# Acknowledgement

Dear Guests...

Welcome to the 4<sup>th</sup> International Conference of New Horizons in Education-2013.

"The International Conference of New Horizons in Education-2013 (INTE-2013)" is an international educational activity for academics, teachers and educators. It promotes the development and dissemination of theoretical knowledge, conceptual research, and professional knowledge through conference activities, the conference proceeding book. This year, INTE-2013 received almost 830 applications. The conference academic advisory board accepted 760 applications.

The International Conference of New Horizons in Education-2013 aims to diffuse the knowledge and researches among academicians and lead to development in educational sciences.

We have lots of participants from 38 different countries. Some of these countries are Austria, Australia, Brazil, Canada, Croatia, Czech Republic, China, Egypt, Denmark, Finland, Germany, Greece, Hungary, Malaysia, Mexico, New Zealand, Philippines, Poland, Portugal, Romania, Russian Federation, Saudi Arabia, Slovenia, Slovakia, Spain, Switzerland, South Africa, Turkey, United Kingdom and United States

Should you have any enquiries regarding INTE conference, please do not hesitate to contact with us for any additional information you may require.

Finally, we would like to wish you all a pleasant stay in Rome and safe return back home. I hope that INTE-2013 will be a meeting you will pleasantly remember.

We hope we will meet again at the International Conference of New Horizons in Education 2014 in Paris/France.

Thank you...

Assoc. Prof. Dr. Ahmet ESKİCUMALI  
Coordinator of INTE 2013

Prof. Dr. Aytakin İŞMAN  
General Coordinator of INTE

## **General Coordinator**

Prof. Dr. Aytakin İŐMAN

## **Conference Coordinators**

Prof. Dr. Colleen SEXTON, Governor State University, USA  
Prof. Dr. Teresa FRANKLIN, Ohio University, USA  
Prof. Dr. Carlos De Sousa REIS, Instituto Politecnico da Guarda, Portugal  
Assoc. Prof. Dr. Ahmet ESKICUMALI, Sakarya University, Turkey

## **Conference Associate Coordinator**

Assist. Prof. Dr. Mubin KIYICI, Sakarya University, Turkey

## **Conference Secretary**

Lec. Onur İŐBULAN (Sakarya University)  
Lec. Ali KIRKSEKIZ (Sakarya University)  
Lec. Aydın KİPER (Sakarya University)  
Lec. Selçuk Sırrı TERCAN (Sakarya University)  
Res. Asst. Mehmet UYSAL (Sakarya University)

## Advisory Board

- Aaron DAVENPORT, Grand View College, United States  
Abbas TÜRNÜKLÜ, Dokuz Eylül University, Turkey  
Ahmet ESKİCUMALI, Sakarya University, Turkey  
Ahmet PEHLİVAN, Cyprus International University, North Cyprus  
Ahmet ADALIER, Cyprus International University, North Cyprus  
Alev ÖNDER, Marmara University, Turkey  
Ali Ekrem ÖZKUL, Anadolu University, Turkey  
Alper Tola KUMTEPE, Anadolu University, Turkey  
Andreja Istenic STARCIC, University of Primorska, Slovenija  
Antoinette MUNTJEWERFF, University of Amsterdam, Netherlands  
Antonis LIONARAKIS, Hellenic Open University, Greece  
Arif ALTUN, Hacettepe University, Turkey  
Arvind SINGHAL, University of Texas, United States  
Asaf VAROL, Firat University, Turkey  
Asuman Seda SARACALOĞLU, Adnan Menderes University, Turkey  
Atilla TAZEBAY, Cyprus International University, North Cyprus  
Aydin Ziya OZGUR, Anadolu University, Turkey  
Ayfer KOCABAĞ, Dokuz Eylül University, Turkey  
Aytekin ISMAN, Sakarya University, Turkey  
Bayram BIÇAK, Akdeniz University, Turkey  
Bayram ÇETİN, Gaziantep University, Turkey  
Behbud MUHAMMEDZADE, Cyprus International University, North Cyprus  
Belma TUĞRUL, Hacettepe University, Turkey  
Brent G. WILSON, University of Colorado at Denver, United States  
Buket AKKOYUNLU, Hacettepe University, Turkey  
Canan İLERİ, Cyprus International University, North Cyprus  
Carlos De Sousa REIS, Instituto Politecnico da Guarda, Portugal  
Cem BİROL, Near East University, North Cyprus  
Cemil ÖZTÜRK, Marmara University, Turkey  
Cemil YÜCEL, Usak University, Turkey  
Cengiz Hakan AYDIN, Anadolu University, Turkey  
Cevat CELEP, Kocaeli University, Turkey  
Charlotte GUNAWARDENA, University of New Mexico, United States  
Colleen SEXTON, Governor State University, United States  
Cumali ÖKSÜZ, Adnan Menderes University, Turkey  
Dale HAVILL, Dhofar University, Oman  
Danguole RUTKAUSKIENE, Kauno Tech. University, Lithuania  
Don FLOURNOY, Ohio University, United States  
Eda KARGI, Cyprus International University, North Cyprus  
Elnaz ZAHED, University of Waterloo, UAE  
Işık GÜRŞİMŞEK, Eastern Mediterranean University, North Cyprus  
Izzettin KÖK, Yzmir University, Turkey  
İbrahim Yıldırım, Hacettepe University, Turkey  
Jagannath DANGE, Kuvempu University, India

