are made even if it interrupts my conversation, (4) After I finish speaking, (5) After the activities, and (6) At the end of class. For teachers, the category consists of four items: (3) As soon as errors are made even if it interrupts the student’s speaking, (4) After the student finishes speaking, (5) After the activities, and (6) At the end of class. The students and teachers were asked to rate each question with “Always, Usually, Sometimes, Occasionally, or Never.” “Always” was worth 5 points, and “never”

was worth 1 point.

Of the four choices, “after the student finishes speaking” received the highest mean from the students and teachers, 3.84 and 4.0 respectively. “As soon as errors are made” received the lowest mean from the teachers ( $M = 2.33$ ), whereas “at the end of class” received the lowest mean from the students ( $M = 2.98$ ).

Results indicate that over half of the students strongly agreed or agreed that their spoken errors should be corrected as soon as they are made even though it hinders the flow of conversation. On the contrary, only 11% of the teachers regarded correcting their students’ errors right after they made them as the appropriate time. This finding suggests that interrupting their students’ speaking in order to treat errors was not a good option for teachers. Unlike the students who were focused more on accuracy in their spoken English, the teachers regarded fluency as well as accuracy as a crucial factor for their students’ development of speaking skills. It is also obvious that there was a significant difference between the students and teachers about providing corrective feedback as soon as the students made.. The teachers considered “after the student finishes speaking” to be the most appropriate time to treat errors to a larger extent than the students. For Question 5, almost the same percentage of the students and teachers regarded “after the activities” as the appropriate time to treat students’ spoken errors. Both the teachers and students believe that correcting spoken errors after students complete the communicative activities can enhance both accuracy and fluency since this allows the students to engage in communication without interruption caused by error treatment. There were discrepancies among the students in regard to correcting errors at the end of class. Thirty-six percent of the students strongly agreed or agreed that student errors should be corrected at the end of class, whereas 41% of the students disagreed or strongly disagreed. Likewise, a discrepancy among the teachers was also found in regard to correcting students’ errors at the end of class. Thirty-eight percent of the teachers agreed that correcting student errors at the end of class was good, while almost the same percentage of the teachers (39%) disagreed.

### 3.4 Types of Errors that Need to Be Treated

The questions in the fourth category asked which types of errors should be corrected by the teachers. The category consists of five types of errors: serious spoken errors, less

serious errors, frequent errors, infrequent errors, and individual errors. The students and teachers were asked to rate each question with “Always,” “Usually,” “Sometimes,” “Occasionally,” or “Never.” “Always” was worth 5 points, and “never” was worth 1 point.

Results show that question 7, “Serious spoken errors that may cause problems in a listener’s understanding” received the highest mean from both the students and teachers. Comparing the students and teachers, the mean of the student responses in every question, except the one regarding serious errors, was higher than that of the teachers. Overall, the findings indicate that the students wanted more error correction regardless of the types of errors than teachers did.

All of the teachers responded that students’ serious spoken errors should be always or usually treated, whereas 71% of the students wanted their serious spoken errors to be treated always or usually, and 22% of the students wanted their serious spoken errors to be treated sometimes. In general, the teachers treated their students’ errors less frequently than the students expected; however, the teachers showed a strong preference for correcting serious spoken errors that may cause problems in a listener’s understanding. It is not possible for a teacher to correct all the errors made by students in a classroom setting. Taking this into consideration, it is natural for teachers to focus on the most important errors that can cause misunderstanding between the speaker and listener. This finding shows that the teachers consider that being understood by the listener is the most important factor for ESL learners to convey their thoughts and keep conversation going. By treating serious errors, the teachers can help their students decrease misunderstanding between the speaker and listener and increase the students’ awareness of using target-like forms in their speaking. Unlike the teachers, the students did not seem to take their serious errors gravely. While both the teachers and students had a similar opinion

about frequent errors, they showed a discrepancy in treating infrequent errors. Forty-two percent of the students wanted corrective feedback always or usually on their infrequent errors, but only 6% of the teachers usually provide their students with corrective feedback on the infrequent errors. Another significant difference was also found between the two groups in Question 11, which asked about correcting students' individual errors. Thirty-four percent of the students always wanted their individual errors to be treated, but none of the teachers always corrected individual errors made by only one student. Sixty-two percent of the students always or usually wanted their individual errors to be treated by their teacher, whereas only 11% of the teachers usually treated this type of error. Given the findings, teachers focus more on serious spoken errors than individual errors. It is not realistic to expect that teachers provide their students with corrective feedback on individual errors in a classroom setting. These findings indicate that teachers focus more on serious and frequent errors made by their students rather than correcting infrequent and less serious errors. By focusing on serious and frequent spoken errors, teachers can help their students enhance both accuracy and fluency.

### **3.5 Method of Corrective Feedback**

The fifth category asked the students and teachers about their preferences for types of corrective feedback. The category consists of eight methods of corrective feedback, including clarification request, repetition, implicit feedback, explicit feedback, elicitation, metalinguistic feedback, recasts, and no corrective feedback. The students and teachers were asked to rate each item on a 5-point scale, from "Very effective" to "Very ineffective." "Very effective" was worth 5 points, and "very ineffective" was worth 1 point.

According to the results, elicitation ( $M = 3.74$ ) and explicit feedback ( $M = 3.7$ ) had the highest mean among the students, whereas explicit feedback ( $M = 3.78$ ) and repetition ( $M = 3.67$ ) had the highest mean among the teachers. No corrective feedback had the lowest mean among both the teachers and students. These findings show that both the students and teachers value corrective feedback on spoken errors. Explicit feedback and elicitation were the most favored methods of corrective feedback among the students, and an almost equal percentage of the students rated the methods as very effective or effective, 64% and 66% respectively. The findings indicate that the students wanted their teachers' explicit corrective feedback on their non-target-like

utterances, but on the contrary, they also wanted to have an opportunity to come up with the target-like language forms by themselves rather than entirely depending on their teachers' help. Explicit feedback helps the students learn what the target-like form is by directly pointing out the error, whereas elicitation can help them develop self-editorial skills by providing the students with time to think about the target form. The findings suggest that the students might expect their teachers to know and use various types of corrective feedback in a flexible way that suits their current proficiency level regarding the target item. For instance, if the students make errors that they can correct by themselves, they prefer their teachers to simply guide them to notice the ill-formed utterances so that they can restate the utterances with the target-like forms by themselves. In that case, the teachers' explicit comments on the error can keep their students from consolidating their relevant knowledge on their own and moving on to the next level of automatization

There were discrepancies between students' and teachers' preferences for the methods of error correction. Unlike the students, repetition was the most favored method and explicit feedback was the second most favored type of corrective feedback among the teachers. The results show that a higher percentage of the teachers rated explicit feedback as a more effective method than elicitation, which suggests that the teachers believe that directly pointing out their students' errors and providing the correct forms are more effective than encouraging them to find the target-like forms by elicitation. The teachers might want to guide their students to recognize non-target-like utterances without confusion. Seventy-seven percent of the teachers regarded repetition as effective corrective feedback, whereas only 53% of the students rated the method as effective. The finding indicates that the teachers believed that repetition can allow their students to think about their utterances once more, so that they can notice an error they made in their speaking. The students did not regard repetition as an effective feedback type to help them find the target-like forms to the same degree as teachers. From a student's perspectives, repetition can be confusing because it might not always be clear whether the teacher is repeating the student's utterance to indicate the problem or to acknowledge the content.

The highest discrepancy between the students' and teachers' responses was on metalinguistic feedback. Thirty-eight percent of the students responded that metalinguistic feedback was effective, whereas no teachers regarded it as effective. The finding suggests that some students believe that they can benefit from

their teachers' explanations on their errors because it can help them notice what makes their utterances ungrammatical. On the other hand, teachers may not consider this as an ideal type of corrective feedback in a classroom setting. There were discrepancies between the students and teachers regarding no corrective feedback. Interestingly, 78% of the teachers rated no corrective feedback as ineffective, and no teachers regarded it as effective, whereas 60% of the students rated it as ineffective, and 15% of the students rated it as effective. Given that 94% of the students agreed with the statement "I want to receive corrective feedback when I make mistakes," the findings indicate the students' inconsistent opinions about error correction. The same percentage of the students (53%) rated repetition and recasts as effective methods of error correction. Conversely, a high discrepancy was found among the teachers regarding the effectiveness of repetition and recasts on their students' spoken errors. Specifically, 77% of the teachers regarded repetition as effective, whereas only 33% of them considered recasts as effective feedback. Also, regarding the effectiveness of explicit feedback and elicitation, almost an equal percentage of the students rated the two methods as effective, whereas more teachers rated explicit feedback (72%) as an effective method over elicitation (67%). Although there were no statistically significant differences between the two groups in opinions about explicit feedback, the findings show the teachers' and students' different opinions on corrective feedback.

### **3.6 Delivering Agents of Error Correction**

The last group of questions asked the students who should correct their errors. The statement in the question was "The following person should treat students' errors." There were three choices: classmates, teachers, and students themselves. The three questions attempted to elicit opinions regarding the value of peer-correction, teacher-correction, and self-correction. The students and teachers were asked to rate each question with "Strongly agree," "Agree," "Neutral," "Disagree," "Strongly disagree." "Strongly agree" was worth 5 points, and "strongly disagree" was worth 1 point.

Results reveal that teachers received the highest mean from both the students ( $M = 4.47$ ) and teachers ( $M = 4.34$ ). Both the teachers and students regarded teachers as the most appropriate people to correct student

errors, 94% and 91% respectively; therefore, there was no significant difference between the two groups. Also, there was no discrepancy in opinions of peer-correction between the teachers and students. The finding indicates that the mean of peer-correction was the lowest among the three choices; that is, both the teachers and students did not strongly believe in the effectiveness of error correction delivered by classmates. For self-correction, 71% of the students and 89% of the teachers strongly agreed or agreed that students should correct their own errors by themselves. Even though a statistically significant difference was not found between the two groups, the teachers valued self-correction more than the students did. The findings indicate that the teachers and students preferred self-correction to peer-correction.

#### **4. CONCLUSION**

The findings show that both the teachers and students agreed that student errors should be treated, but students wanted more correction than their teachers thought. A discrepancy was found between the teachers and students regarding the timing of error correction. Unlike the teachers, the students regarded immediate error correction that can interrupt the flow of conversation as effective. Both the teachers and students believed that serious and frequent errors should be treated, but the students wanted to receive more error treatment. The students wanted error treatment even on infrequent and individual errors. Repetition, explicit feedback, and elicitation were the three most favored types of feedback among the teachers, whereas elicitation, explicit feedback, and implicit feedback were the most favored types of corrective feedback among the students. Teachers were the most popular source of feedback among both the teachers and students. The findings show that the teachers and students had significantly different opinions about timing, method, and delivering agents of error correction, as well as types of errors that need to be corrected.

## Abstract

Teaching efficacy and reflective thinking are both important for teacher education and they may influence teachers' behaviors during instruction. In the light of existing literature it is suggested that there is a relation between teaching efficacy belief and reflective thinking. The purpose of this study is to investigate whether reflective thinking tendency of pre-service mathematics teachers predict their mathematics teaching efficacy beliefs. The study was conducted in a public university with 125 secondary mathematics education students. The data were collected by Mathematics Teaching Efficacy Belief Instrument and Reflective Thinking Tendency Scale. Regression analysis was used for analyzing the data. It is concluded that reflective thinking tendency of pre-service mathematics teachers predict significantly their mathematics teaching efficacy beliefs.

*Keywords:* self-efficacy, reflective thinking, pre-service mathematics teacher

## 1. Introduction

The most important objective of today's educational systems is to equipping students to be life-long learners and to be able to use different thinking skills. There are various types of thinking such as critical thinking, creative thinking, analytical thinking and reflective thinking. These thinking skills are very important for both teachers and students. Especially reflective thinking which has its origins in Dewey's (1933) learning by doing and living approach (cited in Kızılkaya & Aşkar, 2009) is essential for teachers. Reflective thinking teachers continuously learn from their own teaching practice and gradually improve it over time (Jansen & Spitzer, 2009). In the reflection process teachers confront the complexity of students and their learning, of themselves and their teaching (Rodgers, 2002) and at the end of reflection they develop skills that may assist them to become more critical and to develop expertise in their instruction (Phan, 2007). Reflection is a systematic, rigorous, disciplined way of thinking and it gives a learner deeper understanding of relationships and connections between experiences (Rodgers, 2002). Reflective thinking can be effective when it is used in problematic classroom situations. Teachers deal with problems and try to develop their teaching practice by means of reflection when they have problems in their instruction. Reflective thinking teachers take into account student feedbacks, monitor themselves and evaluate their instruction. These teachers are more critical and open minded and have the responsibility of teaching, so it is clear that they will put forth an effort to increase their students' success and facilitate their learning.

Self-efficacy belief is an important affective factor related to social cognitive theory and it concerns beliefs of individuals about their own ability in performing a task or an action. Teachers' efficacy belief is a construct derived from Bandura's (1997) self-efficacy concept and it is the belief in one's his or her ability to teach effectively. Tschannen-Moran and Woolfolk Hoy (2001) defined teacher efficacy as teacher's judgment of his or her own capabilities to bring desired outcomes of student engagement and learning. Degrees of efficacy are related to teachers' performance in their classroom and the teaching strategies they use. Teachers with high teaching efficacy are more likely to use student-centered methods and they are more open minded and critical about their teaching. Teacher efficacy is a subject-specific construct (Bandura, 1986) and it is also multidimensional and can be affected by different variables. Phan (2007) indicated in his study that self-efficacy directly predicted the stages of reflective thinking. Reflective thinking and teaching self-efficacy belief are both factors that have effect on teachers' teaching performance.

In the light of existing literature and according to the definitions of reflective thinking and self-efficacy belief, it is hypothesized that reflective thinking and mathematics teaching efficacy beliefs are related. This study determines the mathematics teaching efficacy of pre-service teachers, their reflective thinking tendencies and the role of reflective thinking in mathematics teaching efficacy degree. The purpose of this study is to investigate whether reflective thinking tendencies of pre-service mathematics teachers predict their mathematics teaching efficacy beliefs.

## 2. Method

This study is a descriptive research designed to investigate how much the mathematics teaching efficacy beliefs of pre-service teachers is explained by their reflective thinking tendencies. Survey model is used with the purpose of determining the mathematics teaching efficacy beliefs and reflective thinking tendencies of pre-service teachers.

### 2.1. Participants

Participants of the study are 125 pre-service secondary mathematics teachers studying at Secondary Mathematics Education Department of a public university in Ankara. Pre-service teachers consist of 98 females

and 27 males. 27 of the students are first grade, 18 are second grade, 25 third grade, 30 fourth grade and 25 fifth grade.

## 2.2. Instruments

In this study “Reflective Thinking Tendency Scale (RTTS)” and “Mathematics Teaching Efficacy Beliefs Instrument (MTEBI)” are used to collect data.

### *Reflective Thinking Tendency Scale*

This scale is developed by Semerci (2007) and consists of 20 positive 15 negative totally 35 items. There are seven sub-dimensions of the scale and these are continuous and intentional thinking (items 1-7), open minded (items 8-13), interrogative and effective teaching (items 14-18), teaching responsibility and science (items 19-23), researcher (items 24-29), foresighted and sincere (items 30-33), looking professional (items 34-35). This scale is 5 point Likert scale and possible scores on RTTS range from 35 to 175. Low scores indicates low reflective thinking tendency and high scores indicates high reflective thinking tendency. The reliability cronbach alpha coefficient of the original RTTS is 0,91. In this study the reliability was found as 0,90.

### *Mathematics Teaching Efficacy Beliefs Instrument*

Mathematics Teaching Efficacy Beliefs Instrument (MTEBI) was developed by Enochs, Smith and Huinker (2000) and it is adopted in Turkish by Sari et al. (2007). The scale has two subscales of Personal Mathematics Teaching Efficacy (PMTE) with 13 items and Mathematics Teaching Outcome Expectancy (MTOE) with 8 items. This scale is 5 point Likert scale and possible scores on PMTE subscale range from 13 to 65 and MTOE scores may range from 8 to 40. High scores indicates high self-efficacy beliefs and the lower ones are low self-efficacy belief. The Cronbach’s alpha for PMTE subscale is 0,80 and 0,81 for MTOE subscale.

## 2.3. Data Analysis

Data were analyzed in SPSS 17.0 statistical package and descriptive statistics and linear regression analysis was used.

### 3. Findings

The descriptive statistics of the data collected by RTTS from 125 pre-service mathematics teachers are given in the Table 1.

	Continuous and intentional thinking	Open minded	Interrogative and effective teaching	Teaching responsibility and science	Researcher	Foresighted and sincere	Looking professional	Reflective thinking tendency
N	125	125	125	125	125	125	125	125
Mean	28,81	26,76	22,36	20,97	24,45	16,82	8,38	148,54
Std. Deviation	3,207	3,234	2,775	3,245	3,845	2,464	1,506	14,628
Minimum	14	12	12	10	12	4	2	78
Maximum	35	30	31	25	30	20	10	174

Table 1. Descriptive statistics of reflective thinking tendency of pre-service mathematics teachers

As it seems from Table 1 the mean of reflective thinking tendency scores is 148,54 and this score shows that pre-service teachers have high reflective thinking tendencies. The highest scores of pre-service teachers are in continuous and intentional thinking sub-dimension and the lowest ones are in looking professional sub-dimension.

The scores for subscales of Mathematics Teaching Efficacy Beliefs Instrument can be seen from Table 2.

Table 2. Descriptive statistics for PMTE and MTOE

		PMTE	MTOE
N	Valid	124	124
	Missing	1	1
Mean		52,27	29,01
Std. Deviation		6,438	4,746
Minimum		26	8
Maximum		65	40

The mean for scores of Personal Mathematics Teaching Efficacy subscale is 52,27 and 29,01 for Mathematics Teaching Outcome Expectancy subscale.

Linear regression analysis was used to determine whether reflective thinking tendencies of pre-service teachers predict their mathematics teaching self-efficacy beliefs. Before regression analysis, one sample

Kolmogorov-Smirnov test applied to data to test the normality of the variables and scatter diagrams are analyzed to determine the type of the relation between variables.

Table 3. One-Sample Kolmogorov-Smirnov Test

		MTOE	PMTE	RTT
N		124	124	125
Normal Parameters <sup>a,b</sup>	Mean	29,01	52,27	148,54
	Std. Deviation	4,746	6,438	14,628
Most Extreme Differences	Absolute	,098	,059	,121
	Positive	,063	,051	,060
	Negative	-,098	-,059	-,121
Kolmogorov-Smirnov Z		1,093	,659	1,349
Asymp. Sig. (2-tailed)		,184	,779	,053

Table 3 shows that the significance for variables mathematics teaching outcome expectancy, personal mathematics teaching efficacy and reflective thinking tendency are all  $>0.05$ . This means that the data have normal distribution for these three variables.

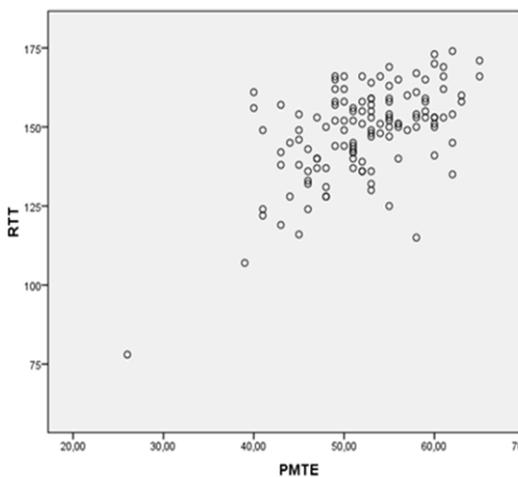

Figure 23. Scatter diagram for personal mathematics teaching efficacy and reflective thinking tendency

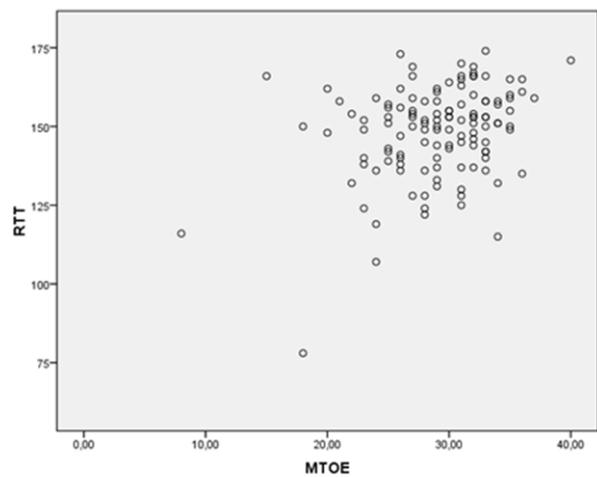

Figure 22. Scatter diagram for mathematics teaching outcome expectancy and reflective thinking tendency

In Figure 1 scatter diagram shows that there is a linear relationship between personal mathematics teaching efficacy and reflective thinking tendency variables. Figure 2 shows the relationship between mathematics teaching outcome expectancy and reflective thinking tendency variables is also linear. The results of normality test and scatter diagrams show that data fulfill the assumptions for linear regression.

Regression analysis was applied on personal mathematics teaching efficacy and reflective thinking tendency variables.

Table 4. Anova table for PMTE and RTT

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	1635.124	1	1635.124	57.603	,000 <sup>a</sup>
	Residual	3463.093	122	28.386		
	Total	5098.218	123			

Table 4 shows that the constructed model is significant (sig.<.05)

Table 5. PMTE and RTT Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	,566 <sup>a</sup>	,321	,315	5,328

As it seems in the model summary table (Table 5)  $R^2$  value is 0.315. This means that the 32 % of total variance in the dependent variable of personal mathematics teaching efficacy is explained by the independent variable of reflective thinking tendency.

Table 6. Parameter Estimates for PMTE and RTT

Model		Unstandardized Coefficients		Standardized Coefficients		Collinearity Statistics		
		B	Std. Error	Beta	t	Sig.	Tolerance	VIF
1	(Constant)	15.396	4.881		3.154	,002		
	RTT	,248	,033	,566	7,590	,000	1,000	1,000

From parameter estimates table (Table 6) the constructed model can be expressed as

$$Y = 15.396 + 0.248X \quad (1)$$

In this equation (1) Y represents the personal mathematics teaching efficacy variable and X represents the reflective thinking tendency variable.

Table 7. Anova table for MTOE and RTT

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	265.166	1	265.166	12.190	,000 <sup>a</sup>
	Residual	2505.826	122	20.540		
	Total	2770.992	123			

Table 7 shows that the constructed model is significant (sig.<.05)

Table 8. MTOE and RTT Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	,309 <sup>a</sup>	,096	,088	4,532

As it seems in the model summary table (Table 8)  $R^2$  value is 0.096. This means that the 10 % of total variance in the dependent variable of mathematics teaching outcome expectancy is explained by the independent variable of reflective thinking tendency.

Table 9. Parameter Estimates for MTOE and RTT

Model		Unstandardized Coefficients		Standardized	t	Sig.	Collinearity Statistics	
		B	Std. Error	Coefficients			Tolerance	VIF
1	(Constant)	14.160	4.152		3.410	,001		
	RTT	,100	,028	,309	3.593	,000	1,000	1,000

From parameter estimates table (Table 9) the constructed model can be expressed as

$$Y = 14.190 + 0.1X \quad (2)$$

In this equation (1) Y represents the mathematics teaching outcome expectancy variable and X represents the reflective thinking tendency variable.

#### 4. Conclusion and Discussion

This study shows that the reflective thinking tendencies of pre-service mathematics teachers significantly predict their personal mathematics teaching efficacy and mathematics teaching outcome expectancy which are the sub-dimensions of mathematics teaching self-efficacy belief.

According to the results of linear regression analysis 32% of the total variance of personal mathematics teaching efficacy is explained by reflective thinking tendency. And 10% of total variance of mathematics teaching outcome expectancy is explained by reflective thinking tendency. It can be concluded that the mathematics teaching self-efficacy beliefs of pre-service teachers is explained by their reflective thinking tendencies and it is expected that the increase in their reflective thinking tendencies will increase their self-efficacy beliefs.

The findings suggest that teachers' reflective thinking skills should be developed for increasing their self-efficacy belief which is an important factor in their teaching performance. Teacher education programs should include activities that engage teachers in reflection on their instructional practice. Studies show that reflective thinking activities have a positive influence on performances of pre-service teachers and their attitudes toward teaching profession (Tok, 2008). Phan (2007) indicated that self-efficacy directly predict the stages of reflective thinking and self-efficacy is a determinant of reflective thinking and academic performance.

This study contributes to the literature concerning the variables that explain self-efficacy belief of pre-service teachers. The determination of the constructs that explain self-efficacy and to expose the relationships between them will give clues about how to increase self-efficacy beliefs.

It is recommended to investigate other factors that may influence self-efficacy. Especially the thinking types of critical thinking and creative thinking which are close to reflective thinking can be investigated in constructing models that explain self-efficacy.

Reflective thinking skill can be developed and it is important to plan activities that develop pre-service teachers' reflective thinking. It should be remembered that the students of reflective thinking teachers can have the same thinking skill and this may have a positive effect on students' academic performance. It is also suggested that teachers who think reflective and have high self-efficacy will be more open minded and critical, have responsibility of teaching, deal with increasing students' success and facilitating their learning. Also these teachers will prefer student centered approaches in their instruction and continuously monitor and evaluate themselves during the teaching and learning process.

# Investigation of required qualifications of instructors by means of pair-wise comparison method

Çiğdem Akin Arıkan<sup>\*a</sup> Selahattin Gelbal<sup>b</sup>

<sup>a</sup> Hacettepe University, Faculty of Education, Ankara, Turkey

<sup>b</sup> Hacettepe University, Faculty of Education, Ankara, Turkey

---

## Abstract

This study investigates the qualifications instructors should have by using the pair-wise comparison method. The data collection tool included 8 (eight) qualifications regarding students' demographic data for pair-wise comparison method. Study data were collected from 1241 students from several faculties and departments in 9 Turkish universities. According to the students' views, motivating to learn is the leading qualification required of instructors. The first qualification on the list was found to differ by gender. Accordingly, female students rated motivating to learn the most, while male students rated being inquisitive. By grade level, first-year students prefer having content knowledge by instructors, whereas second, third and fourth-year students opt for motivating to learn on instructors' side. As for distribution by faculties; the students from Education Faculty want instructors to motivate to learn, students from Faculty of Science and Letters require being inquisitive, Faculty of Pharmacy motivating to learn, Faculty of Law prefer democratic instructors, Economic and Administrative Sciences require having world knowledge, Faculty of Aquaculture motivating to learn, and Faculty of Engineering prefer inquisitive instructors. Distribution of the study results by field shows that motivating to learn is the most wanted qualification by students in applied and social sciences, while having good content knowledge by health students. Lastly, a difference was found between newly founded universities and others. The students studying in newly established students mainly require having good content knowledge, whereas others opt for being inquisitive as required qualifications of instructors.

**Keywords:** Scaling, pair-wise comparison, instructors

## 1. INTRODUCTION

Efforts towards accessing to information are becoming more important in Turkey and rest of the world. Societies can develop, improve and lead others by education. Ertürk (1994) defines education as the process whereby an individual makes changes in her/his behaviours by means of experiencing and purposefully. Such changes take place in educational institutions in a well-planned manner. Educational institutions include elementary schools, high schools and higher education institutions. Higher institution firstly recalls universities. In the Higher Education Law Numbered 2547, university is defined as "a higher education institution having scientific autonomy and public entity engaged in carrying out higher education-instruction, scientific research, publication and counselling; and that is comprised of faculties, institutes, high schools and so on". The aim of universities is to carry out scientific studies and research and contribute to social development in this way and to bring up highly qualified labour force. At the same time, those studying at university are expected to bear certain qualities such as adopting to the changing world, being able to inquire and think critically, being creative and critical, generating information, and expressing themselves, etc. Thus, instructors teaching at universities are supposed to have these qualifications at first. It is thought that individuals can acquire qualifications largely in parallel with what qualifications university teachers have. In this context, instructors need to bear certain qualifications. There are lots of Turkish and international studies and recommendations about this matter. One of the studies on characteristics of instructors (university teachers) lists the most frequently rated features and items as confiding in students and expecting only their potential, establishing personal communication with and caring students, having high sensitivity, and having sufficient content knowledge ([www.soyouwanttoteach.com](http://www.soyouwanttoteach.com)). Another study provides a definition for a good teacher (instructor): "the person who is willing to teach, can take risk, develops a positive attitude, gives students confidence, acts consistently, motivates and listens to students." (Morgan, 2003). In Akgöl (1994), the qualities an ideal teacher should have are researched four subgroups: personal, professional, assessment and evaluation and human affairs. Kavak (1986) summarizes qualifications of

\* Corresponding author.

Email address:

instructors as content knowledge, assessment and evaluation, inquiring, teaching methods and human affairs. In Açıkgöz (1990), necessary qualifications are discussed under subgroups such as teacher-student relationships, classroom management, in-class teacher behaviours and personal traits. As literature supports, the qualifications required of instructors are discussed differently by different researchers. Thus, qualifications in different aspects are considered in this study.

### *1.1. Aim and Purpose of the Study*

In pair-wise comparison method, variables in an ordinal scale can be assessed as interval scales, and thus measurement results of observed variables become equivalent to interval scales. In other words, scaling is used in order to improve scale quality of the data. Both judgement and reaction approaches are used in scaling. The judgement approach aims at scaling obtained stimuli at an extent determined through an observer's or expert's judgement. Scaling via Thurstone methods provides a typical judgement approach. The reaction approach is built on collecting reactions of a group of N participants by applying a K number of stimuli. A typical reaction method can be seen in developing Likert type attitude scale. One of the scaling techniques in psychology is called pair-wise comparison method developed by Thurstone. The technique can be used in all cases where stimuli are applied in pairs. Particularly, they are useful for scaling many affective behaviours and assessing some personality traits (Turgut ve Baykul, 1992).

There are many studies on what qualifications instructors must have (Aslan ve Yakar, 2011; Çakmak, 2009; Collins, 2002; Yıldız, 2008; Genç, 2007; Ergün, Duman, Kınca ve Arıbaş, 1999; Saylan ve Uyangör, 1998; Morgan, 2003; Açıkgöz, 1990; Akgöl, 1994; Kavak, 1986). However, there is not a sample which uses pair-wise law and resulting scaling methods for qualifications required of instructors. Present study is significant due to this aspect. To this end, the scaling method using pair-wise comparison seeks answers for the following research questions:

1. What are the scale value results of all students like?
2. How are the scale value results of students distributed by gender?
3. How are the scale value results of students distributed by grade level?
4. How are the scale value results of students distributed by faculty?
5. How are the scale value results of students distributed by field of study (social/applied sciences/health)?
6. How are the scale value results of students distributed by universities?

## **2. METHOD**

### *2.1. Research Type*

The aim of this study is to scale qualifications of instructors as preferred by university students by means of pair-wise comparison method. As the study is designed to describe an existing situation, it is a descriptive one.

### *2.2. Study Group*

1241 students in different faculties of 9 Turkish universities participated in this study during the 2012-2013 academic year. This study attempts to provide a multidimensional description of the qualifications as opted by students.

Information regarding the study group is given in Table 1 and Table 2.

Table 1 displays frequency and percentages of the study group by university.

Table 1: Frequency and Percentage of Study Group by University

	f	%	
Ankara University	80	6,4	
Bayburt University	377	30,4	
Celal Bayar University	36	2,9	
Universities	Çukurova University	115	9,3
Hacettepe University	380	30,6	
Mardin Artuklu University	143	11,5	
Marmara University	33	2,7	
METU	40	3,2	
Osmangazi University	37	3	
Total	1241	100	

Total frequency of the study group for all of the universities is given as 1241 in Table 1. Distribution of the study participants by universities is as follows: Ankara University (80), Bayburt University (377), Celal Bayar University (36), Çukurova University (115), Hacettepe University (380), Mardin Artuklu University (143), Marmara University (33), Middle East Technical University (40), and Osmangazi University (37).

In Table 2, frequency and percentage of both male and female participants by faculty/higher school is given.

Table 2: Frequency and Percentage of Male and Female Participants by Faculty/Higher School

		Gender		Total
		Female	Male	
Pharmacy	f	96	31	127
	%	7,70	2,50	10,20
Education	f	124	117	241
	%	10,00	9,40	19,40
Science-Letters	f	123	69	192
	%	9,90	5,60	15,50
Law	f	76	37	113
	%	6,10	3,00	9,10
Administrative Sciences	f	98	126	224

	%	7,90	10,20	18,00
	f	66	55	121
Engineering	%	5,30	4,40	9,80
	f	84	24	108
School of Health	%	6,80	1,90	8,70
	f	12	103	115
Aquaculture	%	1,00	8,30	9,30
	f	679	562	1241
Total	%	54,70	45,30	100,00%

In Table 2, total frequency of the study group by gender and faculty is given as 1241. Departments of study and frequencies of the study participants are as follows: German Language Teaching (45), Anthropology (20), Biology (88), Midwifery (38), Pharmacy (117), Electrical and Electronic Engineering (64), Food Engineering (97), Philosophy (17), Nursing (70), Law (113), Economics (153), Business Administration (71), Statistics (37), Art History (30), Aquaculture (84), Classroom Teaching (167) and Preschool Teaching (30).

### 2.3. Developing the Measurement Instrument

First of all, literature review was done in order to list the 20 qualifications that instructors should have. The list was sent to 28 students from different universities so that they could mark the ones they regard important. 8 (eight) qualifications were selected from the students' comments because of increased number of comparisons and probability of contradictory triadic in pair-wise comparison. Part I of the measurement contains personal information (university, faculty, department, grade, gender), while part II includes the eight qualifications required of instructors to be assessed via pair-wise method.

### 2.4. Data Analysis

Collected data were first scaled on Thurstone's the fifth condition matrix for comparative judgement. A frequency matrix (F) was calculated for each of the variables. Each cell in the frequency matrix was divided by the number of participants (N) to get the matrix of ratios (P). Then, standard normal distribution value corresponding to each of the values in the matrix of ratios was calculated via Excell for finding the unit normal deviation matrix (Z). Scale values are calculated by. If there are any scale values with negative value, a negative scale value is added to all of the scale values. As a result, scale values for other stimuli are found by switching the smallest scale value to 0,00. After the analysis, mean error and  $\chi^2$  statistical values are calculated for each scaling. A significant Chi-Square value may not supply the fifth condition assumptions of the scaled data or pair-wise comparison axioms or both; or it might indicate that the scaled variable is not one-dimensional (Turgut and Baykul, 1992). Thus, scaling was done with the third condition. But, it wasn't applied in Faculties of Pharmacy and Law due to the high internal consistency of collected data.

## 4. FINDINGS

8 different characteristics required for instructors were compared in pairs by university students. Analysis regarding the third and fifth condition scaling was not given directly. Relevant scale values were given an order only. Also, internal consistency data regarding the fifth condition scaling was given for each group below.

Table 3: Internal Consistency of the Scale Values

	N	$\chi^2$
All Students	1241	234,5
Females	679	154,9
Males	562	108,9
Faculty of Education	241	184,5
Faculty of Science and Letters	192	47,4
Economic and Administrative Sciences	224	70,8
Engineering	121	72,3
Pharmacy	<b>127</b>	<b>31,3</b>
Law	<b>113</b>	<b>27,8</b>
School of Health	108	79,7
Aquaculture	115	74,1
First Year	348	184,1
Second Year	395	836,3
Third Year	274	391,7
Fourth Year	224	1052,2
Social	635	153,343
Health	235	235,000
Applied Science	371	78,542
Newly Established Universities	520	88,995
Other Universities	721	136,028

Chi-square table values  $\chi^2 (0,05;21)= 32,671$

As seen in Table 3, mean error value for the fifth condition matrix was found quite low for Faculties of Law and Pharmacy. Smaller  $\chi^2$  values of scaling than table values indicate that scale values have internal consistency.  $\chi^2$  values for the other variables are above the table value, thus scaling is done with the third condition.

The qualifications required of instructors are scaled on the basis of the data collected from 1241 student participants.

Table 4: Scale Values for Required Qualifications of Instructors and Orders of Stimuli

Qualifications	Scale	Stimuli
	Values	Order
Having good content knowledge	0,779	7
Motivating to learn	0,000	1
Having pedagogical competence	0,517	5
Being inquisitive	0,279	3
Having general knowledge	0,887	8
Being democratic	0,128	2
Using communication techniques effectively	0,339	4
Being objective	0,540	6

As seen in Table 4, listing of the required qualifications from the most to the least wanted ones shows that motivating to learn is on the top. It is followed by being democratic, being inquisitive, using communication techniques effectively, having pedagogical competence, being objective, and having good content knowledge, subsequently. The last item is found as “having world knowledge”.

Below are required qualifications of instructors shown by gender.

Table 5: Distribution of Scale Values and Stimuli Order for Required Qualifications by Participant Gender

Qualifications	Female		Male	
	Scale	Stimuli	Scale	Stimuli
	Values	Order	Values	Order
Having good content knowledge	0,853	7	0,5308	7
Motivating to learn	0	1	0,2333	3
Having pedagogical competence	0,392	5	0,7779	8
Being inquisitive	0,587	3	0	1
Having general knowledge	1,0799	8	0,4847	6
Being democratic	0,4385	4	0,1671	2
Using communication techniques effectively	0,1673	2	0,4458	5
Being objective	0,6356	6	0,295	4

According to Table 5, female participants attach the highest importance to motivating to learn, followed by effective use of communication techniques, being inquisitive, democratic, having pedagogical competence, being

objective, having good content knowledge and world knowledge, respectively. As for the male students, the ordering is found to start with being inquisitive. It is followed by other qualifications such as being democratic, motivating to learn, being objective, using communication techniques effectively, having good content knowledge, lastly having pedagogical competence.

Required qualifications of instructors are distributed by grade level of students as following.

Table 6: Distribution of Scale Values and Stimuli Order for Required Qualifications by Grade Level of Participants

Qualifications	First Year		Second Year		Third Year		Fourth Year	
	Scale Values	Stimuli Order	Scale Values	Stimuli Order	Scale Values	Stimuli Order	Scale Value	Stimuli Order
Having good content knowledge	0	1	0,694	2	0,803	7	0,384	4
Motivating to learn	1,072	7	0,000	1	0,000	1	0,000	1
Having pedagogical competence	1,476	8	0,882	4	0,398	5	0,752	8
Being inquisitive	0,839	6	1,037	7	0,322	3	0,245	2
Having general knowledge	0,667	4	0,869	3	1,222	8	0,494	6
Being democratic	0,522	3	0,912	5	0,225	2	0,348	3
Using communication techniques effectively	0,824	5	1,027	6	0,329	4	0,402	5
Being objective	0,499	2	1,363	8	0,456	6	0689	7

In Table 6, instructor qualifications are given in a decreasing importance order from participant students' point of view by first, second, third and fourth year. Among first year students, having good content knowledge is the most important quality. Then, it is followed by being objective, democratic, having world knowledge, using communication techniques effectively, being inquisitive, and motivating to learn. Having pedagogical competence is found to be the last item in the ordering. From the second year students' point of view, motivating to learn is the leading quality for instructors. The list goes on with having good content knowledge, world knowledge, having pedagogical competence, being democratic, using communication techniques effectively, being inquisitive and being objective, respectively. For the third year students, motivating to learn is the most important factor. Then, others are ordered as being democratic, being inquisitive, using communication techniques effectively, having pedagogical competence, being objective, having good content knowledge, and lastly having world knowledge. Lastly, from the fourth-year students' point of view, motivating to learn is the leading quality for instructors. It is followed by being inquisitive, democratic, having good content knowledge, using communication techniques effectively, having world knowledge, being objective and having pedagogical competence, respectively.

Besides, qualifications rated by students are analyzed by faculty.

Table 7: Distribution of Scale Values and Stimuli Order for Required Qualifications by Faculty of Participants

Qualifications	Education		Science-Letters		Pharmacy		Law	
	Scale Values	Stimuli Order	Scale Values	Stimuli Order	Scale Values	Stimuli Order	Scale Values	Stimuli Order
Having good content knowledge	0,672	7	0,414	7	0,525	5	0,717	8
Motivating to learn	0,000	1	0,199	4	0,000	1	0,489	3
Having pedagogical competence	0,402	5	0,270	6	0,549	7	0,513	5
Being inquisitive	0,064	2	0,000	1	0,469	5	0,436	4
Having general knowledge	0,170	3	0,562	8	0,678	8	0,672	7
Being democratic	0,391	4	0,105	2	0,126	2	0,000	1
Using communication techniques effectively	0,819	8	0,130	3	0,310	3	0,251	2
Being objective	0,530	6	0,213	5	0,432	4	0,525	6

Qualifications	Economic and Administrative Sciences		School of Health		Aquaculture		Engineering	
	Scale Values	Stimuli Order	Scale Values	Stimuli Order	Scale Values	Stimuli Order	Scale Values	Stimuli Order
Having good content knowledge	0,865	8	0,255	3	0,580	5	0,216	2
Motivating to learn	0,792	7	0,000	1	0,000	1	0,394	5
Having pedagogical competence	0,608	6	0,334	4	0,574	4	0,496	7
Being inquisitive	0,210	3	0,409	7	0,443	3	0,000	1
Having general knowledge	0,000	1	0,858	8	0,926	8	0,679	8
Being democratic	0,022	2	0,357	5	0,308	2	0,287	4
Using communication techniques effectively	0,245	4	0,179	2	0,713	6	0,458	6
Being objective	0,413	5	0,395	6	0,727	7	0,256	3

Table 7 displays qualifications required of instructors in a decreasing order of importance from perspectives of the students in Faculties of Education, Science-Letters, Law, Pharmacy, Economic and Administrative Sciences, School of Health, Aquaculture and Engineering. As seen in the table, the most important attribution is found as motivating to learn among students from education faculties. It is found as being inquisitive for faculties of science and letters, motivating to learn for pharmacy, being democratic for faculty of law, having world knowledge for economic and administrative sciences, motivating to learn for school of health and aquaculture, and being inquisitive for students from faculty of engineering.

The necessary qualifications from the students' point of view are also investigated by participants' field of study.

Table 8: Distribution of Scale Values and Stimuli Order for Required Qualifications by Field of Participants

Qualifications	Applied Sciences		Social		Health	
	Scale Values	Stimuli Order	Scale Values	Stimuli Order	Scale Values	Stimuli Order
Having good content knowledge	0,663	7	0,247	3	0,000	1
Motivating to learn	0,000	1	0,000	1	0,375	3

Having pedagogical competence	0,460	5	0,509	6	0,645	6
Being inquisitive	0,219	3	0,292	4	0,395	4
Having general knowledge	0,778	8	0,880	8	1,102	8
Being democratic	0,201	2	0,173	2	0,820	7
Using communication techniques effectively	0,347	4	0,400	5	0,191	2
Being objective	0,536	6	0,593	7	0,585	5

In Table 8, the qualifications are given in a decreasing order of importance from the students' point of view. As seen in the table, motivating to learn is considered the most important quality for students in both applied and social sciences, while having good content knowledge is the first factor for health students. Having world knowledge is found to be the least important factor for students from all of the three fields.

The universities founded 1 to 10 years ago are taken as newly founded ones, whereas those founded earlier than 10 years ago are taken as other universities. On this context, Mardin Artuklu and Bayburt Universities are newly founded ones, while the others are Hacettepe, METU, Ankara, Marmara, Osmangazi, Celal Bayar and Çukurova Universities. Scaling was done in parallel with such grouping.

Table 9: Distribution of Scale Values and Stimuli Order for Required Qualifications by Foundation Years of Universities

Qualifications	Newly founded		Other universities	
	Scale Values	Stimuli Order	Scale Values	Stimuli Order
Having good content knowledge	0,000	1	0,438	6
Motivating to learn	0,276	4	0,263	3
Having pedagogical competence	0,693	7	0,419	5
Being inquisitive	0,144	2	0,000	1
Having general knowledge	0,761	8	0,259	2
Being democratic	0,592	6	0,301	4
Using communication techniques effectively	0,255	3	0,655	8
Being objective	0,292	5	0,502	7

As seen in Table 9, listing of the items demonstrates that having good content knowledge is the most important qualification for participants in newly founded universities. It is followed by being inquisitive, using communication techniques effectively, motivating to learn, being objective, democratic, having pedagogical

competence and world knowledge. On the other hand, being inquisitive is the first factor for students in well established universities. It is followed by having general knowledge, motivating to learn, being democratic, having pedagogical competence, good content knowledge, being objective and using communication techniques effectively.

## 5. DISCUSSION AND CONCLUSION

This study investigates the qualifications instructors should have by using the pair-wise comparison method from the university students' point of view. Study participants come from different universities, faculties, departments, grades and have different genders. As a summary, all of the study participants report motivating to learn as the most important qualification expected from instructors. In a study carried out by Wolters and Rosenthal (2000), it is shown that highly motivated students seem more resolved, enthusiastic, willing, active, curious and insistent to learn during in-class activities than other students. As a result, highly motivated students learn more, feel themselves better and are voluntary to continue education in the future. Our study shows that motivating to learn is the most wanted quality for instructors from the students' point of view. According to Martin (2001), motivation is a power that drives, sustains and guides behaving towards a certain target. This implies that motivation is quite influential on learning. Bearing in mind motivation as the most important factor accelerating learning, it is a meaningful finding that motivation is the most preferred quality for instructors. In studies by Yıldız (2008) and Genç (2007), it needs consideration that students in higher schools of physical education and sports rate having good content knowledge as the leading qualification for instructors, it is in the 7<sup>th</sup> order in our study.

From the grade level point; first-year students prefer instructors with good content knowledge, but second, third and fourth year students opt for motivating to learn. Freshmen mostly prefer instructors that are knowledgeable in their fields. The finding in Saylan and Uyangör (1998) about the same goes parallel with the result regarding the first-year students. The students in the second, third and fourth years prefer instructors who are able to guide others and encourage researching and learning.

As for the participants' fields of studies, the students in applied sciences and social sciences want instructors who can motivate students to learn, while those in health sciences place importance to having good content knowledge.

As for rating by faculty; the students in faculties such as education, aquaculture, pharmacy and school of health choose motivating to learn as the leading quality for instructors, those in faculty of law attach utmost importance to being democratic; faculties of science and letters and engineering have a high opinion of being inquisitive, and those in faculty of economic and administrative sciences opt for having world knowledge. Particularly, the fact that students of law expect democratic instructors is a considerable finding in connection with the department they study. In another study carried out by Ergün, Duman, Kınca and Arıbaşı (2005) in different departments and universities, the leading qualification was found as being objective, democratic and respectful for any idea, which is supportive of our findings. Since research and development bear importance for fields such as science and letters as well as engineering, it is quite understandable that relevant expectation is on the top of the list. As for the students studying economic and administrative sciences, the importance they place on world knowledge can be explained with the fact that they are supposed to keep up with not only their curriculum but also national agenda, and economic and political news.

In a qualitative study by Aslan and Yakar'ın (2012); pre-service teachers placed emphasis on academic competence, social awareness, humaneness/sincerity, friendliness/good humour, attitude towards students, communication skills and professional skills. However, in present study, the order is motivating to learn, being democratic, being inquisitive, using communication techniques effectively, having pedagogical competence, being objective, having good content knowledge and lastly having world knowledge. Despite some similarities between given qualifications, the items of primary importance are different. Also in Çakmak's study (2009) on identifying Turkish pre-service teachers' views about effective teacher qualifications, the highest average was calculated for being objective; however, that item is found to be the second most important factor for first-year students only in our study.

## 6. RECOMMENDATIONS

Due to the constant communication between students and instructors in the class, students' assessment about instructors is becoming one of the most widespread methods. To this end, students' opinions can be conveyed to instructors (depending on university/faculty). Future researchers can discuss other scaling methods and personal and education-instruction related qualifications separately. In addition, the qualifications required of instructors can be studied from instructors' point of view.

# Investigation of the pre-service physics teachers' learning approaches

Deniz Gurcay\*

*Assist. Prof. Dr., Hacettepe University, Faculty of Education, Department of SSME, Physics Education, Ankara 06800, Turkey*

---

## Abstract

The purpose of this study is to investigate the effect of metacognitive self-regulation and academic self-efficacy on pre-service physics teachers' meaningful learning and rote learning approaches. 111 pre-service physics teachers were participated in this study. Research data were collected through "Metacognitive self-regulation" and "Academic self-efficacy" scales and "Learning approaches questionnaire". Stepwise multiple regression analysis revealed that metacognitive self-regulation and academic self-efficacy were significant predictors of pre-service physics teachers' meaningful learning scores and the whole model explains 43% of the variance. However, those independent variables did not significantly predict pre-service physics teachers' rote learning scores.

Keywords: learning approaches; metacognitive self-regulation; academic self-efficacy, physics education

---

## 1. INTRODUCTION

Studies in science education concentrate on investigating factors that affect students' learning of science. Construction of knowledge during the learning process and establishing connections between the newly learned concepts and the concepts learned before will enable students to learn the subject better and thus become more successful. Studies that have been conducted indicate that students' learning approaches constitute one of the factors that influence learning (Cavallo & Schafer, 1994; Cavallo, Rozman, Blickenstaff, & Walker, 2003; Cavallo, Potter, & Rozman, 2004). Similarly, some studies point out that the learning approaches that students adopt are an important factor that affects the quality of their learning (Gordon & Debus 2002; Newble & Entwistle, 1986).

Ausubel (1963) defines the process of establishing connections between the newly learned concepts and the concepts learned before as meaningful learning. Ausubel (1963) emphasizes that in order for meaningful learning to take place, a) students must have prior knowledge appropriate for the subject to be learned, b) learning environments that will provide meaningful learning must be created and c) students must have a positive attitude towards meaningful learning. According to the theory, even if only one of these conditions is missing, rote learning, not meaningful learning, may take place (Cavallo, Potter, & Rozman, 2004). In meaningful learning, which is usually associated with deep learning (Entwistle & Ramsden, 1983), knowledge is constructed by relating new concepts to prior knowledge and establishing connections between concepts. However, connections are not made between concepts in the rote learning approach, which is also called the surface learning approach. Instead, only memorization takes place. It is stated in studies conducted in the fields of physics, chemistry and biology education that students with meaningful learning orientation have better meaningful understanding of

E-mail address: denizg@hacettepe.edu.tr

physics, chemistry and biology (BouJaoude, 1992; BouJaoude & Giuliano, 1994; Cavallo & Schafer, 1994; Cavallo, 1996, Cavallo, Potter, & Rozman, 2004).

One of the concepts connected with meaningful learning is the concept of self-efficacy belief. Bandura (1997 p.3) defines self-efficacy belief as “belief in one’s capabilities to organize and execute the courses of action required to produce given attainments”. The belief in self-efficacy is usually handled in the context of a specific subject or field, but on a larger level, it is also dealt with as a general perception that describes ability to cope with various stressful conditions (Luszczynska, Scholz & Schwarzer 2005). Academic self-efficacy belief, on the other hand, is an individual’s belief in their ability to perform an academic task assigned to them at the desired level (Schunk, 1991; Solberg et al. 1993; Zimmerman 1995). Studies indicate that students with high self-efficacy tend to adopt the deep learning approach (Pintrich & DeGroot, 1990; Sobral, 1997; Zimmerman, Bandura, & Martinez-Pons, 1992).

Self-regulation, which is another factor that is considered to be influential on individuals’ meaningful learning approaches, concerns individuals’ being effective on their own learning processes. Pintrich (2000, p.453) defines the self-regulation concept as “an active, constructive process whereby learners set goals for their learning and then attempt to monitor, regulate, and control their cognition, motivation, and behavior, guided and constrained by their goals and the contextual features in the environment”. There are many definitions and models by various researches regarding the concept of self-regulation (Boekaerts 1996; Pintrich 2000). Studies on cognition reveal that there are learning strategies that students can use as far as academic issues are concerned. There are also learning strategies where metacognitive control and self-regulatory skills such as planning and monitoring their own learning are used to enhance their learning (Garcia & Pintrich 1994; Schraw & Moshman, 1995).

Students’ meaningful understanding of physics is important in order to increase their achievement in physics classes and better understand physics in daily life and make connections. Therefore, determination of variables that predict students’ meaningful learning approaches will contribute to the field. The purpose of this study is to investigate the effect of metacognitive self-regulation and academic self-efficacy on meaningful and rote learning approaches of pre-service physics teachers.

## **2. Method**

### *2.1. Participants*

The study was carried out with 111 Turkish pre-service physics teachers. The majority of the participants (70%) were females. The age of pre-service teachers ranged from 17-25.

## 2.2. Data collection tools

### *Metacognitive self-regulation scale (MSR)*

In the study, the self-regulation subscale of the metacognitive strategies scale of the Motivated Strategies for Learning Questionnaire, which was developed by Pintrich, Smith, Garcia and McKeachie (1991), was used in order to determine students' motivation and learning strategies. Pintrich et.al reported its Cronbach alpha reliability coefficient as  $\alpha = .79$ . MSR which is adapted into Turkish by Sungur (2004), is a seven point Likert type scale ranging from "not at all true of me" to "very true of me" and Cronbach alpha reliability coefficient of the adapted scale was reported as  $\alpha = .81$ . The minimum and maximum scores that a student could receive from this 12 item scale varied between 12 and 84. A sample item from the scale is: "When I study for this physics course, I set goals for myself in order to direct my activities in each study period." In this research the Cronbach alpha reliability coefficient of the MSR was calculated as  $\alpha = .82$ .

### *Academic self-efficacy scale (ASE)*

The academic self-efficacy scale developed by Jerusalem and Schwarzer (1981) consists of 7 items. The scale was developed to determine individuals' belief in executing an academic task successfully. High scores received from the academic self-efficacy scale indicate that individuals strongly believe that they will be able to perform an academic task successfully. The 4-point likert type scale involves the statements "Describes me well", "Describes me usually", "Describes me somewhat", "Describes me not at all". Minimum and maximum scores that can be received from the scale vary between 7 and 28. Sample items from the academic self-efficacy scale are as follows: "I exhibit a relaxed attitude in tests because I have confidence in my intelligence". The Cronbach Alpha reliability coefficient of the original scale was .87. The academic self-efficacy scale was adapted to Turkish by Yılmaz, Gurçay & Ekici (2007). The Cronbach Alpha reliability coefficient of the adapted scale was reported as .79 (Yılmaz, Gurçay & Ekici, 2007). In this study, on the other hand, the Cronbach Alpha reliability coefficient was found to be .81.

### *Learning approach questionnaire (LAQ)*

The learning approaches questionnaire, which was developed by Cavallo (1996), tries to determine whether students are rote learners or meaningful learners. Items in the learning approach questionnaire refer to students' study attitudes and processes in learning physics. The learning approaches questionnaire consists of two sub-dimensions: rote learning approach questionnaire (LAQ-R) and meaningful learning approach questionnaire (LAQ-M). The questionnaire, which is composed of 22 items, is of four-point likert type ranging from "I strongly agree" to "I strongly disagree". Each of the subdimensions (LAQ-M and the LAQ-R) consists of 11 items. Minimum and maximum scores that can be received from both the rote learning approach questionnaire and the meaningful learning approach questionnaire vary between 11 and 44. The questionnaire indicates that students who get high scores in the meaningful learning questionnaire have meaningful learning approach whereas students who get high scores in the rote learning questionnaire have the rote learning approach. Sample items for the rote and meaningful learning approach questionnaires are respectively: "I tend to remember things best if I concentrate on the order in which they were presented by the instructor" and "While I am studying, I often think of real life situations to which the material I am learning can be applied". The Cronbach Alpha reliability coefficient of the original questionnaire was .76 for the rote learning approach questionnaire and .81 for the meaningful learning approach questionnaire (Cavallo et al., 2003). The questionnaire was adapted to Turkish by Yenilmez (2006). The Cronbach alpha coefficient of the adapted questionnaire is .62 for rote learning and .78 for

meaningful learning. In this study, on the other hand, the Cronbach alpha coefficient for rote learning was calculated to be .64 and for meaningful learning .79.

### 3. Results

Descriptive statistics was used to determine the pre-service physics teachers' meaningful learning orientation, rote learning orientation, use of metacognitive self-regulation, and academic self-efficacy belief levels. Mean, standard deviation, kurtosis, and skewness values regarding all these variables are given in Table 1. It was determined that the students' mean scores of the meaningful learning, and academic self-efficacy were high, but pre-service physics teachers' rote learning, and metacognitive self-regulation scores were at a moderate level.

Table 1. Descriptive statistics

	LAQ-M	LAQ-R	MSR	ASE
Mean	33.78	25.92	41.28	19.11
Std. Dev.	3.99	3.80	6.43	3.08
Skewness	0.02	-.26	-.56	-.08
Kurtosis	-.02	-.45	.22	-.12
N	111	111	111	111

Pearson correlation analysis was performed among the variables of meaningful learning, rote learning, use of metacognitive self regulation and academic self-efficacy. As can be seen from Table 2, a low level, negative and statistically significant correlation was found between the meaningful learning approach and the rote learning approach. However, low level, positive and statistically significant correlations were found between the meaningful learning approach and metacognitive self-regulation and academic self-efficacy.

Table 2. Pearson Correlation Analysis

	LAQ-M	LAQ-R	MSR
LAQ-R	-.21*		
MSR	.34*	-.19	
ASE	.31*	-.17	.16

\* Correlation is significant at the .05 level.

Stepwise multiple regression analysis was performed in order to determine how well metacognitive self-regulation and academic self-efficacy predict pre-service physics teachers' meaningful learning and rote learning approaches. The assumptions for multiple regression analyses were tested before the analyses were conducted. Accordingly, it was seen that the sample size was sufficient according to the formula:  $N > 50 + 8m$  (Tabachnick & Fidel, 1996) considering the number of independent variables ( $111 > 66$ ). Therefore, there was no violation of this assumption. Moreover, VIF values were also calculated to examine the multicollinearity assumption. It was

determined that VIF value was lower than 10. This result shows that multicollinearity assumption was met. Moreover, normality and linearity assumptions were also met.

According to the results of the stepwise multiple regression analysis, which was performed to determine the effects of the pre-service physics teachers' use of metacognitive self-regulation and academic self-efficacy beliefs on their meaningful learning approaches, the main variable that accounted for the meaningful learning approach was the use of metacognitive self regulation ( $R^2 = .34$ ;  $F(1, 104) = 13.82$ ,  $p < .05$ ). It was found that when academic self-efficacy was added to the model, these two variables predicted 43 % of the total variance of the meaningful learning approach ( $R^2 = .43$ ;  $F(2, 103) = 11.63$ ,  $p < .05$ ). The direction of the correlation between the meaningful learning approach and metacognitive self-regulation in physics and academic self-efficacy was positive (Table 3.).

Table 3. Stepwise Multiple Regression Analyses for the Meaningful Learning Approach

Model	B	Std. Error	Beta	t	Sig.	Collinearity Statistics

	ASE	.335	.115	.261	2.905	.004	1.021

Dependent Variable: Meaningful Learning Approach

Similarly, stepwise multiple regression analysis was conducted to determine the effects of pre-service physics teachers' use of metacognitive self-regulation and academic self-efficacy beliefs on their rote learning approach. According to the results of this analysis, neither of the independent variables accounted for the variance of the rote learning approach by providing a statistically significant contribution ( $R^2 = .24$ ;  $F(2, 103) = 3.02$ ,  $p > .05$ ). Moreover, the direction of the correlation between the rote learning approach and metacognitive self-regulation in physics was negative (Table 4.).

Table 4. Stepwise Multiple Regression Analyses for the Meaningful Learning Approach

Model	B	Std. Error	Beta	t	Sig.	Collinearity Statistics

Dependent Variable: Rote Learning Approach

#### 4. Conclusion & Discussion

The purpose of this study is to investigate the effects of metacognitive self-regulation use and academic self-efficacy on pre-service physics teachers' meaningful and rote learning approaches. Pre-service physics teachers' meaningful and rote learning approaches, use of metacognitive self-regulation and academic self-efficacy beliefs were studied descriptively.

According to the results of the descriptive analysis, pre-service physics teachers use meaningful learning approach at a high level but they also tend to use the rote learning approach at a medium level during physics learning process. This indicates that though at a medium level, they prefer to learn via the rote learning approach but that when they learn new concepts, instead of rote learning, they prefer to learn by relating them to the previously learned concepts or by establishing connections between the concepts. However, it is seen that when pre-service teachers learn a subject, they use self-regulation skills such as planning, self-monitoring and making judgments about their learning at a medium level. Moreover, it is observed that pre-service physics teachers' academic self-efficacy belief, i.e. their beliefs regarding how well they will be able to perform a task assigned to them when they learn an academic subject, is at a medium level.

Pearson correlation analysis was conducted among the variables of meaningful learning, rote learning, academic self-efficacy and use of metacognitive self-regulation. According to the results of this analysis, a low level, negative and statistically significant relationship was found between the meaningful learning approach and the rote learning approach. This can be interpreted to mean that as pre-service physics teachers' tendency to learn by making connections among concepts increases, their tendency towards rote learning, which means storing concepts in their memory without establishing connections in their minds, is likely to decrease. Cavallo et. al (2004) also found a negative and statistically significant correlation between the meaningful learning approach and the rote learning approach. Moreover, a significant correlation was found between the meaningful learning approach and metacognitive self-regulation. This can be interpreted to mean that as pre-service physics teachers' use of metacognitive self-regulation such as making plans, monitoring their learning and making judgments about their learning in the learning process increases, they may be inclined towards the meaningful learning approach. Various studies have emphasized that learning approaches are related with metacognitive self-regulation processes (Gordon & Debus, 2002; Case & Gunstone, 2002). Case and Gunstone (2002) stated that there is a

significant correlation between the meaningful learning approach and self regulation. Furthermore, a low level, positive and statistically significant correlation was found between the meaningful learning approach and academic self-efficacy. This can be interpreted to mean that pre-service physics teachers who learn by making connections between the concepts they have learned before and the concepts they have learned recently, i.e. who use the meaningful learning approach, have a strong belief in their ability to perform a task given to them successfully. Some studies point out that individuals with high self-efficacy prefer the meaningful learning approach (Bandura, 1993; Hoy, 2004).

According to the results of the stepwise multiple regression analysis, pre-service physics teachers' use of metacognitive self-regulation and academic self-efficacy are influential on their tendency towards meaningful learning. Another result of the study is that these variables do not have an effect on pre-service physics teachers' inclination towards rote learning. It was found that the variable that best predicted the meaningful learning approach was the use of self-regulation. In conclusion, it can be said that the use of metacognitive self regulation is an effective factor on pre-service physics teachers' having the meaningful learning approach. Another factor that is influential on pre-service physics teachers' having meaningful learning approach is their academic self-efficacy beliefs. Case and Gunstone (2002) argues that some factors concerning course design may support metacognitive development. Therefore, if physics classes help students make plans, monitor their learning and make judgments about their learning; this will cause them to be inclined to meaningful learning. Moreover, if pre-service physics teachers attend learning environments of this kind in pre-service education, this will create the quality of the learning environments that they will form in the future. Likewise, it is evident that improvement of pre-service physics teachers' academic self-efficacies will increase their inclination towards meaningful learning. Activities supporting sources of self-efficacy as stated by Bandura (1997), namely direct experience, indirect experience, oral persuasion and psychological state; can be used to improve pre-service physics teachers' academic self-efficacies.

# Investigation of the relationship between self-esteem and metacognitive awareness level of 9th grade students

Fatma Elif Kılınç\*

Assist. Prof. Abant İzzet Baysal University, Bolu 14280 Turkey

## Abstract

This study was conducted with the aim of ascertaining whether there is a relationship between the self-esteem levels and metacognitive awareness in teenagers. Further, it was investigated whether gender and school type had any effect of the level of self-esteem and metacognitive awareness. With this aim, a sample of students attending one public school and one private school located in the municipal district of Çankaya in the province of Ankara. The study sample consisted on 211 9th Grade students. The Rosenberg Self-Esteem Scale and Metacognitive Awareness Scale were used to collect data for the research. The data of the research was analysed with a t test and Pearson correlation analysis. Results of the study suggest that there is a medium level relationship between self-esteem and metacognitive awareness in upper secondary level students.

*Keywords:* Metacognition awareness, self-esteem.

## 1. Introduction

The term metacognition refers to a learner's knowledge about his or her processes of cognition, and the ability to control and monitor those processes as a function of the feedback the learner receives via outcomes of learning (Baker and Brown, 1984; Schwartz, et al., 2004). The term metacognition was originally coined by Flavell in the early 70's who described it as "*knowledge and cognition about cognitive phenomena*" (Flavell, 1979). The term metacognition includes two broad categories of mental activities: self-appraised knowledge about cognition and self-management of one's thinking (Livingston, 1997; Cross and Paris, 1988). Metacognition may be more easily understood as "*awareness of how one learns; awareness of when one does and does not understand; knowledge of how to use available information to achieve a goal; ability to judge the cognitive demands of a particular task; knowledge of what strategies to use for what purposes; and assessment of one's progress both during and after performance*" (Gourgey, 1998; Gourgey, 2001). Metacognition refers to thoughts about thinking, cognition, and mood (Semerari et al., 2003).

In general term, self esteem is considered as the feeling of personal value (Rosenberg, 1965) reached by the result of the evaluation of individual's attitude toward oneself, personality characteristics, people's behaviors and attitudes towards them and individual's interest in himself (Açak ve Karademir, 2011). Apparently, high self-esteem is a state of mind that can potentially boost individual's feelings of self-worth, thus providing the impetus

\* Tel.: +903122987831; fax: +903122987833.

E-mail address: kilinc\_e@ibu.edu.tr

for achievement and life satisfaction. A great deal of the literature argues that having high self-esteem seems to be a key academic achievement, psychological well being, and other positive outcomes in people's lives (Brett, 2007). Self-esteem involves a person's view about his or her own worth and comprises cognitive, affective and social components that are thought to evolve as individuals mature, and as a result of personal interactions with significant others and life experiences (Price, 2007).

Metacognitive belief moderated the association between stress and resultant negative affect, and negative affect and suspicious thinking. Individuals who placed greater emphasis on controlling their thoughts had greater variability in their self-esteem during the stress condition, which in turn predicted the severity of their attenuated psychotic phenomena (Palmier-Claus et al., 2011). The approach of metacognition examines the variables of self-awareness of cognition of an individual, their monitoring and organisation and the choices and changes of preference for strategy of the individual (Karakelle and Saraç, 2010).

This study aims to investigate the relationship between students' general self-esteem and metacognitive awareness. Further, the differences between the variables of gender and school type for self-esteem and metacognitive awareness were also investigated.

## **2. Method**

### *2.1. Research Model*

The relational screening model was used in the study. The relational screening is conducted with the aim of obtaining clues as to cause and effect and to ascertain the relationship between two or more variables (Büyüköztürk, et al., 2008). The relationship between self-esteem and the level of metacognitive awareness in upper secondary level students was calculated. The general self-esteem and level of metacognitive awareness was also investigated in regard to gender and school type.

### *2.2. Research Sample*

The sample of the study comprised of a public high school and private high school within the boundaries of the district of Çankaya of the province of Ankara. The study sample consisted of 211 9<sup>th</sup> Grade students. Of the sample, 56.9% of the students were female and 43.1% were male and 52.6% of the sample attended private school, while 47.4% attended public school. Of the students, 10% had no siblings (only child), 57.8% had one sibling and 25.6% had two siblings. It was found that the age groups of the parents of the students in the sample were as follows: 38.4% of mothers were in the 36-40 age group and 34.1% were in the 41-45 age group; 46.4% of fathers were in the 41-45 age group and 37.4% of fathers were over the age of 46. The education level of parents of the students in the study were as follows: 19.0% of mothers were primary education graduates, 38.4% were high school or equivalent graduates and 37.0% were graduates of tertiary education; 6.2% of fathers were primary school graduates, 28.4% were high school or equivalent graduates, 52.6% were graduates of tertiary education and 12.8% of fathers had post-graduate education degrees.

### 2.3. *The Instruments*

#### 2.3.1. *The Rosenberg Self-Esteem Scale (RSES)*

The Rosenberg Self-Esteem Scale (RSES) was originally developed by Rosenberg (1965). RSES is a widely used unidimensional measure of global self-esteem and consists of 10-items with a 4-point Likert-type scale ranging from “strongly disagree” to “strongly agree”. The scale has five positively (e.g., “I am proud of myself”), and five negatively worded items (e.g., “I certainly feel useless at times”). Scores can range from 10 to 40. People who have the highest self-esteem get 40 from the scale, and those who have lowest self-esteem get 10 points. Items 3, 5, 8, 9, and 10 are reverse scored. Rosenberg (1979; as cited in Chubb, Fertman, and Ross, 1997) studied the scale's reliability and validity on two small college samples and had two week test retest reliability coefficients of  $r = .85$  and  $.88$ . Also, evidence for validity was provided by correlating the instrument with Coopersmith Self-Esteem Inventory (Coopersmith, 1967,  $r = .60$ ). Çuhadaroğlu (1985) adapted Rosenberg's Self Esteem Scale to Turkish adolescents. In the Turkish version, the rating of the scale ranges from “totally right” to “totally wrong” with items 3, 5, 8, 9, and 10 reversely scored. Çuhadaroğlu (1985) reported the correlation coefficient between psychiatric interview scores and scores of RSES as  $.71$ . Test-retest reliability of the scale was also  $.75$ . Another validity evidence was provided by Çankaya (2007). It was reported that there was a significant correlation between RSES and Self-Concept Inventory ( $.26$  for the whole group,  $p < .001$ ;  $.26$  boys and girls  $p < .05$ ). In the present study, an alpha coefficient of  $.86$  ( $N=211$ ) was obtained for self-esteem scale.

#### 2.3.2. *Metacognitive Awareness Inventory for Children (Jr. MAI-Form B)*

The Turkish version of the Jr. Metacognitive Awareness Inventory- Form B was used for the study (Sperling et al., 2002). Jr. Metacognitive Awareness Inventory-Form B (Jr. MAI-B), a self-report inventory, was developed as a measure of general metacognitive awareness of children in grades 6-9. The Jr. MAI was developed from a previous instrument, the Metacognitive Awareness Inventory (MAI), used with adult populations (Schraw and Dennison, 1994). Jr. MAI is a 5-point likert scale ranging from (1=never; 5 =always) the frequency with which they engage in cognitive behaviours when learning and studying. The original inventory consists of 18 items ( $\alpha=.82$ ). The Turkish version of Jr. MAI was adapted by Karakelle and Saraç (2007). The Turkish version of the inventory consisted of 18 items. The internal consistency reliability for the scale was  $.80$  and test-retest reliability of the Turkish inventory was  $.72$  ( $N = 373$ ,  $p < .01$ ). The factor analysis for the Turkish version yielded one factor solution; the authors recommended using the scale as an overall measure of metacognitive awareness. For this study, the internal consistency reliability of the scale was  $.86$  ( $N=211$ ).

### 2.4. *Analysis of the Data*

The data concerning the levels of general self-esteem and metacognitive awareness obtained for upper secondary level students were analysed by using the SPSS 18.0 program. The Pearson Correlation Coefficient was used to calculate the relationship between general self esteem and level of metacognitive awareness. Further,

an independent sample t test was used to investigate general self-esteem and metacognitive awareness levels according to gender and school type.

### 3. Findings

This section includes the findings of the results of the statistical analysis appropriate to the aims of the study.

Table 1: Correlation Between Self-esteem and Metacognitive Awareness

	N	$\bar{X}$	S	r	r <sup>2</sup>	p
Self-esteem	21	19.53	5.31	0.421	0.17	.000*
Metacognitive awareness	21	64.36	13.78			

\*p<.01

Review of Table 1 shows that there is a significant relationship between the scores of self-esteem and the metacognitive awareness levels of 9th Grade students,  $r=0.421$ ,  $p<.01$ . According to this result, it can be stated that as the level of self-esteem increases, the level of metacognitive awareness increases; however, the relationship is of a medium level. When the determination coefficient is considered ( $r^2=0.17$ ), it can be seen that 17% of the total variance (variability) for metacognitive awareness levels is caused by the level of self-esteem.

Table 2. Comparison of Self-esteem and Metacognitive Awareness Scores According to Gender

Gender	Self-esteem						Metacognitive awareness					
	N	$\bar{X}$	S	sd	t	p	N	$\bar{X}$	S	sd	t	p
Female	120	19,75	5,33	209	,687	,493	120	66,20	12,73	209	2,23	.026*
Male	91	19,24	5,30				91	61,95	14,78			

\*p<.05

Review of Table 2 shows that there is a significant difference between the levels of metacognitive awareness between genders,  $t(209)=2.23$ ,  $p<.05$ . The level of metacognitive awareness of females ( $\bar{X}=66.20$ ) were higher than that for male students ( $\bar{X}=61.95$ ). The level of self-esteem in students was not significant between the genders,  $t(209)=.687$ ,  $p>.01$ .

Table 3. Comparison of Self-esteem and Metacognitive Awareness Scores According to School Type

School type	Self-esteem						Metacognitive awareness					
	N	$\bar{X}$	S	sd	t	p	N	$\bar{X}$	S	sd	t	p
Public	100	19,66	5,27	209	.33	.738	100	66,36	10,55	209	2	.046
Private	111	19,41	5,37				111	62,57	15,98			

\*p&lt;.05

Review of Table 3 shows that there is a significant difference in the levels of metacognitive awareness levels according to type of schools,  $t(209)=2$ ,  $p<.05$ . The level of metacognitive awareness in students attending private schools were more positive ( $\bar{X}=62.57$ ) in comparison with that of students attending public schools ( $\bar{X}=66.36$ ). This finding can be considered as a significant relationship between metacognitive awareness and type of school. The level of self-esteem of students was not significant in terms of the type of students,  $t(209)=.33$ ,  $p>.05$ .

#### 4. Result and Discussion

Metacognitive awareness, knowledge and skills are essential components of successful learning since they can guide the choice of strategies, and where necessary, provide for their adjustment (Sternberg, 1997). This paper focused on self-esteem and certain aspects of knowledge of cognition components of metacognition.

According to the first finding of the study, there is a significant medium level relationship between the metacognitive awareness level and self-esteem of 9th Grade students. Studies show that the establishment of self-esteem (Efklides and Tsiora, 2002) and psychological state (Efklides and Petkaki, 2005) have an impact on the experience of metacognition. Compared with persons with low self-esteem; persons with high self-esteem prefer more challenging activities, are more confident that their efforts will lead to success, are less susceptible to emotional mood swings, are less vulnerable to depression, are more receptive to favourable feedback from interaction partners, report less negative affect and are unlikely to experience negative affect when they perceive that others rank above them socially (Yelsma and Yelsma, 1998). According to Silverstone and Salsali (2003), the most important aspect of psychological health is self-esteem, as low self-esteem leads to a lowered sense of self and psychological disorders. A perception of low self worth in teenagers is a disposition factor that may lead to various psycho-pathologies (Kuyucu, 2007). In recent years, studies investigating certain psychological disorders such as obsessive-compulsive disorders, attention deficiency, stress, anxiety and schizophrenia in terms of metacognitive functions are increasing (Karakelle and Saraç, 2010). In this scope, findings of these studies show that several metacognitive treatment techniques are developed for various psychological disorders (Clark, 2000; Mather and Cartwright-Hatton, 2004; Simons, et al., 2006; Fisher and Wells, 2008). According to Nelson (et al., 1999), metacognition can have widespread implications for research in clinical psychology, both in terms of explaining and potentially controlling the positive symptoms of clinical syndromes. Cognitive-behavioural approaches have tended to focus on a limited range of cognition in explaining psychological disorder. In particular, the focus has been dominated by a consideration of the content of thoughts and beliefs rather than cognitive processes such as attention. It is also unclear how key aspects of cognition such as beliefs and their effects on information processing should be represented in information processing terms. Beliefs about the social and physical predominantly in cognitive models of anxiety and depression and treatment focuses on modifying the content of these anxiogenic or depressogenic thoughts and beliefs (Wells and Purdon, 1999).

A further finding of the research is that there are no gender related differences in self-esteem and metacognition awareness in 9th Grade students. It was observed that there is no difference in self-esteem according to gender. Review of the study by Balat and Akman (2004) show that findings were similar and in support of the findings of this study, stating the average scores of self-esteem were high for both genders and having no difference between the genders. The study by Arıçak (1995) on university students also showed no significant difference between genders in regard to self-esteem. Other studies investigating the relationship between depression and self-esteem in teenagers also found no differences in gender (Gür, 1996). Findings in Emil (2003) and Çankaya (2007) concerning self-esteem claim no differences in the total scores between males and females. The study finds that there is a relative significant difference between female students and male students in the gender variable concerning the level of metacognitive awareness. The study conducted by Topçu and Yılmaz-Tüzün (2009) finds that females were positively correlated with knowledge of cognition and regulation of cognition in both 4th and 5th grades and 6th through 8th grades. Liliana and Laviniab (2011)'s study show that the differences between boys and girls regarding metacognitive skills seem to occur solely for specific metacognitive knowledge and skills. The findings indicate that generally both girls and boys use their metacognitive skills in learning.

Investigation of the school type variable, the study finds that the level of self-esteem shows no differences according to school type. Results of the study by Balat and Akman (2004) show similarities with this study as it was found that levels of students self-esteem do not show differences between public school students and private school students. Balat and Akman (2004) find that the level self-esteem of teenagers do not differ according to socio-economic status. However, a significant difference is found for level of metacognitive awareness of students according to school type. The average metacognitive awareness of students attending public schools are higher than that of students attending private schools. This finding should be supported with other studies. In the study by Karakelle (2012), it is stated that all variables are effective at various levels when explaining the level of metacognitive awareness; it is also stated that the variables also affected by the effects of the other variables.

In conclusion, it can be stated that there is a medium level relationship between self-esteem and level of cognitive awareness of teenage 9<sup>th</sup> Grade students attending state and private schools in the Ankara district of Çankaya. Although there were no differences found in self-esteem according to gender or school type, differences were found in the level of metacognitive awareness in terms of gender and school type.

Metacognitive awareness allows the individual to identify their thoughts as their own and creates a foundation for theoretical concepts such as self-efficacy, self-regulation and self-awareness and self-assessment, which are frequently used in the field of psychology (Karakelle and Saraç, 2010). Metacognition plays a key role in effective self-managed learning and research to further understand how other dimensions of metacognition such as goal-setting, attribution, self-monitoring, resourcefulness, self-motivation and strategic choice can contribute toward effective learning is recommended (Gravill, Compeau and Marcolin, 2002). It is strongly recommended that metacognitive processes be researched according to different variables to bring new perspectives to metacognition, as it is a process which affects the daily life of individuals in many aspects.

## Abstract

This study is planned to determine the perceptions of social support of mothers while growing up their children with physical disabilities. This study included 49 children and their mothers. Family Support Scale-FSS was applied to mothers. (Family Support Scale-FSS) which was developed by Kaner. Of the 49 children, 20.4% were in between 1-6 years of age, 32.7% were in between 7-12 years, 46.9% were in between 13-18 years of age. There was significance difference in variance analysis in mothers' knowledge support ( $p=0.006$ ), and FSS total score ( $p=0.038$ ) in between groups of the mothers who have children in preschool (1-6 years), mid childhood (7-12 years) and teenage (13-18years) period. The perceptions of social support of mothers while growing up their children with physical disabilities may support to determine the services which will be provided to families in the rehabilitation process and may increase the quality of life of the families as well as the children.

Keywords: Children with physical disabilities, family support, mothers of children with physical disabilities, social support

---

## 1. INTRODUCTION

To have children with disability may affect both mothers and fathers in physical and emotional aspects (Bailey & Simeonsson, 1988; Bramlett & Blumberg 2007). This study is planned to determine the perceptions of social support of mothers while growing up their children with physical disabilities

## 2. MATERIAL-METHOD

In order to determine the perception levels of social support in mothers of children with physical disabilities, this study included 49 children with physical disabilities and their mothers. Family Support Scale-FSS was applied to mothers. (Family Support Scale-FSS) which was developed by Kaner (Kaner S 2003). FSS have five

subsections entitled as Emotional Support-ES, Information Support-IS, Caring Support-CS, Close Relationship Support-CRS, Financial Support-FS. Datas were analyzed using SPSS 18.0 statistical programme.

### 3. RESULTS

Of the 49 children 22 (44.8 %) were girls and 27 (55.2%) were boys and mean age of all children were  $11.29 \pm 4.43$  years. Of the 49 children, 10 (20.4%) were in between 1-6 years of age, 16 (32.7%) were in between 7-12 years, 23 (46.9%) were in between 13-18 years of age. Mean age of the mothers were  $40.22 \pm 8.09$  years and 38 (77.6%) of mothers were graduated from primary school and 46 (93.3%) were housewives, while 4 (8.2%) had more than one children with physical disabilities. There was significance difference in variance analysis in mothers' knowledge support ( $F=5.697$ ,  $p=0.006$ ), and FSS total score ( $F=3.508$ ,  $p=0.038$ ) in between groups of the mothers who have children in preschool (1-6 years), mid childhood (7-12 years) and teenage (13-18 years) period. Scheffe significance test indicated that the mothers with preschool age group (1-6) declared more knowledge support compared with the midchildhood (7-12) and teenage(13-18) period group. Similarly, ADO toplam scores, the mothers with preschool age children group perceived more support than the other groups. In addition, the perception of the mothers did not differ according to gender of the their child.

### 4. DISCUSSION

The youngest group- preschool group in this study needed to know and perceived more support than the other groups. It may be due to the older groups may already have it as they live with the disability longer than the preschool group. To have detailed information about the families, to take into consideration of the age of the child will help to determine the requirements and support to families of children with physically disabled children (Lily, 1997; Reinhard, Given, Petlick, & Bemis 2008).

### 5. CONCLUSION

The perceptions of social support of mothers while growing up their children with physical disabilities may support to determine the services which will be provided to families in the rehabilitation process and may increase the quality of life of the families as well as the children.

# In art education, soul of materials: soap sculptures

Asist. Prof. Dr. Nermin Özcan Özer\*

*Department of Elementary Education, Atatürk Faculty of Education, Marmara University. Goztepe, 34722, Istanbul, Turkey*

---

**Abstract**

Intelligibility and adoption of art is possible with art education. Art education teaches visual and tactile sensation of thinking methods. While these methods purpose to become skilful at self-understanding and expressing him/herself, realising importance of details, would be expected. When emotions and thoughts turn into visual and tactual performance, concretization efforts turns intellectual activities into acts. By way of art, imagination power is improved. Designing in mind activates knowledge. In this way people become skilful at self-understanding and expressing themselves. Despite three dimensional practising has importance for art, it is not allowed to exercise, as it should be. About three dimensional practices, first thing come to mind is sculpture. Hardly in our country, sculpture has not been taken an interest deservedly. In process of time sculpture will be adopted and endeared by different practises. Providing mental clarity and energy transition in act images contribute art and education, in part of a big change.

This paper shares exercised works in 2011-2012 education period in Marmara University Atatürk Faculty of Education Classroom Teaching Department during the Art Education.

**Key words:** Art education, Soap, Sculpture

---

**1. Main text**

Understanding and adopting the art is achievable through art education. Under this education, individuals can be trained on visual and tactile sensing and thinking methods. The individual becomes skilful at self-understanding and self-expression, and is expected to become aware of the fact that also the details are important. While feelings and thoughts are transformed into visuality and tactility through sensing, mental activities are transformed into action through concretisation attempts. The imagination awareness would be increased by means of the art. When creating the design mentally, the information in memory is activated. Thus, the basis for self-knowledge and self-expression skills is formed.

Always attaching importance to and directing individuals' developments, resulting in improvement in their respective creativity, can be attained through social awareness and education effect. As a result of using and

assessing new materials, creativity will come into view and fruitful and useful products will be concretised. Imitating and reproduction is important to improve the skills, in any field whatsoever. But, if something can be generated beyond imitation or reproduction, then one can make mention of added value. Incorporating technical progress to each work will result in professional outcomes, not amateur works. It should be noted that patient, motive, interest, determination and commitment are keys to the success. When imagination and imitation become integrated, problem solving ability will be improved, as well. Benefitting from various materials in a well-organised training environment will keep the individual away from stress, thus enabling him/her to attain emotional satisfaction. Using the materials in different and various ways will support the individuals to maintain success by developing their achievements positively. Experimental richness gained through using different materials contributes to widening the individuals' creativity horizons and also to evolution of the sixth sense.

Although three dimensional applications in art are important, such works are not mentioned as much as is required. Three dimensional works recall sculpture works at first step. However, in our country the field of sculpture has not drawn as much attention as it deserves. It is intended to popularise the sculpture art and make it adopted during the course of time through different practices. As a matter of fact, Atatürk, the Head Teacher, mentioned the sculpture art during his speech made in Bursa on January 22, 1923:

“It seems that our friend meant sculpture when he mentioned monuments. Any nation seeking to attain civilization, to develop and progress shall, unavoidably, sculpture and train sculptors. Those who claim that erection of monuments here and there as historical monuments is unholy are people who failed to quest and read the religious provisions, as properly as they should. When the Prophet announced God's commandments, people listening to him had idols in their minds and conscience. The Prophet had to throw away those stone figures and delete them from those people's pockets and hearts, in order to call people to believe in God. As the Islamic facts have been fully understood and the evolving conscience faith has been proven to be right by strong facts, assuming and believing that some intellectuals would still worship such stone figures implies to insult the Islamic world. This intellectual and religious nation will improve sculpture, one of the motives of development, at highest level and the memories of our ancestors as well as of our children will reach large masses through sculptures to be erected throughout the country.” With Atatürk sculptures erected immediately after the proclamation of the Republic and following the speech, the Turkish nation began to meet, get accustomed to and like sculptures. “Considering the prevailing circumstances of the period, it was required to start sculpture plastic works in Turkey right from the first step, by launching certain, almost revolutionary, implementations/measures by the government of the Republic, due to the taboos people had as regards to sculpture as well as lack of necessary environment, practice areas and possibilities and lack of qualified sculptor at level and in number to ensure the targeted development in this field, although four well-qualified sculptors, namely İhsan Özsoy, İsa Behzat, Mahir Tomtuk and Nijad Sirel, were trained within the period from Sanayii Nefise School to the proclamation of the Republic. Although the Turkish primary school curriculum contains the subject of sculpture, it is well known that the subject is not handled with required interest and attention because of the teachers' adverse approach to the subject. Whereas there are notable sculptors educated during Republic period. It needs to mention herein some major of them: Osman Yervant Efendi, Hadi Bara, Zühtü Müridoğlu, Hüseyin Anka Özkan, Sadi Çalık, Hüseyin Gezer, İlhan Koman, Ali Teoman Germaner, Burhan Alkar, Ernur Tüzün, Hakkı Karayiğitoğlu, Haluk Tezozar, Mehmet Aksoy.

Showing sensitivity and attention to three-dimensional works (sculpture, large-scale works) at each level of formal and non-formal training & education is of great importance with regard to our future. Thus, sophomores of Classroom Teaching Department, Primary School Branch, Atatürk Faculty of Education at Marmara University made sculptures using soap material, in the Art Education class. The first thing coming to mind when talking about soap is the solid or liquid material we use to wash our hands, which can be bought at affordable

prices. It is found that a substance obtained by mixing potassium with oil was mentioned on clay tablets found in Mesopotamia, which dates from III. Century BC; this finding is evidencing the old and indispensable place soap has in our lives. Soap is a chemical substance composed of the reaction of fatty acids and bases. If required, the cleaning agent can be removed and it can be used as a work of art. It is quite easy to give form to a non-solid, soft soap. For an intact (rectangular) soap bar, the theme to be created is defined as the first step. The theme, a figure or a scenery, plant etc, should be thoroughly studied. The harmony between the teacher and the student constitutes the basis for the shaping plan for the material. A table or a bench shall be covered with newspaper, cloth or linoleum. Rough sketch of the object studied shall be prepared. During the study, the low, high, deep or shallow parts of the object shall be identified. Soap surface can be of different nature – smooth, splintery or rough. Materials to be used when working with soap are available ones during everyday life. They include modelling tools as well as wire, spatula, metal brush, needle, fork, comb, screw, nail, toothpick and similar. The important point is to select them appropriate for the artist's age. Soap residues shall be separately used.

When making a sculpture using soap, the individual is dependent on the size and colour of soaps offered at supermarkets and shopping malls. Anyway, two rectangular soap bars can be combined to increase the size of the material. If soap can be produced at home, the size can be bigger. Soap producers can also produce soaps for children with different sizes and colours. Producers can hold contest for soap shaping and sculpturing and introduce the winning form to the market, and give support to this field of art. After forming, soap can be painted with different colours and water based varnish can be applied to improve the duration of colour. Ensuring energy transition to ways of action in order to attain a widespread power of change shall make contribution primarily to the art and education.

The most difficult thing during this process of creativeness is to be able to leave the fears out. The fear of making a mistake, the anxiety of becoming incapable, the desire of being in safety constantly, all of those mentioned sentiments pointing the lack of trust as of obstacles profoundly settled down in the sense of creation shall force the designer to grasp the initial idea instead of seeking the solution. Being conditioned to the achievement in our mind, even if possibility of “the failure” to be an aspect of testing, this is not be desired. However artist-designer has not only chance of testing but also the chance of failure (Inceoğlu, 2012, p. 30).

While starting the study the individuals having low self-esteem shall be encouraged. It shall make feel that this is not a competition and it is satisfactory to express something. Also it is expressed that it is not required whether the product resemble something or not and to interrogate whether the product is the same or not and also the plotting can be effective. Timid and careless touching which influentially express the sense shall turn into the way of determined and impassioned and free. Beside the impact of products which free of details and based on the simplicity shall become different.

The first form of the design gives clues of the whole. Maturation of thought through design is possible with the help of study. Every single design includes new quests. However products which come into being without being designed on the paper are a sign of talent, ability and skills of an individual. It is not possible to say ‘I just made it without thinking’. Originality is sought by avoiding learned stereotypes and stereotypical thoughts. The forms on the soap are extension of innovation and originality. The construction, structuration and comprehension of designs show an improvement proportional to cultural accumulation in terms of knowledge and skills. So, the individual gains both identities of master of design and artist. In a sense, this artistic product is an expression of the individual and an analysis of the technique.

Different skill levels and styles shall indicate the person's qualities. The method to present person's product to others shall manifest itself by the various appearances and particulars as well. The soap is a kind of stuff suitable for performing the trial and error method easily. Because of that its remaking is easy, the soap performing shall appear in the way of artifact building which can be varied by the replicates. The individuals who are performing an application can be called as soap architecture, soap builder and soap sculptor. As a result of studies, the products shall form the documentary of soap sculpture culture enriching gradually.

### Examples of applications:

# Is every kind of play suitable for the child?

Giorgio Bartolucci Ghelli\*

\* *Direttore del Centro Internazionale Ludoteche Via del Proconsolo, 1550122 Firenze/Italy*

## Abstract

Play is a term that covers a wide range of activities, which has many meanings. The situation is complicated by the Italian language because, unlike the Anglo-Saxon one that can make use of play and game, in Italian the term "play" is unique. Present the results of some research that clearly indicate how important the play is freely chosen and understand the role that each educator plays in this choice. Also how any intervention aimed at giving assistance not required, to suggest or worse to impose a not suitable play it can be an obstacle to the development of the child.

*Keywords:* Type your keywords here, separated by semicolons ; Free Play , play.

## 1. INTRODUCTION

That playing is fundamental in the lives of small and older children is stated by many. Even the "Convention on the Rights of the Child", adopted by 192 countries of the UN Assembly on 20 November 1989, recognizes in article 31 play as a right of the child. Yet this right is somewhat hindered, forgotten and ignored when we think of children abused in many ways, of child soldiers and of the beautiful European cities that steal space to accommodate more cars instead of children's games. All this is a pertaining to a general disregard of childhood.

### 1) The meaning of play in the past times

Some languages, including Italian, have only one word for play while others such as English have two: play and game that refers to structured play. This difference says a lot about the way play refers to different childhood periods, one bound to imagination and improvisation and another to a more rational approach imbedded in games with precise rules such as dodge ball or chess. The English concept "play" is also used in English for playing an instrument and therefore this word has a meaning that especially refers to the first and second childhood period. The concept "game" on the contrary refers to the second and later periods in childhood because children up to six years, sometimes also seven, hardly agree to play by rules different from those that they themselves have stated: "I was the king, and you ..." or "you were ... and I ...", usually using the past tense: "it seemed to me ...". Every human being develops from childhood to adolescence passing different stages of maturation during which play is of the utmost importance: from being small and playing alone in a thousand ways meanwhile taking on or stepping out of roles and manipulating objects or persons to the second childhood during which large group games with strict rules are invented as so well described by Ferenc Molnar in "The Pal Street Boys".

E-mail address: giorgio bartolucci <bartolucci.giorgio@fastwebnet.it>

It is interesting to note that younger children evolve from individual play based on dynamic and sensorial knowledge of diverse objects to smaller or larger playgroups that progressively come closer to the way of life and activities of adults. So the progressive differences in play activities should be experienced in full by any child or youngster during the different periods of life and repeated with pleasure and spontaneously without which children enter adult life in a bad condition.

It is an internal process of development implemented through personal experiences and different from child to child because each one of them is unique and irreplaceable moreover requiring no intervention by adults, whether they are family members or educators. Like other living beings every little boy or girl knows what it needs. We send them to school, train them for this or that, but not in relation to play - why and how, where and how much – something they know much more about than us adults. Only their intuition regarding play helps them to grow and develop skills related to the precise moment in their life.

Many parents are surprised that his their children reject an expensive toy and prefer another cheap and less showy toy. Obviously, the child finds stimulations in that toy that the other toy cannot give him. Using external pressure to make the child comply with our requirements is useless if not harmful because it requires reactions contrary to the laws of development and to what nature predisposes for childhood in many species (look at how puppies of cats or dogs act), including our own species, and even with more reason given the complexity of the human brain.

There are many scholars who have highlighted the relationship between play and growth, including spontaneous movement and mental development. See the experiences and writings of Maria Montessori in particular for 3 to 6 year old children and older ones or those of Emmi Pikler on small children from 0 to 3 years. In both cases, the educational project starts from the idea of preparing a suitable environment in which children can operate their free choice, according to the terms proposed by Montessori. This is confirmed by the research conducted by Bortolotti and Ceciliani, professors at the University of Bologna and by Anthony D. Pellegrini of the University of Minnesota who says: "The free play can offer creative responses (...) because it stimulates the brain in developing more than when following predetermined rules. In free play children use their imagination and experience new activities and new roles. Play with structured rules establishes in advance what must be followed. Spontaneous play, however, has no a priori rules and offers more creative answers. In other words, it is a fundamental aspect that favors the development of the brain more than predetermined rules do".

## 2) - *Once upon a time*

In ancient times play was widely recognized. Every opportunity was good to celebrate (equinoxes, harvests, religious events, etc.). During the Carnival, the "Magister Ludi", the "master of play" also assumed political power in the city.

This was possible because the concept, the idea of play was rooted in the soul and heart of the people, there was a general awareness of a culture of the play. All this made the play activities become an important part of individual and collective life.

In the first "National Seminar on Italian toy libraries", which was held on the wonderful island of Ischia in October 1985, there were three different working groups.

The first group was centered on "Culture of Play", and coordinated by prof. Andrea Canevaro from the University of Bologna. The result of our workshop focused on "the need to be aware disclose and disseminate the irreplaceable values of the play for the development of the human personality, even if we recognize evident difficulties for let appreciate play in a society that has deliberately created a dichotomy between work and play, between fiction and reality, among gratuity and possession, leaning on this many of its values leading to a segmentation of society, to a cultural sterility, to a distorted conception of the relationship with the environment.

We need a constant commitment of all the game area operators to enforce the play as a cultural content, a tool, a way of life. In this context, particular attention should be paid to the cultural traditions scattered by emigration or suffocated by an internationalization of the play material. The toy librarian must reflect on the importance of their role and the seriousness of their profession.

The stakes are very high and difficult. The society is experiencing a crisis of values and relationships, violence is becoming a lifestyle, the inability to achieve the objectives that often are not real but induced, leads the individual to make personal choices sometimes destructive. All this makes a change increasingly necessary and urgent, a change that affects deeply both interpersonal relationships and the environment.

A culture centered on its playful aspect, creates environments and relationships that lead to a high quality of life.”

And we should not forget the cultural value. In his book "Homo Ludens" (1938), Huizinga examines play as the foundation of every aspect of culture and as part of the social organization.

#### *1.2. - Learn from the animals*

Has we know even animals play and this means that play is a pre-cultural phenomenon.

The puppies of animals plays: they recognize the objects they find around them as the possible toys and use them to train. A kitten is exercised, attacking and dodging a twisted branch, to fight against snakes and, by rolling a pinecone with legs, to hunt rats. But for them all end there: maturity concludes the play.

It is interesting to observe the puppies playing; the mother is present but doesn't intervene, merely she observe and monitor; her presence is sufficient to ensure the emotional security that allows to her sons the total immersion in the play so that it can be most effective.

For us humans instead the matter is more complex because we have a history, we are our history, and the stories we weave around the toys anticipate the future and, in some ways it determine, for the ability of the predictions of self occur. It is not the same thing if a child prefers the ball, sword or board games and a little girl playing the mothers rather than the ladies.

#### *1.3.- Pinocchio is arrived*

With the advent of the industrial revolution, and simplifying things, productivity at any cost became the rule and the slogan "Who plays does not produce" was extended to children. Pinocchio is an example: wasting time by playing instead of studying he was transformed into a donkey and exiled to Toyland. He returns to being a "good boy" when he stops playing. No one ever thought he could become a good boy because he played a lot.

If we want play to be appreciated again, we have to revalue an important social aspect. It is necessary to re-establish play as a strong cultural value so that it will be universally recognized and fully recovers its role.

### **3) The meaning of play in the present time**

For this reason ITLA (International Toy Libraries Association) ruled in 1999 that once a year children and adults should be able to play freely in the streets, squares, parks, schools, etc. to rediscover the pleasure of play as a personal satisfaction and as an element of cohesion between individuals of different ages and conditions.

Therefore every year on May 28th the World Play Day is organized to support and promote article 31 of the "Convention of Children's Rights", which recognizes play as a basic right. That day in forty countries around the world play is promoted for all, the older and younger ones.

In Argentina, the "Day of Play" has been legally recognized and parents who want to play with their children, have the right to a paid holiday.

We are convinced that play is a daily necessity, especially for boys and girls, young and old, and we hope that this initiative is the first step to bring play into everyday's life for everyone.

# Is Gender Important On Understanding Construction Course In Architectural Education?

Z. Ozlem Parlak Bicer\*

*Erciyes University, Faculty of Architecture, Department of Architecture, 38039 Kayseri, Turkey*

---

## Abstract

Architectural education has a different formation when compared with other profession educations. The first year of architectural education is specially difficult because, students directly start to architectural education after high school without any opinion about architecture. The first class construction course is given as Construction Knowledge I in Erciyes University Architecture Faculty. Construction Knowledge I course is given for familiarization for elements like foundation, floor, wall, column and joist of a building. In this study, it is aimed to determine the thoughts of students and their sensations for construction course in the first year of architectural education. It is tried to measure the effect of sex on understanding the construction course. It is tried to find out that which sex (male or female) has a positive/negative opinion for home works and studio studies. This study was done between the years 2003-2012 in a period of 9 years and 18 semesters, by performing a questionnaire to all students who are taking Construction Knowledge I course. By this study, we tried to find out that which systems for understanding the construction lesson may be better for students of different gender. We hope that this study will positively improve the construction education in the first year of architectural education.