# Academic achievement and sports involvement of Malaysian university athletes

Aminuddin Yusof<sup>1\*</sup>, Chun Cheng Chuan<sup>1</sup>, Parilah Mohd Shah<sup>2</sup>

<sup>1</sup>Faculty of Educational Studies, Universiti Putra Malaysia, 43400 UPM Serdang, Selangor, Malaysia

<sup>2</sup>Faculty of Education, National University of Malaysia, 43600 Bangi, Selangor, Malaysia

---

## Abstract

This research studied the factors that influence the academic achievement of Malaysian university athletes. The respondents consisted of 156 field hockey players. The Team Socialization Scale (Allen, 1997) was used to measure the relationships between team subculture, parental influence, the learning environment, support systems, financial aid, training factors, academic assistance, socialization, and stress level and academic achievements of student athletes. The findings showed that there is a significant positive relationship between the learning environmental and academic achievements of university athletes. However there is a negative relationship between the support system and academic achievements of university athletes. The study provides suggestions on how to improve the academic achievement of athletes in Malaysian universities.

*Keywords:* Academic achievement; student athletes; team subculture

---

## 1. Introduction

The goal of most universities is to produce students who have excellent academic performance as well as those who have the capability, talent and potential to contribute significantly to the development of a nation. However the competitive nature of intercollegiate sports has resulted in a lack of opportunities for university athletes to develop as the model citizen they should be (Adler & Adler, 1985). Factors such as stressful training schedules and an emphasis on winning have contributed to the differences in the academic experiences of an athlete and a non-athlete (Figone, 1994). These differences have influenced university athletes socially, emotionally and academically throughout their university education experience (Adler & Adler, 1985; Mayer, 1990). University administration and the coach would want to produce university athletes with excellent academic achievements and with good socialization skills on par with non-athletes. The findings of some research showed that non-academic cultural factors, class segregation and an unchallenging major, as well as too much time spent on sports influenced the academic achievements among university athletes (Adler & Adler, 1985; Pascarella, 1991). Commitment to and too much time spent on sports and the 'anti-intellectual' subculture among male student athletes (Adler & Adler, 1985) had resulted in lower academic achievements among student athletes and there was also an over dependency on personal support from other people for better achievements in both the academic and social environment.

Adler & Adler (1985) noted that university athletes were not ready and not interested in academic matters. They enrolled in a university or college to develop their career in sports. They obtained lower 'CGPA's, and had higher dropout rates and lower chances of completing their college education. Throughout their university education, university athletes will be exposed to various cultures and lifestyles in the campus that could affect their academic achievements. Their culture will develop as they socialize with their peers, coaches, lecturers, university staff and faculty members, as well as academic counsellors and with others in the university

\* Corresponding author. Tel.: +6019-2972053; fax: +603-89468552

E-mail address: draminuddin@hotmail.com

community from their first year until they graduate from the university. One of the components in the university athletes' culture is the indirect influence they receive from their coach and team mates (Allen, 1997). University athletes are more likely to be influenced by the behaviour of their coach and team mates. Male university athletes are said to have a culture of not valuing the importance of academic achievement. This is seen in the behaviour displayed by some team members such as poor class attendance, spending more time in sports, focusing on becoming a professional athlete and so on (Allen, 1997). Such non-academic behaviour will influence all team mates to behave in the same way. On the contrary, female university athletes receive positive influence from their team mates in both their sports and academic achievements. The team agrees on reasonable academic achievements and this creates a positive team subculture among the female university athletes leads to a positive influence on all team members' academic achievement. Team members also display a more 'pro academic' behaviour which contributes to their good academic achievements.