Selection and peer-review under responsibility of International Conference on New Horizons in Education-INT-E, Rome, Italy.

*Key words:* Construction course; Architectural education; gender differentiation;

---

## 1. INTRODUCTION

The purpose of this study is to investigate whether gender has any effect on architecture education, with special emphasis on construction lessons. This study measures whether there is a difference between female and male students in the understanding and comprehension of lessons offered in architecture departments providing education for an important profession within the construction sector. The roles of men and women in male-dominant developing countries differentiate through some social functions, although the distinction is not sharp. The construction sector is densely populated by men in line with this understanding. There are many female architects in the Turkish construction sector. In architecture education, the number of female students sometimes exceeds that of men. Architecture education has a different formation than other professional education programs. Since students proceed to architecture education directly after high school in Turkey and they lack the basic information about the profession and professional education, the first year of the architecture education is difficult. It makes it difficult for the students to understand the new information in a field they are being introduced to for the first time. This is more evident in construction and design lessons in particular.

\* Corresponding author. Tel.: +90-532-683-6153.

*E-mail address:* parlakoz@yahoo.com, parlako@erciyes.edu.tr

There are publications in literature about the role of gender in choice of profession or differences between men and women in terms of understanding the work in the construction sector (Gale, 1994). Also, research has been conducted on the definition and scope of “business ethics” in the last 20 years. However, the issue is not found among the concepts that are “illuminated” in the literature. Generally, men perceive moral issues in terms of “justice, rules and individual rights”, whereas women associate them with “relations, showing interest and mercy”. Research results have manifested the perceptual and behavioral differences of female employees. Although there is research (Schermer, 2001) in the literature warning instructors to have a better understanding of customer-oriented organizations in order to prepare architecture students better for their professional careers, no study was found about the effect of gender on understanding the lessons in architecture education except the study carried out by us that included a small number of students. Although efforts have been made in recent years aimed at reducing the gender difference among people working in the science field, women continue to be represented less in scientific branches such as engineering and technology (Brotman & Moore, 2008).

It is not wrong to say that architecture education has a different formation than other professional educations. However, instructors of our university’s Faculty of Architecture who try to provide architecture education have no training in formation. This brings along many problems in areas such as student-instructor, student-lesson understanding and similar fields. The role of student gender in understanding the lessons is studied. In this study, it was tried to identify the thoughts and perceptions of students about the basics of construction unit they encounter in the first year of architecture education. In the study, the Basics of Construction I unit was addressed. The construction unit, which teaches construction techniques and technologies, in the second term of first year of the Architecture Department of Erciyes University is Basics of Construction I. This course aims at introducing components such as foundation, flooring, columns, girders and massive and skeleton systems. Systems and subjects addressed in the Basics of Construction I unit are: Massive construction system, Skeleton construction system, Foundations, Walls, Floorings.

Students are divided into four to five groups depending on the number of students and whether it is fall or spring. Each group is headed by Construction Department Instructors who supervise and follows the application. This means one instructor per 10 to 15 students, depending on the term of the lesson. This system, which is not found in university departments other than architecture, includes the application of the course. In universities, where the system is based on passing the unit, students who cannot pass the unit on their first attempt repeat the unit in the following terms. For this reason, although the topics discussed are the same each year, applications and tasks differ. Also, in-class applications are graded and combined with mid-term and/or final test grades at certain ratios, which results in the term grade. Mid-term and final tests as measurement and evaluation methods are based on application projects. In the architecture departments of other universities, the same subjects are taught under different unit titles. Construction units in which the same topics are discussed and the same applications conducted are found all over Turkey. Male and female students in the Architecture Departments define the gender distribution of those who are thinking of entering into the profession. In the 19-year period that passed from the foundation of the Department of Architecture until today, the number of female students has always exceeded the number of male students. It is possible to see an increase in the number of female students and a decrease in the number of male students in just one year.

Society’s perception of whether a particular profession should be populated by men or women has affected channelization into certain professions. In this study, main pillars of the building site work, i.e. construction work, are considered to be part of a man’s profession. Therefore, gender of students and their levels of understanding and comprehension of the subjects discussed in class form the foundation of this study. Measurement of attitude of students by gender towards the unit “Basics of Construction I”, which they take in the first year of architecture education, was achieved by a survey conducted on all students.

In this study, it was aimed to identify the thoughts and perceptions of students encountering the basics of construction unit in the first year of architecture education. While doing this, the effect of student gender on understanding the lesson was measured. Measurement of the attitudes of students towards the “Basics of

Construction I” unit, which they complete in the first year of architecture education, according to their gender was achieved by a survey conducted on all students during a nine-year. We hope that the study will contribute to the first years of construction education as part of architecture education and assist in understanding the importance of construction education.

## 1. MATERIAL AND METHOD

The study first of all examines construction education and techniques. Studies relating to the significance of gender in different areas in Turkey and the world are reviewed. With the direct application of the survey to students, all the details needed for the research were observed in minute detail, which led to an unprecedented study in Turkey. The effect of gender differences on architecture education was determined, which creates a foundation for diversifying construction education alternatives and enhances their reliability in line with these findings in all universities providing architecture education. Working over such a long period is necessary for accuracy of data. Also, this survey is applied to students in their senior years or interim years that can be reached and all of the students in their first years during the previous year. Creating a model for and evaluating the differences between female and male students in understanding and perceiving the construction unit was done by SPSS program by help of the chi square test (Table 1.).

Table 1. The Effects of Gender on Construction Knowledge I Course

	How many times did the student take the course and when did he/she passed	
	The opinions of students about the necessity of course content	Necessity of solid masonry system Necessity of framework system Necessity of foundations Necessity of walls Necessity of floors
	Why students think as they mentioned above about the necessity of course	
	The understanding level of students on the content of course	solid masonry system framework system Foundations Walls floors
GENDER	Opinions of students about the studio practices of the course	
	Opinions of students about the homework practice of the course	
	Opinions of students about the group studies in the course	
	Are the practices in the course adequate for understanding the content of the course?	
	Expectations of the students from the teaching assistant for better understanding of the course	
	Do students have any negative effect on the understanding of course?	
	Do students want to search the content of the course out of the studio?	

In the literature, no research was found about the effect of gender on architecture education except our previous study which contained fewer students. Most of the research on the effect of the gender parameter on lessons or general school outlook was conducted at the level of secondary education. The survey was applied to all architecture students taking the unit who could be reached. All of the students of Architecture who take the unit were included in the study instead of a sample group.

## 2. FINDINGS

In 9 years period, 321 (191 female and 130 male) students took Construction Knowledge I unit. The number of student that took part in the survey is 179, including 101 female and 78 male students. Students are free to take

Basics of Construction Unit I once or more than once. The effect of gender in terms of in how many attempts the unit was passed was measured. Whether girls or boys pass the lessons covered in this study, where constructions subjects are taught, in the lowest number of trials was investigated. When all the answers to all items related to the question were compared, no statistically significant difference was found between female students and male students ( $P=0.063$ ). Subjects taught in class are discussed under main topics of massive system, skeleton system, foundations, walls and floorings. It was investigated whether there is a difference in perception of necessity of the subjects covered in the lesson according to female and male students, and each topic was rated in five steps. When all the answers in the survey given to the questions on necessity of topics of massive system, skeleton system, foundations, walls and floorings were compared, no statistically significant difference was found between female students and male students (Table 2).

Table 2. The effects of student gender on the perception of necessity of the subjects as, floorings, massive and skeleton system constructions, foundations and walls

	Floorings	Massive Constructions	Skeleton Constructions	Foundations	Walls
Absolutely Unnecessary F/M n(%)	0(0.0) / 0(0.0)	1 (1.0) / 1(1.3)	0 (0.0) / 1(1.3)	0 (0.0) / 1(1.3)	0(0.0) / 0(0.0)
Unnecessary F/M n(%)	1(1.0) / 4(5.3)	6 (6.0) / 4(5.2)	0 (0.0) / 1(1.3)	0 (0.0) / 1(1.3)	0 (0.0) / 2(2.7)
No comment F/M n(%)	3(3.0) / 4(5.3)	5 (5.0)/7(9.1)	1 (1.0)/2(2.6)	1 (1.0)/2(2.7)	1 (1.0)/2(2.7)
Necessary F/M n(%)	43(43.4) / 31(41.3)	49(49.0) / 38(49.4)	40(40.0) / 31(40.8)	45(45.0) / 33(44.0)	44(44.4) / 35(47.3)
Absolutely Necessary F/M n(%)	52(52.5) / 36(48.0)	39(39.0) / 27(35.1)	59(59.0) / 41(53.9)	54(54.0) / 38(50.7)	54(54.5) / 35(47.3)
TOTAL F/M n(%)	99 / 75	100 / 77	100 / 76	100 / 75	99 / 74
$P$	0.314	0.855	0.477	0.484	0.274

$p \leq 0.05$  considered significant

F = Female, M = Male

In the survey, students replied to the question that enquired about their awareness that they may benefit from the subjects covered in the lesson in the future. When the answers to the items related to the question were compared, no statistically significant difference was found between female students and male students ( $P=0.834$ ). In the survey conducted, students replied to the question about compensation of the deficiencies related to the subjects covered in the lesson. When the answers to the items related to the question were compared, a statistically significant difference was found between female students and male students ( $P=0.033$ ) (Table 3). Female students do not think that they can learn the subjects covered in the lesson through the help of other lessons in the future compared to male students; i.e. they stated that everything can be learned within the scope of this unit.

Table 3. Compensation of the deficiencies related to the subjects covered in the lesson by the help of other lessons in the future

	Female n (%)	Male n (%)	Total n (%)	P
Can not compensate	96 (95.0)	67 (85.9)	163 (91.1)	0.033
Can compensate	5 (5.0)	11 (14.1)	16 (8.9)	
TOTAL	101	78	179	

$p \leq 0.05$  considered significant

In the survey, students replied to the question about learning the basics of the field owing to this unit. When the answers to the items related to the question were compared, no statistically significant difference was found between female students and male students ( $P=0.380$ ). In the survey, how the place of the unit in architecture education was perceived by students was examined. Students replied to the question about the unit being the foundation for other subjects. When the answers to the items related to the question were compared, a statistically significant difference was found between female students and male students ( $P=0.002$ ) (Table 4). Female students (49.5 %) think more than male students (26.9 %) that other subjects will not have a foundation without this unit.

Table 4. Is this a primary lesson and a foundation for other lessons and architectural education?

	Female n (%)	Male n (%)	TOTAL n (%)	P
No it is not	51 (50.5)	57 (73.1)	108 (60.3)	0.002
Yes it is	50 (49.5)	21 (26.9)	71 (39.7)	
TOTAL	101	78	179	

$p \leq 0.05$  considered significant

It was thought that female and male students could have interests in different subjects. This interest makes it more difficult or easier to understand the topic discussed in class. Levels of understanding the topics discussed in class by female and male students separately was measured in five steps. In the survey prepared in parallel to this, it was found that the gender of the student has no effect on understanding the lessons on the subjects of floorings, massive construction, skeleton construction, foundations and walls ( $p > 0.05$ ) (Table 5).

Table 5. The effect of student gender on understanding the lessons on the subjects of floorings, massive construction, skeleton construction, foundations and walls.

	Floorings	Massive construction	Skeleton construction	Foundations	Walls
I never understand F/M n(%)	2(2.1) / 0(0.0)	2(2.0) / 1(1.3)	1(1.0) / 2(2.6)	0(0.0) / 0(0.0)	0(0.0) / 0(0.0)
It is very hard but I understand F/M n(%)	23(24.2) / 11(14.9)	26(25.7) / 10(13.2)	30(30.9) / 11(14.5)	23(24.2) / 11(14.5)	19(20.2) / 10(13.3)
I do not have an idea F/M n(%)	6(6.39) / 5(6.8)	3(3.0) / 6(7.9)	3(3.1) / 3(3.9)	8(8.4) / 4(5.3)	7(7.4) / 3(4.0)
It is easy but need to study F/M n(%)	42(44.2) / 38(51.4)	44(43.6) / 42(55.3)	46(47.4) / 44(57.9)	42(44.2) / 41(53.9)	43(45.7) / 38(50.7)
It is very easy F/M n(%)	22(23.2) / 20(27.0)	26(25.7) / 17(22.4)	17(17.5) / 16(21.1)	22(23.2) / 20(26.3)	25(26.6) / 24(32.0)

$p \leq 0.05$  considered significant

F = Female, M = Male

Within the scope of the tests, sample projects are assigned to help the students to consolidate the subjects taught in class. Students' ideas about these applications conducted under supervision of instructors in class were investigate, and whether the gender of the student is an effective factor for the application examples in class. In the survey, students replied to the question that enquired about applications in class. When the answers to the items related to the question were compared, no statistically significant difference was found between female students and male students ( $P=0.061$ ) (Table 6).

Table 6. The effect of student gender on applications in class room.

	Female n (%)	Male n (%)	TOTAL n (%)	P
It is hard to understand the examples given in classroom	11 (11.0)	2 (2.7)	13 (7.4)	0.061
Although it is hard to understand the examples, I can understand when teachers explain	34 (34.0)	29 (38.7)	63 (36.0)	
I do not have an idea about applications in classroom	4 (4.0)	7 (9.3)	11 (6.3)	
The applications are enough for lesson explanation	19 (19.0)	20 (26.7)	39 (22.3)	
It is easy to understand lesson with applications and support our knowledge about the lesson	28 (28.0)	12 (16.0)	40 (22.9)

As part of the unit, students are assigned application projects as homework in order to help them understand the subjects better. Also, students prepare project papers in some periods by conducting investigations on subjects covered in class. Students' thoughts on homework they prepare on their own without the supervision of the

instructors were investigated, and whether the gender of students is an effective factor in the projects they prepare themselves as homework. In the survey, students replied to the question that enquired about the applications assigned as homework. When the answers to the items related to the question were compared, no statistically significant difference was found between female students and male students ( $P=0.632$ ) (Table 7).

Table 7. The effect of student gender on applications assigned as homework

	Female n (%)	Male n (%)	TOTAL n (%)	P
I think the applications assigned as homework are adequate	34 (34.7)	24 (31.6)	58 (33.3)	0.632
I think topic preparation homeworks are adequate	11 (11.2)	8 (10.5)	19 (10.9)	
Both homeworks are adequate	29 (29.6)	24 (31.6)	53 (30.5)	
Application homeworks are unnecessary	6 (6.1)	4 (5.3)	10 (5.7)

The possible effect of gender of student on group work was deemed to be important. It was investigated if group work is perceived as negative or positive by male and female students. In the survey, students replied to the question about group work in the atelier. When the answers to the items related to the question were compared, no statistically significant difference was found between female students and male students ( $P=0.476$ ) (Table 8).

Table 8. The effect of student gender on group work in the atelier.

	Female n (%)	Male n (%)	TOTAL n (%)	P
It helps for beter understanding	21 (21.4)	21 (28.0)	42 (23.39)	0.476

Applications in class are sometimes performed using examples drawn and sometimes using models, and sometimes by both equally. This type of lesson teaching is preferred to help students to understand the subjects better. It was thought that the gender of the students would have an effect on understanding the subject by using drawings or models. A question was prepared for the type of application in class. In the survey, students replied to the question about the method of teaching the unit. When the answers to the items related to the question were compared, no statistically significant difference was found between female students and male students ( $P=0.389$ ) (Table 9).

Table 9. The effect of student gender on the application types in classroom

	Female n (%)	Male n (%)	TOTAL n (%)	P
Drawings are helping me for better understanding the topic	11 (11.2)	13 (17.6)	24 (14.0)	0.389
Models are helping me for better understanding the topic	17 (17.3)	11 (14.9)	28 (16.3)	
Both models and drawings are necessary for all topics	40 (40.8)	25 (33.8)	65 (37.8)

Participants were not required to supply their names and were asked to reply to the survey sincerely. As a result of the anonymity, they provided their real thoughts comfortably. It was investigated if there was a difference of opinion between female and male students who take the lesson. Since students chose more than one option in this question, all of the items were tested using the chi square test within themselves. According to this, students replied to the questions about sufficiency of the subjects covered by the unit ( $P=0.429$ ), teaching of the new construction systems in the unit ( $P=0.125$ ), necessity of new units for new construction systems ( $P=0.874$ ), measurement of the sufficiency of the subjects ( $P=0.891$ ) covered in the unit according to whether they are taking other units and to the question on finding the subjects sufficient which are covered by the unit ( $P=0.460$ ). When the answers to the items related to the question were compared, no statistically significant difference was found between female students and male students ( $P > 0.05$ ).

In the survey, students replied to the question on teaching construction systems that make use of modern materials. When the answers to the items related to the question were compared, a statistically significant difference was found between female students and male students ( $P=0.004$ ) (Table 10). In the survey, there were students who did not offer any opinions about the subjects taught in the unit.

Table 10. Is it necessary to teach the construction systems that make use of modern materials?

$p \leq 0.05$  considered significant.

It was thought that female and male students would have suggestions for the all instructors who teach and assist the teaching of the unit for a better understanding of the lesson. It was measured how the negativities between those taking and teaching the knowledge would be mended on the side of those receiving the knowledge. It was hoped that students would contribute to the way unit is taught. Here, we attempted to question the deficiencies of the unit and instructors through the eye of the student. In the survey, students replied to the question on suggestions for the instructors for a better understanding of the unit. When the answers to the items related to the question were compared, no statistically significant difference was found between female students and male students ( $P=0.341$ ) (Table 11).

Students studying in the Architecture Department can achieve success in some units but fail some others. Attempts were made to investigate some of the problems pertaining to personal problems of the students. In the survey, students replied to the question on problems related to the student resulting in failure to understand the unit. When the answers to the items related to the question were compared, no statistically significant difference was found between female students and male students ( $P=0.196$ ) (Table 12).

Table 12. The effect of student gender on problems related to the student resulting in failure to understand the unit.

It is clear that students in the Architecture Department do not have the same income, culture etc. levels, which is also the case for other departments. Some out-of-department issues affect areas of the academic life of students or some of their units. External conditions sometimes affect the investigations related to the unit. Here, the effect of gender of the student on investigating the subjects assigned in class for the said unit was addressed. In the survey, students replied to the question on investigations on subjects assigned in class. When the answers to the items related to the question were compared, no statistically significant difference was found between female students and male students ( $P=0.196$ ).

### 3. DISCUSSION

While scanning the resources, data were found pertaining to the place of women in the construction sector and job opportunities by gender (Gale, 1994). However, except our previous study which contained fewer students, no resource was found on the place of gender in architecture education. There was, however, research in business life about women asserting their leadership notion and power in professional business life (Kruse & Prettyman,

2008,). Gender and science is one of the most addressed topics in the field of science education. Articles focusing on topics related to gender increase continually in science education journals. Today, press and other media organs, fashion, and trends play a role in channeling students in a certain direction. Channeling male and female students according to their areas of interest in the early years of their growth plays an important role, too. In the subsequent periods, an imbalance in the number of men and women involved in events related in the textbooks, reserving posters used in the laboratories and examples given in classes to a certain gender, and the inappropriate attitude of teachers cause female and male students to approach science lessons in different ways. Also, it was stated that there are differences arising from the toys provided for children in the early ages of development (Ozay, Ocak and Ocak, 2003).

In a study that summarized the interest of boys and girls in science. it was put forth that male students are generally more interested in science than female students. This is particularly visible in the fields of physics and technology. On the other hand, girls have more interest in biology than boys. Research shows that women have more interest in health, medicine, the body, the brain and healthy living, whereas men want to learn more about physics, chemistry and how technology works (Baram-Tsabari, Sethi, Bry and Yarden, 2006,).

In the study that measured whether there was a difference between female and male students in terms of need for special education at the nursery school level and above, it was found that male students need 65 % more special education in terms of ratio of girls to boys. This ratio goes up to 70 % among those who skip the nursery school level and start with primary school. Ratios are the same in the nursery school. Starting from primary school and in the secondary and high school levels, girls suffer more from problems associated with vision, hearing, language and intellectual problems. Boys in these periods suffer more from problems associated with reading and writing, psycho-social problems and attention deficit. As a result, the need for boys in the pre-school years arises from the genetic and biological differences between genders. The reasons behind an increased need of male students for special education during school years are that pedagogy cannot meet the educational needs of male students, along with genetic and biological factors (Skårbrevik, 2002).

The purpose of Brandell and Staberg's (2003) research was to see that secondary school students in Sweden perceive the math lesson as female-male or neutral gender. A certain majority was found that mathematics lessons are symbolically associated with male gender. While positive opinions about mathematics lesson were in majority among male students, negative opinions were in majority among female students (Brandell G., Staberg E.-M., 2008). In Allen's research, it was investigated if there was a gender difference in terms of what the content of a sex education lesson should be among high school students. Data of the research was collected from youths between 16-19 years of age in 15 schools in New Zealand. In the study, no difference was found between female and male students about what the content of the lesson should be for many of the subjects (Allen, 2008). In the research titled "Sustainability in Construction Education", inclusion of sustainability in engineering education is clearly seen. In order to educate students with new knowledge and techniques, engineering instructors need appropriate in-class content and effective teaching methods. In the light of experiences regarding the development of a sustainability lesson within Construction Engineering Departments, and associated construction management programs, this paper deals with studying sustainable knowledge areas, lesson planning, and lessons that can be learnt in class. At the same time, this paper includes basic class topics and feedback from students about the subjects, which are important for the development of sustainable education in the field of construction (Wang, 2009).

The study of Grebennikov and Skaines (2009) aims to contribute to discussions about gender differences in university education. In this study, the comments of male and female students on several university services were compared. The results show that female students attach more importance to the majority of the university's services compared the male students. Secondly, as female students make progress in their study, they become more demanding regarding the quality of the services provided at the university. Male students, on the other hand, are more tolerant compared to girls. Thirdly, female students have more interest in the fields that develop more compared to male students (Grebennikov & Skaines, 2009). Also, there are studies where the lessons

provided are rearranged according to the gender parameter. In the German project conducted on re-arranging the curricula along a common line, gender effects in medicine education was addressed. At the end of this study, it was found that successful gender blending is both a strategic issue and how strategy is arranged by medicine schools. It was argued that a time strategy would overcome natural dilemmas as well as the resistance to gender blending. More female teachers were accepted than male teachers. However, women were assigned to positions that seemed less strong (Baram-Tsabari, Sethi, Bry and Yarden, 2006,).

In a study, a significant difference in favor of female students was found in terms of the relationship between time management skills of female and male students and their academic successes. Generally, female students can manage time better than male students and they are more successful (Demirtaş & Özer, 2007). In another study, the opinions of university students on pre-school education were investigated. Opinions of university students on pre-school education was investigated according to their genders, the faculties they were in, the education levels of their parents, the jobs and income levels of their families, and whether they attended a pre-school program (Ozturk, Sahin and Mercan, 2010). Another study that deals with gender difference investigated if there is a difference between male and female students in terms of academic success and consolidation in the general biology lesson. As a result, a meaningful difference was found in favor of female students in terms of both academic success and consolidations (Ozay, Ocak and Ocak, 2003). In another study dealing with gender and sensual attitude of university students towards English as a foreign language lessons was investigated according to their gender, disciplines, economic situation of the family, and the education level of parents. At the end of this study, female students were found to have higher attitude, although they do not exhibit a statistically significant level of difference (Tok, 2010).

In the study that was conducted in order to evaluate the “Academic Study Skills” of students in various grades It was found that students see their sufficiency as medium or lower in skills relating to planned study, in-class participation, effective reading, use of the library, learning, health and nutrition, and listening and writing respectively. It was observed that students’ opinions regarding inclusion of this lesson in the curriculum did not differ by age, gender, class or the high school groups they graduated from (Ergür & Saracbası, 2009). In another study conducted to measure self sufficiency beliefs of prospective teachers studying according to their gender, branch and sub-dimensions of the scale, a relational screening model was utilized. No significant difference was determined in the self sufficiency beliefs of prospective teachers by branch and gender (Üstün & Tekin, 2009).

The purpose of the study conducted on first year students aimed to investigate the relationship between gender and their level of understanding the mechanical concepts and problem-solving skills. No statistically meaningful difference was found between final score averages of female and male students (Ateş, 2008). In another study aimed to determine the levels of interest of prospective teachers in the geography lesson and gender differences in interest. Results of the study showed that students had low interest in the geography lesson and there was no gender difference (Cin, 2007).

The goal of the study was to determine the attitude of prospective science teachers towards chemistry lessons and to investigate the relationship between attitude and academic success. The relationship of the mentioned parameters with the gender and school situation was examined. The results pertaining to gender showed that there are differences of attitude and academic success depending on gender and the type of high school they graduated from. Although there was no significant difference between female and male prospective science teachers, it was observed that female prospective teachers have a higher attitude and academic success points (Hançer, Uludağ and Yılmaz, 2007). In another study that aimed to find out the attitude of secondary school students towards geography lessons. The attitude of students towards geography lessons was medium and did not show a meaningful difference by gender and type of school (Alım, 2008). The general goal of another study conducted at the level of secondary education was to evaluate the meaningful deterministic thinking skills of students in terms of academic success, reading comprehension and gender. It was found that the meaningful thinking skill does not differ meaningfully by gender, and gender does not predict meaningful deterministic thinking skills (Berkant, 2009). In another study, the effect of student gender has been measured in the survey application carried out on

students. In this study it was determined that student gender has effects on making up for the inadequacies if any regarding the topics covered in the course, the perception of the status of the course in the architectural curriculum and the explaining of modern structural systems in the course (Parlak Bicer, 2010).

It was observed that, none of the studies in Turkey and the world covered in this section that deal with the effect of gender differences on education is about the gender parameter in architecture education except for our previous study. The reason behind some of the statistical shortcomings of our study is that no other study is conducted in the field of architecture. From another point of view, it is clear that this study included many data that will pioneer the works in this field.

#### 4. CONCLUSION

In this study, which investigated the thoughts and perceptions of students concerning the basics of construction unit that they take in the first year of architecture education, the gender parameter was addressed. It was investigated which of the activities, such as atelier work and homework, are considered positive/negative by female and male students in respect of understanding the subjects discussed in class. The gender difference was addressed by the survey the “Effect of Student Gender on Understanding the Lesson,” which was developed by me.

At the end of the analysis, it was observed that student gender has no effect on passing the course, necessity of the subjects covered by the lesson, awareness that topics discussed in class may be benefited from in the future, awareness that the lesson helps to learn the basics, understanding the subjects discussed in class, applications performed in class and assigned as homework, group work in the atelier, the way the lesson is taught, sufficiency of the topics covered in the lesson, teaching the new construction systems, comparing with the subjects taught in other lessons, suggestions to the instructor for better understanding of the lesson, problems related to student regarding failure to understand the lesson well, investigation of the subjects assigned in relation to the lesson.

As a result of the analysis, a statistically significant difference was observed between female and male students pertaining to compensation of deficiencies in subjects discussed in class by other lessons in the future ( $P=0.033$ ). There is a statistically significant difference between female and male students in perception of the place of the lesson in the architecture education ( $P=0.002$ ). When we looked at the effect of gender on teaching of construction systems that use modern materials, a statistically significant difference was observed between female and male students ( $P=0.004$ ).

It was found that in developing countries like Turkey, gender has no effect, except in some areas, on understanding and comprehension of lessons about construction techniques and technologies by architects who will take part in the construction sector. Female students should be encouraged after their graduation to use their education of construction techniques and technologies not only in offices but on building sites. Thus, women will be able to find more jobs in the construction sector dominated by men. After finding that gender has no effect on architecture education, a result of this study will be to highlight that gender has no importance in the sector, too. It is hoped that this study will open the way for further studies on architecture education.

## Abstract

We present analysis of results of entrance examinations for the University of Economics, Prague in the subject of “Mathematics” and “English” in our paper. For anonymous data we carried out statistical analysis that take into account dimensions like time series for years 2010-2012, type of high school and country of origin of applicants for study.

Conclusions then point to the better results in admission tests found in case of foreign students and declining number of points acquired in time for all applicants. Overall analysis may be evaluated as a declining number of points acquired while maintaining unchanged difficulty of examination.

*Keywords: Knowledge; Mathematics; English; Education Process, Entrance Examination*

## 1. Introduction

Together with the way in which the demographic distribution of the population in the Czech Republic changes, especially in the “teenage” group, there are also gradual changes in the models according to which the education system is regulated (Fischer, Finardi, 2010), (Finardi, Fischer, Mazouch, 2012), (Kunstova, 2012), (Kunstova, Rezankova, 2012). The uneven population curve of different periods causes a shortage of pupils and students at individual levels of the education system, (Doucek, Maryska, Novotny 2012). These gaps in numbers then on the one hand cause a drop in the number of educational institutions when there is a drop in the number of students, and on the other hand there are situations when there are insufficient institutions when the number of students rises. The present situation, where there has been an expected decline since 2011 in the population years, which might enter the sector of tertiary education, will quite certainly leave, together with the long-term economic recession, strong marks both on the number and the structure of university education in the Czech Republic (Finardi, Fischer, 2011) (Doucek, Kunstova, Maryska, 2011).

With a view to the expected structural changes (Hanclova, Doucek, 2012), we at the University of Economics, Prague (UEP) prepared and elaborated a project, dealing with the analysis of the data from the entrance exams at the University of Economics, Prague divided up according to the type of exam, faculty and eventually also subject, and subsequently evaluating in the simplest version the results achieved in time; in the more complicated versions it then also investigates the relations between the results of the entrance exams and the results achieved in the individual study courses, including the bachelor’s course state examinations. The aim of the project is, in particular, to answer the following questions:

\* Milos Maryska. Tel.: +420-604-228-819

E-mail address: milos.maryska@vse.cz

- What is the level of knowledge of the students who apply to study at the UEP from secondary schools in the subjects of “Mathematics” and “Foreign Language” (in this article presented results are for the “English language”)? How does this knowledge develop in analyzed period, or is this level of knowledge dependent on the type of secondary school?
- Are there any links between the results achieved in the entrance exams and the results in the courses during their studies?
- Are there relationships between the results achieved in the entrance exams and the results of the state examinations of bachelor degree courses?

In this article, only the results of the basic analyses of the entrance procedure in “Mathematics” and “English” are presented. Its aim is, then, to analyze the results of the students applying for admission to the UEP in the years 2010 – 2012 according to nationality and time.

The starting points for the proposed models and analyses were in particular studies (Psacharopoulos, 1995) and the experience gained at the University of Economics, Prague from earlier projects with a similar theme (Scholleova, Mikovcova, 2011) and research on the education systems of European countries (Maryska, Doucek, 2011) and (Ala-Mutka, Punie, Redecker, 2008), (Maryska, Doucek, Novotny, 2012).

## 2. Methods and Data Collection

The data for this project are collected regularly in the course of the admissions procedure from all applicants for studies. In accordance with the provisions of Law No. 101/2000 Coll., on the protection of personal data, the data of applicants are rendered anonymous for the requirements of processing and are then worked with in such a way that all personal identification factors are removed and they are processed in such a way that there is no possibility of ascertaining which applicants they originally indicated.

Further data on the results of the exams are acquired from the university information system by a single transfer of data. The actual analysis and modeling then takes place on inter-connected and completely anonymous data.

The database does not contain all the data of applicants for study at all faculties of the University of Economics, Prague because some faculties do not have exactly the same admission procedure and one faculty admits Czech students on the basis of SCIO tests (SCIO is a leading CEE educational assessment centre offering commercial services to schools, universities, self-governing institutions, school boards and other institutions in the Czech Republic. The company is engaged in development of state-of-the-art products and services aimed at education and student assessment.). For this reason we do not have the data on the results of their entrance exams at our disposal. We do, however, have the data on the level of SCIO points achieved and the data from subsequent examinations in individual subjects. We also subject these facts to further analysis, but not in this article due to the lack of space.

### 2.1. Methodology

The primary data used for evaluation were imported to the database of the MS SQL Server through extracts in the form of text files. These were exported from the central database of the University of Economics, Prague. Connected number registers were also available, enabling the clarification of primary data.

For the processing of data a data model was created in the MS SQL Server 2008 R/2 application. This model respects the principles of business intelligence, thanks to which it was possible to create analytical data cubes (OLAP). (Kimball & Caserta, 2004; Imhoff, Gelammo & Geiger, 2003), (MacLennan, Tang, Crivat, 2009).

For the analysis of the data we used two different approaches. The first was based on the use of OLAP cubes in the MS SQL Server 2008 R/2, in which a larger number of statistical indexes was created (e.g. median, average, maximum, minimum, determining deviation, etc.), enabling the data to be statistically described.

The second approach to the evaluation of the data was based on the use of the Microsoft Excel 2010 application. Through this the acquired data was also analyzed by means of statistical methods.

The combination of suitable dimensions (for instance Year of entrance exam, Selected study subject, Language of entrance exam, etc.) with the selected indexes (Number of applicants for study, Average value of points acquired in the language entrance test, Average value of results of mathematics entrance test, correlation between points achieved, etc.) made it possible to analyze the data effectively and in great detail and thus identify both the trends and the mutual links between data.

The combination of the two above approaches enabled both the mutual verification of the results achieved by the functions of various technologies, and especially the extension in this way of the range of possible statistical analyses. The reason for this is the fact that the groups of functions in the applications MS SQL Server and MS Excel are partly disjunctive.

### 3. Results and Discussion

Among the primary results of the investigation is finding out how many students submitted applications to study at the University of Economics, Prague and what the level of admission to the individual faculties was. For the requirements of this paper there are two basic groups of results – on the one hand the overall analysis of the structure of applicants for study, the proportions of applicants according to country of origin, and then the results achieved in the entrance exam in “Mathematics” and in “English”. The decline in the number of students from the Czech Republic may also be supplemented at Czech schools by admitting students from other countries, or eventually also by what is called delayed demand (studying after several years of practical work experience) (Kunstova, 2011). This is why part of the analyses carried out was not only the number of foreign students applying for admission to the VSE, but also a more detailed analysis of the results of their admission procedure. In this paper, however, there is no room for greater detail and so in Table 1 we give only the proportions of the first six countries in the number of students applying to study at the University of Economics, Prague.

Table 1: Proportions of Applicants for Study at the UPE According to Country

Source: Authors

UEP Applicants	2010	2011	2012
Czech Republic	85.51%	84.22%	83.36%
Slovak Republic	8.05%	8.07%	7.85%
Russian Federation	2.11%	3.18%	3.07%
Vietnam Socialist Republic	0.81%	1.29%	1.47%
Ukraine	1.06%	1.26%	1.45%
Kazakhstan	0.60%	0.85%	0.92%

The proportion of students from the Czech Republic is not surprising, nor is the position of Slovakia in second place surprising. The next countries in order being the Russian Federation and especially Vietnam are, however, a surprise, as is the sixth place of the Republic of Kazakhstan. There is a surprising increase in the number of students claiming Vietnamese nationality. Here we cannot distinguish whether these are really students straight from Vietnam or students who are permanently resident in the Czech Republic and claim Vietnamese nationality. Tab. 1 can be evaluated as a slow but constant decline in the numbers of Czech and Slovak students at the expense of students from other countries, which confirms the expected demographic trend (Doucek et al., 2012).

#### 3.1. Initial Knowledge of “Mathematics”

In general it may be said of the results of the entrance examinations in “Mathematics” that the average level of points achieved declines in the individual years. The incline of the set is slowly returning to a normal division from negative values (the number of smaller values is dropping compared with the middle value) and the spikiness of the set, on the contrary, is growing (more values collecting around the middle value). The scatter is, de facto, unchanged. A very interesting fact is the value of the characteristic Modus – at the level of 100.00 points. Fig. 1 provides more information on this value.

If we started off from the optimum situation, then the values given in Fig. 1 should take on roughly the shape of normal distribution. From the values given in Fig. 1 it is evident that the data ascertained does not follow this distribution. This may be caused in particular by the fact that the entrance exam in “Mathematics” is based on teaching matter generally known to students of all types of secondary schools (detail given in the Table 2) and the majority of the better students master this. A second aspect of the matter is the absence of more difficult examples, which would sort out the applicants at the top end of the point’s spectrum. The question is, however, whether such classification is strictly essential given the declining demographic curve and whether for the needs of admission to the UEP it is not sufficient to divide up the applicants into those who acquire a number of points around the median in the entrance exam and those we accept. An important part is also played here by the number of students admitted to the individual faculties or subjects.

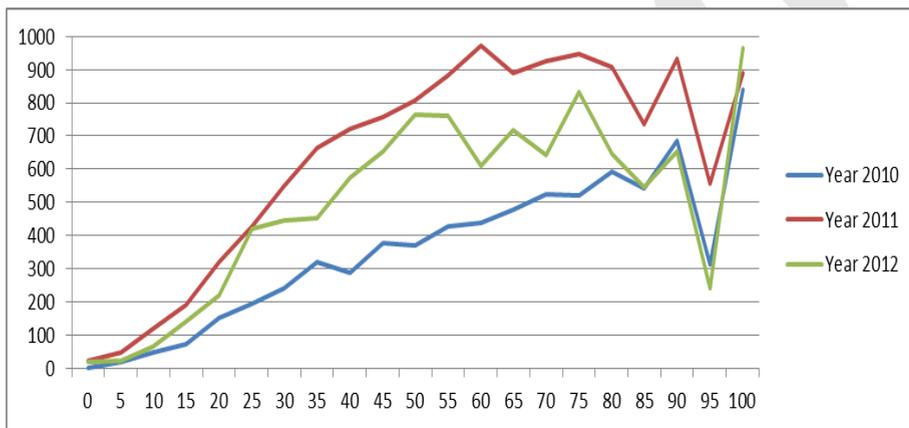

Fig. 1. Frequency of Occurrence of Numbers of Acquired Points from the Entrance Exams in “Mathematics” 2010 – 2012

Source: Authors

In the analysis of the results of the entrance exams in “Mathematics” we also dealt with the results achieved according to the nationality of the applicant.

Table 2. Results of the Entrance Exams in “Mathematics” According to Country of Origin of the Students

Source: Authors

Mathematics	2010		2011		2012	
	Avg.	Med	Avg.	Med	Avg.	Med.
Czech Republic	65.53	70.00	61.36	60.00	59.72	60.00
Slovak Republic	73.57	80.00	67.63	70.00	67.37	70.00
Russian Federation	79.44	85.00	71.89	75.00	77.81	80.00
Vietnam Socialist Republic	69.16	70.00	68.03	70.00	68.36	70.00
Ukraine	74.69	80.00	71.29	75.00	64.65	65.00
Kazakhstan	78.53	80.00	68.04	85.00	73.86	80.00

On first looking at the Table 2 we can see that the level of the number of points achieved is smallest in the case of the Czech students. On the one hand this is due to the number of applicants. They are applying to study at a university in their own land and therefore the range of applicants is wider than in the case of students coming from abroad and with certainly greater motivation. The countries of the former Soviet Union demonstrate traditionally good preparation in the exact sciences, which our investigation also confirmed. Although here too the number of points acquired is showing a certain decline in time.

A more detailed look at the Czech students, or rather at the results of their entrance exams, is shown in the Table 3. This table shows that, according to expectation, the best results are those of grammar school students. Students from grammar schools (gymnasias) are also the majority group of applicants for study at the UEP (Table 3). But even in this index we can trace a decline in the number of points gained in the entrance exam in practically all types of schools in time.

Table 3. Results of the Entrance Exams in “Mathematics” According to Type of Secondary School

Source: Authors

Mathematics	n %	2010		n %	2011		n %	2012	
		Avg.	Med		Avg.	Med		Avg.	Med
Grammar School	68.25	72.28	75.00	65.74	66.96	70.00	62.14	65.11	68.00
Economics School	17.75	58.29	60.00	20.57	53.14	50.00	21.95	52.37	50.00
Vocational School	14.00	49.87	45.00	13.69	47.42	45.00	15.92	48.62	45.00

From the Table 3, it emerges that in course of three consecutive periods we can identify only a declining trend in level of knowledge represented by average number of points achieved in entrance exam. The only exceptions are Vocational Secondary Schools, which in 2012 showed a slight increase in number of points gained.

### 3.2. Initial knowledge of “English”

The English language was identified as the most frequent language for applicants at University of Economics, Prague. Summarizing of data is presented on the Table. 3

Table 4. Results of the Entrance Exams in Foreign Languages 2010 - 2012 Source: Authors

	Total in 3 Years	2010	2011	2012
English	77.31%	76.63%	76.95%	78.04%
German	12,98%	14,33%	12,77%	12.43%
French	6.08%	5.58%	6.61%	5.85%
Spain	3.63%	3.46%	3.67%	3.68%
Total	100.00%	100.00%	100.00%	100.00%

Added information from the Table 4 is that more than three fourth of applicants prefer „English“ as the first language. There were identified faculties (Faculty of Finance and Accounting and some specializations on Faculty of Informatics – for example Applied Informatics), where language entrance examination is performed only in „English“. Other foreign languages in what the entrance examinations are preformed at UEP are Russian and Italian languages, but the share of applicants making entrance exams in these languages represents only 1.5 % of all applicants. Other aspect is the evaluation of results in „English“ according to the applicant’s country of origin – the Table 4.

Table 5. Results of the Entrance Exams in Foreign Languages 2010 - 2012 Source: Authors

English	2010		2011		2012	
	Avg.	Med.	Avg.	Med.	Avg.	Med.
Czech Republic	66.50	68.00	66.95	68.00	65.99	67.50
Slovak Republic	74.79	78.00	72.06	74.00	72.44	74.00
Russian Federation	74.29	78.00	71.59	74.00	72.07	74.00
Vietnam Socialist Republic	66.98	70.00	73.16	76.00	72.91	76.00
Ukraine	74.69	80.00	71.63	74.00	67.56	68.00
Kazakhstan	75.60	78.00	66.98	70.00	71.84	76.00

The best knowledge of “English” was identified by applicants for Kazakhstan in 2010, but in three year this knowledge declined to the fourth place behind applicants from Vietnam Socialist Republic, Slovak Republic and Russian Federation. Knowledge of Czech applicants is the worst of all investigated countries, but the lagging off is not so dramatically.

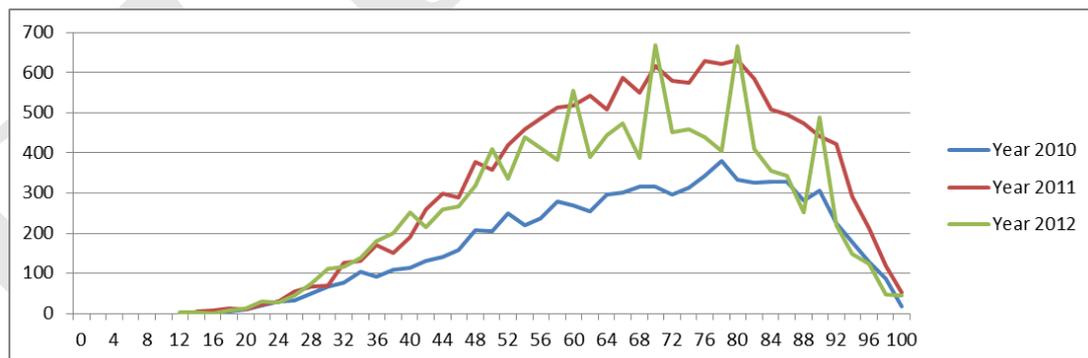

Fig. 2. Frequency of Occurrence of Numbers of Acquired Points from the Entrance Exam in “English” 2010 – 2012 Source: Authors

Other question (the second one) was related to the occurrence of numbers of acquired points from „English“. The reconstructed curve is visible on Figure. 1 and it reflects the normal distribution, as was expected during the survey.

From the Table 6 it emerges that in the course of three consecutive periods we can identify an only declining trend in the level of knowledge represented by the average number of points achieved in the entrance exam. The only exceptions are the Vocational Secondary Schools, which in 2011 and 2012 showed a slight increase in the number of points gained.

Table 6. Results of the Entrance Exams in “English” 2010 - 2012

Source: Authors

English	2010			2011			2012		
	n %	Avg.	Med	n %	Avg.	Med	n %	Avg.	Med
Grammar Schools	60.83	72.53	74.00	65.26	72.13	74.00	61.40	71.78	74.00
Economics Schools	23.36	59.32	58.00	20.20	58.45	58.00	21.65	57.18	56.00
Vocational Schools	15.80	54.69	54.00	14.53	55.61	54.00	16.96	56.23	56.00

The better quality of „English“ learning process seems to be visible (difference for more than 10 per cents of gained points) identified in grammar schools, although the level of gained points is slightly but permanently decreasing during the investigated period.

#### 4. Conclusion

Research into the admission procedure at the University of Economics, Prague was originally undertaken in an effort to acquire basic material to strengthen the qualified decision-making of top management of faculties regarding the manner of admission of applicants to the university. For these needs we used standard statistical methods for statistical analysis on the data we acquired from the entrance exams of applicants for study. For the requirements of this paper and with regard to its limited possibilities we present here only part of the results achieved for the subject of “Mathematics” and “English”.

The decisive share of applicants for study at the University of Economics, Prague comes from the Czech Republic (this share is dropping very slightly). The second most numerous group consists of applicants from the Slovak Republic (their share is also dropping very slightly); the next group are students from the Russian Federation (their number has increased by one percentage point in the three years studied), followed by students from Ukraine.

In the analysis of the collected data for “Mathematics” we reached the following results in particular:

- The number of points acquired in the entrance exam in “Mathematics” is constantly dropping although the difficulty of these tests remains the same. This applies regardless of the nationality of the students or the type of secondary school the applicants attended. The results achieved in the admission procedure are not regulated by normal classification, but have the tendency to separate out the average and below-average applicants from the others – the borderline is somewhere around 55.00 – 60.00 points. The entrance exam also does not identify applicants who are really outstanding in mathematics.

- The best level of “Mathematics” education procedures was identified by grammar schools.

In the analysis of the collected data we reached the following results for “English” in particular:

- English language is the most frequent language of applicants for study on UEP; approximately more than ¾ of applicants selected “English” as the language for entrance procedure; the best results in points gained present applicants from Vietnam Socialist Republic, Slovak Republic and Russian Federation.

- The occurrence of numbers of acquired points from „English“ reflects the normal distribution; it corresponds to presumption, that questions and exercises entrance exams are correctly prepared and examinations give real mirror of applicant’s knowledge.
- The best quality of “English” education procedures was identified by grammar schools.

## Acknowledgements

Paper was processed with contribution of GAČR by handling task “P403/11/1899 Sustainability support of SME based on ICT innovation”.

# Knowledge and attitudes of university students on consumer rights

Gulden Gok<sup>†a</sup>, Ufuk Ozen<sup>b</sup>, Erdal Yoruk<sup>c</sup><sup>a</sup>*Selcuk University, Vocational High School of Social Sciences 42151, Konya, Turkey*<sup>b</sup>*Maltepe University, Faculty of Economics 34857, Istanbul, Turkey*<sup>c</sup>*Selcuk University, Vocational High School of Social Sciences 42151, Konya, Turkey*

---

## Abstract

Manufacturing have increased rapidly dragging consumption away frenzy level due to advanced technology and various communication possibilities during recent years. Some products decay before opening the packaging because of excessive amount of buying. The concept of "fashion" emerged for Electronic instruments too. Waste of forests, fuel, water etc. consume the resources in the countries. Before buying, the negligence of consumers about prices, quality, safety or healthy for products is also play important role of increasing this waste. With a view to raise awareness and to protect consumers, "Consumer Protection Act, numbered 4077" was enacted and became effective on 23.02.1995 in Turkey. This Act regulates the issues regarding "*measures to protect consumers' interests, to enlighten and educate consumers, to indemnify consumers, to protect consumers against environmental hazards, to encourage consumers to take actions to protect themselves and to promote voluntary consumer organizations*". As the subject of consumer rights are gaining great significance at national and international levels nowadays, consumer awareness becomes a lifetime process starting from childhood. In this respect, it is important to know whether the consuming preferences of the youths are based on the true knowledge or not. This study was conducted in Alaaddin Keykubat Campus of Selçuk University, in Konya, in order to assess the knowledge of university students on "The consumer protection Act numbered 4077" for determining whether they are conscious consumers or not as they purchasing goods and services.

---

Keywords: Consumer Awareness, Consumer Rights, Goods and Services, Defective goods

## 1. INTRODUCTION

The consumer concept has emerged and used especially beginning from 19th century. Before the industrial revolution of the 19th century, persons who buy goods and service to meet needs was considered as 'buyer, rather than consumer' (Aslan: 1996: 1). The industrial revolution increased production of various types of goods, boomed the consumption level to frenzy bringing several issues with it. Consumers who failed to reach enough information about goods and services such as market prices, quality and healthy level, stayed weak position in the face of strong manufacturers.

They didn't know what they do or where they complain about problems of sold products.

Large increase in the number of consumers forced authorities to solve that kind of problems in legal ways and brought consumer rights on the agenda. Since the early 19th century this topic has gained momentum steadily.

### *1.1. The Emerge of Consumer Rights in Europe*

For the first time, European Union consumer law was mentioned in the Maastricht Treaty. Starting from 1993, consumer rights gained importance in the European Union (Erdoğan, 2011:2). Consumer rights was accepted in European countries such as England, Germany, France, Belgium, Swiss (Poroy,1979:517). U.S. President j. Kennedy, 15 February 1962, laid the base of the rights of consumer in his speech at the Congress for the first time. (Ede and Calcich,1999;113). J. He said: Consumers' fundamental rights are: the right to safety, the right to be informed, the right to choose, the right to be heard (Skinner,1990:673); Kennedy's highlights affected not only advanced Western countries, but also other countries in the world in that direction and resulted in positive approaches to the consumer problems. (Göle,1983:24; Tokol,1977:18; Erdoğan,2011:2).

### *1.2. Fundamental Consumer Rights*

The guidelines were adopted by the UN on 9 April 1985 in the General Assembly of the United Nations and accepted by Turkey too. They gave important legitimacy to the principles of consumer rights and practical support and guidance for developing national consumer protection legislation. The protection of consumers, a number of principles that developed by universal organization of consumer associations was adopted and recognized by the European Union on July 5, 1986 (Hippel,1986: 23; Demir, 2001: 22;

Tuskan,2011:18 [www.istanbulbarosu.org.tr](http://www.istanbulbarosu.org.tr); Tüketiciler Bülteni). The guidelines have been interpreted by CI and translated into clear consumer rights as follows:

1. The right to the satisfaction of basic needs

2. The right to safety
3. The right to choose
4. The right to be informed
5. The right to consumer education
6. The right to redress
7. The right to be heard
8. The right to a healthy environment.

[www.tupadem.hacettepe.edu.tr/evrenseluketicihaklari.php](http://www.tupadem.hacettepe.edu.tr/evrenseluketicihaklari.php). [www.mevzuat.adalet.gov.tr/html/862.html](http://www.mevzuat.adalet.gov.tr/html/862.html).

The right to the satisfaction of basic needs: The minimum needs of the human being to survive, The fundamental right of consumers, To have access to basic essential goods and services; adequate food, clothing, shelter, health care, education and sanitation. They are:

- Basic physiological needs (hunger, thirst, insomnia, gender)
  - Security requirement (a sense of confidence, physical and economic security)
  - Social needs (belonging, being loved, proximity, and friendship),
  - Needs the ego (reputation, achievement, self respect),
  - Self development needs (being a famous scientist or athlete, etc.)
- ([www.tupadem.hacettepe.edu.tr/evrenseluketicihaklari.php](http://www.tupadem.hacettepe.edu.tr/evrenseluketicihaklari.php).)

The right to safety in goods and services bought: The right to expect that household products and children's toys, when used according to manufacturer's instructions, will not explode, set houses on fire, or cause personal harm or injury in any way. In cases where goods and services are not reliable in quality, today's consumer faces with the danger of injury, poisoning, disablement, even death risk at any moment. (Akipek,1999:132). This right is different from others as it relates to the life and health of consumers directly . ( [www.tupadem.hacettepe.edu.tr/evrenseluketicihaklari.php](http://www.tupadem.hacettepe.edu.tr/evrenseluketicihaklari.php), [http://journal.yasar.edu.tr/wp-content/uploads/2011/07/no3\\_vol1\\_08\\_durmaz.pdf](http://journal.yasar.edu.tr/wp-content/uploads/2011/07/no3_vol1_08_durmaz.pdf).)

The right to be informed: to be given the facts needed to make an informed choice, and to be protected against dishonest or misleading advertising and labelling. Consumers can make a rational selection before buying. To do this, informations like the prices, quality and skills of goods should be given; after buying, tools or instructions for using the goods in a healthy and safety way and fit-for-purpose should be given to the consumer. The consumer have the right to be informed about the legal procedure in case of defective goods and services, or in the absence of agreed property, and the prevention of misleading. This refers to the rights of the consumer's right to information. ([www.tupadem.hacettepe.edu.tr/evrenseluketicihaklari.php](http://www.tupadem.hacettepe.edu.tr/evrenseluketicihaklari.php), [www.mevzuat.adalet.gov.tr/html/862.html](http://www.mevzuat.adalet.gov.tr/html/862.html)).

The right to choose between products of different qualities and prices, which are required to satisfy our needs: personal demands, taste and others factors, of course, affect prices. It is the consumer's right to choose a level of quality and performance equal to the price which he/she is prepared to pay. In a democratic system, citizens (consumers) choose political authorities with their free wills (Kuzu,2011:22), similar to this, citizens (consumers) should have to choose the right products or services to meet their needs.(Tanör,1978:9) For this reason, substitute products and services should be provided alternatively; should not be limited since the

fundamental logic of the free market economy is "development-improvement through competition between available alternatives". The consumer's right to choose includes; competitive prices with a wide range of other comparable qualifications, presenting products and services to consumers with so much diversity, even if it is limited in the specific areas, acceptable price with the provision of satisfactory quality and service guarantee. (tupadem.hacettepe.edu.tr/evrensel tuketicihaklari.php)

The right to be heard: to complain to a retailer if one is dissatisfied about a product or service. To have consumer interests represented in the making and execution of government policy, and in the development of products and services. Participation of consumers and consumer organizations to the decisions that are directly or indirectly related to the rights or benefits of consumers taken by the various institutions must be provided. Consumers should attend at the decisions that directly or indirectly concern themselves through unions democratically. They can defend their rights, political thought and interests with legal, administrative, technical, commercial, economic, social etc. tools. The development of voluntary consumer organisations must be encouraged. Consumers should be protected with the institutions created by the public sector and, where applicable, must be supported to be represented. (www.tubitak.com/evrensel.htm)

The indispensable condition of democracy is organized society. The development of the community in economic, social and cultural aspects, to reach at a healthy and contemporary level, to use underground and ground resources of the country efficiently and in accordance with the needs of the community, the settlement of consumer rights and human rights, is possible with organizing society and living democracy. (Kuzu,2009), (www.tupadem.hacettepe.edu.tr/evrensel tuketicihaklari.php)

The right of redress: means the right to a fair settlement of just claims. It includes the right to receive compensation for misrepresentation or shoddy goods or unsatisfactory services. It provides:

- Simplicity of receiving the defective goods back
- Possibility to regenerate the offending services
- If it is not possible to withdraw defective goods, the return of the cost must be provided
- The payment of compensation or loss depending on legal basis (Baykan,1997:22 ; AB, Tüketiciyi korur, 2007) .(www.tupadem.hacettepe.edu.tr/evrensel tuketicihaklari.php)

The right to consumer education: means the right to acquire the knowledge and skills to be an informed and assertive consumer. Consumer's education can be defined as an informative investment to orientate economic activities of an individual and to increase its strength to influence market. Consumer education is important in terms of both protection and information. The most promising solution for protection of consumers in the long term is consumer education for being "a better consumer" . It is believed that informative and protective efforts will not give the expected results without education in developed countries. The main purpose of the training programmes is to teach the consumers to find needed information and how he/she can evaluate or use the information. In addition to this, developing the ability to purchase and use of goods and services; examining production and distribution conditions, creating total environmental awareness, teaching to become party to the economic and social preferences are other objectives. (www.tupadem.hacettepe.edu.tr/evrensel tuketicihaklari.php.)

To reach above aims, followings should be implemented:

1. -Informative education and training in all schools
- Training and education in other institutions through social organizations.
- Notification and enlightenment by printed and visual media (www.tukobir.org.tr/frame.asp?sayfa=haklar.)

2. The right to a healthy environment: means the right to a physical environment that will enhance the quality of life. It includes protection against environmental dangers over which the individual has no control. We live in an age of consumerism. As is well known, people consumed the nature for a long time. As a result of this frantic consumerism, a lot of problems and dangers came up with. Today, the environment has been an extreme precision in developed countries, to overcome, very large plans or projects are being produced the participation of each segment of society. It is fact that remedies to develop environmental awareness is strictly related to consumer consciousness. It is not possible to separate the consumer consciousness from environmental awareness no longer. The criteria for being responsible and conscious consumer in developed countries is not only “defending rights” or “to pay true price” no longer. In addition to this, purchased goods and services are discussed in the aspect of social cost. Conscious consumer is defined as the person who goods and services purchased, does not harm the environment, and does not waste natural resources. ([www.tupadem.hacettepe.edu.tr/evrensel tuketicihaklari.php](http://www.tupadem.hacettepe.edu.tr/evrensel tuketicihaklari.php))
3. -The right to a healthy environment has the following items:
4. - The right to have a physical environment which improves the quality of life
5. -Prevention of environmental hazards,
6. - The right to protect and guard the environment for today's generations, as well as for future generations. ([www.tuko-bir.org.tr/frame.asp?sayfa=haklar](http://www.tuko-bir.org.tr/frame.asp?sayfa=haklar))

### *1.3. Historical Development of Consumer Rights in Turkey*

History of consumer protection legislation in Turkey extends to the period of Ottoman Empire. The Ottoman Empire executed various mechanisms and established some Institutions and organizations to protect consumers, tried to balance of the rights of manufacturers, consumers and distributors by performing a triple system. The basic elements of this triple system were state, artisan representatives and consumers. (Aydoğdu, 1998:3). Shopkeepers in cities organized and established a chamber of artisans called “Ahi organizations” that is similar to today’s professional organizations. Ahilik Organizations (Özyılmaz, 2011:56-59) worked as consumer protection organizations.

In the first years of the Republican era, there was not any special law or regulation relating to consumer protection. During this period, some laws which had been put into force in order to protect public order used for aiming to protect the consumer rights. (Akipek, 1999:111; Arslan, 1996: 29).

In the 1970s, with the developments in Turkey's economy, the industrial sector and the service sector gained weight, production increased along with increased consumption. (Akipek, 2001:20) Increasing consumption brought the issue of protection of consumers in legal sense. As a result, the Ministry of Commerce took Consumer Issues Seminar on the agenda for the first time and consumer issues were discussed in this seminar: the necessity of legal regulations for the protection of the consumer like in developed countries discussed. After this date, this work has won speed and came to the present. (Tokol, 1977: 95).

The basis of the legislation in Turkey related to consumer rights are : Universal Declaration of Human Rights, Universal Declaration of Consumer Rights of U.N.A.s to article 172 of 1987 Constitution: "the State takes protective and enlightening measures for consumers, encourages consumers' preventive initiatives." Related laws are:

- 1982 Constitution's 172. item (direct), items 167 and 171 (indirect).
- The consumer protection Act 4077 " in 1995
- The Protection of Market Competition Law,
- Obligations code(in particular the new code of obligations).
- Turkish Commercial Code (especially The New Turkish Commercial Code).
- The Turkish Penal Code.
- Public Hygiene Law

Consumer protection law entered into force in 1995 in Turkey. The latest changes in this law were made in 2003. Nowadays, following governmental or non- governmental institutions work to protect consumer rights in Turkey: Turkey Consumer Organisations, Consumer Associations, Consumer Protection And Competition General Directorate, Ministry Of Industry and Commerce, Consumer Council, Consumer Issues Arbitration Committee, Advertising Board, Consumer Courts (www.tupadem.hacettepe.edu.tr.,www.mevzuat.adalet.gov.tr/html/862.html)

## 2. OBJECTIVES OF THE STUDY

This study was conducted in Konya in order to determine the knowledge and attitudes of university student as consumers about consumer rights. Also, to reveal whether they are conscious consumers or not as they purchasing goods and services was another aim. Target population of the study was the students in Alaaddin Keykubat Campus in Selcuk University in Konya. In this campus, there are Law, Economics, Business Administration, Public Administration and International Relations, Communication and Health Sciences Faculties. It was assumed that target population, namely the universe, had basic knowledge about "The consumer protection Act 4077 " since the Faculty of Law together with the mentioned faculties are being taught general law through lessons such as "Introduction to Law" , "Basic Concepts of Law" . The results of this research will also contribute to the planning of law education in the future.

## 3. LITERATURE RESEARCH

There are a lot of works to measure consumer awareness in the literature. The first scientific field study to decide awareness level of citizens about consumer rights was done by Borak in Turkey in 1984. Borak's study revealed that consumers did not know their rights and consciousness level of using these rights were low. (Borak, 1989: 80-98).

A study named "The importance of Consciousness Level in Consumer Protection, An application on Households" was done by Kaynakve Akan. Although the vast majority of consumers did not know the Consumer Protection Law; they did not believe the existence of enough consumer protection in the country as to the results of this study. The rate of becoming aware of the consumer protection law increased as to education level in this study. The rate of being aware of the consumer law was 100% in post graduate, while those who graduate from primary school was 62.7% . Although more than half of the respondents considered themselves as none-

conscious consumer, the rates of considered themselves as a conscious consumer were 65,8% (first place) at those who have postgraduate education, only 39.1% at primary school graduates.

In 2003, a field survey for revealing consumer awareness and levels about “The Consumer Protection Act4077” done by Mert. He found that:12.9% of attendants never know anything about, 48.8% of them know little, 28.3% of them good at, and 10% of them were not sure about their knowledge.(Mert, 2004: 315-324).

Babaoğlu’s survey on same subject says that:37.8% of consumers are not aware of their legal rights. 84.8% of them don’t know where she or he applies for a purchased defective good or service. 2.8% of consumers know 8 Fundamental Consumer Rights.77.3% of consumershave not heard “Arbitration Comitee for Consumer Issues”yet. 75,8% of consumers don’t know non-governmental organizations aimed at consumer protection. 90,4% of consumers do not know consumer advice phone number. 54.2% of them do not know “Consumer Protection Act, numbered 4077”. 42.1% of them don’t believe that they have properly protected rights. Only 0.5% of consumers are a member of consumer organisations.(www.tupadem.hacettepe.edu.tr/.../tuketicinin\_koronmasi\_bilinc\_duze)

Güler and his colleagues made a study at two high schools in Ankara to decide consumer rights knowledge and attitudes of teenagers. (Totallly 353 students, 58.6% of participats are men, 47,0% of them were 16 years old. 63.2% of students were in grade 9). As to the results of this study, “The right to the satisfaction of basic needs” is best known and “The right to redress” is the least known item of 8 items of Fundamental Consumer Rightsin students. Most of the students (85%) said that the seller of the product is the first reference for a purchased defective product. (Güler and his colleagues, 2007:16).

Dickinson and Shaver made a study in the United States in 1982 to decide the level of information related to consumer rights and to what extent they use this information when they have a problem. In this study, it was come out that consumers who had upper grades than high school were more conscious consumers than those who had high school or under grades (Dickinson and Shaver, 1982:241-260).

Singh K. and his colleagues made a study named Awareness of Consumer Protection Act (CPA) Among Doctors in Udaipur City in India in 2009. The survey was in a cross sectional study, a total of 448 professionals (253 males, 195 females) belonging to dental (222) and medical (226) categories were surveyed using a self administered structured questionnaire. Results: The awareness scores were significantly higher for medical professionals compared with those of dental professionals. Similarly, postgraduates showed more awareness in both the professions and it was found that private practitioners significantly have more awareness than the academic sector.

Conclusion: Though medical professionals have more awareness of CPA compared to dental professionals, considering the present scenario, better knowledge of CPA is necessary for both professionals in order to be on the safer side.

## **4. METHOD OF THE STUDY**

### *4.1. The Sample*

The survey was designed to measure and evaluate attitudesand information level of the university student to consumer rights, especially “The consumer protection Act4077 ” and it was performed with a questionnaire. The

data set of this study was collected by conducting the questionnaire to university students that were selected randomly. Frequency distribution and differences between groups were analyzed using chi-square test by SPSS.

Like similar studies, easy sampling method was used to collect data in this study because of providing quick access to a large amounts of data sampling (Cui vd., 2003; Zhou, 2004), (Nakip, 2003). The universe of the study was limited to the students of some faculties which have fundamental law lessons under any name. The number of the student in these faculties is 4934. Due to the number of the universe, the number of the elements of the sample was decided as 607. By taking into account the Sample Sizes Table ( $\alpha= 0.05$ ) prepared by Yazıcıoğlu and Erdoğan (2004), the minimum number of needed survey was determined as 240 with  $\pm 0.05$  sampling error. During the implementation of the application of the survey for two months, 607 questionnaires were achieved. Obtained questionnaire number exceeded targeted number. As a result of this, the survey recycle ratio can be thought of as an acceptable recycle ratio.

#### *4.2. The Hypothesis of the Survey*

Developed Hypothesis are as follows:

**Hypothesis 1:** There's a difference between the levels of awareness of consumer rights as to gender.

**Hypothesis 2:** There's a difference between the levels of awareness of consumer rights as to age groups.

**Hypothesis 3:** There's a difference between the levels of awareness of consumer rights as to marital status.

**Hypothesis 4:** There's a difference between the levels of awareness of consumer rights as to home city.

**Hypothesis 5:** There's a difference between the levels of awareness of consumer rights as to monthly income.

## 5. FINDINGS

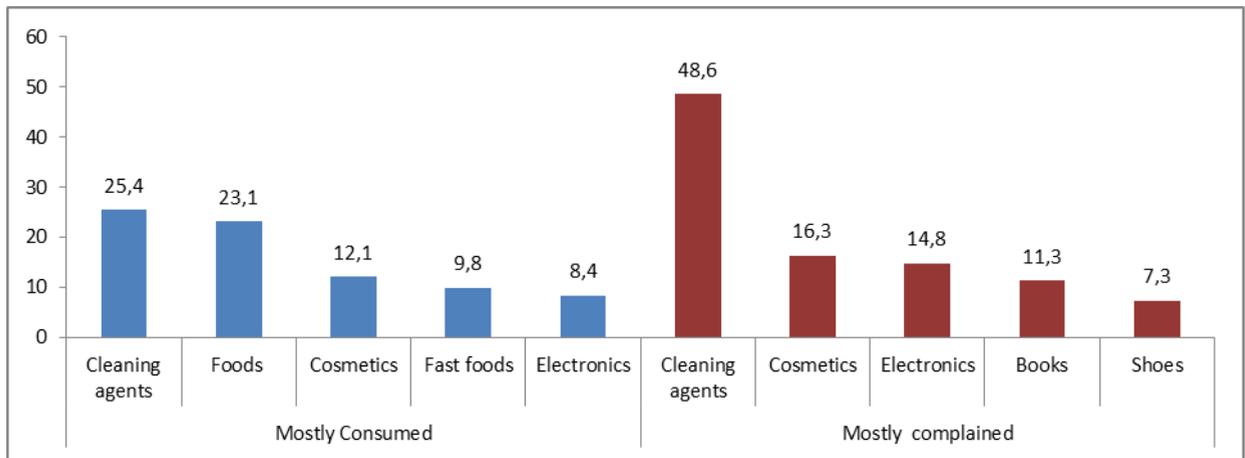

Figure 1: Mostly consumed and mostly complained product groups of the participants (%)

Complaints about cleaning agents were the top. Cosmetics were the second. Electronics were 5<sup>th</sup> in consume list but got the third in the most complained product groups list.

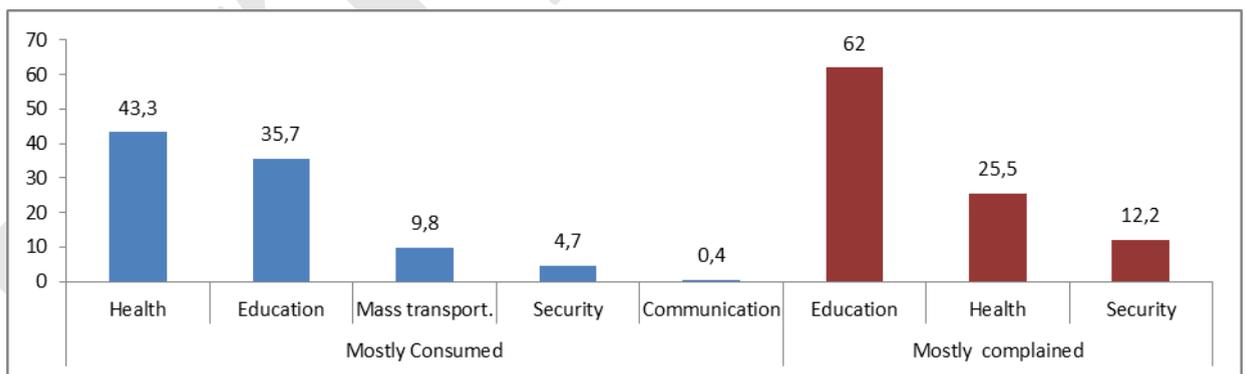

Figure 2: Mostly consumed and mostly complained service groups of the participants (%)

The most consumed service groups of the students were the most complained service groups at the same time with a change in order.

### 5.1. Reviews on the Hypothesis of the Survey

In order to determine the level of awareness about consumer rights, items in the figure 3 were asked to the participants in the form of a likert scale. As to the evaluation criteria, “certainly not agree” shows 0 point, “certainly agree” shows 5 point in the scale. The results are given below in the figure.

Items for measuring the awareness level of participants on consumer rights are listed from the most supported sentence to the least in figure 3. No item got half point as an average shows lower awareness level. Slight differences of standard deviations between items show that lower awareness level has a normal distribution between items.

Items	Men (n=214)		Women (n=376)		Mann Whitney U Test	
	Avg.	S.D.	Avg.	S.D.	z	P
Deceptive and misleading ads abuse children and the elders more than others.	1,93	0,80	1,98	0,76	-0,62	0,539
The idiom "No return for purchased goods." has lost importance nowadays.	2,07	0,75	2,01	0,75	1,08	0,281
Consumers can end subscription agreements by sending written notification to the seller unilaterally.	1,93	0,79	1,94	0,78	-0,24	0,809
If the consumer pays arrears of installment buying, he or she deserves a discount.	2,02	0,78	2,05	0,74	-0,53	0,599
If you apply for a defective goods or services to the seller within thirty days, the contract can be terminated.	1,80	0,80	1,82	0,79	-0,305	0,761
If a product fails within the warranty period, the dealer is obliged to repair the product without demanding labor costs, repair part cost or any cost under any name.	2,22	0,72	2,08	0,78	2,125	0,034
Creditors are obliged to notify the consumer in case of any increase in interest rate before 30 days.	2,06	0,83	2,00	0,82	0,898	0,37
If the marked price or the price at the price tariff is different from the cashier price, the price that is consumer's favor is valid.	1,55	0,76	1,56	0,73	-0,183	0,854
When purchasing goods or services with a credit card vendor or provider can't ask for an additional payment like commission or under any name.	2,00	0,78	1,98	0,76	0,171	0,864
Total	17,57	5,01	17,42	4,86	0,364	0,716

Figure 3: The awareness level of participants on consumer rights ( as to gender) Note: “ n” is the number of participants

It can be seen from the table that there are slight differences between total amount of averages and standard deviations as to gender. This shows similarity between two groups. Both groups have almost same awareness as to items too. ( $p_i > 0,05$ ) So, the rejection of an gender-based perception hypothesis is possible, because there is no difference in the levels.

Whether the awareness level of participants on consumer rights change as to age groups or not was also examined in the study. Although total amount of averages and standard deviations are slightly decreasing with respect to age groups, there is no meaningful difference as to Anova test as to age groups. ( $p_i > 0,05$ ) So, the rejection of an age group-based perception hypothesis is possible, because there is no difference in the levels.

Whether the awareness level of participants on consumer rights change as to marital status or not was also examined in the study. Although total amount of averages and standard deviations are slightly decreasing as to marital status, there is no meaningful difference as to Anova test. ( $p_i > 0,05$ ). The rejection of a marital status-based perception hypothesis is possible, because there is no difference in the levels.

Whether the awareness level of participants on consumer rights change as to home city or not was also examined in the study. As regard with home city, there is no meaningful difference as a result of Anova test. ( $p_i > 0,05$ ). The rejection of a home city-based perception hypothesis is possible, because there is no difference in the levels.

Whether the awareness level of participants on consumer rights change as to monthly income or not was also examined in the study. As to the statistics of the the study, monthly income has no effect on the awareness as a result of Anova test. ( $p > 0,05$ ). The rejection of a monthly income -based perception hypothesis is possible, because there is no difference in the levels.

## 6. CONCLUSION

As to the result of this study, the most consumed commodities of the students were cleaning agents, foods and cosmetics respectively. But almost half of the complaints of the students were about cleaning agents. Others were cosmetics and electronics. Various studies found cleaning agents as mostly complained commodity too. It seems a general problem. May be, extensive ads on mass media create fictive expectations about those product. As a result, consumers feel disappointment about those products. On the other hand, the most consumed service groups of the students were health, education and mass transportation. Education was the most complained service group of the students with 62 %, others were health and security services respectively.

The average knowledge level of the participants to the questions related to "The Consumer Rights Act 4077" was low. It can be found as 39 % by integrating the related questions among questions 1-17. Figure 4 shows this analysis.

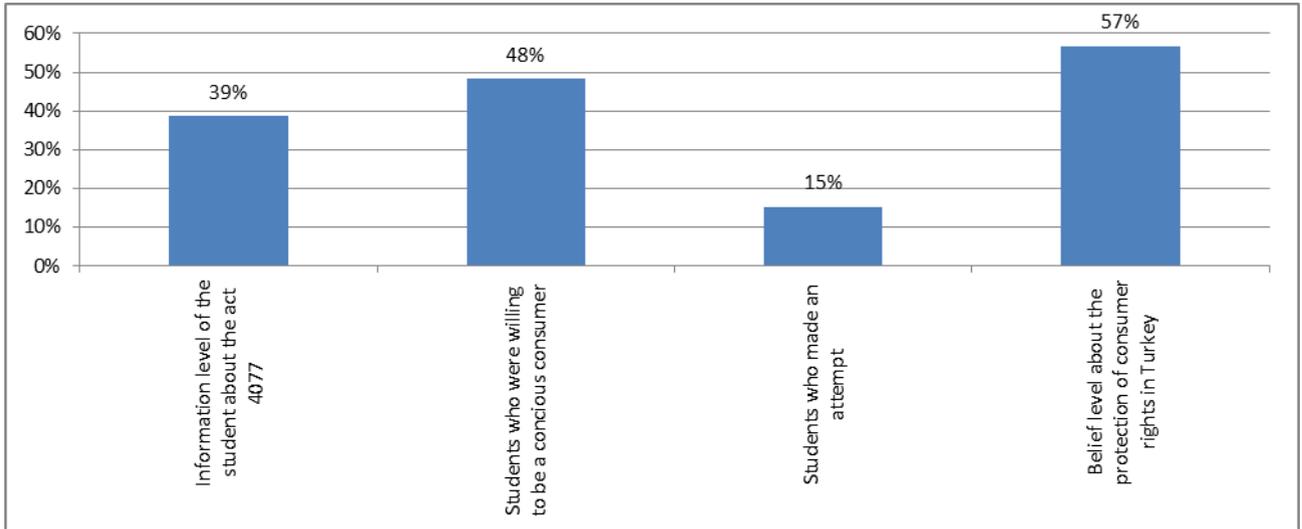

Figure 4: The analysis chart of the questions according to the relevant topics

It is clear that new methods and activities is necessary to increase the knowledge level of the university students about this act.

The rate of the students who were willing to be a conscious consumer or made a conscious consumer behavior was 48 %. The average percentage of the students who made a formal application to any consumer organization or called "ALO 175" was 15%. Depending on those statistics, it can be said that students prefer complaints rather than applications. In order to remove unwillingness for actions, some initiatives such as encouraging them to be a member of any consumer associations or assigning performance homeworks that includes a real consumer issue to them etc. On the other hand, questions on measuring the belief in the protection of consumer rights in Turkey got 57% totally, seemed hopeful.

Lastly, it can be seen from above graph that average awareness level of the university students on consumer rights was about 17 points. (Whole point was 45) and gender, age groups, marital status, home city or monthly income among university students has not got any extra effect on the awareness level about consumer rights. ( $p > 0.05$ ) This result may be due to the reducing effect of university education on the differences between individuals.

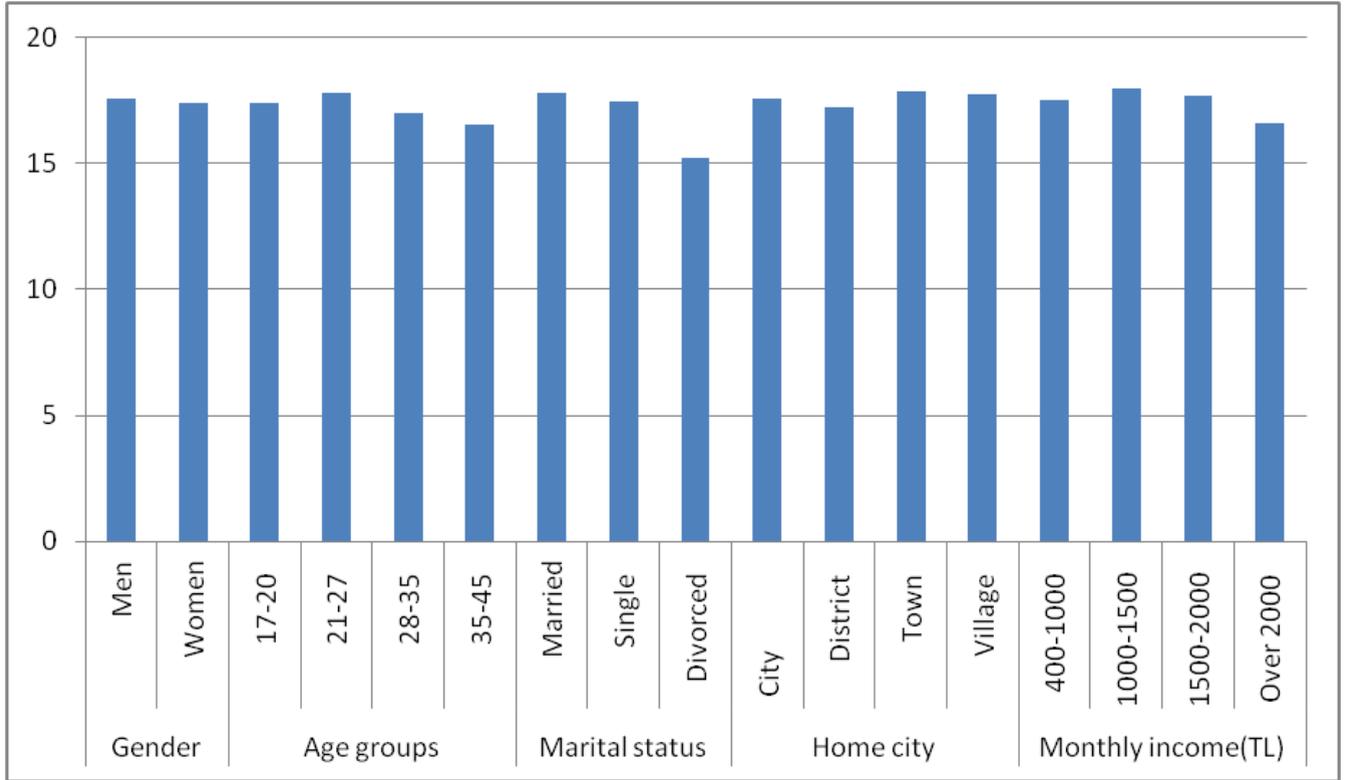

Figure 5: Average awareness level of the university students on consumer rights. (Whole point was 45)

### Abstract

Technology demands individuals to be knowledgeable in another language, in particular the English language. Learning a second language (L2) is one of the significant experiences encountered by a student in an institution of higher learning. Some L2 acquirers would be more successful than others in acquiring another language. University students need a good knowledge of the English language to access the globalized world technologically. An investigation was conducted to examine the challenges, needs, attitudes and beliefs about English language learning held by university students in Malaysia. The subjects exhibited somewhat differing responses with respect to L2 learning perceptions of experiences. The paper also addressed the practical implications of the results.

*Keywords:* L2 learning; challenges; needs

### 1. Introduction

Technology demands individuals to be knowledgeable in another language, in particular the English language. Learning a second language (L2) is one of the significant experiences encountered by a student in an institution of higher learning. Being a complex process, it would take an individual a considerable period of time to acquire another language, other than his/her own native tongue. Some L2 acquirers would be more successful than others in acquiring a second language. University students all over the world need a good knowledge of the English language for various reasons. What are their reasons? Which aspects of the language that they need most and urgently? What are the challenges they encounter and how could they be assisted to produce a good command of the English language? Educationists seem to frequently contribute views and suggestions that could increase the rate of second language acquisition or design materials that would enhance second language learning and mastery. Nevertheless, seldom would educationists investigate and document learners' challenges, needs, attitudes and beliefs about their L2 learning and their learning experiences. Investigations on students' challenges, needs, attitudes and beliefs should be conducted for several reasons: (i) educators would be aware about language learning from the learners' perspectives, (ii) learners' needs and beliefs guide the way they behave and these can impact their learning outcomes, (iii) educational institutions can provide empowerment to the learners, (iv)

E-mail address: drparila@hotmail.com

learners' views could lead to an improvement in the system of education. The researchers believe that this study would provide a compelling contribution to the field of applied linguistics.

A study of learners' perceptions is would present a better understanding of students' performance. According to O'Shaughnessy (1992) "perception is an experience" (p. 226) that assists and provides physical actions. A study of learners' challenges, needs, attitudes and beliefs would enable researchers to gain access into the learners' worldview as well as into how they interpret their learning and learning experiences. The purpose of this investigation is to examine the challenges, needs, attitudes and beliefs about English language learning held by university students.

## 2. Literature Review

This section focuses This section focuses on two theoretical perspectives of second language learning and acquisition that form the basis of this research. The first one is Gardner's Socio-Educational Model and second, it is Cummin's Model of Academic Language. Previous studies related to this investigation were also discussed.

Gardner's Socio-Educational Model (1985) asserts that second language acquisition takes place in a social and cultural context. It proposes that the cultural beliefs and the community that the individuals are in, may influence the general language proficiency. For instance, if the cultural belief is that second language learning is difficult, then there would be low level of achievement. The model also indicates that there are four different kinds of individual differences, for instance intelligence, language aptitude, motivation and situational anxiety. Attitudes and personality would have their effect through one of these four components.

Cummin's Model of Academic Language (Cummins, 1992 cited in Short, 2002; Snow, Met & Genesee, 1992) considers the integration of language and content instruction. According to Snow, Met and Genesee (1992), Cummins posits a paradigm in which the language tasks may be characterized as context reduced or context embedded and in which the tasks addressed through language may be cognitively demanding or undemanding. This model is based on the basic interpersonal communication skills (BICS) and cognitive academic language (CALP) distinction. BICS refers to the language proficiency in everyday communication context while CALP concerns the manipulation of language in decontextualized academic situations (Cummins, 1992, 2003). Richards, Platt and Platt (1993) further clarify that BICS refers to the language proficiency needed to perform tasks which are not directly related to learning academic content and cognitively undemanding, while CALP concerns the proficiency needed to perform tasks that are cognitively demanding and often have to be solved independently by the learner without support from the context.

The research literature generally supports the belief that a measure of attitudes and needs toward learning a second language would relate to achievement in that language (Gardner, 1985). In general, positive attitudes towards the L2, its speakers, and its culture can be expected to improve and enhance learning. (Ellis, 1994; Gardner, 1985). An investigation conducted by Tremblay and Gardner (1995) on secondary school students at a francophone school in Canada revealed that positive language attitudes orient students toward developing specific learning goals and thus improved achievement in French courses. Among the findings found

in Shah's (1999) study was that lack of positive attitude exhibited by key informants and low motivational intensity and L2 learning needs due to minimal effort put on English language learning led to low ESL achievement and academic achievement.

Al-Tamimi and Shuib (2009) investigated on engineering students' attitudes and motivation towards English language learning at Hadhramout University of Sciences Technology in Yemen. It was found that most of students had positive attitude towards the social value and educational status of English, and a high number of the students showed their need and interest in the culture of the English speaking world as represented by English-language films. The data showed that students exhibited greater support of instrumental needs and reasons for learning the English language including utilitarian and academic reasons, and regarding the integrative reasons, the results provided evidence that learning English as a part of the culture of its people.

There is another study conducted by Shah and Ng (2005) which investigated on the reasons as to why international students from China and Indonesia did not perform well in the English Improvement Programme (EIP) available at Inti College, Malaysia. It addressed the students' attitudes towards Acrolect Malaysian English and their needs and motivation to learn the language. Survey questionnaires were utilized to gather the data from the EIP students. The findings revealed that the students showed negative attitudes towards Acrolect Malaysian English. The preferred models were the native English speaker models, for instance Standard American English and Standard British English. In terms of motivation and needs, the students were instrumentally motivated than integratively motivated.

Yashima, Zenuk

-Nishide and

Japanese adolescent learners of English. The findings indicated that learners with the higher WTC scores seemed to exhibit more frequent communication in class. They also showed the tendency to interact with teachers outside the classroom and asked questions. It was also found that the learners who were interested in international activities were inclined to show willingness to communicate in the English language more frequently.

Littlewood (2001) addressed three perspectives which are of special potential relevance to language teaching; they are: (i) the distinction between collectivism and individualism; (ii) different perceptions of power and authority; and (iii) different types of achievement motivation. It was found that "most students in all countries question the traditional authority-based, transmission mode of learning. They wish to participate actively in exploring knowledge and have positive attitudes towards working purposefully, in groups, towards common goals" (p. 3).

Shah, Yusof, Al-Bataineh, Yusop, Haron, Ong and Ahmad (2007) addressed the L2 learning beliefs the Malay students in a Malaysian university. The study examined the subjects' beliefs in terms of the nature of second language learning, difficulty of second language learning, and second language learning aptitude. Survey questionnaires that were issued to the subjects were adapted from Horwitz's (1987) Language Learning Beliefs Inventory. One of the most important findings was that majority of the respondents felt that it is not necessary to know about the English-speaking culture in order to speak English. They just would like to learn the English language per se. Over two-third of the respondents judged that vocabulary and grammar to be the most important for language learning. The participants seemed to believe that producing utterances with accurate vocabulary and

correct grammar would enhance one's credibility. They did not seem to believe in experimenting with the second language at the initial stage of learning. Over half of the participants considered some languages are easier to learn than others, while 43% indicated that English is a difficult language. English language is far from similar to the subjects' first language (Malay language) in terms of language structures and rules. Majority of the respondents were not sure about having special language learning ability. This could impede their second language learning process and acquisition could be delayed.

In another related study Shah, Yusof, Sulaiman, Kudus, Yusof and Latiff (2009) compared the responses from the male and female subjects. One of the results revealed that both the males and females believed that learners who already acquired the L2 would face less difficulty in learning the third one. Both gender groups probably felt that these learners would inevitably employ the language learning strategies that they used to acquire the L2 in their attempt to acquire any subsequent languages. The subjects also resorted to translation throughout their learning process. Being in a climate where the Malay language was a dominant language, translating, word borrowing, code-switching and making associations between the two languages were the best options for the learners as they believed that these activities could hasten their pace of learning another language.

Shinbo (2004) addressed the heritage language students' weaknesses and needs, strengths, challenges in a foreign language classroom. The data were collected via questionnaires, interviews, observations and e-mails. The data showed that the subjects endorsed strongly the need to improve reading, writing, and oral skills. The language instructors felt that the students "need to improve their oral skills sophisticated enough for utilizing at the academic and professional levels" (p.87). The results revealed two types of challenges encountered in the learning process. The first one concerns the difficulty of learning Japanese as a foreign language, such as unfamiliar with terminology, lack of ability to master kanji, lack of linguistic skill especially the grammatical rules, tendency to mix discourses styles, and difficulty of employing formal register. The second type of challenge includes pressure to excel, pace of class and peers' negative perception.

### **3. Methodology**

The data were collected through issuing survey forms from a random sample of students taking English language courses at Centre of General Studies, National University of Malaysia (Universiti Kebangsaan Malaysia – UKM). The data were collected from 89 UKM students of various disciplines taking English language proficiency courses at the Centre.

A questionnaire was designed based on the works of Sparks, Ganschow and Javorsky (1993), Argaman and Abu-Rabia (2002), and Bell, McCallum, Kirk, Brown, Fuller and Scott (2008). The instrument consisted of Likert-scale items (a scale from 1-5) which used a forced-choice format in which subjects were asked to select from one of the following choices: (1) strongly agree, (2) agree, (3) neutral, (4) disagree, and (5) strongly disagree. In addition, the subjects were required to respond to question items pertaining to demographic information such as age, sex, ethnicity, hometown, program major, years in program, English courses taken, and length of exposure to English. The data will be processed using an SPSS program, in which frequency analysis was performed to examine the subjects' responses with respect to their challenges, needs, attitudes and beliefs about L2 learning.

#### 4. Findings of the Study

The aspects under L2 learning that were analyzed were attitude and needs, beliefs on attention, challenges on anxiety and challenges on self-confidence. Under attitude and needs, subjects responded to items such as “I need to be successful in the English language”, “I want to learn the English language,” “I need to study harder for my English language courses”, and “I feel I have spent too much time studying for my English language courses.” The students’ responses on L2 language learning attitude and needs are presented in Table 1.

**Table 1: L2 Learning Attitudes and Needs**

No.	Question Items	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree
1.	I need to be successful in the English language.	28.1%	39.3%	15.7%	11.2%	5.6%
2.	I want to learn the English language.	16.9%	52.8%	15.7%	14.6%	0%
3.	I need to study harder for my English language courses.	12.4%	64%	21.3%	1.1%	1.1%
4.	I feel I have spent too much time studying for my English language courses.	3.4%	11.2%	28.1%	50.6%	6.7%

It was found that most of the subjects (67.4%, i.e. 28.1% strongly agreed and 39.3% agreed) defined being successful in an English language course as an ‘A’ scale, while 11.2% disagreed and 5.6% strongly disagreed with this notion. Majority of students wanted to learn the English language, of which 16.9% and 52.8% indicating “strongly agree” and “agree” responses respectively. More than 70% of the respondents expressed the need to study harder for their English language courses. The results also revealed that only 14.6% (3.4% strongly agreed and 11.2% agreed) of students felt the need to spend a lot of too time studying their English language courses. The results clearly showed that majority of the subjects wanted to learn L2, and yet not much time was spent in doing so.

With regard to beliefs on attention, the respondents were required to respond to statements such as “I feel my attention wanders more easily in my English language course than my other courses,” “I feel I fall asleep more easily in my English language course than my other courses,” and “I am more easily distracted when I study an English language course than my other courses.”

**Table 2: L2 Learning Beliefs on Attention**

No.	Question Items	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree
1.	I feel my attention wanders more easily in my English language course than my other courses.	6.7%	18%	20.2%	50.6%	4.5%
2.	I feel I fall asleep more easily in my English language course than my other courses.	6.7%	18%	14.6%	49.4%	11.2%
3.	I am more easily distracted when I study an English language course than my other courses.	7.9%	23.6%	22.5%	32.6%	13.5%

As can be seen in Table 2, the data revealed that 55.1% of the subjects did not feel that their attention wanders more easily, with 50.6% disagreeing and 4.5% strongly disagreeing with the statement. More than half of the participants (60.6%) indicated that they did not easily fall asleep in an English language class, specifically 49.4% disagreed and 11.2% strongly disagreed with the item. Further, a somewhat similar response was obtained for the next item, of which there were 46.1% of the subjects who presented 32.6% disagree and 13.5% strongly disagree choices when answering question pertaining to being easily distracted when studying an English language. From the findings, it can be seen that more than half of the students indicated paying attention during their L2 learning, less than half revealed weak attention span, while the rest of the learners were not sure about their focus towards L2 learning.

With respect to challenges on anxiety, the subjects provided responses to items such as “I have not gotten nervous and tense when studying for my English language course,” “I do not worry about my English language course,” “I feel anxious about English language exams,” and “I feel nervous and afraid about participating in class discussion during my English language course.”

**Table 3: L2 Learning Challenges on Anxiety**

No.	Question Items	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree
1.	I have not gotten nervous and tense when studying for my English language course.	7.9%	28.1%	14.6%	28.1%	36%
2.	I do not worry about my English language course	1.1%	23.6%	18%	43.8%	13.5%
3.	I feel anxious about my English language exams.	18%	38.2%	24.7%	16.9%	2.2%
4.	I feel nervous and afraid about participating in class discussion during my English language course.	24.7%	29.2%	20.2%	20.2%	5.6%

As shown in Table 3, the results showed that 36% (strongly agree = 7.9 % and agree = 28.1%) of the subjects indicated that they had not gotten nervous and tense when studying for the English language course. A dissimilar number of students (19.1%, of which 16.9% responded to disagreement and 2.2% chose strong disagreement) did not feel anxious about their English language exams. In addition to this, more than half (57.3%

= 43.8% chose disagree and 13.5% chose strongly disagree) were worried about their English language courses. It is probably due to this that again slightly more than half of the students, i.e. 53.9% (strongly agree = 24.7% and agree = 29.2%) felt nervous and afraid about participating in the English language class discussion. The fear of learning L2 could affect students' L2 attainment.

With respect to challenges on self-confidence, participants answered the following items: "I do not feel capable of studying for my English language course," "I feel that I am not in control of my grades in my English language course," and "I will never be successful in an English language course."

**Table 4: L2 Learning Challenges on Self-Confidence**

No.	Question Items	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree
1.	I do not feel capable of studying my English language course.	5.6%	23.6%	12.4%	46.1%	12.4%
2.	I feel that I am not in control of my grades in my English language course.	5.6%	36%	29.2%	24.7%	4.5%
3.	I will never be successful in an English language course.	1.1%	7.9%	11.2%	31.5%	48.3%

The findings in Table 4 showed that 58.5% (46.1% selected "disagree" and 12.4% selected "strongly disagree") of the students felt that they were capable of studying an English language. About one-third i.e. 29.2% (24.7% and 4.5% showed disagreement and strong disagreement to the statement) felt that they were able to control their grades in the English language course. The data also revealed that 31.5% and 48.3% of the participants disagreed and strongly disagreed that they would never be successful in an English language course. This means that a great majority, specifically 79.8% believed that they were capable of achieving success. The data revealed that majority showed confidence in attaining success. However, despite this, their L2 general performance was about average.

## 5. Discussion and Implications

Given the participants' different language circumstances and target language learning setting, the data revealed different learners' responses and a variation of students' perceptions about English language learning. Among the important findings in the aspect of attitudes and needs were that majority of the participants needed to learn English and most indicated paying attention in class. Despite this, not much of their time was allocated outside class towards their target language learning. Almost half of the students were worried about L2 learning even though majority believed that they had the capability and would be successful. Quite a majority felt that they should have studied harder; this gave the indication that they had not been putting on a maximum effort in the learning of L2. The findings did not indicate that a great majority of the respondents giving maximum attention to L2 learning. This low motivational need indicated that the degree of attitude toward the learning of L2 exhibited by the subjects was not very high. One of Shah's (1999) findings revealed that low achievers showed lack of positive attitude and low motivational need towards L2 learning; similarly this study indicated

that these research subjects showed lack of positive attitude and also somewhat low motivational intensity towards the learning of the L2.

The results of this investigation provided useful insights on respondents' perceptions on English language learning. Most participants would like to learn another language, and hence implying that they were aware on the importance of being bilingual and the significant position of the English language in the global setting. But, there was lack of effort and energy put on target language learning; this effort should be increased and this means increasing the time of learning. The administrators from UKM should allocate more time and exposure to teaching of English, and a more formal and authentic English language situation should be created. The structures of a language should be emphasized and effective instruction of grammar should be employed.

The Ministry of Education, Malaysia could embark on, at the macro level is the introduction of a bilingual program, emulating the two-way bilingual program existing in the United States. The present language policy should perhaps be changed; a bilingual language policy would be more appropriate. More school subjects should be taught in the English language. Thirty to fifty per cent of the school hours should be reserved for the use of English in the teaching of some other subjects. To ensure that Malaysians could function effectively globally, this practice should be introduced; this could prevent the further decline in the target language competence and fluency among the Malaysian students.

# Laboratory activities, science education and problem-solving skills

Laurinda Leite\*, Luís Dourado

*University of Minho, Campus de Gualtar, Braga, Portugal*

## Abstract

Science education specialists, science teachers as well as Portuguese science curricula acknowledge lab activities as important educational tools, namely for students to learn how to do science. If doing science is conceptualized as solving problems, some kinds of lab activities may be more appropriate for students to attain that objective than others. This paper presents a categorization of lab activities based on both their main educational goal and the way they deal with phenomena and models. Afterwards, it discusses the extent to which each type of lab activities fosters the development of problem-solving skills.

*Keywords: laboratory activities, science education, problem-solving, problem-based learning*

## 1. The role of lab activities in science education

The Portuguese science curricula guidelines (DEB, 2001) as well science teachers (Abrahams, 2011; Leite & Dourado, 2007) and science education specialists (e.g., Hofstein, 2004; Millar, 2010; Wellington, 2002) acknowledge laboratory activities (also known as lab activities) as important educational tools. Over the years, several arguments have been put forwards for the use of lab activities in science education. One of them has to do with a particular interpretation of the following Chinese saying: tell me, I'll forget; show me, I'll remember; involve me, I'll understand. 'Involve me' has been understood in a restrict way, that is ask me to do things in the lab, with lab apparatus, reactants, and so on, ignoring or at least not valuing thinking about what happens in the lab. Of course people can forget what they listen to and they may remember what they watch but this raises a question: what do they remember from the scene? Is it the visual and/or spectacular part of the activity or is it its meaning? And when they do practical things themselves (so that they are immerse in the scene) based on a screenplay-like worksheet, then what guarantees do teachers have that they understand the scene they are playing? Is handling apparatus enough to yield understanding?

Another argument has to do with the idea that "science is practical". A belief in this argument leads to the idea that if scientists use research laboratories to develop theories, then students should use school science laboratories to learn them (Jenkins, 1999). It would also mean that students should rediscover the science content prescribed in the curriculum. The question is how long would it take and what guarantees would teachers have that they would discover the same as past scientists did?

Hodson (1988) argues that science education includes three major components that are worthwhile being conceptualized to be differentiated, as they require different teaching approaches, being some more lab based than other do. Those components are: learning science, learning how to do science and learning about science. According to Hodson, lab activities are not required for students to learn the science content that was discovered

\* Corresponding author. Tel.: +351 253 604 274; Fax: +351 253 601 201

*E-mail address: lleite@ie.uminho.pt*

by past scientist neither to learn about the nature of science. In the former case, it should be emphasized that lab activities show what happens; they do not show why it happens (Woolnough & Alsop, 1985). Even if lab activities are used, teachers have to find effective ways of dealing with the ‘why’, that is of teaching science content without having students rediscovering what scientists have already discovered. As Einstein and Infeld (nd) have argued, concepts are free creations of the human mind, and are not uniquely determined by experiments, even though the opposite may seem to make more sense at first sight. These are the reasons why Millar (1998) argues that if we teach science because it is a practical subject, we also teach science because science is a theoretical subject. In fact, there is no previously known path that leads directly from an experiment to a new theory. Rather, there is a complex interplay between theory and practice (Leach, 1999), that is schematically represented in figure 1 (translated from Leite & Figueiroa, 2004). An implication of this interplay is that one observes what his/her theories ‘show’ him/her and one does the experiments that his/her theories allow him/her to do. This is so because empirical evidence serves as a basis for new ideas development and at the same time it depends on the ideas that yield it (Hodson, 1988; Ball, 1999). Therefore, not only creativity, imagination and insight, but also disappointment, difficulty, success and failure are typical steps of an explanation building process (Jenkins, 1999). Hence, students could conceptualize things differently from the way scientists do.