Previous studies (Castiglione, 1983; Harrison 1976; Hood; Larson, 1973; Sack, 1987, 1988; Allen, 1997; Miller & Kerr, 2002; Beamon & Bell, 2006) found that university athlete achieved lower academic performance compare to non-university athletes. However, a study on Malaysian university athletes by Abdul Rahim Mohd Meerah (1995) have obtained reverse findings. Specifically, there was no significant relationship between good academic performance and active involvement in sports among university athletes who were high achievers at Universiti Teknologi Mara, Shah Alam. Academic achievement was influenced not by active involvement in sports, but instead by time management and effective time tabling by the university administration, facilities to support a conducive learning environment and incentives provided by the universities; all of this contributed to the university athletes' motivation to study and achieve better grades.

Further research needs to be done on this topic to have a better understanding and explanation on the topic and factors that influence the academic achievement of university athletes, especially in Malaysian public universities. This study seeks to answer the following questions;

1. What is the relationship between the coach's influence and the academic achievement of university athletes?
2. What is the relationship between team mates' influence and the academic achievement of university athletes?
3. What is the relationship between parental support and the academic achievement of university athletes?
4. What is the relationship between the learning environment and the academic achievement of university athletes?
5. What is the relationship between financial aid and the academic achievement of university athletes?
6. What is the relationship between training and the academic achievement of university athletes?
7. What is the relationship between academic assistance and the academic achievement of university athletes?
8. What is the relationship between support systems and the academic achievement of university athletes?
9. What is the relationship between socialization factors and the academic achievement of university athletes?
10. What is the relationship between stress level and the academic achievement of university athletes?

## **2. Methods**

Using convenience sampling, 156 respondents were selected from among field hockey players from five public universities in Malaysia. These institutions include Universiti Malaya (UM), Universiti Putra Malaysia (UPM), Universiti Kebangsaan Malaysia (UKM), Universiti Teknologi Mara (UiTM) and Universiti Islam Antarabangsa Malaysia (UIAM).

Table 1 : Subjects

University	Male	Female
Universiti Putra Malaysia (UPM)	24	20
Universiti Malaya (UM)	25	18
Universiti Kebangsaan Malaysia (UKM)	16	-
Universiti Islam Antarabangsa (UIAM)	20	15
Universiti Teknologi Mara (UiTM)	18	-
Total	103	53

The '**Team Socialization Scale**' produced by Allen (1997) is used in this research. The scale has two sub-scales that is firstly the influence of the university coach and secondly the influence of team mates. Besides **Team Socialization Scale**, seven other factors are included in the questionnaire: learning environment (6 items), financial aid (6 items), training (7 items), academic assistance (7 items), support systems (4 items), socialization (6 items) and stress level (6 items). These items were included in the questionnaire to measure their relationship with academic achievement among student athletes. The second part of the questionnaire is to analyse university athletes' involvement in academic and faculty activities. Astin (1993) said that involvement in academic activities include: 1) Allocation of time to attend class or lab work; 2) time to study and do homework; 3) time to use personal computers. Finally the third part of the questionnaire collected demographic information of the respondents such as age, gender, ethnic group, year of study and academic information such as academic results, mean grade GPA and CGPA on majors and information on sports such as competition level, the role in team (main player or reserve) and sponsorship status.

Data collected was processed and analysed using the Statistical Package for the Social Science (SPSS) version 14 using multiple regression analysis. This type of analysis is used for descriptive and inferential statistics. In the process of analysing the research, the level of significance was stated at 0.05 and the confidential level at 95%. The level 0.05 is used as a point of reference as it a standard low-risk significance level which is used in many social sciences research. All the research questions were analysed using multiple regression analysis to explain the relationship between the independent variables, namely the behaviour of the coach, team mates' behaviour, parental support, the learning environment, financial aid, training, academic assistance, support systems, socialization and stress level and the dependent variable that is academic achievement among university athletes.