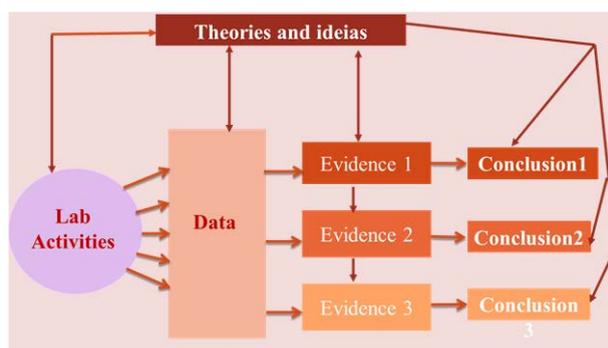

Figure 1: Interplay between theory and evidence

As far as learning about science is concerned, it is worth noticing that no science theory development path can be easily and rapidly replicated or modelled in a school science laboratory. Thus, Hodson (1994) believes that instead of having students working in the laboratory, it is worth having them doing an analysis of the history of some science ideas. This would lead students to perceive how science knowledge evolved as well as how its evolution was influenced by technological, historical, political, social, etc. factors and caused itself modifications in technology, society and environment.

However, Hodson (1994) also argues that lab activities are required if students are to learn how to do science. This science education component requires the mastery of some basic skills, processes and methods that need to be learned by doing (De Pro, 1998). However, learning them ‘one by one’ is not enough for learning how to do science. In addition, this is not consistent with the practice of receipt-like lab activities, which Hofstein and Lunetta (2004) found that have pervaded science teaching over the last decades. To some authors, the point is that learning how to do science requires students to acquire a flavour of what doing research means. Thus, although research results are not completely consistent (Sadler, Burgin, McKinney & Ponjuan, 2010), some authors argue (Bleicher, 1996; Ritchie & Rigano, 1996; Schwartz, Lederman & Crawford, 2004) that this component can be better developed in research laboratories. Nevertheless, it is worth mentioning that throughout decades several authors (e.g., Bennet, 2001; Caamaño, 1992; Kerr, 1963; Kirschner & Huisman, 1988; Woolnough, & Allsop, 1985) have put forwards lists of educational valuable objectives that may be attained through school lab activities.

Those objectives were summarized by Hodson (1994), as follows:

- To foster students' extrinsic motivation for learning science;
- To develop scientific attitudes, that is attitudes that scientists are supposed to have (e.g., critical thinking, probabilistic thinking, objectivity, persistence);
- To develop content knowledge, related to understanding and using science concepts, laws, theories;
- To develop lab skills, including mastering lab techniques and handling equipment as well as potentially harmful materials safely;
- To become familiar with science methods, including doing problem-solving and using data to build empirically based arguments.

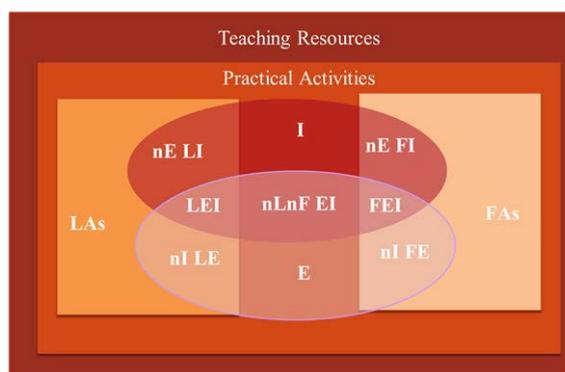

This list raises three different issues. One of them has to do with motivation. There is some evidence that lab activities may motivate students and develop students' attitudes towards science (Abrahams, 2011). However, the fact is that on one hand all activities' that are carried out in science classes should motivate students and, in the other hand, according to Ausubel, Novak and Hanesian (1980), extrinsic motivation is limited in terms of its educational value. Therefore, yielding motivation should not be the only motive why lab activities are carried out. The other one has to do with the fact that the development of scientific attitudes should be ever present, in lab as well as in non-lab classes. The third one has to do with the fact that lab activities performed in schools may hardly help students to attain those objectives. As a matter of fact, teachers and even some curriculum guiding documents hardly differentiate among some basics concepts associated with lab activities which may impair students from benefiting from lab activities as they should. In addition, it may lead teachers to think that as far as they have students doing lab activities, they have students learning how to do science. Unfortunately, this is not the case (Hofstein & Lunetta, 2004). Therefore, some conceptual clarification is needed in order to help making sense of the requirements that school lab activities may have in order to play a meaningful role in science education, namely with regard to doing science.

## **2. From practical work to lab activities**

Practical work, lab work, lab activities, lab experiments and investigations are some related but different concepts that are worthwhile defining so that lab activities are used in a more rational way. Hofstein and Mamlok-Naaman (2007) argue that to support science education knowledge development (by informing curriculum development, teaching and assessment practices, and education policy), "it is essential to define technical terms precisely to explicate knowledge in the field [and] to use those terms consistently in research reports and in scholarly writing." (p.106). Thus, differentiating among lab work related concepts is a necessary requirement for increasing the probability of having students to effectively attain the diversity of objectives referred to above.

Thus, practical work has to do with all the practical activities that require students to be actively engaged (Hodson, 1988), from a cognitive point of view. It may include lab activities (LAs) as well as paper and pencil activities, field activities (FAs) or other sort of activities. Lab work encompasses all the lab activities that students do. Lab activities have to do with things like the study of natural world from their indoor reproduction, the analysis and/or discovery of the underlying structure or material composition of some object or natural sample. They require that usual lab materials or alternative materials are available and used. They can take place in the school science laboratory or in a normal classroom (if no specific safety requirement has to be taken into account). Experiments (E) have to do with activities that require control and manipulation of variables. If, in addition, they involve lab activities, than they are a special part of lab activities and are encompassed by the lab work concept too. However, they can rather involve field activities, computer based activities, etc., and they can, therefore, be non-lab activities (nLAs). Finally, investigations (I) are problem-solving activities that are not supported by a worksheet. As a matter of fact, problem-solving activities face students with a dilemma that they

feel as worthwhile solving (Jonassen, 2004). This dilemma is associated with a felt need that is perceived as worth to be fulfilled. Thus, investigations may be lab-based investigation activities (LI) if they require the performance of lab activities, but there are other types of investigations, which can take place, for example, in the social or natural field, or in a computer. Figure 2, taken from Leite (2002a), shows how the different types of activities relate to each other.

The main purpose of lab activities is to help students to make links between the domain of real objects and the domain of ideas (Millar, Tiberghien & Le Maréchal, 2002). However, there is often a mismatch between intended and achieved students' learning outcomes (Psillos & Niedderer, 2002; Woolnough, 1998), as the latter depend on the very specific things students do and the way they do them. On the other hand, it is well known that teachers are highly dependent on school textbooks with regard to what they do in the classroom (Tobin, Tippins & Gallard, 1994; Morgado, 2004), namely in what concerns lab activities they use in their science classes (Leite & Dourado, 2007). The point is that school textbooks do not make such differentiation and therefore they do not facilitate teacher's job of providing students with a diversity of lab activities, selected according to the outstanding learning objective they want students to achieve. As a matter of fact, research has shown that a considerable amount of lab activities included in school science textbooks or laboratory guides (Bandiera, 2002; Galiana, 1999; Hofstein & Lunetta, 2004), namely in the Portuguese ones (e.g., Dourado, 2010; Figueiroa, 2007; Leite, 2002b; Leite, 2006; Sousa, 2009), have a low level of openness, provide data and their interpretation, aim at confirming previously introduced content knowledge or to obtaining the right answer, do not ask students to collect data that would be evidence of the required conclusion, do not use an appropriate control of variables, etc. This means that they miss relevant educational characteristics, namely at the epistemological level and in some cases they even suffer from a lack of internal consistency which prevents students from making sense of what they do or what they get from them.

### 3. Classifying lab activities

For a long time, several authors have classified lab activities. When they do it, they usually focus on conceptual and procedural issues. Some authors suggested a reduced number of types of lab activities (e.g., White & Gunstone, 1992; Woolnough & Allsop, 1985) and others used a lot of types (e.g., Caamaño, 1992; Wellington, 2002, Roberts, 2004). The classification criteria differ from study to study and in some cases they are not completely explicit. These ambiguities make it hard to make sense of the relative educational potential of lab activities, namely in terms of students' expected roles and learning outcomes. As a matter of fact, several criteria can be used to classify lab activities, each of them leading to a set of types of activities. However, criteria should

be intelligible, useful and relevant. The most relevant from an educational point of view are: responsibility of the performance of the lab procedure; object of study; and outstanding learning objective. An appropriate use of these criteria requires a previous analysis of the broad structure of a lab activity. Besides, it should be noticed that doing lab activities includes performing a procedure - the lab phase - but lab activities are not limited to that. In fact, two other phases should be considered: the pre-lab phase, devoted to the theoretical preparation of the laboratory phase, and the post-lab phase, that is targeted to the analysis and discussion of lab results. Nevertheless, the pre- and post-lab phase may be more important within the context of one type of activity than in the other, depending on factors like the outstanding objective of the lab activity, the way it is integrated in the teaching sequence and the expected engagement of the student in the data analyses and interpretation processes.

Thus, based on the criterion centred on who assumes the responsibility of performing the lab procedure, lab activities can be classified as lab demonstrations or as students' lab activities (Millar, Tiberghien, & Le Maréchal, 2002). In the former case, students just observe someone (usually the teacher) performing the lab procedure; in the second case students perform the lab procedure themselves, either individually or in small groups. It should be noticed that the performance of the procedure makes a difference in terms of procedural learning, but it does not mean that students learn less or worse than if they were performing the procedure themselves. In fact, there is some evidence that demonstrations may be effective (Gaspar & Monteiro, 2005; McKee, Williamson & Ruebush, 2007) or even more effective (Couto, 2000) than students' activities, at least with younger students, when learning science is at stake. These results may have to do with the fact that younger students have more difficulty in working and thinking systematically than their older counterparts. Besides, the pre- and post-lab phases may help student to make sense of the procedure they observe someone else performing. During the performance of the procedure they can also be cognitively engaged with what is going on, as far as teacher discusses with them what is being done.

With regard to the object of study, lab activities can focus on a phenomenon that is reproduced in the lab to be better understood or on the mechanical modelling of an entity, whether to understand how it is or how it works. As far as the outstanding objective is concerned, it has to do with the distinguishing learning outcomes that a given activity enables students to achieve when compared to the other lab activities. In fact, there are several competences that students can develop whatever the kind of lab activity but there are some that can be better developed from one type of lab activities than from the others. These two criteria can be combined so that activities can be classified according to both. Nevertheless, activities that focus on understanding reproduced phenomena have outstanding objectives that differ at least in part from the objectives of the modelling ones. Therefore, activities having one of these focuses will be categorized separately, based on previous work done by Leite (2002a) and Dourado and Leite (2008).

Table 1 (based on Leite, 2002a) shows the types of lab activities focusing on reproduced phenomena that result from the use of the outstanding objective criterion. The outstanding objectives focusing on conceptual knowledge indicate how and when the lab activities can be used. In fact, lab activities aiming at reinforcing conceptual knowledge require concept teaching to happen in advance that is before the lab procedure is put into practice; those targeted to knowledge construction require concepts to appear after the lab procedure is carried out; those aiming at knowledge reconstruction require students' ideas to be elicited during the pre-lab phase and the accepted ideas (if different from students' ideas) to be introduced in the post-lab phase. Even though lab skills and technics may be developed within other types of activities are carried out, mastering them with proficiency requires explicit learning and training (Woolnough & Allsop, 1985; De Pro, 1998). Therefore, lab skills and technics oriented activities are a sort of pre requisite for other activities. However, they should be included in a meaningful context that is they should be used when the technics or the skills are required for other purposes. Finally, it should be stressed that investigations are the only type of lab activities that has two broad outstanding and different objectives, namely conceptual and methodological objectives. In fact, they enable students to learn conceptual knowledge at the same time as they develop science methodology related competences. They are also integration promoting activities as they require students to use conceptual and procedural knowledge to draw and

put into practice a procedure that they find appropriate to solve the problem given in the activity statement.

Table 1. Types of lab activities that focus on phenomenon reproduction, based on their outstanding objective

Outstanding objective	Type of Lab Activities	Brief description of what students have to do
Lab skills and technics mastery	Exercises	Carry out a technique or use some equipment repeatedly in order to acquire training
	Activities for getting a feeling of the phenomena	Smell, listen, touch, watch just to get a feeling of how it looks like
Knowledge reinforcement	Illustrative activities	Get a confirmation of some idea that was already taught to make sure that it is like that
	Activities to find out what happens when...	Follow a receipt like worksheet in order to get “the right answer”, that is the only possible answer if everything works properly
Conceptual knowledge	Investigations*	Discover new knowledge on his/her own by solving a problem; no worksheet is available
	Preview-Observe- Explain-Reflect, procedure given	Follow a pre lab, lab and post lab procedure thought able to originate cognitive conflict and to foster a conceptual change process
Knowledge reconstruction	Preview-Observe- Explain-Reflect, procedure not given	Draw a procedure thought able to originate cognitive conflict and to foster a conceptual change process
	Investigations*	Draw a strategy to solve a problem, put it into practice and conclude; methodological and conceptual knowledge are developed

\* the same activity serves both objectives

Table 2 (adapted from Dourado & Leite, 2008) shows the types of lab activities dealing with mechanical modelling that result from the use of the outstanding objective criterion. Their outstanding objectives range from the less demanding ones, centred on visualizing models without interfering with them, to the most demanding ones, focusing on building up a model which is thought to correspond to a part of the world that is under study.

In fact, models are representations of reality that are thought to describe it (Gilbert, Boulter & Rutherford, 1998; Justi & Gilbert, 2002) but that cannot be taken as true, in absolute terms, because they are used when the entities to be studied through modelling are non-accessible (due to its large dimension, to the time they take or to the distance people are from them). Therefore a model cannot be directly compared to the reality it is supposed to describe. Of course as students may not have the chance of observing the reality, then they may feel it difficult to accept model-based lab activities (Sensevy, Tiberghien, Santini, Laubé & Griggs, 2008; Tiberghien, 1999).

It is worth emphasizing that most of the types of activities given in tables 1 and 2 may be either performed by students or demonstrated to them by the teacher. However, activities for getting a feeling of the phenomena (table 1) need to be performed by the students themselves so that they can get that feeling. Similarly, investigations (table 1) and development of a model activities (table 2) should to be performed by the students because they have procedural knowledge related outstanding objectives.

Table 2. Types of lab activities that focus on mechanical modelling, based on their outstanding objective

Outstanding objective	Type of activity	Brief description of what students have to do
Perceive underlying mechanical models	Visualization of a statics mechanical model	Students have to observe and describe a structure that does not change over time in order to find out how it is
	Visualization of a dynamic mechanical model	Students have to describe structure that changes over time in order to find out how it is. The modification conditions belong to the model and cannot be altered.
Understand underlying mechanical models	Exploration of a mechanical model	Students interacts with a model of a changing phenomenon in order to study how it behaves under different conditions
Discover an underlying mechanical model	Development of a mechanical model	Student has to discover and to build up a model of a phenomenon or structure based on an analogy with some familiar situations or without any support. It promotes knowledge integration as well as problem solving and modelling competences. It shows how it is, how it works and it behaves.

#### 4. Lab activities and problem solving for problem-based learning

Although there is no single way of doing science (Woolnough, 1998), science is about “solving problems, be that to create new knowledge, to answer empirical questions, to make something or to make that something work.” (Roberts, 2004, p.115). In addition, solving “problems with no easily recalled solutions, is the ‘ideal goal’ of practical work” (Roberts, 2004, p.119). Hence, Woolnough (1998) states that problem-solving activities should be included in the science curriculum in order:

- to enable students to develop and use personal knowledge;
- to enable them to experience doing authentic science;
- to provide students with the skills and attitudes that are useful to employees;
- to motivate students towards science and to learn science.

Taking these objectives as reference, an analysis of tables 1 and 2 shows that only a reduced part of lab activities have to do with problem-solving, as it was defined in section 2. As a matter of fact, only Investigations (table 1) and Development of a mechanical model (table 2) activities can give students the opportunity to use personal knowledge and to experience doing authentic science. Their holistic nature requires an integrated use and development of conceptual and procedural knowledge. If they are contextualised in everyday situations, then they may also promote both students’ intrinsic motivation to learn science and development of skills and attitudes. Everyday contextualization of these types of activities would favour transferability of competences and make them more useful in work contexts. Nevertheless, as Roberts (2004) puts it, investigations are in no sense in competition with other types of lab activities: “one type is no better than another. They complement each other” (p.119) in the sense that some specific competences developed through close lab activities (like exercises or visualization of mechanical models) may be needed by problem-solving activities while the latter give meaning to the former, as close activities are better conceptualized as a mean to a useful end.

Drawing appropriate problem-solving strategies requires conceptual and procedural competences (Roberts, 2004) that may either be mastered in advance or be learned at request for problem-solving to reach a successful end. However, “Contemporary research and theory on problem solving argue that problem solving skills are domain and context specific, that problem-solving activities are situated, embedded, and therefore dependent on the nature of the context or domain.” (Mukhopadhyay, 2013, p. 21). Therefore, problem-solving competences should not be expected to be easily transferred from one context or content to another one, different from that in which they were first developed. However, success on learning as well as on transferring acquired knowledge is also dependent on students’ prior knowledge as well as on affective factors (Toh, 1991).

Problem-solving is related *to* but different *from* problem based learning, as the latter requires the former but the opposite is not true. Problem solving can be done at different pedagogic moments (Leite & Esteves 2005). It is often done after teaching, as an opportunity of using previously acquired knowledge. For example, after studying about the structure of animal and vegetal cells students can be asked to identify the origin of a piece of live material, based on cell structure. Such an activity would not lead to new conceptual knowledge but it may reinforce and stimulate the integration of previously acquired knowledge. However, problem-solving can also happen during teaching, as a way of getting feedback about how learning is taking place and as a strategy to deepen some aspects of it. For example, after studying some separation techniques, students may be asked to identify the components of an aqueous mixture of substances in order to perceive that naked eye observation is not enough to be sure that all components were separated from water – it may happen that some colourless substance dissolved in the water is left. Solving this problem would give teacher feedback on whether or not they are able to use the recently learned separation techniques and would enable him/her to make students feel that those techniques have some limitations. Therefore, it can lead to further development of conceptual knowledge.

Finally, problems can be used as starting points for learning which is the most innovative way of using problems. It has to do with problem-based learning (Lambros, 2004) that is a student centred teaching approach that enables students to acquire new conceptual knowledge by solving problems. Hence, students can be asked to work on a problem as if they were scientists, and to try to solve it. To do so, students have to analyse the problems in order to find out what they have, what they need to know and what they need to do to find an answer for the problem (Lambros, 2004), assuming that at least one solution does exist. Then they have to look for conceptual information and/or for lab techniques in order to draw appropriate lab procedures to reach the solution. If this does not work, everything has to be revised so that a happy end is reached.

Investigations can be used for problem-based learning purposes given that they are organised around a dilemmatic issue (problem) that is felt as a need that is worth being fulfilled. A problem may be brought by the teacher or by the students or it may emerge from a scenario. In any case, to be consistent with PBL the problem has to be solved by the students, preferably in small groups. If problems or scenarios are brought by the students, then they may be harder to fit a prescribed curriculum than the teacher brought ones are. Mechanical model building activities (table 2) also fit the requirements of Problem-based learning even though they may be more demanding and time consuming than investigations are. In fact, they require a problem solving strategy to be drawn (being conceptual and procedural knowledge required for that) and technological knowledge to be used. In fact, students may have to conceptualize the model and afterwards they have to construct and test the mechanical model for its fit with the observed evidence. The model has to be improved so that the best fit is achieved. A good mechanical model would be the one that leads to observations that are similar to those observed in the real world, in the place modelled. Hence, differentiating among lab activities shows that some of them (investigations and development of a mechanical model) may be problem-solving activities. In addition, these activities may also be used as starting points for learning, within a problem-based learning framework. Distinguishing the conditions of implementation of the lab procedure from the overall structure of the activity enables to understanding that handling equipment does not necessarily means that students are doing investigations even though it does not make too much sense inhibiting students from handling equipment and carrying out the lab procedure when they asked to draw the procedure themselves within an investigation activity setting.

## 5. Final remarks

Science is about solving problems. Some problems can be solved in the lab but the school science lab has not been used as an appropriate context for students to learn how to do science. Problem-based learning has shown to be a promising approach for learning conceptual as well as procedural knowledge. It may also provide opportunities for students to learn how to investigate (Hofstein & Lunetta, 2004) in order to solve real world problems and, in doing so, to relate science to technology and society (Llorens-Molina, 2010). Solving a problem

in science requires a synthesis of two sets of understandings: a substantive understanding and a procedural understanding (Roberts, 2004, p.115). Using a problem as a starting point for learning a certain content may require more time than if the content was taught through a teacher-centred approach. Thus, it is obvious that pupils will not be able to do many problem solving activities in an overcrowded curriculum (Roberts, 2004). However, it is worth keeping in mind that when students solve a problem, they develop a lot of other competences besides the concepts required by the problem. In addition, students' difficulties with PBL decrease with experience (Ünal & Öxdemir, 2013). This means that teachers need to perceive that students need time to get acquainted with problem-based learning and to believe that students may learn without being told the content.

# Laboratory Experiences in Software Engineering from a Constructivist Perspective

Sara Zuppiroli<sup>\*</sup>, Maurizio Gabrielli, Paolo Ciancarini*Department of Computer Science - University of Bologna, Italy*

---

## Abstract

In this paper we give a new interpretation, from a constructivist perspective, of two recent laboratory experiences in the context of a Software Engineering course at the University of Bologna. The two experiences were quite different both in the tools and in the modalities that were used: in one case a software product line was developed by following the rules of a role-playing game; in the second case students had to develop four software products using a process model chosen among Waterfall, Spiral, and Extreme Programming. Despite these differences, both cases can provide some evidences of the validity of the constructivist approach to teaching. In fact, from the results obtained and from the perceived experience of students emerged clearly the fact that, in both cases, the students working autonomously, in small groups and with a limited presence of a teacher, were able to build their own model of knowledge which resulted to be correct, as proved also by the good quality of the artifacts produced.

Keywords: Constructivism; Software Engineering; Computer Science

---

## - Introduction

One of the basic ideas of constructivism is the specific meaning of knowledge: this understood as something which is not completely accessible and which remains constantly evolving. Knowledge in this context depends on the person who is representing and propagating it and can be considered as the set of conceptual structures that an agent, within her own culture, can consider well-founded and support.

Constructivism is mainly interested in the paths that allow to arrive at the knowledge, not just knowledge in itself. In his research Jean Piaget, one of the fathers of constructivism, has attempted to formulate a model for the generation of sustainable knowledge. According to Piaget, cognitive change and learning take place when a scheme rather than producing the expected result leads to a disturbance, which then leads to a new balance producing learning and new knowledge in two different ways: in the field of sensory perceptions and motory new knowledge allows to achieve specific goals in interaction with the world; at an abstract conceptual level, the operational schemes allow to achieve a coherent conceptual network, which reflects both the action and the thinking activity that the organism considers acceptable given the present experience.

*E-mail address:* sara.zuppiroli@unibo.it

The distinction between constructivism and behaviorists is mainly in the way learning is perceived: the former is mainly interested in the process for building the knowledge, the latter to obtain specific behavior through teaching and training. The following citation from Ben Ari can clarify what constructivism is: "This theory claims that knowledge is actively constructed by the student, not passively absorbed from textbooks and lectures, since the construction builds recursively on knowledge that the student already has.

In this paper we give a new interpretation, from a constructivist perspective, of two recent laboratory experiences in the context of a Software Engineering course at the University of Bologna. The two experiences were quite different both in the tools and in the modalities that were used: in one case a software product line was developed by following the rules of a role-playing game; in the second case students had to develop four software products using a process model chosen among Waterfall, Spiral, and Extreme Programming. Despite these differences, both cases can provide some evidences of the validity of the constructivist approach to teaching. In fact, from the results obtained and from the perceived experience of students emerged clearly the fact that, in both cases, the students working autonomously, in small groups and with a limited presence of a teacher, were able to build their own model of knowledge which resulted to be correct, as proved also by the good quality of the artifacts produced. In the next Section we will present two laboratory activities. Hence in Section 3 we will discuss how constructivist principles have been implemented within two laboratories and how these two learning experiences can be reinterpreted in terms of the constructivist theory.

### **The two Laboratory projects**

The main goal of a Computer Science curriculum focusing on Software Engineering is to prepare students to practice, know, and apply engineering principles when they build software systems. This general principle has been adopted by the educational community in several ways, e.g. by moving from lecture-format courses to team projects, by involving directly students with actual development and by requiring students to exercise the ideas that they are learning. In order to achieve this educational objective in 2011 we have introduced into a Software Engineering course (taught to undergraduates in the third year of a conventional Computer Science degree) at the University of Bologna a laboratory experience where the students have participated in a roleplaying game having the goal of developing a Software Product Line (SPL). A SPL is a set of software systems sharing a common, managed set of features that satisfy specific needs of a particular market segment or mission and that are developed from a common set of core assets in a prescribed way.

Moving from a traditional software development process to developing family of applications in a SPL implies a shift of focus: one moves from an individual system developed by an ad hoc process to a product line consisting of similar products developed for some domain reusing some software assets. Students have followed a two-life cycles model: each student had two different roles, one for domain engineering and the other for application engineering. In the domain engineering life cycle students' activities consisted mainly of designing, developing, and testing the reusable assets sharable by all products in the family, useful to be reused in the application engineering developing a specific product of the family.

The second laboratory activity, done in 2012, had two objectives: the first one was aimed reproducing in the laboratory some experimental data, taken from the software engineering literature, concerning three different software development process models, namely Waterfall, Spiral, and Extreme Programming (XP): the second one was comparing "on the field" the different curricular competence of the students and their skills, especially with respect to the requirements of the different (software development) processes. The students in this activity

had first to build four software products by using the three development processes mentioned before. Then these artifacts and several quantitative and qualitative aspects related to their development had been analyzed in the class and became the subject of an empirical study for comparing the three different processes.

### **Our experience**

In this section we discuss our thesis: the teaching of laboratory activities in a Software Engineering course for the Bachelor and Master degrees in Computer Science can be a good candidate for applying successfully the principles of constructivism. This will be done starting from our experience at the University of Bologna previously described and considering several aspects of our laboratory activities. More precisely, in the following we will list several principles which are essential in the constructivist approach to teaching and we identify their (direct or indirect) application in our laboratory activities.

As previously mentioned, according to Piaget, cognitive change and learning happen when a scheme, a teaching action, rather than producing the expected results leads to a disturbance. Such a disturbance will eventually allow to reach a new balance. The learning and new knowledge produced are the result of such a new balance, even though with different aspects depending on the abstraction level we consider. Such a disturbance can be produced in several ways and using several strategies by the teacher.

First, a constructivist teacher is guide that does not offer the solution and the path to the solution, but invites students to reflect and to analyze their building of knowledge. She/he offers new tools that can help in this process, opens a dialogue on any aspect that may emerge in the building of knowledge and is open to students' opinions, assuming that each problem may have different solutions. This practice was followed in both our laboratory activities even though with different modalities: we defined several intermediate milestones in the projects for which we provided a direct feedback to students. We also provided a continuous feedback on their proposed solutions and technical difficulties, even though the teachers were essentially communicator enablers, which in case of discussions among different students did not support any specific position or idea. This was specially true in the Product Line project, where communication of groups was essential in order to reach a common solution.

A second important point in the constructivist approach is the team-work, as a mean to compare different experiences and to generate the perturbation which is a pre-requisite for learning. In our case, both the laboratory experiences were done by small groups of students (up to 4 for each group).

In constructivism communication is a very important feature. A student, choosing a specific language for communicating her results and achievements highlights how she has built from her personal experience the conceptual structures and the relationships between them.

Communication among students, in and outside each group, and with the teachers was strongly encouraged in our activity. In particular some deadlines were fixed for presenting proposals and solutions in the class, the management work of each group was formalized, integration with solution proposed by other groups was required (mainly in the PL projects)

Freedom of expression is also important in constructivism: if there exist no pre-defined solution, of there exist no right and wrong behavior, the students will feel more free to express their own opinions without the fear of being judged. Also this point was implemented in our activity, since students were encouraged to express their own opinions and the teachers never judged proposed solutions as completely wrong.

Finally concerning the evaluation and the assessment of learning it is important that these focus not only on the final product, but also on the process used to produce new knowledge. This was probably the point where the specificity of teaching Software Engineering emerged in its most significant way. Indeed in Software Engineering a great emphasis is placed on the "process", in general. In our specific case, the second laboratory activity considered explicitly different software development processes and the students were confronted not only with the problem of producing an artifact, but also with the more general problem of understanding in deep the process used to produce such a product. This helped in the evaluation of the process used by students to reach new knowledge, since it was easier to ask students them to formulate the solution of a problem and to support the decisions that led to that result. Of course, in order to reach an evaluation of the learning of software development processes, a meta-process was needed.

Concerning the teaching constructivist strategies, collaborative learning and cooperative learning are particularly important. Collaborative learning is a teaching method in which a group of students investigates a significant question or develop an interesting project. The interdependence between group members allows to create a sense of responsibility w.r.t. the group itself and its goals. Communication is essential for this modality of learning. Cooperative learning is a specific collaborative learning where small groups of students (3/4) work together with a structured activity. Each students is individually responsible for her own work, but it is also assessed the product of the whole group. In order for this technique to work, students should feel confident, even though the assigned task are not easy, and groups should be small enough so that each participant can contribute.

Both our projects involved collaborative and cooperative learning. The product line project, in particular, involved collaborative learning because all the groups collaborated to the domain engineering needed to develop the core part of the software product line, which was then used by each group for developing a specific application. Cooperative learning was then used within each single group. From the perspective of a student the experience with domain engineering has been particularly important to understand team work and the need of cooperation and coordination capabilities. In the development of the application the students experienced how collaborative systems which require an integration of the produced artifacts need an effective communication among team members, well defined common objectives, and relational capabilities.

The second project used mainly cooperative learning in each group for developing each specific application. Collaborative learning here was mainly in the comparison activity among the different software development processes used. From the data analysis activity performed in this comparison activity the students were able to deduct themselves the most important differences existing among different software development processes by using in practice suitable indicators. Some results of the processes comparison performed by the students confirmed those from the related studies existing in the literature. This was an important lesson for the students, who were made protagonists of the process comparison, and provides a clear constructivist indication.

It is worth noticing that Seymour Papert, who created the Logo programming language at MIT, worked together with Piaget and built his theory of constructionism up on the work of Piaget. Papert created Logo as a tool to improve the way that children think and solve the problems, insisting on the importance of developing tools to strengthen the ability to learn knowledge. Some aspects of UML, a specification language used in software engineering, are similar to the visualization of results of Logo. More generally, following Papert, we believe that the use of computers and the development of software engineering projects, as those we have considered in our laboratories, can be a useful tool to build new ideas and new knowledge.

## Language awareness enhancing strategies for efl learners

Metin Timuçin\*

*Sakarya University, Foreign Languages Department 54187, Sakarya-Turkey*

---

### **Abstract**

The main focus of the present paper is creative use of language in various texts, and potential language awareness strategies that English as a Foreign Language (EFL) teacher may employ in his/her classes. To this end, the paper dwells on the relevance of using representational material in EFL classes, and argues on the importance of the recognition that it takes imagination and an ability to be aware of language use to learn a foreign language. Throughout the paper, it is also emphasised that when creatively employed, representational materials can lead to a move beyond the traditional four skills of listening, speaking, reading and writing to the utilisation of the crucial but often ignored or taken for granted fifth skill: thinking.

Awareness; EFL Teaching; EFL Context; Teaching Strategies.

## **Introduction**

The importance – and necessity – of a shift in English as a Foreign Language (EFL) teaching that results in less focus on teachers and teaching and greater emphasis on learners and learning has frequently been voiced by EFL practitioners. Effective language teaching and learning seems not just a matter of intelligence, but also a matter of making students to be active participants in the learning/teaching process and making them aware of the language use they are exposed to.

As Tomlinson (1994) noted dynamic and active language learners try to notice how language is used, how cognitive skills can be developed, and how they can be independent towards language and learning language.

The aim of the current paper can best be summarized as an attempt to discuss the importance of the notion of language awareness and relevance of utilizing teaching/learning materials that might help to raise EFL students' language awareness.

### **1. Language Awareness in EFL Context**

Despite the fact that, on its own, “awareness” is a broad term, in its simplest definition it can be defined as knowing that a certain entity exists and is important. This knowledge also leads to a state of being interested. To raise awareness, on the other hand, is to inform and educate people over a certain topic by intentionally influencing their attitudes, behaviours and beliefs to reach a previously decided purpose. For Vygotsky (cited in Akerblom et al., 2011), “awareness is an intentional activity of consciousness raising.

Language awareness first started to be the concern of the scholars in early 1980s. However, there is still an ambiguity on the conceptualization of language awareness. While language awareness is defined as “dynamic and intuitive” and developed internally by the learner by Tomlinson (1994, p.123), van Lier (2001, p.347) posits that language awareness is a “movement which might include explicit teaching of form, metalinguistic rules and terminology”. Tomlinson (1994) also states that dynamic and active language learners try to notice how language is used, how cognitive skills can be developed and how they can be independent

towards the mastery of a language. Carter (2003), on the other hand, defines language awareness as language learners' "consciousness and sensitivity to the forms and functions of language". It is of vital importance to emphasize at this point of the presentation that, throughout the activities which will shortly be shared, I heavily rely on Carter's (2003) definition of language awareness, and I would like to note that all related activities were designed to raise such a "consciousness" and "sensitivity".

Various studies concentrated on the value of language awareness in EFL context. Chan (1999), Hawkins (1999), Cots and Nussbaum (1999), Andrews (2006) have similarly investigated and elaborated on the pedagogical implications of awareness on the perception of the target language. Chan (1999) further pointed out that by the help of language awareness activities, learners could stand a better chance to reflect on their curriculum by focusing on what is learned, how is learned and why is learned. Bolitho (2003, p.257) argues that connecting language awareness with the theory of language learning and teaching requires an insight into the curriculum, EFL context, and awareness raising materials and activities.

### 1.1 *Representational language*

Appropriate text selection appear to be at the heart of language awareness activities. For the purpose of the current paper, I will extensively be using instance and pieces of representational materials instead of referential materials, which are commonly used in many EFL teaching/learning contexts. As is explained by McRae (1996, p.17), referential language and therefore referential materials, remain close to what they mean in a dictionary sense: one word has one meaning, one grammatical construction is right and another wrong, the words mean what they say, no more and no less. At this stage of language use, any text or communication is on one level only; purely informational, or at the level of basic interpersonal communication.

Representational language, on the other hand, stretches beyond the limits of sentence and it requires the analysis and interpretation of language use, not just as reference but also as representation. In other words, language is seen as a means of communication in which "words are used to refer to a concrete and common-sense world and it is also seen as a mode of communication in which a speaker's or writer's attitude and stance towards that world is represented in terms of how they are positioned within a discourse community. In

that process, common-sense understanding may be displaced or at least relativized and questioned (Carter, 1997, p.75). Where representational language teaching/learning differs from purely referential language teaching / learning is that rules are questioned, played around with, and put to different uses as part of that on going process of language acquisition.

### *1.2 Classroom activities*

At this phase of the presentation, some teaching/learning activities will be proposed to raise the language awareness of the EFL students. Although all the materials were chosen to be representational for obvious reasons, it must be emphasized that this paper does not claim that referential materials must be moved out from the class for good. Referential language is fundamental to any learner's knowledge about language and of a language system that rules, structures and grammar are acquired and that the way language operates is understood in an on going way. What is proposed by this paper can best be described as a "happy marriage" between referential and representational teaching/learning.

## **2. Conclusion**

The main focus the present paper has been to discuss the notion of language awareness, especially the importance of raising language awareness in English as a foreign language classes. Also some strategies and teaching/learning activities that may be employed to enhance language awareness were proposed. It is hoped that by the help of proposed activities the EFL teachers will stand a better chance to keep their prospective students engaged and active participants and, more importantly, make them enjoy and appreciate the fact language is richness and variety.

## Abstract

This qualitative study, aimed to analyze eight French-speaking learners' beliefs about English and English language learning. The data were obtained via semi-structured interviews. The study drew on Weiner's attribution theory of achievement motivation and Bandura's self-efficacy theory. The novelty about this research is the employment of an attributional analysis framework to study and explain the learners' stated beliefs about English and English language learning.

Keywords: L2 learner beliefs; attributions; self-beliefs; self-efficacy; foreign language beliefs

## 1. Introduction

Since the 1980s, with the developments of cognitive psychology, language learners' beliefs have received remarkable attention. So far, L2 learner belief studies have looked for possible relationships between learner belief systems and various aspects of L2 learning and other related psychological constructs. Research into L2 beliefs continues to dominate the Foreign Language Learning (FLL) literature and shows no sign of diminishing (see Bernat and Gvozdenko, 2005; Gabillon, 2005, 2007, 2012a, 2012b; Hawkey, 2006; Kalaja and Barcelos, 2003; Kormos et al., 2011; Levine, 2003; Loewen et al., 2009; Wenden, 1986a, 1986b, 1995 and so forth).

The present study reports on eight French-speaking university students' beliefs about English and English language learning. The learners' beliefs were examined by drawing on Weiner's attribution theory of achievement motivation (1985, 1986) and Bandura's self-efficacy theory (1986). The novelty about this study is the employment of an attributional analysis framework to study and explain the learners' stated beliefs about the English language and learning of this language.

## 1. Literature review

Heider (1958) claimed that people act on the basis of their beliefs and maintained that psychologists could learn a great deal from people's explanations and understandings of the events, and behaviors about them. He stressed the importance of taking ordinary people's beliefs seriously, whether these beliefs are valid or not, and suggested that beliefs must be taken into account when dealing with human behavior. The individual's explanations of his/her experiences and attributions s/he makes, therefore, are considered to be important because they are the individual's inferences (self-attributions) to understand and interpret the causes that s/he believes to be responsible for his/her own behavior, feelings, and attitudes (Ross 1976).

Weiner's (1985, 1986) attributional theory of achievement motivation provides a scheme for analyzing and understanding learner attributions in educational settings. In Weiner's attributional theory of achievement

\* Corresponding author. Tel.: + 698 482547.  
E-mail address: zehra.gabillon@gmail.com

motivation, attributions play a significant role on people's behaviors. Attribution (causal ascription) is the key term in attribution theory and it refers to individuals' interpretations of the causes of events that happen to themselves and others (Weiner 1986). According to Weiner (1980), individuals use attributions to interpret and predict the possible consequences of their actions. Weiner's theory considers ability, effort, task difficulty, and luck as the key factors that influence attributions people ascribe for their achievements. Weiner (2000) proposed three properties of causes: locus (internal or external), stability (stable or unstable), and controllability (controllable or uncontrollable) (see Figure 1).

<u>Properties of Cause</u>			
<u>Types of Causal Ascriptions</u>	<u>Locus</u> Internal or External	<u>Stability</u> Stable or Unstable	<u>Controllability</u> Controllable or Uncontrollable
Ability	internal	stable	uncontrollable
Effort	internal	unstable	controllable
Task Difficulty	external	stable	uncontrollable
Luck	external	unstable	uncontrollable

Fig. 1. Attribution model based on Weiner's attributional theory of achievement motivation

Weiner asserted that these three properties play an important role in shaping two key determinants of motivation: a) expectancy of future success and b) value ('...emotional consequences of goal attainment or non-attainment.'--Weiner 2000: 5). Weiner (2000) explained that when the individual perceives the cause 'stable' s/he will anticipate the same outcomes in the future. For instance, if the individual believes that s/he lacks the ability (which is internal locus, stable, and uncontrollable) to perform an action that s/he has already experienced and failed, then s/he will expect failure again and will not be willing to perform the task. If, for example, the student attributes his/her failure to a teacher that s/he perceives as unfair (which is external locus, stable, and uncontrollable), then s/he will anticipate failure again if s/he takes the same course from the same teacher.

Bandura (1986) claimed that self-referent beliefs are better indicators of individuals' behaviors than what they are actually capable of doing. In educational research literature, self-referent beliefs became a real research interest with Bandura's sociocognitive theory (e.g. Zimmerman 1990; Schunk & Zimmerman 1997 etc.). Self-efficacy beliefs, which are considered to be the most important self-referent beliefs, are studied under self-efficacy theory--a sub-theory developed under the framework of social cognitive theory (Bandura 1986). Simply defined, self-efficacy beliefs refer to personal beliefs (judgments) about one's capabilities to engage in an activity or perform a task (Bandura 1986). "Self-efficacy beliefs revolve around the question of 'can'." (Pajares & Schunk 2002:20). Bandura (2006a) claimed that self-efficacy beliefs shape individuals' motivations, goals, outcome expectations (i.e. whether they expect their efforts to produce favorable or unfavorable outcomes), way of thinking, emotions, and their determination in front of difficulties. Bandura (2006a) acknowledged that the individual's successes help him/her develop strong sense of self-efficacy. On the other hand, the individual's repetitive failures weaken the individual's self-efficacy beliefs.

Bandura (1986) maintained that people choose to engage in tasks that they believe they have high efficacy and avoid the ones that they perceive beyond their capabilities. Learners who believe that they have difficulties often avoid or resist the subjects or activities for which their self-efficacy is weak (Margolis 2005). Bandura (2006b) asserted that self-efficacy beliefs play a significant role in the regulation of motivation. He maintained that people

feel motivated to undertake challenges on the basis of their outcome expectations. The likelihood that people will act depends highly on whether they believe they can produce the required performance. Self-efficacy influences the type of attributions individuals make about their performances (Bandura 2006a). When people perceive strong self-efficacy they exert more effort and are more persistent and resilient in face of failure. According to self-efficacy theory, an individual with low self-efficacy beliefs perceives tasks to be fulfilled more difficult than they actually are. Thus, this belief restrains him/her from performing his/her best. Individuals with high self-efficacy belief are assumed to attribute their failure to insufficient effort rather than lack of ability or luck. That is, people with high self-efficacy believe that success can be achieved by effort, and in case of failure, they exert more effort when they engage in a similar task next time. However, individuals who have low self-efficacy beliefs attribute their failure to the lack of necessary skills and ability. For instance, people with low self-efficacy beliefs avoid performing tasks that require the skills that they believe they lack.

The interactions between learners' actions, their beliefs (self-efficacy, self-concept etc.), prior experiences, and attributions have been a topic of interest for many SLA (Second Language Acquisition) and FLL (Foreign Language Learning) researchers. Dörnyei and Otto (1998) maintained that, learners are influenced by their belief systems when they evaluate task demands before engaging in a task. They emphasized the importance of prior experience and its psychological consequence. They maintained that influenced by their experiences learners might generalize a failure in one classroom task to the whole language learning. They argued that learners assess their task outcomes based on their self-efficacy beliefs, perceived goal difficulty, perceived L2 competence, and the causal attributions about their prior experiences (e.g. failure and success). Dörnyei (2007) asserted that failure that is ascribed to stable uncontrollable factors such as low ability hinders future achievement; whereas failure that is attributed to unstable and controllable factors such as effort can be regulated. He therefore suggested that teaching/learning environments should work towards promoting effort attributions and prevent ability, and other-related attributions as much as possible. Williams and Burden's study (1999) revealed that majority of the attributions that the learners made about their school achievement pointed mainly to external factors (e.g. teachers) rather than personal effort. Graham (2003) who studied an L2 learner's attitude towards learning French discovered that this learner's attributions were related to lower perceived self-beliefs. The data she obtained suggested that the learner's negative attitude towards French stemmed from low self-efficacy and a maladaptive attributional style.

Research findings have also demonstrated that beliefs that language learners hold about a target foreign language and its culture affect their attitudes towards that language (Csizér & Dörnyei 2005). Many other empirical investigations have also found statistically significant connections between positive beliefs towards the L2 and L2 culture and various aspects of L2 learning motivation (e.g. Gardner 2001).

## **2. Aim of the study**

This small-scale exploratory study reports on eight French students' stated beliefs about their like or dislike of English language learning and the English language. The study addresses attributions and self-referent beliefs such as self-efficacy beliefs and self-concept beliefs. The aim was: a) to elicit the causes the learners ascribed to their perceived like or dislike of English language learning; b) to examine the nature of these attributions; c) to look into the relationships between the learners' attributions, self-referent beliefs, perceived value of English language learning, and the marks they obtained in English.

## **3. Participants of the study**

The participants in the study were eight adult male French learners of English who were studying at a two-year university program. The learners had eight to ten years of English language learning experience. The

participants for this study were selected according to the scores they obtained in English. The score they obtained was the average of the marks obtained in all four skills (speaking, reading, writing, and listening).

#### 4. Methodology and Analysis

The study used semi-structured interviews as a research tool. The researcher prepared a set of questions (see below) but also allowed flexibility to ask other questions whenever it was necessary. The interviews were done in French and each individual learner's discourse items were transcribed and then translated into English. Weiner's (1985) attribution theory was applied to see the attributions each learner ascribed for their like or dislike concerning English and English language learning. The learner interviews were analyzed by focusing on whether the learners stated a like or a dislike towards learning English and the types of attributions they ascribed as causes. The researcher also attempted to establish links between the learners' beliefs and possible consequences of these stated beliefs on future learning. The main interview questions asked during the interviews were the following:

- 1) Do you like learning English?
- 2) Explain why/why not?
- 3) What is 'being good at English' for you?
- 4) Do you think you can get a better mark in your next English test?

Three students out of eight stated that they did not like the English language and/or English language learning (see *Student 1*, *Student 2*, and *Student 3*). Two out of eight were hesitant. These two students (*Student 4* and *Student 5*) referred to their past learning experiences as having negative effects on their foreign language learning. *Student 6*, *Student 7*, and *Student 8*, all expressed positive feelings towards both the English language and learning of this language.

##### 4.1. Participants' attributions for 'I don't like English'

*Student 1* revealed that he did not like learning English (see Table 1). He attributed his perceived dislike for English language learning—to his lower perceived L2 self-concept "I am not a good language learner" (an internal, stable and uncontrollable cause). The learner was convinced that he could not learn English because he perceived that he lacked the required L2 ability to learn English. He attributed his perceived L2 difficulty (or lower perceived L2 competence) as the consequence of his lack of ability to learn English. When the learner was asked what he meant by 'being good at English', he responded as: "Being able to speak and understand English". For this learner 'understanding and speaking English' represented a core belief, an implicit goal/expectation of learning English. The learner's discourse analysis indicated that the learner believed that he failed to achieve this goal because he perceived that he lacked the ability to learn this language. The reason for this learner's negative attitude towards learning English seemed to originate from his negative self-referent beliefs (i.e. lower perceived L2 competence and negative self-concept) which have internal, stable and uncontrollable causal properties.

Table 1. Analysis of *Student 1*'s discourse

*Student 2*, like *Student 1*, attributed the causes for his dislike of English language learning to his lower

(Do you like learning English?)	<i>Student 1</i> 's stated belief: ' I don't like learning English'	
<u>Causal ascription</u> Lower perceived ability in L2 learning (properties of cause: negative, present, internal, stable/uncontrollable )	"I am not a good language learner."	Attributes his dislike of English to his perceived lack of L2 ability and low L2 self-concept
<u>Causal ascription</u> Perceived task difficulty ( properties of cause : negative, present, internal, stable/uncontrollable)	"I find English difficult. I can understand when I read the texts given in the class, without much difficulty, but I cannot speak and understand English-speaking people well"	Attributes his perceived L2 difficulty to his lower perceived self-efficacy in English
<u>Goal/Expectation</u> (What is 'being good at English' for you?)	"Being able to speak and understand English-speaking people well"	
Outcome	English mark obtained:9/20	Fail
Expectancy of future success (Do you think you will get a better mark next time?)	"No, I don't think I can"	The student has low expectancy of success in his next English test

perceived L2 competence and his lower perceived L2 progress, which the learner believed to be beyond his control (see Table 2). *Student 2*, like *Student 1*, attributed his dislike to learning English to his lack of ability to learn this language. *Student 1*'s perception of the importance of listening and speaking skills was also shared by *Student 2*. In short, he as well perceived speaking and understanding as being the goal of language learning, and was convinced that he failed to achieve this goal.

Table 2. Analysis of *Student 2*'s discourse

(Do you like learning English?)	<i>Student 2</i> 's stated belief: ' I don't like learning English'	
<u>Causal ascription</u>  Lower perceived L2 competence (properties of cause: negative, present, internal, stable/uncontrollable)	"My English is not good."	Attributes his dislike of English to his lower perceived L2 competence
<u>Causal ascription</u>  Perceived repetitive failure (properties of cause: negative, past/present, internal, stable/uncontrollable)	"I have been learning English for more than eight years, yet I don't know much English."	Attributes his lower perceived L2 competence and his lack of progress as a cause for his non- achievement
<u>Goal/Expectation</u>  (What is 'being good at English' for you?)	"Having good speaking and listening competence"	
<u>Outcome</u>	English mark obtained:8/20	Fail
Expectancy of future success  (Do you think you will get a better mark next time?)	"I don't think I will"	The student does not expect to succeed in his next English test

Both *Student 2* and *Student 1*'s discourses showed that these learners did not expect to get a better mark in their next English test. Bandura (2006a) asserted that learners who perceive that they did not have the required competence would believe that they could not produce desired effects by their actions and would not be willing to participate in classroom activities. In the case of *Student 1* and *Student 2* their lower perceived L2 competence (because of their perceived lack of ability, perceived L2 difficulty and lower perceived L2 progress) was attributed as the major cause for their negative feelings towards L2 learning. These learners' negative beliefs might affect their future learning behaviors negatively.

The case of *Student 3* (see Table 3) appeared to be slightly different from the first two learners, whose beliefs were directly related to their lower perceived L2 competence and L2 self-concept. *Student 3* attributed his dislike of learning English to the nature of the English language. This learner expressed an explicit negative attitude towards the English language. His discourse also revealed that he did not perceive English as being relevant to his goals and future expectations. This learner stated that he could get a better mark in his next English test if the test was easy (external, uncontrollable causal ascription). The data obtained indicated that the behavioral consequence of *Student 3*'s L2 beliefs would probably be non-participation in the L2 learning activities.

Table 3. Analysis of *Student 3*'s discourse

(Do you like learning English?)	<i>Student 3</i> 's stated belief: 'I don't like learning English.'	
<u>Causal ascription</u> Perceived dislike for English and English language learning (properties of cause: negative, present, internal, stable)	"I don't like English because It sounds strange."	Attributes his dislike of learning English to his dislike of this language
<u>Causal ascription</u> Perceived value for another foreign language (properties of cause: positive, present, internal, stable)	"I prefer learning Spanish."	Ascribes his lack of interest in learning English to his preference for Spanish
<u>Causal ascription</u> Perceived insignificance of English course (properties of cause: negative, present, internal, stable)	"...and also I really don't think that I'll need English after I finish school. I already have a lot of other important school subjects to worry about."	Attributes his lack of interest in learning English to his perceived insignificance of learning English
<u>Expectation/Goal</u> (What is 'being good at English' for you?)	(Not relevant)	
<u>Outcome</u>	English mark obtained:10/20	Pass
Expectancy of future success (Do you think you will get a better mark next time?)	"Perhaps, I will. I don't know. It depends on the test."	The student has some expectancy of success. He expresses that the test (task difficulty) will determine whether he will be successful or not

#### 4.2. Participants' attributions for 'I like English but...'

*Student 4* and *Student 5* expressed dual feelings about English and English language learning and attributed their non-achievement to an external cause. They both referred to their past L2 learning situations as unfavorable and ascribed their prior L2 experiences as a cause for their lower perceived L2 competence and at the same time as a cause for their dislike for learning English.

*Student 4*'s discourse revealed that he perceived English language learning as instrumental to achieving his goals. He believed that learning English would be useful for getting a good job and for his school achievement (see Table 4). *Student 4* believed that his L2 learning experience at high school was the major reason for his dislike for English classes (past, external, uncontrollable cause). He stated that at high school his teachers focused mainly on the teaching of grammar, which he did not find useful and enjoyable to learn. In short, he attributed his teachers' language teaching approach at high school as a cause for his low L2 competence.

Although previously he attributed his teachers' emphasis on grammar teaching as a cause for his non-attainment, when the learner was asked what he considered as 'being good at English', he explained that for him knowing English meant 'being good at grammar and speaking'. When he was pointed out that he considered emphasis on grammar learning/teaching as one of the causes for his dislike of English, he responded as follows:

‘I don’t like doing grammar exercises. I never felt that I learnt English when we did grammar lessons. But I know that I need to know grammar well to speak and understand English. Now we speak a lot and the teacher corrects our grammar mistakes after. It’s better.’

Table 4. Analysis of *Student 4*’s discourse

(Do you like learning English?)	<i>Student 4</i> ’s stated belief: ‘(I think) I like English but...’	
<u>Causal ascription</u> Perceived L2 value (properties of cause: positive, present, internal/external, stable)	“I believe English is an important language ...for my future career, for my studies etc.”	Perceives English as a significant language to learn (for his studies/ future career) and attributes this as a cause for his interest in English
<u>Causal ascription</u> Previous L2 situation (properties of cause: negative, past, external, unstable/ uncontrollable)	“But, I didn’t have good teachers at lyc�ee (high school)”. I have problems with English. “They mostly taught grammar...not useful...not enjoyable”	Attributes his low L2 competence in English to his teachers’ teaching in his past L2 learning situation (i.e. not having good teachers)
<u>Goal/Expectation</u> (What is ‘being good at English’ for you?)	“knowing grammar and speaking well”	
Outcome	English mark obtained:12/20	Satisfactory
Expectancy of future success (Do you think you will get a better mark next time?)	“I don’t know. Well! I don’t think. I have never learnt English well. Perhaps it’s a little late now.”	The student has low expectancy of getting a better mark. He attributes it to his lower perceived L2 self-concept.

*Student 5* ascribed internal self-referent causes for his lower perceived L2 achievement (see Table 5). He explained that he was not interested in learning English when he was a high school student. He recognized his previous lack of interest to be the major reason for his lower perceived L2 competence. However, he added that he perceived English learning as being important for his future career and his studies.

Table 5. Analysis of *Student 5*'s discourse

(Do you like learning English?)	<i>Student 5</i> 's stated belief: 'I like English but...'	
<p><u>Causal ascription</u></p> <p>Lack of interest (properties of cause: negative, past, internal, stable/uncontrollable)</p>	"I was not interested in English when I was at the secondary/high school."	Attributes his perceived lack of interest in his previous English classes as a cause for his lower perceived L2 competence.
<p><u>Causal ascription</u></p> <p>Perceived L2 significance(properties of cause: positive, present, external/internal)</p>	"I know that learning English is important.	Perceives English as a significant language to learn .
<p><u>Causal ascription</u></p> <p>Lower perceived L2 competence (properties of cause: negative, present, internal)</p>	"But my English is not good. My speaking is not good, at all."	Attributes his lower perceived L2 competence to his previous lack of interest
<p><u>Causal ascription</u></p> <p>Intrinsic interest in L2 activities (dimension: positive, present, external/internal)</p>	But I like the activities we do in class now. I even feel that my English is getting better	Attributes his appreciation of English and his progress in English classes to the nature of the classroom activities used in his present L2 classes
<p><u>Goal/Expectation</u></p> <p>(What is 'being good at English' for you?)</p>	"Speaking with English people fluently"	
Outcome	English mark obtained:12/20	Satisfactory
<p>Expectancy of future success)</p> <p>(Do you think you will get a better mark next time?)</p>	I don't know...It is possible	Low expectancy of getting a better mark

*Student 5*, as well as *Student 1*, *Student 2* and *Student 4*, equated 'being good at English' to being able to speak this language. Like the other participants, this learner also considered his lower perceived L2 competence as an obstacle for his L2 enjoyment. However, this particular learner, despite his lower perceived L2 competence, expressed a positive attitude towards his present L2 situation. He stated that he liked the activities he did in his current English classes. He also maintained that he made progress with his English. This change in *Student 5*'s learning conditions, therefore, led him to conciliate his attitude towards learning English more positively. However, his speech was still cautious and uncertain.

### 4.3. Participants' attributions for 'I like English'

*Student 6, Student 7, and Student 8* expressed positive attitudes towards English language learning. *Student 8* expressed high intrinsic interest in the English language itself, as well as English language learning. *Student 6* and *Student 7*'s discourses followed more or less the same thematic pattern (see Tables 6 & 7). Their opening remarks acknowledged their positive perceptions of English language learning. They both expressed positive views about their present L2 learning situation and attributed their like for learning English to their L2 task enjoyment in their current English classes.

Table 6. Analysis of *Student 6*'s discourse

(Do you like learning English?)	<i>Student 6</i> 's stated belief: I like English	
<u>Causal ascription</u> Perceived intrinsic interest in L2 learning. (properties of cause: positive, present, internal)	"I think I like learning English."	Attributes his interest in this language to his liking for learning this language
<u>Causal ascription</u> Favorable L2 conditions. (properties of cause: positive, present, external)	"English classes are different from other classes. We are active. We talk, we do things."	Attributes his liking for learning English to his active involvement in class activities
<u>Causal ascription</u> Favorable L2 conditions. (properties of cause: positive, present, external)	"I like the listening and speaking activities that we do. They are mostly fun."	Attributes his liking for learning English to doing listening and speaking activities in his L2 class
<u>Goal/Expectation</u> (What is 'being good at English' for you?)	Understanding people when they talk and speaking well	
Outcome	English mark obtained: 14/20	Good
Expectancy of future success (Do you think you will get a better mark next time?)	Ohm... I hope.	The student has expectancy of a better achievement in English.

Table 7. Analysis of *Student 7*'s discourse

(Do you like learning English?)	<i>Student 7</i> 's stated belief: 'I like English'	
<u>Causal ascription</u> Perceived intrinsic interest in L2 learning (properties of cause: positive, present, internal, stable, uncontrollable)	"I enjoy English classes a lot."	Attributes his interest in this language to enjoying L2 classes.
<u>Causal ascription</u> Favorable L2 situation (properties of cause: positive, present, external, unstable, uncontrollable)	"We use computers... for example we listen using the internet, we use the internet dictionaries ... we do other activities, for example we record our voices if we want and listen..."	Attributes his liking for learning English to his liking for the learning activities in his present L2 learning situation.
<u>Causal ascription</u> Favorable L2 situation (properties of cause: positive, present, external, unstable, uncontrollable)	"I love talking in English ... we have the opportunity to talk in our English classes. We did not do such things at lycée."	Attributes his liking for learning English to having opportunities to talk in L2 classes.
Goal/Expectation (What is 'being good at English' for you?)	Speaking without an accent	
Outcome	English mark obtained:15/20	Good
Expectancy of future success (Do you think you will get a better mark next time?)	I think with our new teacher I will.	The student has expectancy of a better achievement in English.

The data revealed that both *Student 6* and *Student 7*, like all the other learners, recognized language learning primarily for oral communication. The data obtained from *Student 6* and *Student 7* indicated that external factors such as the activities used in their English classes had an influence on these learners' motivations and consequently on their interest in the L2 tasks used in their English classes. The interview data also indicated that the learning activities used in their present English classes correlated with their expectations and goals.

*Student 8*, among all the participants, was the one with the highest positive attitude towards the L2. The student expressed a wholesome intrinsic interest in both the English language and English language learning (see Table 8). He attributed his interest in this language to his strong liking of this language. He maintained that he especially enjoyed talking in English. He also revealed that he perceived English as a language with a high international status and he expressed willingness to participate in any kind of classroom tasks in his English classes. *Student 8*, like the other participants equated knowing English to the ability to communicate in this language well. However, differently from rest of the participants, this learner's goals and expectations concerning the learning of English indicated much higher standards. The learner's discourse indicated that his higher perceived incentive value for this foreign language motivated him towards achieving a native speaker level of

English. This learner had the highest mark from the English course and his discourse suggested that he was also the one with the highest intrinsic (and integrative) motivation.

Table 8. Analysis of *Student 8*'s discourse

(Do you like learning English?) English	<i>Student 8</i> 's stated belief: 'I like English (I like the English language)'	
<u>Causal ascription</u>  Perceived value of English (properties of cause : positive, present, internal, stable, uncontrollable )	"English is a nice language."	Attributes his interest in this language to a higher perceived value for this language (high intrinsic interest in the L2)
<u>Causal ascription</u>  Perceived intrinsic interest in L2 (properties of cause : positive, present, internal, unstable, uncontrollable)	"I like talking in English. I sometimes chat on the net (internet) when I play games. I like learning English."	Attributes his willingness to communicate in English to his liking for this language (high intrinsic interest in the L2)
<u>Causal ascription</u>  Intrinsic interest in L2 learning (properties of cause : positive, present/past, internal, stable, uncontrollable)	"Yes, I enjoyed learning English when I was at lycée, as well."	Ascribes his enjoyment of learning English to his liking for this language
<u>Causal ascription</u>  Perceived L2 significance (properties of cause : positive, present, internal/external)	"Learning English is a must for everybody. It's an international language."	Perceives English as a language with high incentive value
Goal/Expectation  (What is 'being good at English' for you?)	Being able to communicate well in English	
Outcome	English mark obtained: 17/20	Very Good
Expectancy of future success  (Do you think you will get a better mark next time?)	"I don't know... I already have a good mark. Well, it's possible I think."	The student has expectancy of a better achievement in English.

## 5. Overall

The learners' attributions indicated that these learners' perceived 'like' or 'dislike' of English language learning was influenced by their beliefs about: a) L2 competence and self; b) L2 learning situation and L2 goals and expectations; and d) the perceived value of the English language. These learners in general had the tendency to attribute failure either to external uncontrollable factors such as teachers or teaching/learning situations or internal uncontrollable factors such as low ability and low self-efficacy. The learners' interview data suggested that lower perceived self-concept and lower perceived L2 competence were ascribed as principal causes for their lack of interest in learning English. The students' grades also correlated with their perceived L2 competence, self-concept beliefs and their likes or dislikes for learning English.

Favorable L2 learning situation was one of the main factors, which the learners attributed as a cause for their enjoyment in learning English and their attainment in English classes. During the interviews, the students expressed that they liked English classes mainly because of their present favorable L2 learning situation. They attributed this positive feeling to external factors such as relevant, interesting, and useful L2 activities their present English classes offered (e.g. the use of the Internet, speaking activities, variety of activities which encourage student participation etc.). The activities that corresponded to their expectations and goals seemed to have significant influence on their interest in learning. *Student 4, Student 5, Student 6, and Student 7* all referred to their learning situations indicating how the L2 situation influenced their feelings towards learning English. This study also suggested that belief and attitude change could be possible with the change of conditions and methods used in language learning settings: “Now we speak a lot and the teacher corrects our grammar mistakes after. It’s better”; “...but I like the activities we do in class now...I feel that my English is getting better.”

## 6. Discussion

The research on student learning has demonstrated that learners’ perception of their learning situation has a significant impact on their attitudes towards the L2 they are learning (Williams & Burden 1999). Pajares and Schunk (2002) suggested that research should focus on student beliefs in order to understand why students choose to do certain activities and avoid others, why they achieve and why they fail to achieve. Zeldin and Pajares (2000) asserted that learners who believe that they do not have the required skills will not engage in tasks in which those skills are required and these beliefs about their competencies will affect “the choices they make, the effort they put forth, their inclinations to persist at certain tasks, and their resiliency in the face of failure.” (Zeldin & Pajares 2000: 215). Although a number of the above-mentioned issues concerning learner beliefs have been explored and verified through research done in the field of educational psychology, there is still need for more research in the area of L2 learner attributions to have better understanding of learners’ perceptions and interpretations of their learning situations.

Providing ways through which learners can exercise some control over their learning environment is highly recommended in order to enhance both self-efficacy beliefs and intrinsic interest in learning (Bandura 2006b). Educationalist have also asserted that providing learning environments where learners work collaboratively, and creating natural environments in which real communication takes place, would enhance learners’ self-concept beliefs. They also recommend that teachers should consider individual differences and use variety of task types that appeal to different individuals’ needs and interests to improve learners’ self-efficacy beliefs. However, we have not yet had substantial research on the types of classroom tasks that enhance self-beliefs and learning. Thus, applied linguistic research should continue to look into the factors that influence L2 learners’ task and learning preferences and investigate how these are related to learners’ self-belief systems. I believe that researching the nature of the relationship between prior classroom experiences, learners’ task preferences, self-beliefs and learner attributions is a promising path of inquiry.

# Language Learning Strategies: A general Overview

Abdalmaujod A Hardan\*

*University of Anbar, Ramadi, Iraq*

---

## Abstract

The paper is mainly about the concept of language learning strategies discussing its definitions, types and classifications. It will also discuss the use of language learning strategies among English language learners and the role of these strategies in promoting the process of language learning. The progress of language learning strategies over the time is explored precisely in this paper. The paper will also provide information regarding the use of language learning strategies which will lead researchers to better understanding and to guide them to the righteous way when making research in this field. At the end, this paper defines the notion of Good Language Learner explaining the relationship between Good Language Learner and the use of the appropriate strategies.

*Keywords: Language Learning Strategies; Learning Strategies; Good Language Learner*

---

## 1. Introduction

The significance of language learning strategies is increasing in the current year with the increasing importance of language learning all over the world. This paper is talking about language learning strategies providing a complete description of the field starting from the different definitions and classifications given by different scholars ending to the point of describing the good language learner according to the frequency of the use of these strategies. At the very beginning the researcher provides definitions and description of learning strategies as every learning process requires a manner to be adopted to achieve the main purpose. The next section will be devoted to the definitions of LLS as different researchers have defined LLS in different ways. The definitions of LLS are introduced and discussed here. Relevant studies and classifications of LLS by many researchers are addressed in this study in a section dedicated for the historical background of the research in this field. Rebecca Oxford's work (1990) will be specially discussed as she introduced the Strategy Inventory for Language learning (SILL). Rebecca's inventory is mostly adopted in the studies undertaken in the field of LLS.

E-mail address: abdulla\_808@hotmail.com

Finally, the notion of good language learner is defined and discussed in a specific section to clarify the relationship between the good language learner and the choice and frequency of learning strategies.

## 2. Learning Strategies

Every learning process requires a manner or a strategy to be adapted in order to achieve the main purpose of learning. Among the important things in the process of learning are "what" to use for learning and "how" to use it. However human beings are involved with many and different strategies while they are learning a language, some of these strategies are giving the ultimate benefit, yet some others are not effective. The term 'learning strategies' means different things and researchers have defined it in many ways. The modest definition provided by (Brown, 1980) who talked about learning strategies as processes that may contribute directly to learning. Chamot (1987, cited in Hismanoglu, 2000) went further when he attempted to define the term as processes, techniques, approaches, and actions that students take to facilitate the learning and recall of both linguistic and content areas of information.

Most of the research on learning strategies is related to the notion of successful learner(s). Researching in learning strategies, Rubin (1975) started doing research focusing on the strategies of successful learners and stated that once identified such strategies could be made available to less successful learners. He classified strategies in terms of processes contributing directly or indirectly to language learning. What exactly is meant by the term "learning strategy"? As Wenden (1987a:7-8) says "Learning strategies are the various operations that learners use in order to make sense of their learning". Also, Williams & Burden (1997) indicated that when students are involved in a learning task, they have several resources which they use in different ways to finish or solve the task, so this can be termed process of learning strategy. This explanation might be too abstract to understand, so it may be easier to say that learning strategy is learning skills, learning-to-learn skills, thinking skills, problem skills or, in other words the methods which learners use to intake, store, and retrieve during the learning process. Oxford (1990) defines learning strategies as "specific actions taken by the learner to make learning easier, faster, more enjoyable, more self-directed, more effective, and more transferable to new situations" (p.8). They do not only aid language learning, but also the learning of other subjects such as maths, chemistry, etc. In other words, when learners start to learn something, they have the ability to respond to the particular learning situation and to manage their learning in an appropriate way. Thus, learning strategy is like footballers who use tactics in order to win a game, when they are in the stadium. Learners use learning strategies in order to learn something more successfully.

O'Malley and Chamot (1990:43) went beyond the previous definitions to give a more focused definition. They defined Learning strategies as "techniques and devices used by second language learners for remembering and organizing samples of the second language. One of the ways learners become actively involved in controlling their own learning is by using strategies. Strategies are the thoughts and behaviours that learners use to help them comprehend, learn, or retain information". For O'Malley and Chamot (1990) learning strategies may include focusing on selected aspects of new information, analyzing and monitoring information during acquisition, and organizing or elaborating on new information during the encoding process, and evaluating the learning when it is completed or assuring oneself, that the learning will be successful as a way to allay anxiety.

Additionally, Ellis (1994:558) writes that "The study of learning strategies holds considerable promise, both for language pedagogy and for explaining individual differences in second language learning. It is probably true to say, however, that it is still in its infancy. For this reason, perhaps, discussions of learning strategies typically conclude with the problems that have surfaced and that need to be addressed before progress can be made". Meanwhile Ghani (2003) gives a new dimension to the definition of the learning strategies describing them as a facilitator in successful learning process. She stated that learning strategies are procedures, employed by the learners; in order to make their own language learning as successful as possible.

A very important part of learning strategies is the language learning strategies. Language learning strategies play an important role in learning process. In language research recently, 'Learning Strategies' as a term is gaining importance. It refers to 'techniques' and 'tactics'; it basically refers to the process that the learner employs in practicing language activities.

As we have seen in this section learning strategies are related to tactics and techniques used in the process of learning; learning of a language in particular. Therefore, there is an increasing research in the field of language learning strategies attempting to determine which of the language learning strategies mostly used by students. The next section will discuss and explain the definitions of language learning strategies in more details.

### 3. Definitions of Language Learning Strategies

Language learning strategies have received a considerable amount of significance since early 1970s for the crucial role they are playing in language learning. Many scholars defined language learning strategies differently focusing on the way used by learners to deal with the information they receive and what the kind of strategies they use. Language learning strategies are defined differently by many researchers. An early definition given by Riggeny (1978) who defines language learning strategies as the often-conscious steps or behaviours used by language learners to enhance the acquisition, storage, retention, recall, and use of new information. Oxford, Lavine, and Crookall (1989) have the same idea as Riggeny (1978) about language learning strategies. They stated that language learning strategies are used to enhance and to facilitate language acquisition. They referred to language learning strategies as “actions, behaviors, steps, or techniques—such as seeking out target language conversation partners, or giving oneself encouragement to tackle a difficult language task—used by learners to enhance learning (1989: 29). As further noted by these authors, such strategies facilitate the acquisition, storage, retrieval, and use of information.

According to Wenden (1987a), language learning strategies can be defined from the aspect of language learning behaviours, such as learning and regulating the meaning of a second or foreign language, cognitive theory, such as learners’ strategic knowledge of language learning, and the affective view, such as learners’ motivation, attitude, etc. It is argued that three points of views can improve language learning.

Rubin (1987) defined language learning strategies as behaviours, steps, or techniques that language learners apply to facilitate language learning. Moreover, the definition by Oxford (1990) also included cognitive, emotional, and social aspects of language learning strategies that enhance learners’ language learning proficiency and self confidence (Oxford, 1990; Ehrman & Oxford, 1990). Next, Ghani (2003) defined language learning strategies as specific actions, behaviours, steps, or techniques that students frequently use to improve their progress in L2 developing skills; these can facilitate the internalization, storage, retrieval, or use of new language.

Language learners use language learning strategies as a means to facilitate the acquisition of language and the use of information they receive, store, and recall. However many researchers accomplished many studies in the field of language learning strategies as it will be discussed in the next section.

#### 4. Research Background in Language learning strategies

The early research in language learning strategies was originated in 1970s when Rubin and Naiman (1975) tried to recognize the strategies used by good language learners when learning a second language. Rubin (1975) identified that there are certain strategies employed by the learner to enhance learning. Meanwhile Naiman and Frohlich (1975) made a list of strategies used by successful language learners, adding that they learn to think in the language and address the affective aspects of language acquisition. In (1976) Naiman et al. agreed with previous researchers on the importance of the kind of the strategies involved in learning process. They differentiate between 'Good' and 'Poor' language learners and they noted that "good" language learners appeared to use a larger number and range of strategies than "poor" language learners.

Language learning strategies vary widely and they are divided into distinct categories. O'Malley and Chamot (1990) described language learning strategies in more detail. They classify the strategies under three main headings: cognitive (applying a specific technique to a particular task, for example repeating, reasoning and analyzing), metacognitive (related to the learning process, for example organizing, planning and monitoring) and socio-affective (involving oneself and others, for example co-operating with peers and seeking clarification).

O'Malley and Chamot (1990) give special emphasis to those classed as metacognitive, maintaining that "students without metacognitive approaches are essentially learners without direction or opportunity to plan their learning, monitor their progress, or review their accomplishments and future learning directions" (1990: 8). They concluded that the best strategy is the cognitive one, repeating words and phrases out loud "repetition as the most frequently used strategy" (1990: 80)

Later in 1993, O'Malley and Chamot stated "individuals who take a more strategic approach learn more rapidly and effectively than individuals who do not" (1993: 105). Strategies of learning a foreign or second language as defined by Oxford (1990b) includes: specific actions, behaviors, steps, or techniques students use -- often consciously -- to improve their progress in apprehending, internalizing, and using the second language.

Research has repeatedly shown that the conscious, tailored use of such strategies is related to language achievement and proficiency.

Going beyond O'Malley and Chamot (1990) and in more detail, (Oxford, 1990) also classified language learning strategies, she divided these strategies into six categories arguing that many different strategies can be used by language learners: metacognitive techniques for organizing, focusing, and evaluating one's own learning; affective strategies for handling emotions or attitudes; social strategies for cooperating with others in the learning process; cognitive strategies for linking new information with existing schemata and for analyzing and classifying it; memory strategies for entering new information into memory storage and for retrieving it when needed; and compensation strategies (such as guessing or using gestures) to overcome deficiencies and gaps in one's current language knowledge.

Having more advanced idea about strategies of second language learning Andrew (1998) argued that the term strategies in the second-language-learning sense, has come to be applied to the conscious moves made by second-language speakers intended to be useful in either learning or using the second language. According to Andrew (1998) strategies can be very different in nature, ranging from planning the organization of one's learning (a metacognitive learning strategy) through using mnemonic devices to learn vocabulary (cognitive learning strategies) and rehearsing what one expects to say (a performance strategy) to enhance one's self-confidence for a language task by means of "self-talk" (affective strategy).

Recently, there has been a prominent shift within the field of language learning and teaching over the last twenty years with greater emphasis being put on learners and learning rather than on teachers and teaching. Parallel to this new shift of interest, how learners process new information and what kinds of strategies they employ to understand, learn or remember the information has been the primary concern of the researchers dealing with the area of foreign language learning (Murat, 2000). Murat's (2002) hypothesis supports what is really going on recently in the field of language research as the main concern of this field has turned to focus on the process of learning, including the learners, the strategies they used to use, and the context in which the process of learning takes place.

Ghani (2003) had an extensive study on the area of language learning strategies, she defined these strategies as: specific actions, behaviours, steps, or techniques that students (often intentionally) use to improve their progress in developing second language skills. According to her, these strategies can facilitate the internalization, storage, retrieval, or use of the new language. Ghani (2003) studied in more details the learners in terms of their use of strategies for learning. She states that learners have been found to vary considerably in both the overall frequency with which they employ strategies and also the particular types of strategies they use. Different students adopt different behaviors or strategies to learn a new language. Learners used to use strategies which are helpful for them according to their learning styles. This is confirmed by (Ghani, 2003) when she said that “These learners use different kinds of language learning strategies, or specific actions and behaviors to help them learn. Their strategies differ greatly, at least in part because their general learning styles are so varied. Some students learn words by breaking them down into their components and some of them consciously use guessing when they read.

Yet another study on language leaning strategies focused on students of foreign language by Andrew (2006) agrees with (Ghani, 2003) which states that learners are being encouraged to learn and use a broad range of language learning strategies that can be tapped throughout the learning process. This approach is based on the belief that learning will be facilitated by making students aware of the range of strategies from which they can choose during language learning and use.

Eventually, research on strategies for effective language learning has focused on (1) the identification, description, and classification of strategies; (2) their frequency of use and the learner’s success at using them; (3) differences in language proficiency level, age, gender, and cultural background that might affect their successful use of strategies; and (4) the impact of language strategy training on student performance in language learning and language use.

## **5. Taxonomy Of Language Learning Strategies**

Language Learning Strategies have been classified by many scholars. However, most of their attempts to classify language learning strategies reflect more or less the same categorizations of language learning

strategies without any radical changes. In what follows, Rubin's (1987), Oxford's (1990), O'Malley's (1985), and Stern's (1992) taxonomies of language learning strategies will be handled:

O'Malley (1985) divided language learning strategies into three main subcategories: Metacognitive Strategies, Cognitive Strategies and Socioaffective Strategies. Metacognitive Strategies is a term to express executive function, strategies which require planning for learning, thinking about the learning process as it is taking place, monitoring of one's production or comprehension, and evaluating learning after an activity is completed. Cognitive strategies are more limited to specific learning tasks and they involve more direct manipulation of the learning material itself. Repetition, resourcing, translation, grouping, note taking, deduction, recombination, imagery, auditory representation, key word, contextualization, elaboration, transfer, inferenceing are among the most important cognitive strategies. Socioaffective Strategies can be stated that they are related with social-mediating activity and transacting with others. Cooperation and question for clarification are the main socioaffective strategies (Brown 1987).

Rubin (1987), who is pioneered in the field of strategies, makes the distinction between strategies contributing directly to learning and those contributing indirectly to learning. According to Rubin, there are three types of strategies used by learners that contribute directly or indirectly to language learning. These strategies are:

- Learning Strategies
- Communication Strategies
- Social Strategies

Learning Strategies are of two main types, being the strategies contributing directly to the development of the language system constructed by the learner:

- Cognitive Learning Strategies
- Metacognitive Learning Strategies

Cognitive Learning Strategies refer to the steps or operations used in learning or problem-solving that requires direct analysis, transformation, or synthesis of learning materials. Rubin identified 6 main cognitive learning strategies contributing directly to language learning:

- Clarification / Verification

- Guessing / Inductive Inferencing
- Deductive Reasoning
- Practice
- Memorization
- Monitoring

Metacognitive Learning Strategies, these strategies are used to oversee, regulate or self-direct language learning. They involve various processes as planning, prioritizing, setting goals, and self-management. Communication Strategies are less directly related to language learning since their focus is on the process of participating in a conversation and getting meaning across or clarifying what the speaker intended. Communication strategies are used by speakers when faced with some difficulty due to the fact that their communication ends outrun their communication means or when confronted with misunderstanding by a co-speaker. Social strategies are those activities learners engage in which afford them opportunities to be exposed to and practice their knowledge. Although these strategies provide exposure to the target language, they contribute indirectly to learning since they do not lead directly to the obtaining, storing, retrieving, and using of language (Rubin and Wenden 1987:23-27).

Oxford (1990:9) sees the aim of language learning strategies as being oriented towards the development of communicative competence. Oxford divides language learning strategies into two main classes, direct and indirect, which are further subdivided into 6 groups. In Oxford's system, metacognitive strategies help learners to regulate their learning. Affective strategies are concerned with the learner's emotional requirements such as confidence, while social strategies lead to increased interaction with the target language. Cognitive strategies are the mental strategies learners use to make sense of their learning, memory strategies are those used for storage of information, and compensation strategies help learners to overcome knowledge gaps to continue the communication. Oxford's (1990:17) taxonomy of language learning strategies is shown in the following:

- **DIRECT STRATEGIES**

- I. Memory

- A. Creating mental linkages
    - B. Applying images and sounds
    - C. Reviewing well

## D. Employing action

## II. Cognitive

- A. Practicing
- B. Receiving and sending messages strategies
- C. Analyzing and reasoning
- D. Creating structure for input and output

## III. Compensation strategies

- A. Guessing intelligently
- B. Overcoming limitations in speaking and writing

- INDIRECT STRATEGIES

## I. Metacognitive Strategies

- A. Centering your learning
- B. Arranging and planning your learning
- C. Evaluating your learning

## II. Affective Strategies

- A. Lowering your anxiety
- B. Encouraging yourself
- C. Taking your emotional temperature

## III. Social Strategies

- A. Asking questions
- B. Cooperating with others
- C. Empathizing with others

According to Stern (1992), there are five main language learning strategies. These are as follows:

- Management and Planning Strategies
- Cognitive Strategies
- Communicative - Experiential Strategies
- Interpersonal Strategies
- Affective Strategies

Management and Planning Strategies are related with the learner's intention to direct his own learning. A learner can take charge of the development of his own program when he is helped by a teacher whose role is that of an adviser and resource person. That is to say that the learner must:

1. decide what commitment to make to language learning
2. set himself reasonable goals
3. decide on an appropriate methodology, select appropriate resources, and monitor progress,
4. Evaluate his achievement in the light of previously determined goals and expectations

Cognitive Strategies are steps or operations used in learning or problem solving that require direct analysis, transformation, or synthesis of learning materials. In the following, some of the cognitive strategies are exhibited:

- Clarification / Verification
- Guessing / Inductive inferencing
- Deductive Reasoning
- Practice
- Memorization
- Monitoring

Communicative-Experiential Strategies, Communication strategies, such as circumlocution, gesturing, paraphrase, or asking for repetition and explanation are techniques used by learners so as to keep a conversation going. The purpose of using these techniques is to avoid interrupting the flow of communication. According to interpersonal strategies learners should monitor their own development and evaluate their own performance. Learners should contact with native speakers and cooperate with them. Learners must become acquainted with the target culture. For Affective Strategies it is evident that good language learners employ distinct affective strategies. Language learning can be frustrating in some cases. In some cases, the feeling of strangeness can be evoked by the foreign language. In some other cases, second language learners may have negative feelings about native speakers of second language. Good language learners are more or less conscious of these emotional problems. Good language learners try to create associations of positive affect towards the foreign language and its speakers as well as towards the learning activities involved. Learning training can help students to face up to the emotional difficulties and to overcome them by drawing attention to the potential frustrations or pointing them out as they arise.

It can be seen that much of the recent work in this area has been underpinned by a broad concept of language learning strategies that goes beyond cognitive processes to include social and communicative strategies. In 1990, Rebecca L Oxford introduced strategies inventory for language learning (SILL). This inventory describing the various types of language learning strategies that learner employs to help him/her to learn a new language. These LLS can be classified under six types, Memorization, Cognitive, Compensation, Metacognitive, Affective and Social strategies. Below is a detailed description of them:

- **Memorization Strategies:** Memorization strategies are techniques used to remember more effectively, to retrieve and transfer information needed for future language use. Memorization helps students to store in memory important information gathered from their learning. When the information is needed for use in the future, these strategies help the student to get the information back. For example, the semantic map of a group of nouns or verbs that shows the relationship between the words.
- **Cognitive Strategies:** Cognitive strategies used to help the students to manipulate the target language or task correctly by using all their processes. They include reasoning, analysis, and drawing conclusions. For example, the use of drills to practice the language and the use of dictionary to find difficult words.
- **Compensation Strategies:** Compensation strategies are employed by the students to compensate the missing knowledge in the target language due to lack of vocabulary. The strategies help to allow the students to use the language to speak and write in the target language even when their vocabulary is limited. For example, the use of linguistic clues to guess the meanings or by inventing words to the use of linguistic clues to guess compensates their lack of vocabulary.
- **Metacognitive Strategies:** Metacognitive strategies are employed by the students to help them coordinate the learning process by centering, arranging, planning, and evaluating their learning, this help learner to control their own learning. Students will also be able to plan what their learning strategies should be and change them if they are not suitable. For example, overviewing with already known material and deciding in advance on what to pay attention to.
- **Affective Strategies:** Affective strategies are techniques to help the students control their emotions, attitudes, motivations and values. These strategies have a powerful influence on language learning because they allow the students to manage their feelings. For example, students may use laughter to relax and praise to reward themselves for their achievements.

- **Social Strategies:** social strategies are activities that students engage in to seek opportunities to be exposed to an environment where practice is possible. These strategies are important because language learning always involves other people; it is a form of social behaviour. For example, questioning for understanding or facts and work together with peers or speakers of the target language including native and native like speakers in order to upgrade their language skills.

Oxford's (1990) taxonomy of language learning strategies divides these strategies into two main classes, direct and indirect strategies according to their contribution in the process of language learning. The first class is direct strategies employed by language learners. Direct strategies include memorization, cognitive and compensation strategies.

## 6. Good Language Learner

For many people, learning a second language is one of the most important and demanding tasks they will need to accomplish. This is particularly true in some countries where a student's English abilities are often more important for their career success than their university marks. For these reasons, an awareness of how to learn a language, not just what to learn, is very important. Knowledge of the characteristics of a good language learner can help students increase their language learning efficiency (Sewell, 2003). According to Sewell (2003) the interest in language learning strategies originated from a desire to understand the characteristics of the good language learner. The concept emphasizes the active role of the learner in the learning process. The use of proper strategies for language learning plays a very effective role in the learning process. The good learner represents the use of good and proper strategies that lead to accurate acquisition. For this reason the study of characteristics of good language learner is a crucial need to achieve successful learning which results in successful acquisition.

Early researchers tended to make lists of strategies and other features presumed to be essential for all "good L2 learners." (Rubin, 1975) suggested that good L2 learners are willing and accurate guessers; have a strong drive to communicate; are often uninhibited; are willing to make mistakes; focus on form by looking for patterns and analyzing; take advantage of all practice opportunities; monitor their speech as well as that of others; and pay attention to meaning.

Rubin (1975) observed in her study the strategies used by the good or successful language learner. In her observation of the language learning process of good language learners, she identified that there are certain strategies employed by the learner to enhance learning. She identified the following strategies used by good language learners:

Αππενδix B. Making reasoned guesses when not sure.

- Making an effort to communicate and to learn through communication.
- Finding strategies for overcoming inhibitions in target language interaction.
- Practicing the language whenever possible.
- Monitoring their speech and that of others.
- Attending to form (i.e., grammar)
- Paying attention to meaning.

Naiman, Frohlich, and Todesco (1975) went beyond (Rubin, 1975), they made a list of strategies used by successful L2 learners, adding that they learn to think in the language and address the affective aspects of language acquisition. They state that self-Directed learners need to identify the strategies that make them more effective language learners. These strategies will vary according to the goals and objectives of the learner. They described a language strategy as a conscious thought or behaviour used by a learner to improve understanding of the target language.

Naiman et al. (1976) differentiate between 'Good' and 'Poor' language learners and they noted that "good" language learners appeared to use a larger number and range of strategies than "poor" language learners, the implications of understanding strategy use have seemed increasingly important. Naiman et al. (1976) concluded there are still many questions to answer. Does strategy use actually aid language learning, or is it just something that good learners do? Are some strategies better than others, or is it the number and range of strategies used that counts? Are there "bad" strategies that actually making learning or performance worse? Can "poor" language learners' benefit from being taught the strategies that "good" learners use, or do you need to be a good learner already to use some of the strategies? Does strategy training affect language learning?

In 1978, Naiman et al found six types of strategies, which were common in good language learners (cited in Cook, 1996) as to find a language learning style that suits you, involves yourself in the language learning process, develop an awareness of language both as system and as communication, pay constant attention to expanding your language, develop the L2 as a separate system and take into account the demands that L2 Learning.

In most of the research on language learning strategies, the primary concern has been on “identifying what good language learners report they do to learn a second or foreign language, or, in some cases, are observed doing while learning a second or foreign language.” Rubin and Wenden (1987:19)

Oxford (1994) agreed with Rubin and Wenden (1987) that the study of good language learners’ characteristics got primary concern in the field of studying language learning strategies. He argued that a number of good language learners’ characteristics have been validated by subsequent research. The "uninhibited" aspect has not been confirmed as part of all or most good language learners. Because of language anxiety, many potentially excellent L2 learners are naturally inhibited; they combat inhibition by using positive self-talk, by extensive use of practicing in private, and by putting themselves in situations where they have to participate communicatively.

Claus Gnutzmann (2005) states, “Most researchers have rejected the notion of a single profile of the “good language learner” because over the years research studies have shown that there can be remarkable differences among equally successful language learners. Rather than limiting the description of the good language learner to one that is prescriptive and ignores learner differences, the more recent and inclusive view is that there are various ways that language learners can be successful. For the most part, these learners are strategic in their learning”.

## 7. Conclusion

This paper has discussed the concept of language learning strategies in a general overview. It presents definitions of the concept by different scholars who are giving various definitions yet they are mostly agreed that language learning strategies are steps, behaviours and techniques used by learners to enhance and facilitate the language acquisition. The concept of language learning strategies has received a considerable amount of significance since early 1970s for the crucial role they are playing in the processes of language learning and acquisition. When scholars defined language learning strategies differently they were focusing on the way used by learners to deal with the information they receive and the kind of the strategy they use.

Language learning strategies vary widely and they are divided into different categories. O'Malley and Chamot (1990) classified LLS into three headings: cognitive, metacognitive and socio-affective. Oxford (1990) also classified LLS; she divided these strategies into two main classes direct and indirect strategies which are further subdivided into 6 groups. Direct strategies include memorization, cognitive, and compensation strategies and indirect strategies include metacognitive, affective and social strategies. In relation to the concept of language learning strategies the paper defined the notion of good language learner who represents the use of proper strategies that lead to accurate acquisition.

# Latvian music teachers' survey on the assessment criteria of mastering improvisation

Jevgenijs Ustinskovs\*, Svetlana Ignatjeva

*Kandavas 2a, Daugavpils, LV-5401, Latvia, choirdaugava@inbox.lv*

## Abstract

Improvisation has been used in music practice for ages, but at present it is a component of several subjects on music. The research aim is to study the attitude of Latvian music teachers to the criteria developed for assessing the level of mastering improvisation. For this purpose, a questionnaire survey was carried out, with music teachers of different schools and higher education institutions from all regions of Latvia (N=187) participating in it. A paired comparison method was applied: the respondents were supposed to compare each assessment criterion of mastering improvisation with respect to each other assessment criterion of mastering improvisation. The SPSS software was used for the analysis of statistic data and presentation of the research results. The research outcomes show that the respondents' opinions on the assessment criteria of mastering improvisation differ depending on their gender, work place, involvement in improvisation, concert activities, self-identification and length of service. Therefore the assessment made by different music teachers may also be different and equal attention should be paid to all assessment criteria.

**Key words:** acquisition of improvisation; assessment criteria; survey; music teachers; statistics.

## Introduction

Several investigators consider improvisation really necessary for music teachers and acknowledge that it is also an important competence for their profession (Ferand, 1956, 1957; Короутек, 1976; Pressing, 1984; Regineld, 1987; Глущенко, 1990; Мальцев, 1991; Blauzde, 2001; Ustinskovs, 1995; Martin, 2005; Zariņš, 2005; Lehmann, Sloboda, Woody, 2007; Birzkops, 2008; Stefanuk, 2008; Кинус, 2008; Спигин, 2008; Hickey, 2009; Petrauskas, 2009; Kingscott & Durrant 2010; Столяр, 2010; McGhee, 2011; Spigins, 2012).

Currently, the course on improvisation is included in the curricula of music secondary schools, but there is no integrated approach to teaching it, and no theoretical foundations and methodological techniques for the assessment of the acquisition of improvisation by prospective music teachers have been developed, because the problems concerning the assessment of the level of mastering improvisation have not been sufficiently studied as yet. T. S. Brofi (Brophy, 2000) recommends using several levels and criteria for assessing improvisation. The scholar thinks that a music teacher has to be able to evaluate learner's improvisation activity and has to know assessment criteria of mastering improvisation.

A report by J. Spigins (Spigins, 2010) on the evaluation of the acquisition of the basics of improvisation is one of those investigations which have been conducted in this field. The study done by J. Ustinskovs is concerned with assessing the skills of improvisation of music secondary school learners (Ustinskovs, 2011).

\* Corresponding author.

Email address:

As the acquisition of improvisation is a field that has been little studied, the aim of this research is to investigate what attitude to the assessment criteria of mastering improvisation Latvian music teachers take.

### Method and Procedure

Latvian music teachers' survey took place in the autumn of 2012. The respondents were supposed to compare the assessment criteria of mastering improvisation (Ustinskova, 2011). A pairwise comparison method was applied: each criterion of assessing the acquisition of improvisation was examined as to its relative importance with respect to each other. This method is widely applied in pedagogy and in other sciences as well (Albrehta, 1998).

187 music teachers of different schools and higher education establishments from all regions of Latvia participated in the survey: 54 (28.9%) from Riga, 42 (22.5%) from Latgale, 29 (15.5%) from Vidzeme, 33 (17.6%) from Kurzeme, 29 (15.5%) from Zemgale.

By gender they were: 128 (68.4%) – female, 59 (31.6%) – male.

Music teachers were differentiated by their work place: schools of general education – 48 (25.7%); children music schools and schools providing in-depth music studies – 52 (27.8%); music secondary schools and higher education institutions – 87 (46.5%).

In the procedure of data collecting the researcher himself and three of his colleagues from regions of Latvia were involved.

The SPSS software package “Statistical Package for the social Sciences”, Windows 19.0 version was used for the statistic data analysis and presentation of the research results.

The use of the verbal-numerical scale increases the objectivity of the assessment, contributes to the attraction of this field's specialists for assessment and ensures comparability.

At substantiating the criteria of relative importance of coefficients, each i-criterion is given a positive number  $F_i$  which reflects its relative importance.

The coefficients of relative importance of the criteria are given according to the law:  $0 < F_i < 1$ ; where  $n$  – is the quantum of the criteria.

The numerical values of this type are called values in the relationship scale scale, but the task itself, at giving numerical values to non-numerical objects that meet the given requirements, is called a scale task in the relationship scale. The most widely applied method for solving such tasks is Saaty value method.

By applying the above mentioned method, during the first stage the pairwise comparison of values was made. Such comparison is the simplest form of reflecting one's own preferences, minimizing the complications for the respondents.

Making use of the verbal-numerical scale, the respondents filled in the matrix of paired comparison:  $A_{ij} = I$  and  $j$  are the outcomes obtained from comparing the criteria. Values are determined according to a verbal-numerical scale  $a_{ij} =$

0 – criterion  $j$  is more significant than criterion  $i$ ;

1 – criteria  $j$  and  $i$  are equally significant;

2 – criterion  $i$  is more significant than criterion  $j$

The elements of the matrix of the  $a_{ij}$  paired comparison are viewed as the real criteria values of the relationships between the relative importance of the unknown coefficients:

$$a_{jk} = V_j / V_k$$

In an ideal case, using the logic at determining the value in a paired comparison, the condition  $a_{ik} = a_{ij} * a_{jk}$  should be observed. The matrix where such conditions are observed is called super transitive. In this case the equation  $A * V = V * n$  is satisfied, where  $V$  is a vector of real criteria values of relative importance of the unknown coefficients.

The value of the criteria of relative importance of the unknown coefficients is the calculation done according to the

$$\text{formula } V_i = \frac{1}{\sum_{j=1}^n a_{ij}},$$

with further standardizing of the obtained data. To make the interpretation of the data easier, the relative importance of criteria is expressed in percentage. To better understand and further to interpret the values of importance coefficient criteria it is worth while standardizing them. Standard values are divided according to the law of normal distribution with the null mean and the dispersion which is equal to one. This is very convenient when a comparative analysis of standard values of different indicators or the same indicators of different respondent groups is made. Standardized values of factors provide the opportunity to classify the respondents by each factor depending on whether the indicators are higher or lower than the mean.

## Results

Table 1. Matrix of paired comparison

Assessment criteria	Content of improvisation and its revealing, the sense of style	Time and agogics	Dynamics	Phrasing and form	Originality of the music	Reproduction of rhythm	Reproduction of the pitch	Use of the techniques of composition and improvisation	Use and development of a texture
Content of improvisation and its revealing, the sense of style	a11	a12	a13	a14	a15	a16	a17	a18	a19
Time and agogics	a21	a22	a23	a24	a25	a26	a27	a28	a29
Dynamics	a31	a31	a33	a34	a35	a36	a37	a38	a39

Originality of the music material	a51	a52	a53	a54	a55	a56	a57	a58	a59
Reproduction of rhythm	a61	a62	a63	a64	a65	a66	a67	a68	a69
Reproduction of the pitch	a71	a72	a73	a74	a75	a76	a77	a78	a79
Use of the techniques of composition and improvisation	a81	a82	a83	a84	a85	a86	a87	a88	a89
Use and development of a texture	a91	a92	a93	a94	a95	a96	a97	a98	a99

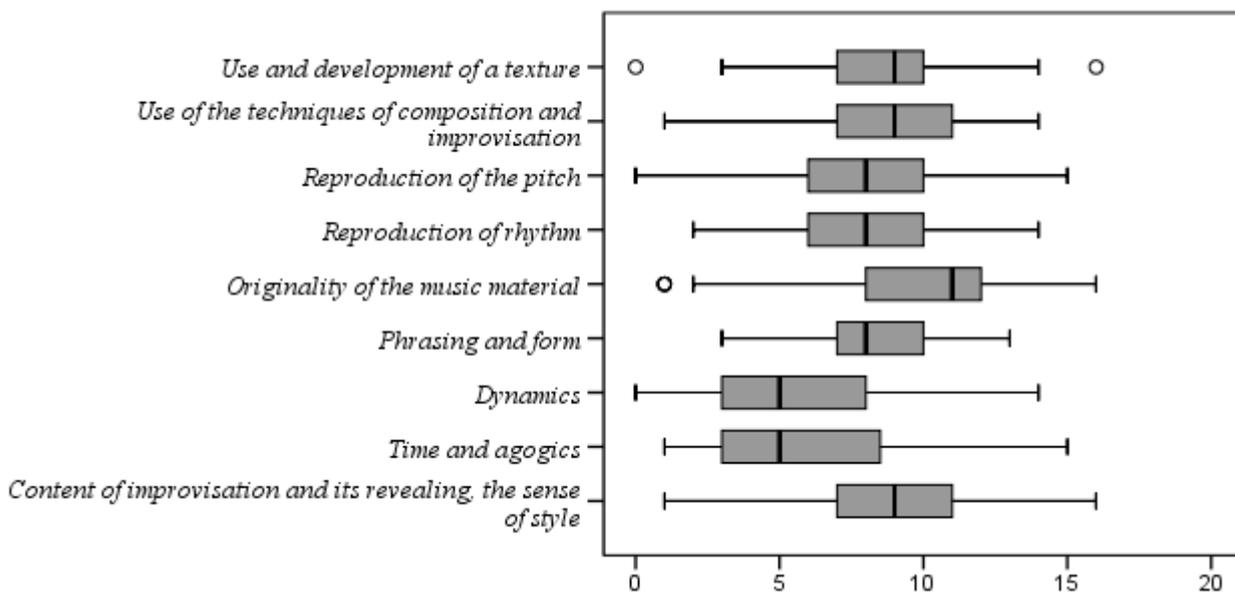

Figure 1. Diagram of the relative importance of criteria

Table 2. The descriptive statistics of the relative importance of criteria

	Content of improvisation and its revealing, the sense of style	Time and agogics	Dynamics	Phrasing and form	Originality of the music material	Reproduction of rhythm	Reproduction of the pitch	Use of the techniques of composition and improvisation	Use and development of the texture	
Mean	12,60	8,18	7,78	11,76	13,74	10,96	10,64	12,31	12,02	
Median	12,50	6,94	6,94	11,11	15,28	11,11	11,11	12,50	12,50	
Mode	13	6	10	11	15	13	10 <sup>a</sup>	11	13	
Std. Deviation	4,097	4,398	3,953	2,699	4,066	3,837	3,933	4,119	3,221	
Range	21	19	19	14	21	17	21	18	22	
Minimum	1	1	0	4	1	3	0	1	0	
Maximum	22	21	19	18	22	19	21	19	22	
Percentiles	25	9,72	4,17	4,17	9,72	11,11	8,33	8,33	9,72	9,72
	50	12,50	6,94	6,94	11,11	15,28	11,11	11,11	12,50	12,50
	75	15,28	12,50	11,11	13,89	16,67	13,89	13,89	15,28	13,89

The paired comparison matrix (Table1) indicates that the indicators having the greatest importance are *Content of improvisation and its revealing, the sense of style; Originality of the music material; Use of the techniques of composition and improvisation; Use and development of the texture*, while the smallest importance is attached to the criteria *Dynamics; Time and agogics*.