### 3. Results

The majority of the subjects (n=103, 66%) were males while females comprised 34% (n=53) of the sample. Fifty-four respondents (34.6%) are in year 1 of their university studies, 37 respondents (23.7%) are in year 2, 35 respondents (22.4%) are in year 3, and 30 respondents (19.2%) are in year 4. In terms of ethnicity, 146 or 93.6% of the respondents are Malays, 2 respondents (1.3%) are Chinese, 4 respondents (2.6%) are Indians and the remaining 4 respondents (2.6%) are of other races. The respondents are aged between 18 to 25 years (M = 21.78, SD = 1.54), and those aged 22 and 23 years make up the majority of students athletes who represent the universities in hockey competitions. As for the level of competition, it was found that 27 respondents (17.3%) had represented the country before, 50 respondents (32.1%) had represented the state, 70 respondents (44.9%) had represented the universities and 9 respondents (5.8%) had participated in other levels of competition.

Table 2 : Factors that Influence the Academic Achievement of University Athletes

Factors that Influence Academic Achievement	Mean	Standard Deviation
Parents' Behaviour	4.55	0.65
Support Systems	4.21	0.85
Socialization	4.15	0.65
Training	4.12	0.64
Academic assistance	4.10	0.59
Team Mates' Behaviour	3.90	0.67
Learning Environment	3.58	0.62
Financial Aid	3.53	0.68
Coach's Behaviour	3.51	0.58
Stress Level	3.19	0.68

Table 2 shows factors that influence the academic achievement of Malaysian university athletes. Parental influence has the highest mean at 4.55 (standard deviation = 0.65) followed by support systems (mean = 4.15, standard deviation = 0.65), socialization (mean = 4.15, standard deviation = 0.65), training (mean = 4.12, standard deviation = 0.64), academic assistance (mean = 4.10, standard deviation = 0.59), team mates' behaviour (mean = 3.90, standard deviation = 0.67), learning environment (mean = 3.58, standard deviation = 0.62), financial aid (mean = 3.53, standard deviation = 0.68), and coach's behaviour (mean = 3.51, standard deviation = 0.58). The lowest mean score is for stress level at 3.19 (standard deviation = 0.68). The results suggest behaviour of parents, team mates and coaches, the support system, training, academic assistance, and socialization can influence the academic achievement of university athletes with the influence of parents as the most dominant factor.

Table 3 shows university support system ( $\beta = -2.31$ ) and learning environment ( $\beta = 0.181$ ) have a significant relationship with the academic achievement of Malaysian university athletes. The value of R square ( $R^2$ ) that was obtained showed that a small variance in the dependent variable (GPA) is influenced by independent variables. With an R value at 0.080 ( $0.08 \times 100 = 8.0\%$ ), only 8.0% constitute variance in the dependent variables.

(academic achievement) and are influenced by independent variables. As for the learning environment, the analysis shows that there is a significant relationship between the learning environment and academic achievement among university athletes. ( $\beta = 0.18$ ,  $p < 0.05$ ). The positive correlation indicates that if a student athlete studies with a non-athlete, spending time to study and having discussions on relevant academic matters, it can enhance his or her academic achievement. If the reverse happens, the academic achievement will be lower.

Table 4 : Multiple Regression Analysis of All Factors that Influence the Academic Achievement of University Athletes

Variable	Non Standard		Standard		t	P
	Coefficient		Coefficient			
	B	Standard Error	Beta			
Constant	2.390					
Coach's Influence	.090	.073	.113		1.242	.216
Team Mates' Influence	-.028	.064	-.040		-.438	.662
Parents' Influence	-.014	.064	-.020		-.224	.823

\* p<0.05

Next, the results of analysis show a significant negative relationship between the support system and academic achievement among university athletes ( $\beta = -0.23$ ,  $p < 0.05$ ). The result suggests if support system is positive, in terms of recognition by the university, providing rewards to university athletes, and providing training and proper planning for them, academic achievement will be lower. However in the absence of the above, the academic achievement of university athletes will be positively affected. The findings suggest Malaysian university athletes are not getting proper support system, but their academic achievement was still good.

#### 4. Discussions

The effort to enhance sporting achievements of Malaysian university athletes has raised concerns that involvement in sports might be a hurdle for university athletes to have high academic achievements on par or even better than non-athletes. The findings of this study suggest learning environment and support systems are significantly related with the academic achievement of university athletes in Malaysia. A direct significant positive relationship was found between the learning environment and academic achievement among university athletes. This finding is consistent with past research by Abdul Rahim Mohd Meerah (1995) to determine the relationship between academic achievements and outstanding involvement in sports in UiTM, Shah Alam. The research found that outstanding academic achievement among university athletes is because of the university's effective management in terms of providing a good learning environment, time table, and incentives that could motivate students. The findings emphasize the need for Malaysian universities to create a conducive learning environment so that students can study in a more pleasant environment. University athletes need to be given the opportunity to mix and interact with other students and join tutorial groups just like other students and not be segregated to specific groups consisting only of university athletes or made to stay in the same dormitory as their sports team mates as the practice in some countries (Allen, 1997).

In this study, support systems was found to be negative related with academic achievement of university athletes. This finding is not consistent with past research that indicated that with the existence of good support systems for the university athlete, the academic achievement of these students will improve (Allen, 1997). The Malaysian higher education system is different especially from those in the western world that provide equal support systems to all students. In Malaysia, only a handful of weak university athletes will be given extra attention because of their low academic achievement. They will be allocated counselling sessions, extra classes and tutorial sessions to help them improve their grades. University athletes with better grades do not get any form of additional support as their academic achievement leads to the belief that good support systems are not necessary for good academic achievement. In contrast, weaker students, in terms of academic achievement, will be given all the support they need such as counselling, and tutorials to help them achieve better grades. However, the practice of providing support only to academically weak student athletes should stop. Instead Malaysian universities need to provide a support system to all students whether they are high achievers or the weaker ones so that their academic achievement can be improved. Besides providing tuition and extra classes for university athletes, universities should provide financial aid and allowance for training to motivate the students athletes to continue being active in their respective sports.

For the other factors, the findings show that there is no significant relationship between academic achievement among university athletes and factors like influence of the coach's behaviour, influence of team mates' behaviour, parents' behaviour, financial aid, academic assistance, socialization, and stress level. Thus the findings are not consistent with past research done in other countries. The findings are in opposition with previous research that concluded that there is a significant relationship between coaches' behaviour and team mates' behaviour with academic achievement (Allen, 1997). However, the present findings that there is no significant relationships between academic achievement of university athletes and factors such as the coaches' behaviour, team mates' behaviour, parents' behaviour, financial aid, academic assistance, socialization and stress level are in line with past research that concluded that there is no significant relationship between high academic achievement and the active involvement of outstanding university athletes in sports in UiTM, Shan Alam (Abdul Rahim Mohd Meerah, 1995). This research found that good academic achievement is not the result of active involvement in sports but rather is because the students have good time management and also because the university is effective in scheduling classes, and providing good learning systems and attractive incentives to motivate university athletes.

Even though the focus of this study is on external factors, like the subculture of the team (coaches' and team mates' influence), and academic achievement among university athletes, there are also other internal factors such as personality and motivation of university athletes that have not been researched. Perhaps future research should look into the influence of these internal factors on the academic achievement of university athletes.

# Academic motivation levels of technical high school students

S.Muge Yukseloglu<sup>a\*</sup>, M.Hulya Karaguvan<sup>b</sup>

<sup>a</sup>*Marmara University, Faculty of Technology 34722, "Istanbul", Turkey*

<sup>b</sup>*Marmara University, Atatürk Faculty of Education 34722, "Istanbul", Turkey*

## Abstract

Motivational problems are very widely seen in education. One of the greatest frustrations mentioned by many teachers is that their students are often not motivated to learn. Determination of effective factors on students' academic motivation levels can be helpful in order to improve student academic performance. The aim of this study is to identify the effective factors on a group of high school students' academic motivation. Study group of this research consists of 300 high school students. A Turkish form of the Academic Motivation Scale was used to collect data. Additionally, Communal-Mastery Scale and a nine item questionnaire were also used in this study. Results indicated that a group of demographic characteristics and communal mastery were effective in academic motivation levels of students.