The greatest amplitude of dispersion of assessment is that of the criteria *Time and agogics; Content of improvisation and its revealing, the sense of style; Use of the techniques of composition and improvisation; Originality of the music material*, but the smallest one is that of the criterion *Phrasing and form* (Figure 1, Table 2).

Table 3. Assessment of the correlation between the relative importance of the criteria and respondents' professional characterizations: the results of the use of one factor dispersion analysis

Assessment criteria	Content of improvisation and its revealing, the sense of style	Time and agogics	Dynamics	Phrasing and form	Originality of the music material	Reproduction of rhythm	Reproduction of the pitch	Use of the techniques of composition and improvisation	Use and development of the texture
Workplace	0,008	0,008	0,093	0,959	0,008	0,001	0,012	0,551	0,185
Involvement in improvisation	0,849	0,221	0,001	0,060	0,193	0,720	0,011	0,207	0,017
Concert activities	0,615	0,242	0,001	0,179	0,134	0,178	0,003	0,942	0,072
I perceive myself more as	0,951	0,470	0,010	0,188	0,117	0,815	0,191	0,771	0,298

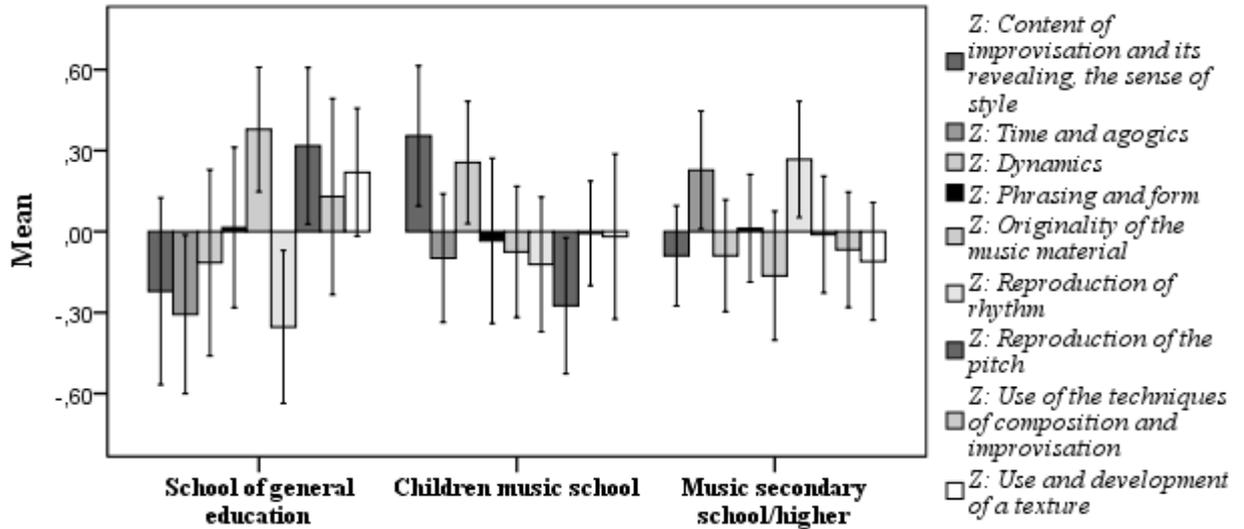

Figure 2. Mean importance of the assessments of the criteria by the respondents' workplaces

Respondents' workplace has a great influence on the assessment of several criteria, except the criteria *Phrasing and form*; *Use of the techniques of composition and improvisation*; *Use and development of the texture*. On the whole, all respondents assess these criteria close to the mean level of the respondent group. Respondents, whose workplace is school of general education, assess the criteria *Originality of the music material*; *Reproduction of the pitch* higher than the mean respondent group, while the criterion *Reproduction of rhythm* - lower than the mean respondent group. Respondents, whose workplace is children music school, assess the criteria *Content of improvisation and its revealing, the sense of style*; *Dynamics* higher, while the criterion *Reproduction of the pitch* is assessed by these respondents lower than the mean respondent group. Respondents from music secondary schools and higher education establishments typically give higher assessment to the criteria *Reproduction of rhythm and Time and agogics*.

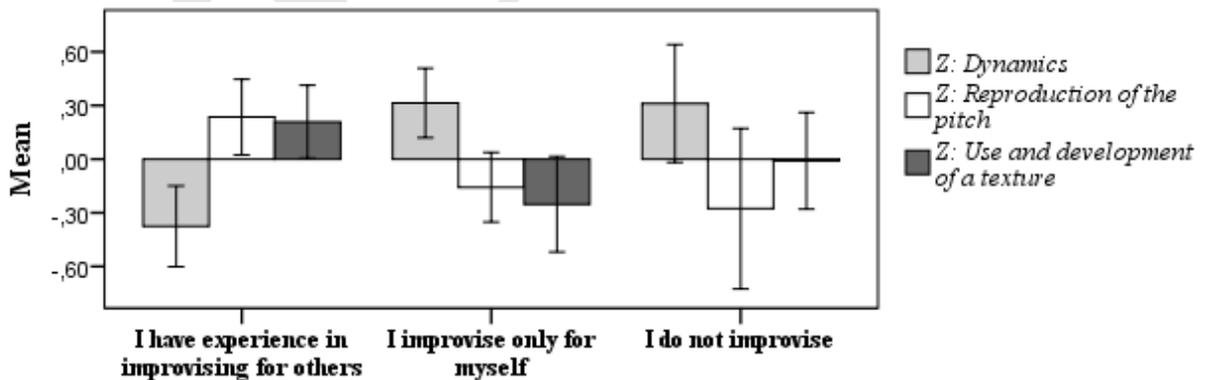

Figure 3. Mean importance of the assessments of the criteria by respondents' involvement in improvisation

Respondents' involvement in improvisation influences the assessment of such criteria as *Dynamics*; *Reproduction of the pitch*; *Use and development of the texture*. The respondents with the experience to improvise for others assess the criteria *Reproduction of the pitch*; *Use and development of the texture* higher than the respondents group on average. But the respondents who do not improvise or improvise only for themselves typically assess the criterion *Dynamic* higher than the mean group of the respondents.

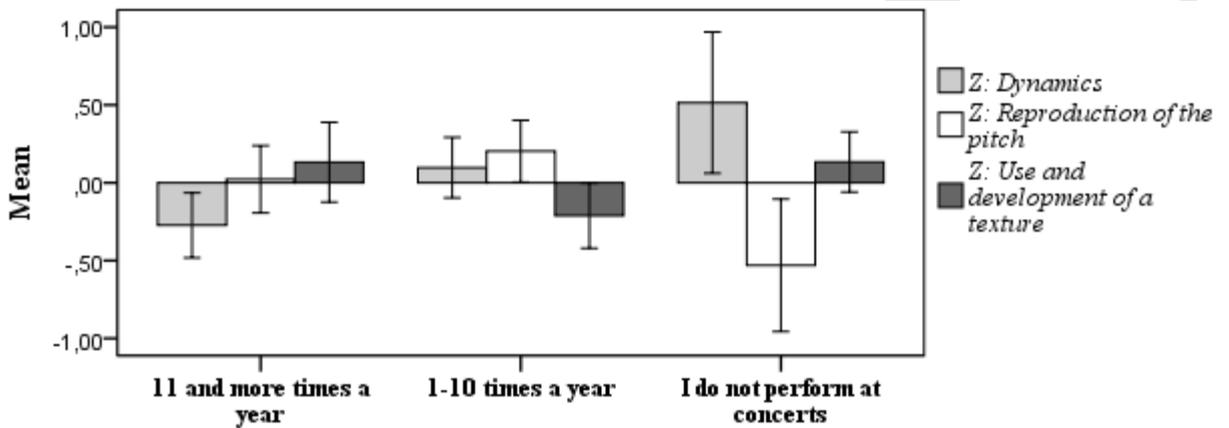

Figure 4. Mean importance of the assessment of the criteria by respondents' concert activities

The frequency of respondents' concert activities influences the assessment of the criteria *Dynamics*; *Reproduction of the pitch*; *Use and development of the texture*.

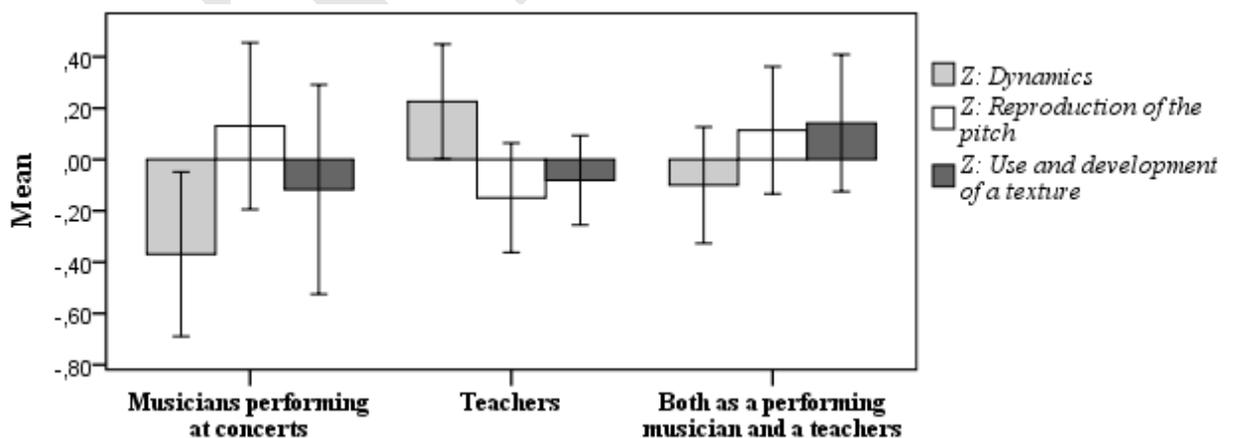

Figure 5. Mean importance of the assessment of the criteria by respondents' involvement in improvisation

The age range of the respondents is from 21 to 72, and half of them are older than 44. The respondents' length of service is from one year to 47 years, and for half of them it is longer than 21 years. There is a direct, significant and strong correlation between the respondents' age and their length of service, the correlation coefficient being 0.978.

The correlation between the assessment of the relative importance of the criteria *Time and agogics*; *Reproduction of the rhythm* and respondents' length of service is non-linear. The correlation approaches the squared curve with the convex point close to the age 21. To assess the observed correlations by means of Pearson correlation coefficient is possible only within the age ranges from 1 to 21 years and from 21 to 47 years.

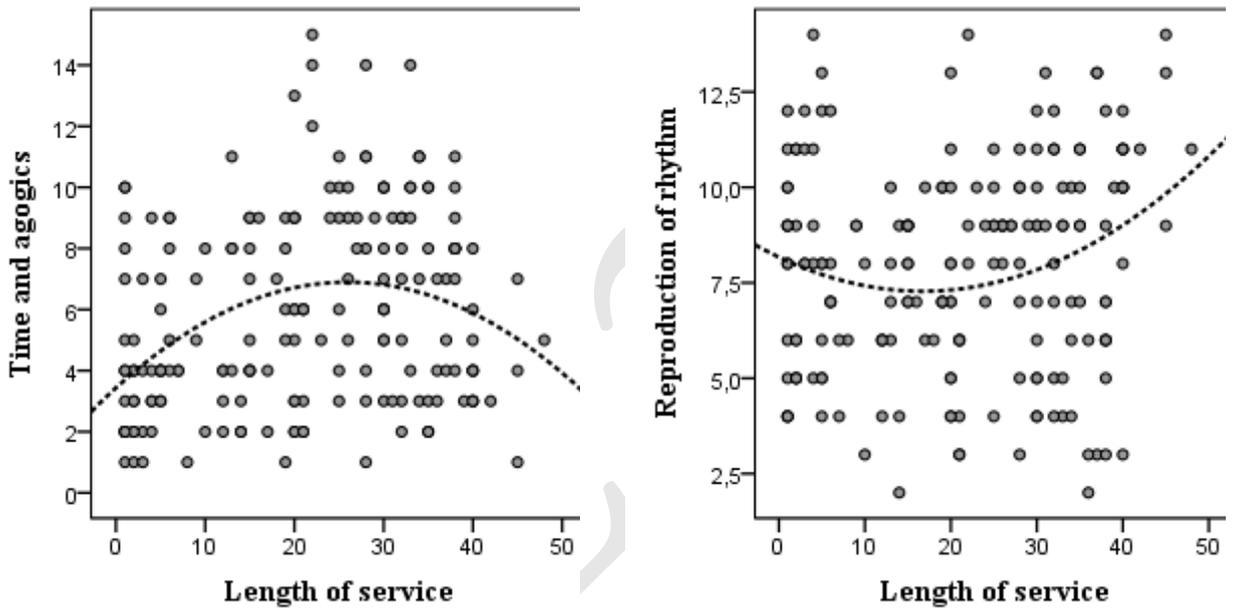

Figure 6. Scatter diagrams with a squared curve in planes: Length of Service and Time and Agogics; Length of Service and Reproduction of Rhythm

Table 4. Coefficients of correlation between the relative assessment of the criteria and respondents' length of service

Length of service	Content of improvisation and its revealing, the sense of style	Time and agogics	Dynamics	Phrasing and form	Originality of the music material	Reproduction of rhythm	Reproduction of the pitch	Use of the techniques of composition and improvisation	Use and development of the texture
1-20	0,426	0,234	0,148	0,094	-0,214	-0,083	-0,364	-0,013	-0,339
21-47	-0,261	-0,242	-0,133	-0,117	0,181	0,208	-0,075	0,285	0,155

Respondents with the length of service to 21 years show direct significant correlations between the *Length of service* and *Content of improvisation and its revealing, the sense of style* as well as between *Length of service* and *Time and agogics*. For respondents, whose length of service is more than 21 years, the character of these correlations is inverse. For respondents having the length of service more than 21 years direct correlations can be observed also between the length of service and the assessment of the criteria *Reproduction of rhythm*; *Use of the techniques of composition and improvisation*.

Table 5. Correlation coefficients between the assessments of the relative importance of the criteria

	Time and agogics	Dynamics	Phrasing and form	Originality of the music material	Reproduction of rhythm	Reproduction of the pitch	Use of the techniques of composition and improvisation	Use and development of the texture
Content of improvisation and its revealing, the sense of style	-0,134	-0,074	0,035	-0,049	-0,431**	-0,451**	0,100	-0,010
Time and agogics	1,000	0,613**	-0,130	-0,665**	0,148*	-0,062	-0,605**	-0,331**
Dynamics		1,000	-0,024	-0,478**	-0,008	-0,146*	-0,460**	-0,483**
Phrasing and form			1,000	-0,136	-0,150*	-0,177*	-0,090	0,136
Originality of the music material				1,000	-0,254**	0,020	0,515**	0,080
Reproduction of rhythm					1,000	0,087	-0,282**	-0,164*
Reproduction of the pitch						1,000	-0,175*	-0,018
Use of the techniques of composition and improvisation							1,000	0,075

The analysis of correlations shows direct significant correlations between the criteria:

- *Time and agogics and Dynamics;*
- *Originality of the music material and Use of the techniques of composition and improvisation;*
- *Time and agogics and Reproduction of rhythm.*

However, several other correlations have a contrary character, for instance, *Time and agogics and Originality of the music material;* *Time and agogics and Use of the techniques of composition and improvisation* and others (See table 5).

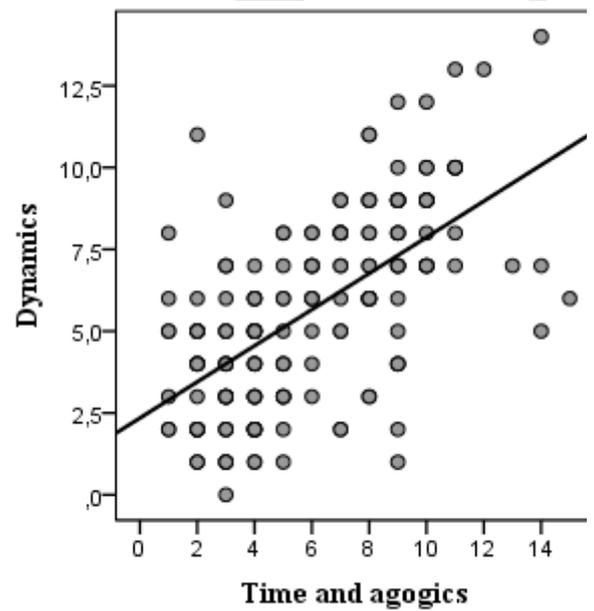

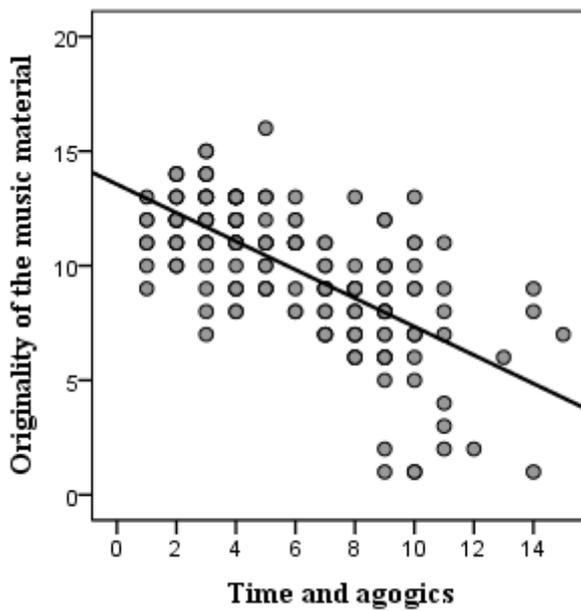

Figure 7. Scatter diagrams with a straight linear regression in planes: *Time and agogics* and *Originality of the music material*; *Time and agogics* and *Dynamics*

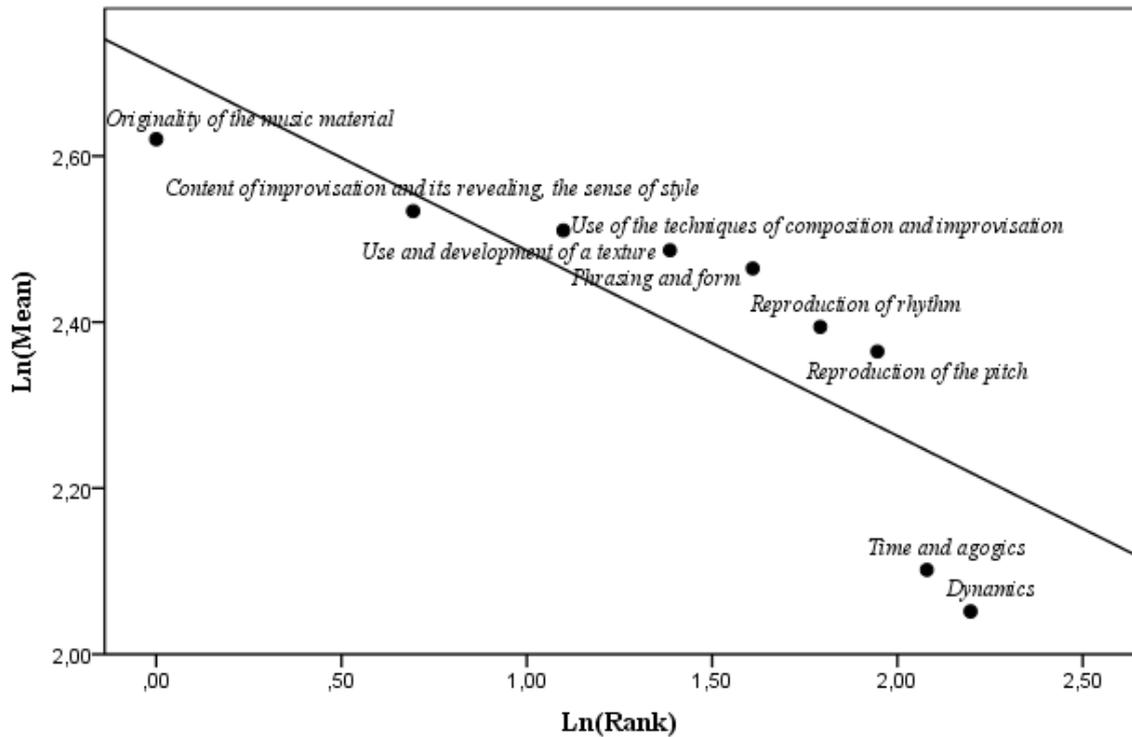

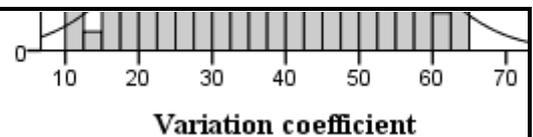

Figure 8. Scatter diagram with a straight log-linear regression in the plane of relative importance of the criteria and the mean value

Table 6. Variation coefficient

Mean		38,63
95% Confidence Interval for Mean	Lower Bound	36,74
	Upper Bound	40,51
5% Trimmed Mean		38,75
Median		39,53
Std. Deviation		13,085
Minimum		11
Maximum		65
Range		54
Interquartile Range		19

The variation of relative importance of the whole set of criteria can be assessed by applying variation coefficient:

$$\text{Variation coefficient} = \frac{\text{mean squared deviation of the criteria}}{\text{mean value of the criteria set}} * 100\%$$

The variation coefficient calculated in this way varies within the range of 11% -65% in relation to the mean value of 38.63% and for half of the respondents exceeds 39.53%. According to Kolmogorov-Smirnov criterion, the variation coefficient has a normal distribution ( $p=0.640$ ).

If variation coefficient is smaller than 33%, the assessment may be considered homogenous. Only 59 (31.6%) respondents demonstrate homogeneity in the criteria use, while variation coefficient of 128 (68.4%) respondents exceeds 33%.

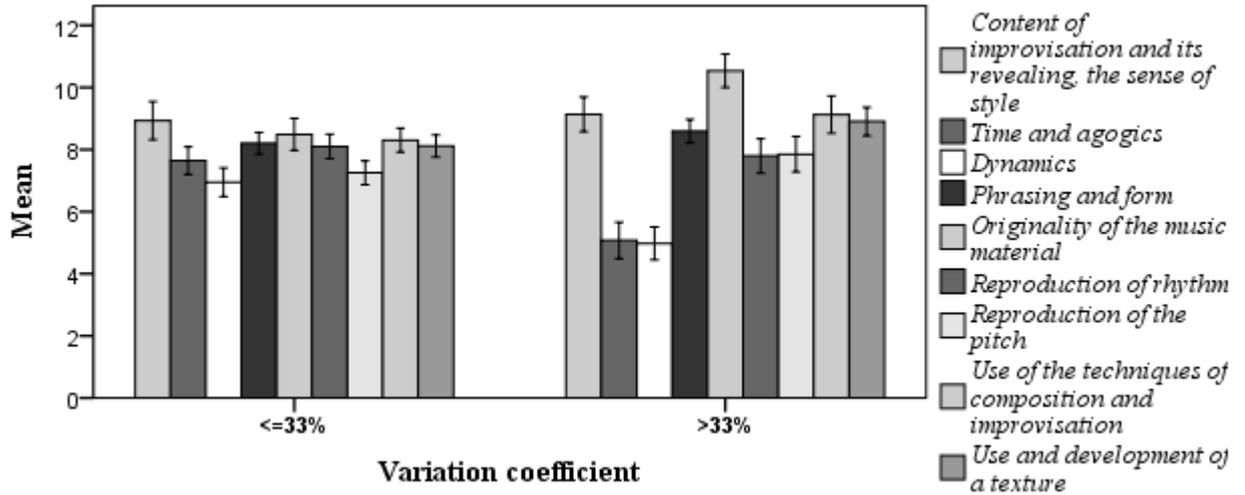

Figure 9. Mean values of the relative importance of the criteria in groups where the assessment is homogenous and unhomogenous

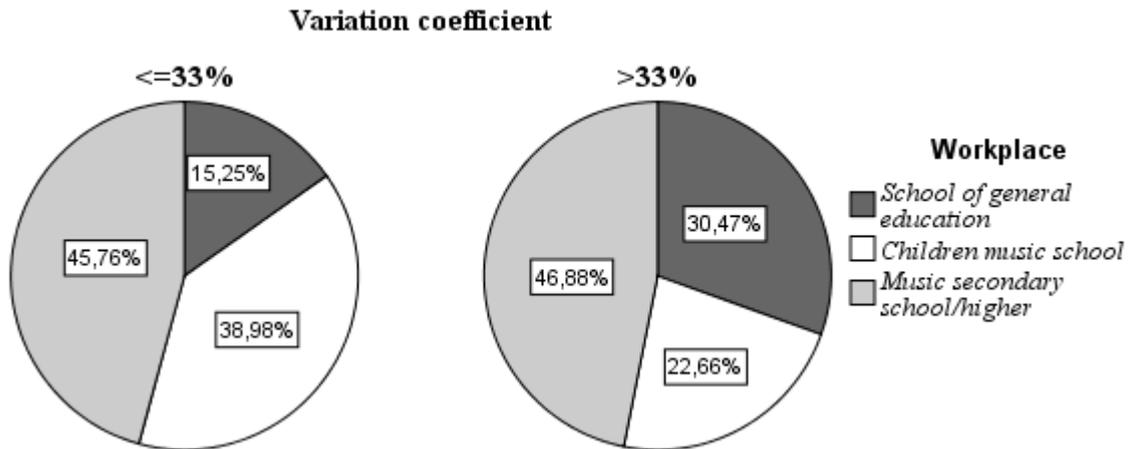

Figure 10. Distribution of respondents with different workplaces by groups with a different level of homogeneity of criteria assessment

There is a statistically significant correlation between the homogeneity level of criteria assessment and respondents' workplace (Chi-Square Test,  $p=0.023$ ).

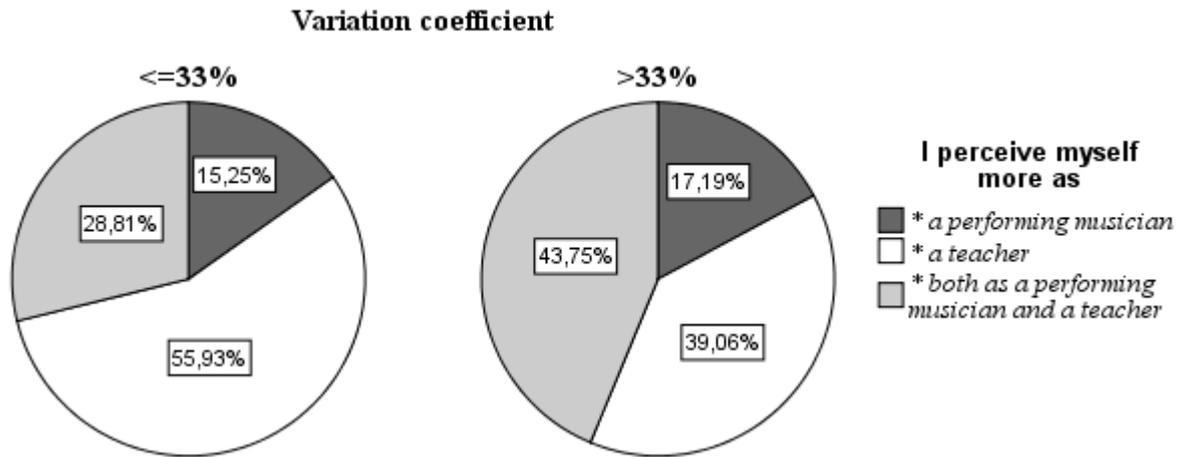

Figure 11. Respondents having a different distribution of self-identification by groups with a different homogeneity level of the criteria assessment

Statistic significance (Chi-Square Test,  $p>0.083$ ) is shown in the correlation between the respondents' self-identification and the homogeneity level of the criteria assessment. But there is no statistically significant correlation between the homogeneity level of the criteria assessment and respondents' involvement in improvisation, as well as between the homogeneity level of the criteria assessment and respondents' concert activities (Chi-Square Test,  $p>0.1$ ).

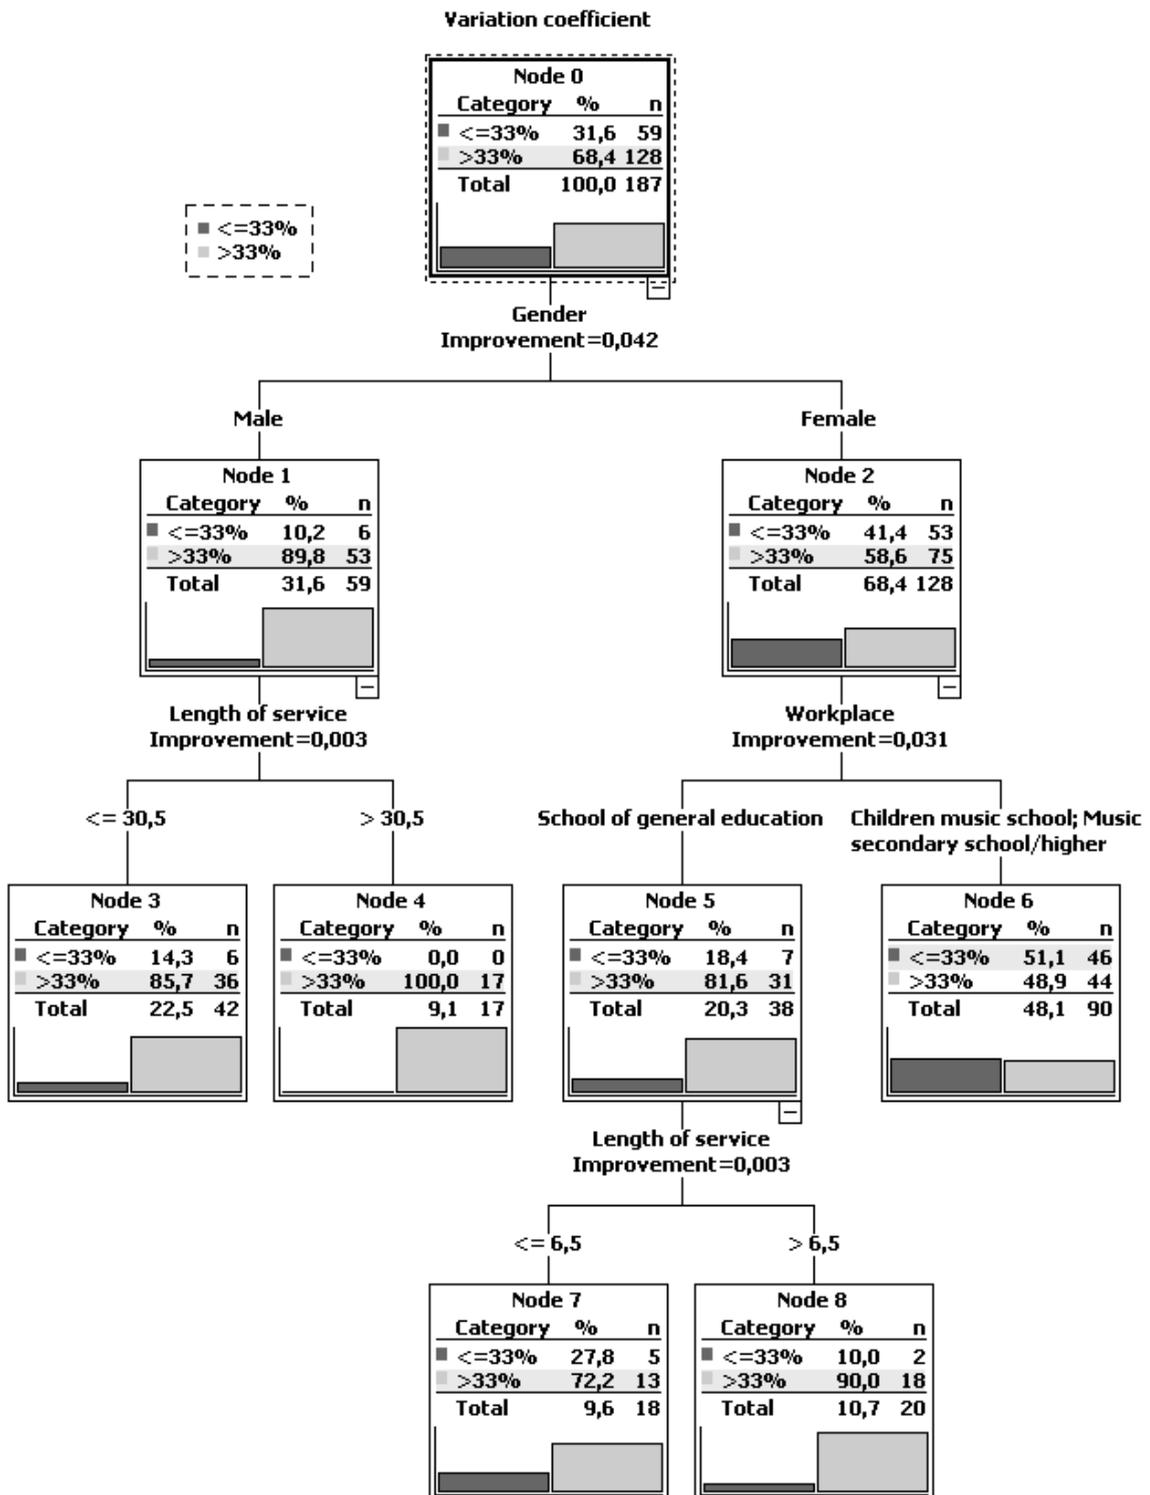

Figure 12. Classification tree by groups with a different homogeneity level of the assessment of criteria importance

The analysis of the classification tree by groups with a different homogeneity level of the assessment of criteria importance (Fig. 13) allows formulating such regularities:

- at classifying into groups with a different homogeneity level of assessment, the greatest discreteness is observed in Gender, for 89.8% of males a variation coefficient of criteria is greater than 33%, while the coefficient of females with the same non-homogeneity level of assessment is 58.6%;
- 81.6% of women working in schools of general education are in the group with a high non-homogeneity level of the assessment of criteria importance;
- 100% of women working in children music schools, music secondary schools and higher education establishments whose length of service is more than 38 years showed a high non-homogeneity level of the assessment of criteria importance.

## Conclusions

The research results indicate that music teachers of Latvia have different views on the importance of the assessment criteria of the acquisition of improvisation. Therefore the assessment of the process of mastering improvisation may be assessed differently by different teachers.

Only 59 (31.6%) respondents demonstrate homogeneity of the use of criteria, but for 128 (68.4%) respondents the variation coefficient exceeds 33%. This implies that the group with a high variation coefficient of the criteria of mastering improvisation put a different weight on the assessment criteria. The smallest dispersion amplitude of the assessment was observed for the criterion *Phrasing and form*, but the greatest – for the criteria:

- *Time and agogics;*
- *Content of improvisation and its revealing, the sense of style;*
- *Use of the techniques of composition and improvisation;*
- *Originality of the music material.*

The views of music teachers of Latvia on the importance of these improvisation assessment criteria differ.

The results of the research testify to the fact that the respondents' opinions on the importance of these improvisation assessment criteria differ depending on their gender and workplace, involvement in improvisation, concert activities, self-identification and length of service.

On the whole, the research results show that non-homogeneity in the use of these criteria is characteristic of:

- music teachers – men;
- music teachers – women working in children music schools, music secondary schools and higher education establishments with the length of service more than 38 years;
- music teachers – women working in schools of general education.

The analysis of the research results has produced such recommendations: at assessing the acquisition of improvisation equal attention should be paid to all assessment criteria.

## Abstract

This paper presents the first results obtained from an exploratory study conducted with a Wayana-Apalaï indigenous community living in the High Maroni region in French Guiana. The study is situated within an ecological and interactionist approach and attempts (1) to understand educational family practices and community logic of the training of children and (2) to describe parents' expectations vis-à-vis their children as a postmodern dynamic. The ethnographic corpus was gathered during a period of five years with the aim to link observed behaviors with contextual and cultural variables. Following the analysis of the data, the authors propose a diagram of a) the micro-systems structuring the Wayana-Apalaï kinship system; b) a description of parental roles and educational functions; and c) an overview of parental expectations in terms of "traditional success"/ "school success".

Keywords: parenting, cultural minority, traditional success, school success, French Guiana Wayana.

## 1. INTRODUCTION

At the present time, French Guiana hosts a growing Wayana-Apalaï indigenous community. Nomads started to occupy the Guyana shield less than two centuries ago as an effect of the pressure of colonization. Their ancestors were known as Roucouyennes - because of the habit of painting their bodies in red with the fruit of *achiote or roucou (Bixa orellana)* - and Oupouloui, as described by the paradigmatic works of French geographer Jean-Marcel Hurault (1968, 1972). Nowadays, the Wayana and Apalaï of French Guiana have abandoned the nomad lifestyle and established their homes in the indigenous villages of the Haut Maroni region (the southern sector of the Maroni river): Elahé, Cayodé, Twenké, Taluwen, Antecume Pata and Pidima on the French side; and Anapaiké, Alawa and Koumakapan on the Surinamese side.

A new sedentary lifestyle for the indigenous communities of Guiana has been facilitating interactions between traditional and modern ways of life, with the school playing the role of main vector (Grenand, 2000; Grenand and Lescure, 1990). In fact, from a postcolonial point of view, the school has acted as a balance in a dynamic of encounters and disagreements between different values, models of social organization and communication systems, with an obvious inclination towards the "development" of native people, their "modernization", and, last but not least, their "education": in a few words, their behavioral change. In the last decades, some transformation has been put into operation to develop pedagogical tools and practices to improve quality and to make the organization of primary education easier in this Department/Region of France (Maurel, 2010, 2012). Nevertheless, some scholars complain about the need to increase awareness between French elementary teachers

working with indigenous children in a remote duty station, with no anthropological or linguistic training (Alby and Launey, 2007). If the linguistic field has been catching the attention of a greater part of scholars working in this field, studies on family education practices of minority groups are limited and insufficient. This is the reason why we hereby try to focus on it and why we hope our work could be a contribution to this domain.

## 2. Systemic interaction and social ecology: a theoretical framework

Our work is based both on an interactionist-symbolic approach (Mead, 1928, 1930; Blumer, 1969) and on an ecological approach (Bronfenbrenner, 1979, 1986). The first one is focused on giving a sense to interpersonal performances: interpretation will take into consideration the interactive situation and the sense will be attributed to gestural and language symbols shared by a community (Blumer, 1969). Following this option, we considered presenting the results of our observations underlining the role played by family, as well as the meanings and values attributed to parents' behavior. As described by Garfinkel (1967), this approach rally also an ethno-methodological vision because the researcher has to be involved in the meaning - construction process with the other actors during their everyday lives in order to understand the « common sense » as assumed by community members. The second one has to be considered as a ground model: animating a large number of scholars, it has been declined in countless explanatory and comprehensive models (Levine, 1967; Berry, 1971; Bronfenbrenner, 1979; Ogbu 1985; Super & Harkness, 1986; Valsiner, 1987). Three of them in particular have inspired our research.

- The eco-cultural framework fashioned by Berry (1971, 1976, and 1995) considers that individuals and their environment develop in mutual influences: culture is the functional adaptation of behavior of the ecological and socio-political context. Individual and collective diversity is the result of a series of mutual adaptations. According to its creator and from a macro-environmental point of view, this model is above all a general paradigm, useful to comparative studies and to show both cultural diversity and the cultural pressure applied on behavior by transmission and acculturation.
- The developmental model of Bronfenbrenner (1979) suggests that a set of systems, interlinked and interlocked, act on cognitive child development. A micro-system (the nearest environment) is included into a meso-system (the set of micro-systems), which is included into an exo-system (the external forces – policies, economics, law enforcement - with an effect on micro-systems). All are held in a macro-system (remote forces with a long term influence, like culture and values). Bronfenbrenner's theory of the ecological system tries to understand the global context where children evolve, considering systems to be in a constant, interactive dynamic with the internal structure: the child. Bronfenbrenner's macro-approach has been completed by a bio-ecological model (Bronfenbrenner & Ceci 1994; Bronfenbrenner, 1995, 2005), more focused on the micro-system role and on the positive development of children.
- The cultural-ecological model shaped by Ogbu is based on a macro-sociological theory and it draws the micro and macro approaches closer. His model is more "holistic", integrating economic, political, cognitive and behavioral structures. In addition, Ogbu underlined in his work the difference between the « volunteer minorities » (and the immigrants' children) and the « unwitting minorities », incorporated by the majority society against their will, as an effect of imperialism or slavery: Afro-American, Indigenous and Chicanos people in the United States by way of example (Ogbu, 1978, 1985, 1987). To understand the different rates of school success between unwitting minorities, the author suggests the hypothesis that they build a peculiar and very own cultural system. He also proposes four items for analyzing them: (1) a common sense theory about social success, (2) a fluctuating identity of language and culture, (3) a self-contradictory cultural framework and, finally, (4) a lack of confidence on the dominant elite (Ogbu, 1992). This conceptualization of the unwitting minorities' notion is very useful for understanding the present condition of the Wayana-Apalã people.

### 3. Doing research in French Amazonia: the case and the method

According to the theoretical framework that leads our work, we have developed qualitative research, favoring the ethnographic observation and completed by informal interviews. We consider that deep fieldwork within the Wayana-Apalai community was an honest way to observe family practices during the daily, monthly and annual cycles. Due to the context of research (living the indigenous family life in the Amazonian jungle), note-taking was sometimes impossible during the observation, nevertheless a journal of the experience was recorded at every possible time.

Both authors of this article developed fieldwork in Antecume Pata. One of us carried out a punctual observation during various stays of at least one week: the immersion was granted by the status of guest within a Wayana family and by the opacity of observations (our observer status was not announced with the aim of perturbing the natural development of events and practices). The other author moved to the village as a long-term resident, working as a substitute teacher at the local elementary school between 2011 and 2013. Our position was intentional and motivated by a double form of objectification:

- An external position of strangeness for the first observer which needed a gradual appropriation and understanding of the Wayana-Apalai social environment, through direct observation (not as a participant) and a comprehensive approach: the problem was « to make familiar what is stranger » ;
- An internal position of participant observation for the second observer, needing to remain aloof with the aim of « grasping » the native point of view: here the problem was « to make stranger what is familiar ».

Our comprehensive option combined our representations with the parents' representations. This combination gave us the opportunity to link the researcher's point of view (which would translate scientific objectivity by a « natural » description of the context) with the parents' point of view (which represents subjectivity linked to declared practices).

The communities where we worked at comprised Wayana and Apalai host families, with some Tiriyo and Wayapi individuals. A high number of people were born in Brazil or Suriname, but most of the young and adult people were born in French Guiana and they hold a French passport. Their villages are settled on the riverbanks or on islands surrounded by the Maroni River, all along the border with Suriname. Our research extends to the villages of Antecume Pata, Twenke, Talwen and Cayode. Those isolated communities, located at a distance of more than 300 km from Cayenne, the capital of the Department, in what is also known as the « indigenous country », all dispose of primary schools (we have to note here that the notion of « indigenous country » is, obviously, a colonial category, referent to the nostalgic image of a savage Amazon, a green hell filled by red Indians, far away from any source of civilization). The first school in this sector of the French Amazon was established at Antecume Pata in a peculiar way. This little indigenous village was founded in 1965 by André Cognat, a former worker from Lyon who had left his western life to live in the Amazon. He became part of the Wayana community in 1961 and was renamed as Antecume. Four years later, he founded his own village (translated as pata in the Wayanan language), Antecume Pata, located on the French side of the Maroni River (Cognat, 1967, 1977). Observing the top-down (still colonial) relationships between the indigenous community and the local administration, Antecume decided to give to villagers of all ages a basic scholar training. It was, in fact, the first school experience for the indigenous people of the Haut Maroni region. The first goal to achieve was the learning of writing competences: a team of local trainers was trained and, over twenty years, some generations of indigenous people learned at school outside of institutional education but, as explained by some of Antecume's ancient pupils, « our school gave us the opportunity to understand better the French institutions and bureaucracy. We learned how to survive in town, in Maripasoula, Cayenne or Saint-Laurent du Maroni! ». This sense of surviving was a factor that other villagers consider to be a link to the demographic boom of Wayana people during the last twenty years. Did Antecume's school give them the inspiration for reflection on their ethnic identity? Or did it create a hybrid community of practices, a postcolonial effect of the ethnic

transfiguration imagined by Brazilian anthropologist Darcy Ribeiro (1971)? For a wider discussion on ethnic transfiguration, see also Ali, 2010). It is possible, but not very certain. What is certain however is that, in the villagers' representation, it served as a propeller for more balanced dialogue with the French Republic. The experiment achieved (and advanced) its goals: in 1986 the school was integrated into the public departmental apparatus and became the Antecume Pata Public Elementary School. Entrance was limited to school age children with adults excluded. Planning and educational targets were changed to apply to the national syllabus. For Antecume Pata people, it was like a revolution: we consider that as the starting point of their "unwitting minority" condition.

Antecume dealt with local education officials to preserve the training in the written Wayana language. Until 2008 it represented the entrance door for the writing training, as well as an experimental specificity. Teachers worked with the support of an ILM, a Mother Tongue Assistant (*Intervenant en Langue Maternelle*) and in the first year of school, the preparatory class (*Classe Préparatoire*) was doubled: one year in Wayana and the other one in the French language (see also Maurel, 2012). The Antecume Pata experience was an isolated case for the indigenous people of French Guyana. Other communities were not able to follow that example and so had to accept the imposed republican schooling. The establishment of schools into the «indigenous country», especially on the Maroni side, is recent: Twenke opened its school in 1972, Elahe in 1985 and Cayode in 1990. They represent the privileged vehicle of contact with the western world: for their artifacts, the knowledge they dispense, but also the norms, the style of work, the economic and power relationships that this conveys and obviously, for the people working within: for more than fifty years, teachers in indigenous schools were European and they carried with them their lifestyle, also living in the jungle. In 2012, the first indigenous teacher of French Guiana started working at the Antecume Pata Elementary School. He and his current colleagues of the Haut Maroni region inherit a system where all school age children are sent to school and where most of parents are persuaded that this school is a key social-elevation factor.

We therefore worked with families where most parents took elementary classes. Even if our first goal was to describe the Wayana family style, we also observed the evolution of parents' expectations within the systemic interactive dynamic context: a school is visibly a key factor to generating syncretic forms of values, beliefs and ambitions (in the sense of Ogbu, 1992).

#### 4. Microsystems and indigenous family life

The education and training of young Wayana-Apalaï was, before the advent of school, a family process. At the present day, two micro-systems participate, more than others, to build up their education: family and school. They also feel educated by other micro-systems: religious missions, television, internet and other media. However the family resists as a bastion of the essential Wayana-Apalaï *Weltanschauung*. In fact, the indigenous of French Guiana share a common vision of the family as an extended micro-system enlarged to parents' siblings' families (which also includes none-biologically-linked members). A child will therefore consider all of their mother's sisters as mothers and all of their father's brothers as fathers. On the other side, all of his mother's brothers and all of his father's sisters (*idest*, the opposite sex siblings of their parents) will be considered as parents-in-law, since their descendants are potential husbands/spouses for the child in question. It is a classical classificatory distinction based on sex and generation applied to kinship. The English language, with a similar classificatory option, gathers together the parents' siblings of the same sex and designates them, respectively, as uncles and aunts. We observed also that the family system in Antecume Pata involves both biological and acquired parents. As a case in point, a child will recognize authority and the educational role of both his biological father and his father-in-law equally.

For a Wayana-Apalaï child, there are as many family micro-systems as there are uncles and aunts. In one way or another, all community members are connected by a family link, so every community member could be classified into the kinship pattern of every other member. The family link crosses borders, so the Wayana-Apalaï

people of French Guiana have relatives living in Suriname or Brazil: all of them share a common perception of family community. It is an identity concern based more on family than on ethnicity. What do we mean? We are talking about the fact that, as we observed, the linking factor connecting them is kinship and not a western (and ethnocentric) concept as “ethnicity”. Thus, if we refer to the Bronfenbrenner model, the micro-systems influencing the child life correspond to all families where there is someone who the child considers as their father or mother. This set of micro-systems, to which we have to add the school micro-system, forms the Wayana-Apalai meso-system.

## 5. Parental performances and personal development

The ethnographic approach gave us the opportunity to observe directly during everyday life how the local (traditional) knowledge and the capabilities and skills linked to the Amazonian environment are transmitted. In short, we could classify Wayana-Apalai learning into three fields: every field will be transmitted above all by a care-giving, family micro-system (even though there are other micro-systems in the village that form part of the child’s training, as shamans, musicians or artisans).

- Cultural knowledge (the knowledge, *strictu sensu*), incorporated in cosmology, shamanism, music, graphical arts, oral history and immaterial heritage (tales, legends, rituals, territorial representation, geographical and astronomical references);
- Technical capabilities (the know-how), that we could consider as the concrete response of Wayana-Apalai people to distinctive features of their environment. We are talking about the hunting and fishing “art”, gastronomy and brewing of *cachiri* (a beer of fermented cassava, *Manihot esculenta*), as well as weaving cotton, basketry in *arouman* (*Ischnosiphon arouma*), the manufacture of pirogues and building of huts;
- Social skills (manners and life management competences), represented by their ecosophical *Weltanschauung* (their world-vision based on the natural environment they occupy) and their way to act in the social landscape that they live at: management of resources, cycle of life, rhythms of work, prevention and resolution of community disputes.

The dynamic of education in a Wayana-Apalai house assigns to every family member very specific roles and responsibilities. During the fieldwork, we observed a large number of family interactions linked to child training. For the purposes of this article, we will only describe the most representative.

We could start with the Wayana-Apalai mothers who literally carry their babies in their arms all day long with the aid of a shoulder bag, the *bandoulière*: it is a little cotton hammock where children can sit or stretch out, maintaining skin-to-skin contact with their mothers. As you can imagine, breastfeeding is much easier and the possible stress or pain experienced by the child are quickly overcome due to its proximity with the mother. A significant number of mothers keep on carrying their children in a *bandoulière* until they are three years old. Normally, after the “plunge”, the children keep on suckling up to the age of three or four years. The mother is in charge of the child’s language training: she will teach them “how to” talk and how to distinguish the words (and to conceptualize them) linked with everyday family life. Indeed, between Wayana-Apalai people, “children are never alone [...]. Someone will try to understand the baby talk because all issues concerning children need an answer. Someone else will decrypt the future personality of the child by paying close attention to their behavior: those almost ethological (sic!) observations can determine the name the child will receive when they are able to walk without any aid [...]. Crying is considered as a serious threat for the child’s development, so parents do all they can to avoid such a crisis: less talented women for this type of conciliation fall short on their reputation” (Hurault et al. 1998:140, translated by the authors). When children reach a certain autonomy at about three years of age, the mother’s role will be to train her daughters on household chores and home life: the tools and timings for cooking, settlement and spaces of the orchards (*abattis*), how to spin cotton to transform it and weave shoulder bags or hammocks and, above all, the basic social competences that, in short, we can define as being respect for the other members of community and the availability to be ready at every moment to properly receive

and welcome every possible guest of the family. The sons will be trained on skills that, as resumed by an Antecume Pata villager, consist in “knowing how to take care of themselves”. Children will learn the dangers hidden in the house, the village, the orchard: the fire that burns, the caterpillar that bites, the river that drowns.

The educative role of the father is strictly linked to landscapes and spaces under the competence of the Wayana-Apalaï men: the river and the forest. He will train his daughters to “understand” the ecosystem where they live so that when they grow up, they will be able to recognize the different noises and sounds of the forest, the different species of animals and how to prepare them for cooking. Fathers take back home a good choice of prey, representing a model to show to his daughters what a good hunter has to take back to nourish the family: a warning message too, so that the daughters can understand that the husbands they choose must be able to do the same thing (or better, if possible). The boys will be trained in the art of living in a forest and a river environment, to become “a good father”: hunting (with a bow and arrow for the younger ones and with a shotgun for teenagers), fishing (and its different techniques: archery; poisoning river water with the juice of rotenone extracted from lianas of *Lonchocarpus spp.* gender; lines and hooks; nets or traps in form of creels, for carnivorous predators such as aimara, *Hoplais aimara*); weaving baskets with *arouman* fibers and manufacturing of farming tools; fabrication and driving of pirogues (starting with a paddle and, when a teenager, learning with an outboard motor) and finally, assembling a cabin. It is a slow and progressive learning process, a training path where the child “carried out everything according to his rhythm: eating, sleeping, fishing with his short line. He has probably bothered an adult with his movements, his noises; or he has probably scared a fish away. Even, no order will be proffered, no menace, and the child will not be reprimanded” (Hurault et al. 1998: 142, translated by the authors).

We have to underline that this pattern of family training (vertical and asymmetric) works until adolescence. After that, the teenagers will start a path of horizontal training (symmetric) where the role of parents diminishes in order to leave more space to other actors: friends, associates and same generation family members. For boys, more than girls, adolescence is the age of autonomy “when they form gangs, when the oldest ones serve as a model more than the father himself, whose influence is now more discrete. It is the age of risk, the age when they start hunting in little groups and even alone, and when they get lost during one or two long days in the jungle” (Hurault et al. 1998: 144, translated by the authors).

Grandparents are in charge of the child’s training in the field of hygiene and health, thanks to their knowledge of traditional remedies. They are also the keystone of oral literature and oral heritage transmission (Chapuis and Rivière, 2003). As demonstrated by Suzy Platiel’s ethno-linguistic works, such tales are genuine educative institutions for oral tradition societies, as in the Wayana-Apalaï case (Platiel, 1993). Indeed, the grandparents’ work contributes to developing listening, attention, hearing and memory skills, as well as the skills related to language (lexical and syntactical), to determine logical relations (and not only at the cause-effect level), to construct hypotheses and arguments and to solve everyday issues. It is interesting to note the position of children “offered” to grandparents: a customary opportunity to grant them with an already weaned child, although not the firstborn. According to the principle of uxorilocal residence (even if we observe some anomalies to the principle), children are not separated from their parents since the adoptive family house is the same as (or very close to) the natural family house. Grandparents will act as real parents: for them, the only condition to the offering is to have suitable space, time and resources to nourish and train the child. They are social parents and the child will recognize them as “parallel parents” along with their biological parents, even with their parents-in-law. In the Wayana-Apalaï culture, lineages do not erase each other: they are cumulative (so every community member can embody different degrees of kinship for every other community member) and they form a complex net of relationships that some functionalist could interpret as an inclusive pattern, where every community member could be considered also as a family member.

Other family members have very concrete responsibilities for children. Elder brothers and sisters will be in charge of helping the same-sex younger ones to discover the world: they represent a model for closer (and easier) action in view of the adult’s one (and, above all, less demanding in case of failure). Uncles and aunts will treat

their fictive filiations exactly as they would their natural children, with the same care, same discipline, same rigor... and same love.

Finally, other community members also interact with children's education, even if they are not directly linked with their lineage. Among all of them, shamans play very important roles, not limited to native (and syncretistic) therapies and ethno-biology knowledge, but rather as a manager of the *marake*: a ritual practiced less and less that most of younger people have never seen. *Marake* is the essential ritual of the Wayana-Apalai culture: a celebration spread over several months which brings *tepiem* (the initiated people) into a new stage of their life. The ceremonies include a series of force and courage trials, *kalau* (cosmological and mythological) chant and traditional dance rehearsals. The final, and culminant point, is the application (really a soft touch) on the *tepiem* bodies of a *kunana*, a basket holding a large number of ants and wasps that will bite the *tepiem*, giving them the power to be reborn – after days of starvation - as real (and authentic) Wayana-Apalai people. *Marake* could not be interpreted as a ritual passage because traditionally every community member has the opportunity to pass their trials seven times in the course of their life. We prefer to consider it as a restarting point to underline, in a performing way, the entering to a new stage of life. It is a contact point between the state of Nature (represented by *kunana*) and the state of Culture (the rebirth as Wayana-Apalai social people). In addition, exactly as previewed by Lévi-Strauss for other similar “anthropological contact points” (1969), it is universal and normative, running up the *tepiem* (and the entire community) into a transcendent stage where they act “beyond nature and culture”. Besides their concrete functions (in the field of medicine and social therapy, as Masters of the Spirits), shamans are respected by the community as being sage, savant and discreet: they assure peace and justice into the villages, they establish agreement for villagers and, above all, they guarantee the harmony between humans and nature (as in the case of disregarding an interdiction), as well as with spirits and dead souls (see also Ailincal et al., 2012). For a Wayana-Apalai child, a shaman is a reference point and an example of spiritual heroism.

According to the traditional outlook, for a young Wayana-Apalai, success derivates from the internalization of the three domains of knowledge to which we referred earlier. For a boy, the main goal is to be strong and courageous; to become a man capable of building his home and to respond to the natural household needs (hunting, fishing, maintenance of working tools, caring for infants); briefly, a devoted husband and an attentive father. For a girl, the main goal is to be able to manage her house opportunely, to brew a good quality *cachiri*, to attend a community celebration and, obviously, to be a devoted wife and an attentive mother. To successfully perform in their lives, a young Wayana-Apalai has to grow up with a tough discipline of learning (also individually): thanks to that, he will acquire the skills needed to be considered as a real human being. *Marake* is a symbolic expression of this *Weltanschauung*.

Our observation according to what was observed before by other scholars in ethno-linguistic and anthropology studies (Hurault, 1968, 1972; Léna, 2000; Camargo, 2007; Dupuy, 2007): traditional educative practices are already conserved and the customary roles attributed to the transmission/acquisition of knowledge are respected. It is one of the few domains that has resisted to the progress of the western way of life. Other domains did not resist this shock: for example, the traditional outfit - a little red loincloth called *camisa* or *kalimbe* - is already abandoned by most people. Only in Antecume Pata has the local school preserved the use of *camisa* and *kalimbe* as a form of “school uniform”, according to the wishes of the students' parents.

## 6. Interactive dynamics between tradition and modernity

Even if the educative model that we presented, resulting from our fieldwork observations, seems to remain constant and loyal to the Wayana culture and heritage, parents' declarations (and representation) during the interviews highlight a “progressive” dynamic related to their expectations focused, above all, on the children's success. We use the term “progressive” from a postcolonial point of view: progress, in this case, is intended as a uni-linear (top-down imposed) way, a teleological path separating savagery from civilization.

We especially investigated parental representations during a series of seventeen interviews performed in Antecume Pata. Fifteen of them were able to speak fluent French, the other two were not French speaking at all (the exchange was facilitated by the ATSEM (*Agent Territorial Spécialisé des Ecoles Maternelles*), the primary school assistant, who assists the primary teacher in managing the daily work). Twelve of them were women and five were men; fifteen were 18 to 30 years old, two from 30 to 40 years old; one had only one child, three had two or three children and eleven have four or more children; four out of seventeen had a job (and a wage). By sampling the medium statistical data, our sample result representing a majority of women, was aged between 18 and 30, French-speaking, with more than three children and primarily in charge of the housework.

As remarked before, interviews were not structured; instead six questions served as a common thread with the aim to gather their opinions towards children's success at school: (1) Why do you take your children to school? (2) Do you notice any differences between children who have gone to school and those who have never been to school (or stopped early)? Which ones? (3) What would you include into the school programs? (4) Do you prefer for the teacher to speak in Wayana-Apalai or in French when at school? (5) Do you think it would be a good opportunity to have an open school for adult people during the afternoon, two or three times every week? (6) If so, do you think you would participate?

The data analysis showed how people are significantly still in agreement with traditional Wayana-Apalai learning, but also how they give the same (or, sometimes, a bigger) significance to the school, even if the evoked reasons are substantially different ("to learn French", "to learn something", "to find work", etc.): in all 17 interviews, parents underlined the importance of school, but only six parents agreed with the idea that their children had to go away to attend school. Eleven of them preferred their children to grow up and live their life in the village. The success is generally associated to the traditional idea of "being a good Wayana-Apalai" (*idest*, good fathers and mothers), but a high number of parents preferred the "modern" – economic - ideal of a wage-earning job, possibly as a public officer (in the local police, the local school, the local hospital) or as carpenters, oarsmen or gold washers. Their answers fulfilled the proposition of Ti'iwán Couchili (representative coordinator at the FOAG - *Fédération des Organisations Autochtones de Guyane*, the Federation of French Guiana Native Organizations): "Elder Wayana-Apalai knew how their children would be amputated of part of the knowledge they received. In exchange of this painful (but reflective) decision, which implies the abandonment of the semi-nomadic life, they hope that a little part of us would be able to reach those public territorial jobs: nuns, teachers... We believe this curiosity is linked to this availability to dialogue characterize, also today, the totality of southern French Guiana indigenous communities" (Couchili, 2010, p. 58). We interpret those newborn expectations as the umpteenth effect of an ethnic transfiguration transforming not only behaviors and practices, but also, and above all, their faith, representations and dreams.

Other works carried out between 2007 and 2011 corroborate the same conclusion about the parental representation of school significance into the village as a "cultural landscape". In 2011, Garnier published the results of his 2010 survey with Wayana families registered in the Junior Secondary School of Maripasoula (the only town in the High Maroni region) and when he asked "Do you want your sons and daughters to leave their home village to go to Secondary School?", 14 families out of 16 answered affirmatively, expressing the desire to keep their children going to school to be integrated into French national society (in a wide sense, knowing that Wayana-Apalai have to travel to Cayenne, Kourou, Saint-Laurent du Maroni –in French Guiana - or further away to Paris, Lyon, Bordeaux or Toulouse to attend secondary school or university). Garnier's study highlights the parents' desire to see their children continue going to school, not only for junior secondary studies, but also for secondary and university studies, which is confirmed by the personal experience of Ti'iwán Couchili. She affirms that "Our generation is now in charge of evaluating the effects of the [national] educative system considering the expectations that led our parents to send us to school [...]. Well, if we do not have a successful model, it is difficult to abandon this decadent imaginary that has been shown to us for more than fifty years, since the opening in Camopi of the first primary school of the southern part of the country. French Guiana remains the last South American territory to have never promoted a local elite emanating from the regions considered as

remote and to have always resisted intercultural education principles” (Couchili, 2010: 58). For that matter, in 2010 the French Guiana Board of Education created a Boarding School, the *Internat d'Excellence*, in Maripasoula with the aim of solving the problem of hosting all indigenous students of the local secondary schools. In addition, as remarked by Garnier, it is focused on building an appropriate environment, participating to success at school of children (Garnier, 2011). It is complicated to evaluate the *Internat d'Excellence* from our position (above all, due to the fact that it is too recent a creation), but ongoing research shows not only that it is creating social and psychological stress for students and their parents, but also that it has not achieved its objective to “train the students to excellence” (C. Sune, personal communication, March 15 2013).

The survey led in 2005 by Gourg (2010) showed the open-mindedness (and pragmatism) of young Wayana who have faced foreign language learning. Living on Haut Maroni, a multicultural river net, they are used to speaking not only their native language (Wayana or Apalaï), but also the Sranan and the Aluku Tongo (Creole languages used by afro-descendants' communities all along the Maroni River) with some basic notions of Portuguese (due to the presence of Brazilian diaspora), Dutch (because of the proximity with Suriname) and Chinese Mandarin (thanks to the local Chinese community that owns all the region's low-cost general stores. Some speak other indigenous languages and all those who have gone to school speak, more or less timidly, French. The survey revealed that they would be more skilled in Portuguese and Spanish, even if they had to study English at school. Why do they “have” to study English though? The answer is because the parents themselves feel less concerned about the secondary schooling of their children. Due to these issues, they prefer to follow local teachers' advice and preference is usually given to English.

## 7. Conclusions

Our concern to describe and understand the educative dynamic of the typical Wayana-Apalaï family is limited, in this article, to the presentation of the social organization of the community and to the description of the educational “facts and occurrences” observed during fieldwork. An interaction-focused theoretical framework and an ecological model of interpretation have given us a double opportunity to present, on the one hand, family educational practices and, on the other, to show the dynamic generated by the interaction of the different micro-systems.

The results of our observations present an educative system based on non-coercive performances, an imitative learning with a limited number of interdictions (all linked to real, evident and concrete dangers), where knowledge is transmitted orally and contextualized in a systemic approach. As such, children are trained to create relational niches linked to the visible –tangible - world, as well as cosmological buildings based on myths and legends involving the supernatural (and invisible) world (Ailincai et al., 2012). It is an education without competition or discredit, a training aimed at empowering children and giving them an extremely precocious maturity.

Not so long ago, success for younger Wayana-Apalaï people had more to do with the management of local knowledge related to the habitat. Our research has however highlighted the emergence of new parental expectations, linked to schooling and the labor market. We are at the front of a typical transfigurative dynamic generated by systemic interactions: a post-colonial context where most of the micro, meso, exo and macro-systems represent western values and practices. Only family interactions have withstood. Yet the artillery of modernity is apparently inextinguishable and the Wayana-Apalaï parental representations are being modelled by this generational gap, where there is less place for traditional knowledge and lifestyle.

Finally, we consider that in order to create an adequate balance between the family micro-system (representing the Wayana-Apalaï education system) and the school micro-system (French National Education System), there must be mutual knowledge and understanding of the traditional/local and institutional/national vision of the concept of “success”. What is more, the fact that school success is normally conceptualized by the actors of the French national education system from the angle of school failure, could testify about their ignorance of the gap

existing between the two (world) visions. Our hope is that our research could contribute to showing the pattern of Wayana-Apalai education as a way of living (and not only of surviving) in a peculiar environment: a pattern that the National Education System has to consider in order to build an inclusive school, in agreement with local customs and conditions.

# A sample program offer “the music in pre-school teaching” in post graduate programs in music education

Gülşen G.Erdal \*

*\*Kocaeli University-State Conservatory, P.O. Box 41300, Turkey*

---

## Abstract

Human's indicating variety in terms of source, type or function causes him to comprehend and analyse main requirements and to convert them into some expression styles. The one with the aesthetics basis of these styles is art. Music, which is an important branch of art, has played a great role in human's effort to shape himself and, it has been an indicator of the societies' development level by gaining importance in individual's education and adapting himself to his society . Music is an aspect in which the child interacts with his natural environment. Since the ancient age theorists, doctors, psychologists and educators have indicated the importance of music in individual's development . The children's musical sensitivity starts in pre-school period. The children react to the sound from their babyhood onwards and express this reaction with their gestures. The children respond to music from the moment they were born, and they encounter lullabies and rhythmic movements in the first months of their lives. By means of music education, not only child's musical but also non-musical(tuneless) skills can be developed .

Keywords: Pre-school education, music education, post graduate music education

---

## 1. INTRODUCTION

Pre-school period is the time when children respond kinetically to acoustic sense and their learning is transformed into behaviour, and it is the basis of the other parts of the individual's life. As the education is a process in this period, it has to be spent with good and proper experiences. The quality and style of livings depends on the variety of the opportunities which adult provides child with.(Oktay, 2004)

## 2.PRE SCHOOL EDUCATION AND MUSIC IN PRE SCHOOL EDUCATION

Music Education is a process to make the individual gain specific musical behaviours purposefully through his own living or form specific musical changes purposefully in the individual's (musical) behaviours through his own living (Uçan, 1996). Music supports the child's cognitive and psychomotor, language, social, emotional improvement, communication and awareness skills, aesthetics and creativeness (Ömeroğlu, 2006). Pre-school

\* Corresponding author. Tel.: +90 555 323 96 72; fax: +90 262 303 43 33.  
E-mail address: glsnerdal@gmail.com

education has undertaken a very respectable mission to lead, encourage and develop those characteristics of the child who wonders about his environment and is willing to learn (Otacıoğlu, 2008). Pre-school education institutions' achieving their goals is possible with their education programs and music is of great importance to the main objectives of their programs coming true. Therefore, pre-school teachers must use music activities effectively supporting the child's development areas.

## 2.1.BASIC PRINCIPLES ABOUT CHILD'S MUSICAL DEVELOPMENT

The general and main objective of pre-school education is to prepare 0-6-year-old children to school for their caring, housing, protection; their somatic, mental, intellectual and social development, health and nutrition by taking all measures and by pursuing these activities in a planned and programmed way continuously and systematically (Göncü, 2010).

Musical development requires the individual's musical abilities coming from heritage-environment interaction to be discovered and to be able to develop and the individual's interaction with musical experiences. When genetic-musical ability of the individual doesn't interact with musical environment, it won't be transformed into musical behaviours. Therefore, the quality of pre-school education which is provided to children and the code of practice is of importance (Oktay, 2004).

The musical development of the child in pre-school period is parallel to general development stages.

1. Child's musical development comes out of heritage-environment interaction.
2. Child's musical development keeps continuity with inductive method in different stages and styles.
3. Musical development differs according to the different periods.
4. Musical development advances inside-out, from the general to the specific, from abstract to concrete, from simple to complicated.
5. Child's musical development is integrated with general development.
6. Musical development shows personal differences from child to child (Yıldız, 2002).

Musical development principles match up with the general education principles of pre-school period and support the child's development in all areas.

### 4.RESULT AND SUGGESTIONS

It has been found out that the content of post-graduate programs in music at universities in Turkey generally consist of performance, pedagogy, music training, music theory and research techniques (Kasap,2006). It has become obligatory for the individuals to be trained radically and thoroughly in specific branches of music in order that the functions of music in human's life can work effectively and efficiently. (Uçan, 1996). Pre-school education has undertaken a very respectable mission to lead, encourage and develop those characteristics of the child who wonders about his environment and is willing to learn (Otacıoğlu,2008). It can be considered that the need for music teacher in pre-school area can be covered with pre-school music teacher training, one of the important areas which requires to be specialised in music teaching area.

A scientific area's benefiting from other scientific areas and interacting with them requires secondary/interim disciplines to be formed and individuals who the discipline needs to be trained. Considering the educational functions of music, the necessity for music to be structured in the foundations of education in pre-school education, the most important period for an individual's development becomes crucial. This necessity has paved the way for the development of the sample program for pre-school area. It has been tried that the developed program is made up of common lessons of pre-school and music area.

As a result of the survey, in researches which were applied in the area of pre-school education, it was determined that some problems occur in music activities in pre-school education. The main problem encountered is that music classes are carried out by kindergarten teachers or other branch teachers who do not have required knowledge or ability.

The content of the class and teaching constitute another problem as well. The music studies which are not carried out in a suitable way to the children's ages and development areas create a problem (Otacıoğlu, 2008). Due to the need of "Pre-school Music Teaching" model program's development, a sample program offer "Music in Pre-school Teaching" in Post-graduate Programs in Music Education has been prepared.

# Communication models and sensitivity approaches for intercultural peace education

Bilgehan Gültekin<sup>a</sup>, Tuba Gültekin<sup>b\*</sup>

<sup>a</sup>Assoc.Prof.Dr., Ege University, Faculty of Communication, izmir TURKEY

<sup>b</sup>Assist. Prof. Dr., Mugla University, Faculty of Education Mugla TURKEY

## Abstract

In today's world where intercultural communication stands as a cornerstone determining the world peace, educating the international community about peace and maintaining an effective peace language on the intercultural platform should be one of the main communicational routes to achieve. Peace education embraces a wide range of ideas ranging from creating a peace literature on which international community agrees to developing unique and innovative models for peace. Artistic productivity is one of the main topics for peace education. In this study titled "Communication Models and Sensitivity Approaches for Intercultural Peace Education", peace education through the concept of sensitivity and the strong emphasis of art on peace education will be structured. Also communication efforts in educating the society through peace will be annotated through models and unique public relation activities. Techniques of molding a public opinion on Peace Education, civil society and media's role on educating the society, reinforcing the education with initiatives by artists, international organizations and educational institutions captaincy for peace, peace literature education, emphasizing on democracy through peace education and a strong call for democracy to world public opinion are other important topics on this subject.

*Keywords: Intercultural communication, peace education, artistic sensitivity*

## 1. Introduction

In communication and education campaigns of peace, one of the most important and strategic steps is establishing the persuasive communication framework. Persuasive communication framework for peace means a common belief accepted in society and a unity of conscience for the development and creation of the terms of peace. Therefore, on the basis of any peace attempts and initiative there is a portrait of persuasive communication. As the first step in the communication activities of the peace the public should awaken a desire and effort for the necessity and realization of the peace. In order to spread the peace culture and place it in the centre of the public communication, the desire and need for the peace must be portrayed.

The peace communication and the basis of awareness campaigns are on the point of portrayal of this need and mobilization of the social dynamics for the internalization of peace. Mobilizing the social dynamics based on peace, at the same time, means settling a peace movement that leads society. Communication and artistic campaigns are the expression of the power to create public opinion of the peace communication and education.

\* Assoc.Prof.Dr. Bilgehan Gültekin, phone: +90533 525 69 41; e-mail: bilgehangultekin@hotmail.com

### *1.1. Communication Models For Peace Education*

Regarding peace education subject in intercultural communication, the communication campaigns and models have an effective role. Configuring the peace education on a sensitive point and in order to establish a sensitive peace axis, the strategic support of art and communication campaigns and activities have unifying qualities. One of the approaches suggested in this sense is the "impact of the negotiation messages". The effect that peace-oriented communication messages are encoded and shared with the public is recommended to be configured with the "thematic map model of the message"

#### *1.1.1. Thematic Map Model of the Message*

Mapping of the message in peace education; it means persuading the target audience of the campaign on the broadest perspective and highest profile, the most attendee initiative, in the most effective collaboration platform and public in an ideal peaceful point. "Peace education strives to empower people by providing them with knowledge about strategies that can be used to build peace"(Harris and Morrison,2003). Mapping also includes all communication techniques and activities for peace in all the right spots with the right contents and right timings. to ensure an effective flow of communication with planning, it is needed to bring the public in the most peaceful spot and at this point to develop communicative and artistic campaign models. In the shaping of the public opinion with the thematic mapping towards peace, capturing the most peaceful spot, a scale that is including the peace bureaucracy, peace lodge and human rights hall approaches are recommended.

#### a) Building a Peace Bureaucracy Responsive to Peace:

One of the most important stages of the scale is building a peace bureaucracy responsive to peace. Peace bureaucracy includes the subject of officials that can show initiatives in the name of the peace in levels of various official institutions and organizations create peace protocols and providing the message planning of peace in the official level and training of these personal.

Peace bureaucracy at this point is not a cumbersome structure crushed under official correspondence, the procedures and guidelines but means a peace group that will draw the official map and profile of peace and direct the peace education in an official state. For this reason, it is necessary to examine the concept of peace bureaucracy and establish the formation of the peace process on solid foundations.

The appointment of the young talents receiving higher education on the subject of peace and having a degree on intercultural peace in international institutions and organizations

-The appointment of an official "intercultural peace representative" whose study area is only peace, in Consulates and Embassies

- The establishment of a peace institute by the Ministries of Foreign Affairs and the appointment of the graduates of the this institute that gives one year training program in foreign ministries staff as "peace executive"

- Establishment of peace journalism council which includes representatives of journalist from the country's leading media organizations and the three peace journalists chosen among the group by them, taking the media leadership on the peace issue

- Establishing the "undersecretariat of peace" in the organizational chart of the Ministries of Foreign Affairs, "Undersecretariat of Peace Education" within the Ministries of National Education and "Undersecretariat of Peace Culture" within the Ministry of Culture and running high level initiatives for peace-

- To strengthen the artistic expression of peace and to establish artistic peace motifs that would find ground titled "peace artists" title by the government of the countries to the artists contributing to the peace and support of the peace initiatives of these artists by the governments.

#### b) Peace Lodge

In order to strengthen intercultural peace emphasis and to configure the most powerful peace emphasis in the frame of international public sensitivity, the suggested peace lodge approach is a structure that will manage persuasive peace initiatives and attempts about intercultural peace subjects. Peace lodge is a proposed approach to prompt the international public opinion about peace subject and to bring forward the intercultural sensitivity. "Peace is a concept that derives from a vision of that world that transcends frontiers, ethnicities, nationalities, religions, and those human differences used to rationalize war and oppression"(Alger,1998).The most important part of the approach is the parliamentary diplomacy that is conducted by the variety of units and the method of voting held by the United Nations, NATO, the European Union and other international organizations and institutions. In International institutions and organizations, the major international events and issues are considered in various sessions and resolved by the voting held at the end of the sessions. In diplomacy this method is referred as parliamentary diplomacy. As in the case of parliamentary diplomacy with a decision that will be taken under the roof of the United Nations, creation of a peace lodge in the world's leading international institutions and organizations and by putting the various issues proposed and agreed by this peace lodge to voting in United Nations, realization of peace voting symbolically every week, announcement of the result of voting to the international community and with this perspective developing a peace education model is a strong peace call for the international community.

In order to establish this peace call in a strong axis, the most critical level is the election of the peace lodge and composing it with the right persons. With the participation of a representative from each country and for the structure that will be established with the name of " Permanent Peace Representative to the United Nations", within the body of the United Nations, a strong peace communication model should be developed. Elected "Permanent Peace Representative to the United Nations", under the leadership of the United Nations should be elected among the names who has successfully completed the " Peace Communication Training" conducted in coordination with the Foreign Affairs Ministry of each country and officially offered by the governments of the countries. In this perspective the first level is United Nation's determining the categories for the peace communication training. A two-year education program which is conducted by the Foreign Affairs of that country under the categories established according to the special conditions of each country should be performed within the body of "Permanent Peace Lodge Education Program".

#### c) Human Rights Corridor

To appear peace education and peace all over the world as a common sensitivity and as an attitude, universal awareness regarding human rights is a must. In the world societies, there is no peace for the oppressed, victimized and for each person, a group, a community whose rights are violated. Human rights education is not only a corrective complement to education for peace but that it is essential to the development of peacemaking capacities ( Andreopoulos and Claude,1997). Thus, human rights education is one of the most critical topics during "Peace Guild Selection" process. The aim in the structure where each country's most prominent human rights activists, academics and opinion leaders that contribute to the human rights in society give education is building a "human rights corridor" to raise awareness of universal human rights all over the world. In this context, 100 people who are the most sensitive to human rights in every country, and who have had important contributions to the development of human rights should be invited to the education with a call from the Ministries of Foreign Affairs of the countries which are members of peace communication and education project. In some cases, organizations with peace education program acknowledge in explicit terms the connection between human rights and peace and may include some coverage of human rights material in trainings (Mertus and Helsing,2006).

These 100 people should be given a major human rights violations faced by the world and asked to develop a peace education model in the context of a personal project to resolve this violation. In this context, human rights education should also be included to the training programs of schools and the most important part of human rights corridor established under the leadership of the United Nations, from primary school to university, should consist of educational institutions in the world. The purpose of such an implementation is to gain public attention for the purpose of preventing human rights violations. Every week, to strengthen human rights with a different activity and to create it as a communication campaign model is one of the steps of the basic movement.

### *1.2. Peace Education And The Mediator Calls For Peace*

In implementation of peace education with public relations campaigns and arts activities and establishing "intercultural peace references" project is a decisive and effective project. Establishing "intercultural peace references" is creating symbols of peace which different cultures can take as a reference. In the establishment of intercultural peace references, rather decisive role of public relations, artistic activities and their campaigns are what matters. Decisive steps of intercultural peace references are as follows.

1. International peace testimonials reflect a common starting point for peace and a strong peace initiative before all the world's cultures and nations. In the intercultural platforms, to establish a strong call for the peace is to get hold of the strongest and reconciling, persuasive starting point of message of peace. To get hold of the reconciling call on behalf of the peace and to transform that call to an intercultural peace campaign model is a framework which activates the sensitivities. Thus, it is primarily needed to build a communication model of peace call. To share the active peace call, it is necessary to adopt the common language of the leaders of the peace and to make those leaders as the symbols of the campaign. Every country and region has peace leaders who have dedicated their life to peace and established a strong initiative for the peace. Transforming those leader's common efforts and beliefs to a peace message and to an intercultural communication symbol is a rational step in providing a mediator symbol. Thus, under the leadership of a leading university in each country, with the participation of the leaders of that country's peace, "intercultural peace congress" is recommended.

### 1.2.1. Creative Communication Symbols for Peace Communication

Section Removing the largest obstacles of peace in the world and creating an awareness of this issue is also starting point for the peace education studies. For example, to develop a common stand against terrorism and to create a conscience symbol is a starting point in the peace education and peace campaigns. Therefore, in all the countries of the world, creating a common symbol to present a common stand against terrorism and placing that symbol in the foundations of peace campaigns is the main step towards reconciliation. Countries experiencing terrorism the most and the study of the developments in those countries are the two significant steps. In this regard, in the terrorist attacks that occurred in various parts of the world, “The doves are missing in the first taken photo in the world, A couple of dove wings in your heart against terrorism” slogan is recommended with the use of the first photos depicting the attacks to the world and together with the first taken photo in the world. The first photograph taken in the world by the French photographer Joseph Niepce Nicophore is a garden image and a blurred vision of a pigeon nest on the roof of the hut is involved. In the point of peace communication, country flags are one of the symbols of reconciliation.

There are six types of forms where national flags are used the most. Among those forms, the most preferred ones are the three horizontal strips. Therefore, using those six formats in the form of a flag; the campaign “wave the national flag by your heart and the peace flag by your conscience: Conscience flag against the shame of humanity” is recommended. Using this slogan arranging the flags of each country side by side with a white flag prepared in the same format creates a common symbol in the creation of awareness and sensitivity. The most widespread blood type in the world can also be considered as a part of the communication campaign. As an example, the most widespread blood type is O. Based on these data, the slogan “ The most widespread blood type is **O**, but the most powerful common belief is  ” is recommended.

The use of and the evaluation of the mediator symbols in the communication and awareness campaigns is a process accelerating the convincing of the international community about peace. Slogans used by the world's countries in this regard are effective communication methods in the creation of the conciliatory symbols. When the slogans are examined, it is observed that the most widely used word is unity or in unison. For example, the slogan of Germany; (Einigkeit und Recht und Freiheit- “Unity and Justice and Freedom”); Andorra ( Virtus, Unita, Fortior- United strength is more powerful); Bahamas ( Forward, Upward, Onward Together); Belgium (Eendracht maakt macht, L'union fait la force and Einigkeit gibt Stärke- Strength is born out of unity), El Salvador

(Dios, Unión, Libertad- God, Unity, Freedom”); Indonesia ((Bhinneka Tunggal Ika- Unity in variety ) can be counted. From this point forth: “ Peace with- Birlikte baris” slogan is another suggestion for the communication campaign.

In peace communication studies, the persuasive focus is on the integration of the peace with the aimed ideal and with a peace project that community can follow; operation of the common mind transformed into communication symbols. For example, the focus in the struggle against the terrorism can be peace without loss. In order to transform the response that inflict a heavy blow to peace and response to the terrorist attacks causing huge losses into a common response that all the world screams, it is needed to conceive the losses caused by the terror as a common threat and declaration of that perception and communicative expression of it is also needed. In this framework, the focus is the principle of “ peace without loss”. For example, in a peace campaign aimed at the Middle East countries, in the most famous squares of the capitals of the Middle Eastern countries,

extruding water with sprinklers for 5 minutes, at the same time and day with the participation of the hundred thousand and a campaign such as “There is peace in every spot where the water can reach: Do not get thirsty for peace, catch the peace with water” presents an approach that is trying to establish public sensitivity with water symbol.

### *1.2.2. Peace Communication Campaigns*

While creating peace and consensus atmosphere in public, peace communication campaigns play a vital role in public education strategies and plans. Peace communication campaigns can be described as campaigns to help turn peace culture into a lifestyle, fill social conflict areas with peace themes. They also play a role in creating a powerful call for a strong peace and dialogue for the public to create a peaceful society with a sense of peace, and also they could help turn the faith shared by public into a pioneering feeling as well as providing future generations with a peaceful philosophy. In that view, they are public education campaigns conducted in order to overcome the prejudices that would lessen the impact of peace on public.

In order to create a leading educational role for peace communication campaigns in society and to help it change the social education, people need to be introduced with a strong communication model. In order to create a socially accepted communication model, the public should be provided with a generally accepted and reliable peace model. The first stage of the peace model is to evaluate the peace as a process and to conduct process management. It is necessary that each process be presented to the public in a reliable way and public support be obtained and following this progress after which a possible process would be accepted by the public, the other process to be followed should be implied. When the topic is evaluated within the frame of peace education, it is necessary that the process should be defined and explained also its parameters should be shared. For example, in a peace communication campaign aiming at peace in the Middle East, the process should be shared with the public clearly. The stages of this can be summarized as providing a persuasive focal point, determining the sides of the peace in the peace portrait, enabling a negotiation platform to determine the peace leaders who will lead the process, determining the sides of the conflict and developing consensus policies for the conflict management, reaching to an agreement concerning the conditions that will bring peace and establishing specific peace conditions, as well as presenting the facilitators and determining the sides and areas that are closest to the peace, providing a validator perspective to reach a big agreement that will bring peace, ensuring peaceful public relation activities and communicative coding of the messages, choosing the strongest peace channels to be used in communication call and developing peaceful communication referendums for the overall approval and acceptance of the peace.

### *1.3. Intercultural Respect Model*

One of the most important models of communication campaigns for peace and peace education is intercultural respect. The development of intercultural competence in general and in a multicultural teamwork setting in particular, largely depends on personal attributes such as cultural awareness, curiosity and respect (Guilherme and Garcia, 2010). Respecting and understanding the different cultures, peace, and communication are of vital importance. In order to develop the model of intercultural respect, one of the first steps to be followed is to form a communicative peace ecole. Communicative peace ecole is to create a universal stand that will be adopted by all humanity as a common attitude and that will be passed down from generation to generation and that expresses intercultural respect. While creating this ecole, the sensibility which communication and art activities will create has a big importance. Hence, establishing a sensitivity pact is an important communicative support. Sensitivity pact is taking the lead by the most sensible ones who are sensitive to the problems of the world and cultural communication and who lead the public with this sensitivity. A sensitivity scale should be developed for the sensitivity pact it to influence international community and to be regarded as a communication campaign.

Sensitivity scale should include the main criteria that would enable the international community to meet in a more sensitive path. The main sensitivity scale criteria suggested for peace communication and education can be described as follows:

- The perceivable effort for the protection of cultural heritage in the world and the country
- Taking a leading role in commemorating and embracing the human losses in any area of the world in a common communication platform.
- Conducting leading studies concerning climate and environment to mold a public opinion.
- Taking the lead in the education efforts to broaden the sense of peace among the young generations in order the hand down the peace concept from generation to generation.
- Leading the social and cultural projects for the good of underdeveloped countries and communities.
- Taking the lead in artistic and communicative activities in intercultural communication which will increase the sense of justice.
- Developing artistic and cultural products which will be a guide for intercultural peace.
- Taking the lead in art, communication and philosophical activities that will help the concept of peace on a vast area dominate and popularize peaceful idea.
- Ushering the society in the struggle against any kind of discrimination and symbolizing this struggle by way of communication and art.
- Finding new peace actors who will lead the society.

Another important element is to know and recognize the differences. To understand and beyond that to get to know the religious, sectarian, political, cultural differences, many studies and activities are needed in every parts of the world in the 5 continents. The most strategic point of peace education is the reconciliation of the differences in the world. A rich diversity of peace education is promoted by the myriad contexts in which it is practised (Salomon and Cairns,2010). Therefore, the issue of managing the differences should be put into the center of peace education and courses named “understanding and getting to know the differences” taught in secondary education. In that sense, it could be suggested that some cosmopolite centers around the world can be chosen and declared as “Harmonization Capitals”. The fact that these capitals host some public relations and communication activities to promote the reconciliation among the differences of the world would have an accelerating and strengthening effect on people to gain awareness. 20 harmonization capitals to be suggested are Turkey-Istanbul-Athens, Greece, Israel and Jerusalem, Ramallah, Palestine, Jordan-Amman, South Africa-Cape Town, United States-New York-New Delhi, India, Australia-Snydey, Canada-Toronto, Iraq-Baghdad , Germany-Berlin-Paris, France, England and London, Spain-Barcelona, Italy-Rome-Bounes Aires Argentina, New Zealand-Auckland, Kenya-Nairobi, China-Shanghai.

Giving peace education to harmonize with the differences in 100 pilot first and secondary education institutions in these 20 cities would have a positive effect on the establishment of intercultural respect ecole. For example, all leaders of sects in the world can hold an event in the 20 cities co-organized with the participation of the people named "No denominational difference; Heart Awareness: Peace for the co-existence" Organizing different public relations and communication activities in those 20 centers would raise the public awareness in international community. One of these is the intercultural project titled “Dream of 1000 years” which will symbolize the struggle against discrimination. It can be recommended that a film named “Dream of 1000 years” based on the children’s dreams that recall peace from each race, religion and sect can be produced with the cooperation of directors from every religion. The same can be repeated in the field of art.

#### 1.4. Peace Communication Campaigns Within Peace Education

Peace education-oriented modeling has an important role in peace communication campaigns. One of the most ideal approaches is to increase the number of institutions that teach in the field of peace education among universities and to convince them to adopt the subject.

Locating the peace institutes to teach graduate master programs for 2 years in the field peace in symbolic centers and deciding their course schedule together with eminent peace experts would present an active structure in peace communication studies. The suggested centers are: Institute for Middle East Peace ": Egypt-Cairo," Far East Institute for the Culture of Peace "Thai-Bangonk, Nuclear Peace Institute-Japan-Hiroşimo in the United States: New York," Institute for Interreligious Dialogue: Turkey-Istanbul, "Culture of Peace and Human Rights Institute ": Finland, Helsinki;" for Korean Peninsula Peace Institute ": South Korea: Seoul," India-Pakistan Institute of Peace: India: New Delhi, Pakistan: Islamabad, Institute for Near East Peace: Lebanon-Beirut and Institute for Peace, Non-Discrimination: South Africa: Cape-Town.

In order to teach peace education starting from primary school, schedules complying with primary and secondary curriculum should be developed. War games played by children over internet are one of the leading obstacles in this process, which hinders peace perception among children. Hence, various methods should be developed appealing to primary school children's needs and perceptions. For example, students can be given school reports showing their level of peace perception at the end of each term. It would be useful for children to be given school reports and detailed peace evaluations by peace experts who visit schools periodically, which will further their way of understanding the peace in the future. One of these educations to be taught in primary schools is listening education. Developing their listening-the-other ability is the most fruitful method in this respect. Much of education concerns itself with teaching the arts of written and spoken communication, but in peace education the emphasis is on listening, and communication is an active two-way process (Hicks,1998). Therefore, increasing this listening ability under various subjects is of high importance for the future generations. For instance, in a role play aiming to enhance their listening (respecting) ability created in class atmosphere in which two students supporting two rival football teams listen to each other's opinions and tell why they love their team so much can contribute their way of respect. This listening education to be carried out with the slogan of "If We Have Seen the Same Dream Once We Can Be the Heroes of the Same World" will definitely prove positive in the end. This topic also bears a high importance in terms of overall social-oriented peace education. Especially the widespread movie cue "we are the people of different worlds" is imprinted in people's minds not as a unifying but as a differential sentence. Especially in order to prevent those studying in secondary education from these cliches and let it remain just as a sentence in movies, the slogan "Children of Different World Catch the Stars of the Same World" can be recommended.

Rainbow is another symbol to be used in student-oriented communication campaigns. With the project titled "The most fair seven colors of the world meet in Rainbow; Catch all the Colors of the World in Peacebow (connotation for Rainbow)", fraternity, (brotherhood) equality, justice and the struggle against discrimination concepts can be symbolized under a peace rainbow that will broaden their perception of peace.

The conflict education to be taught at schools is an important part of peace communication campaigns and social peace education. Hence, it would be a wise step to set up intercultural listening camps where children from secondary schools are given listening courses that would prevent conflicts through the agreements to be done among countries. For instance, the main qualities of the international listening camp to be established between Greece and Turkey are to be as follows:

-The topics to be negotiated between Turkish and Greek students should be mutually determined by Peace experts and training professionals.

Historical sites having symbolic value for in both countries should be selected for these camps such as the Acropolis and Ephesus. The aim of the camp should completely be to improve listening skills for “the other” and therefore a communication mechanism should be developed in which students listen to each other in 30-minute sessions on a given topic.

### *1.5. Peace Modellings*

In peace campaigns and peace communication studies, the role of peace modeling is quite decisive. Peace modeling is the transformation of peace communication calls into persuasive communication strategies to process of the structuring of public opinion within the correct communication strategies and management. A direct strategy changes the other actors direction or momentum the way one billiard ball changes another, by hitting it head on ( Paguette,2003). The first of these modellings is the persuasive sharing modellings. The basic principles of persuasive sharing modellings are as follows:

1. In persuasive sharing modeling, communicative flow of peace calls should be analyzed first within the peace communication and peace education. For the communicative flow, the spot where the peace message will make the highest impact and provide an effective and powerful public opinion should be identified properly. The hot spot in the peace process is delivering the peace message which will be shared through the effective communicative channels to a wide target audience, which will build a sensitive public opinion and message's capturing the sensitive point and the ideal participant in the common conscience of the international community. In this regard, in order to conduct peace communication studies, it is needed to draw a peace map. Thus, understanding the core linguistic symbols may be critical to the initiation, negotiation, and resolution phases of any intercultural conflict episode (Toomey and Oetzel,2001) For the peace map, it is needed to discern primarily the most dangerous and the most conflicted zones for the world peace as a campaign system and as a space for the peace campaigns. In the international communicative perspective, a campaign system which will recite symbolically human being's belief for the peace, their longing for peace with the strongest symbol and which will be a common peace mission for all the world are needed to be established. In order that the campaign system can express peace messages with a strong expression, peace diplomacy studies that will be conducted in the zone have importance. Peace diplomacy studies are the diplomatic studies which should be conducted within the politic and diplomatic mechanism for the management of the peace communication with strategies in the zones where expression of peace has the utmost importance for the human being's future. In this context, active institutions and organizations of international political decision-making are primary target masses for the peace diplomacy.

Therefore, for the peace communication and education campaigns, establishing peace bureaucracy and creating a team of peace diplomacy reinforce especially the strategy and the power of decision making ability of peace communication campaigns. In the international political system, embassies and consulates should be evaluated in the context of effective bureaucracy in peace communication studies. The most important task of peace diplomacy is to enable making decisions regarding the intercultural peace in many regions of the world and to ensure the organization of referendums as a communication technique. For the governments in the world especially in areas of conflict, to disseminate the intercultural peace of a variety of cultural institutions and for the establishment of an effective communication mechanism for the world peace and to make decisions expressing their powerful wills towards peace will make an important contribution to the peace will-power in the world. In the international political decision-making, peaceful declaration of will-power in the part of a strong will-power is an important communicative symbol.

One of the active phases of peace bureaucracy and peace lobbying is to meet the world people with the persons whose peace messages are needed by those of the people. People who have the power to create a public opinion with their declarations, expressing peace messages and addressing to the public opinion provide a solid foundation for the intercultural peace studies with a firm stand and ground. At this point the Peace bureaucracy should conduct a peace-oriented traffic for peace. Considerations in the interview traffic to be carried out for peace are as follows:

- 4) Peace leaders to be elected in the interview traffic must be the correct names in terms of creating a public opinion.
- 5) Interview traffic should be handled in a conversation pyramid and each stage of the pyramid of the interview should be configured in a way to influence interview chain and to strengthen a step that will strengthen another step.
- 6) Decisions that have been taken at each stage of interview traffic should be regarded as precursors for the great agreement in binding framework.
- 7) In interview traffic, scheduling module should be created and the period of time of the actions and their orders should be determined. Sharing peace messages with the public opinion at the right time and the operation of peace-oriented right timing of the principles will support the public opinion shaping process towards peace.
- 8) As well as the determination of the main actors that will communicate with each other in interview traffic, new communication actors should be evaluated as a part of the interview traffic. New communication actors will provide the spread of the interview traffic with a chain effect and let it become public.
- 9) In the communication traffic towards peace, in order to catch the convincing focal point, it is necessary to emphasize the sharings that will influence and satisfy the public most.

Constructing the communication pyramid is a strategic step towards creating public opinion for peace. Communication traffic is the implementation of a communication model on each step of which there is a possibility of affecting the other and considering the peace talks in the context of a timing module. For this reason, in the first step of the communication pyramid non-state actors must take the role in the first place and carry out the premise diplomacy for the processes of the public opinion creation. As an example, the Elder's group which is composed of people having served as prime minister, the head of state and ministry of foreign affairs, is one of the effective civil society initiatives on this subject. The mission undertaken by the peace leaders such as Nelson Mandela, Martti Ahtisaari, Kofi Annan, Ela Bhatt, Jimmy Cartar, Desmond Tutu on peace communication and education is an important initiative. The establishment of the entity under the name of "Peace Quintet" which consists of the communication network of the Elders Group in every country and guiding the communication traffic towards peace both in their countries and in world as an entity whose reliability is generally accepted in that country, establishes one of the practical points of the communication traffic. One of the important steps in communication pyramid is managing the communication content and integrating it with the peace symbols. The important thing in the communication content is codding the interview titles with the right communicative symbols and its expression. Particularly, creative communicative and art strategies have binding support in the creation of the peace symbols. One of the world's most widely known symbols of peace are pigeons. As pigeons stretch their wings for peace, in the Middle Eastern capitals with the full participation of the

heads of state and government and cabinet members, flying thousands of pigeons to the sky and an art and organizing a public relations activity named "Peace Leadership stretching Their Wing for Peace in Middle East" are some of the recommended activities.

## Conclusion

In order to let peace communication campaigns be successful and to spread the notion of peace among public, peace subjects should be negotiated and therefore the titles that will shape the negotiation frameworks should be detailed with communication strategies. Those titles chosen for peace to reach the peace itself should be open to negotiations and also be unifying. Hence, peace education Works should focus on the ability to give meaning to these titles. Even the sides meeting around the same table could help the conflicts fade away. Communication symbols should be formed Within the concept of the slogan "If We Can Sit Around the Same Table, There is No Deadlock Ahead". Peace communication and education campaigns are the persuasive communication processes containing the concepts such as reconciliation, conflict management and intercultural respect perspective. For this process to be successful, activating and mobilizing the international community Dynamics with the right communication processes and developing effective sensitivity models are the key elements. In intercultural communication, it would be an ideal starting point that the symbols turn into a peace art and conscience to awaken the international community's conscience and ensure a peace in consciences.