Keywords: academic motivation, technical high school students, communal-mastery

## 1. Introduction

The recent statistics results showed that achievement levels of technical high school students was very low in the university entrance exam and it was also observed that low academic achievement, low expectation and unwillingness to learn were very common among technical high school students. Determination of effective risk factors on students' academic motivation levels may help to improve academic motivation and academic achievement. The aim of this study is to identify the effective factors on students' academic motivation by working with a group of technical high school students within the concept of self-determination theory.

Motivation can be defined as the process whereby goal-directed activity is instigated and sustained. Researchers agree to the one generic definition of motivation, which is a mental state that stimulates the behaviour and arouses goal-oriented desire in human mind (Harris, 1940; Eysenck, 1970; Pintrich & De Groot, 1990). Motivation also known as an academic engagement which identify as the most influential of all the factors that affect student performance and academic motivation has been found positively associated with academic achievement, academic performance and 'will to learn' (McClelland, Atkinson, Clark & Lowell 1953; Entwistle 1968; Frymier et. al. 1975; Pintrich & Schunk, 2002; Woolfolk, 2004). These kinds of results emphasize that academic motivation is one of the basic factors for academic performance. It is described as "The cognitive, emotional, and behavioral indicators of students' investment in and attachment to education" (Tucker, Zayco, & Herman, 2002, p.477). Additionally, it is suggested that academic motivation is the only factor that directly impacts academic achievement; all other factors affect performance through their effect on motivation (Tucker, Zayco, & Herman, 2002). Another factor is the student's perception of themselves as being intrinsically or extrinsically motivated to engage in learning activities within educational environments (Barron & Harackiewicz, 2001; Elliot & Thrash, 2001). There has been a dialectical relation between people, as innately active organisms, and the social environment according to self-determination theory (Deci & Ryan, 1985). In this theory, humans are assumed to be active, growth-oriented organisms that have an innate desire for stimulation and learning from

\* Corresponding author. Tel.: +90 216 336 57 70; fax: +90 216 337 89 87.

E-mail address: myukseloglu@marmara.edu.tr

birth, which is either supported or discouraged within their social environment (Deci & Ryan, 1985; 2000). Within the social environment people attempt to satisfy their three basic needs. These three innate or fundamental psychological needs are competence, autonomy and relatedness (Ryan, & Deci, 2000). In this theory; at the end of the interaction between these needs and the environment three specific types of motivation are differentiated. Firstly, intrinsic motivation; the drive to pursue an activity simply for the pleasure or satisfaction derived from it, secondly, extrinsic motivation; pursuing an activity out of a sense of obligation, or as a means to an end and thirdly, amotivation; the absence of intent or drive to pursue an activity due to one's failure to establish contingencies between the activity and their behavior (Deci & Ryan, 1985; 2000). Additionally, Deci and Ryan (1985) distinguished four types of extrinsic motivation: external regulation, introjected regulation, identified regulation and integrated regulation. These four types of extrinsic motivation show differences in the degree of self-determination that the individual associates with the behavior. More internalized or more integrated behaviours produce a greater sense of self-determination. Based on one of the propositions that intrinsic motivation may be driven by specific, differentiated factors (Deci, 1975); three types of intrinsic motivation have been added to this original theory by Vallerand and his colleagues (1992). Firstly, to know; the desire to perform an activity for the enjoyment one receives while learning new things. Secondly, to accomplish; the desire to perform an activity for the satisfaction one receives from accomplishing or creating new things. Thirdly, to experience stimulation; the desire to perform an activity for the experience one receives while experiencing sensory stimulation which may reflect either intellectual or physical sensations (Vallerand et al. 1992). Thus, academic motivation can be examined within eight subtitles. Vallerand and his co-workers (1992) developed a scale which is measures seven subtitles of academic motivation on the bases of Self-Determination Theory and named as Academic Motivation Scale (AMS). In this study, academic motivation studied with AMS which is evaluates academic motivation as intrinsic and extrinsic motivation. According to Self-determination Theory environment has an important role in motivation. For example: "at the end of interaction between needs and the environment tree specific types of motivation are differentiated", "social contexts either stifle or promote intrinsic motivation" (Deci & Ryan; 2000). Motivation may be mediated by individual differences in social competence and mastery. Communal-mastery may be viewed as a form of social competence. Communal-mastery is defined as the belief that one is capable of successful goal attainment by virtue of being closely interconnected with others by Hobfoll and his colleagues (Hobfoll, Schroder, Wells, & Malek, 2002). A scale was developed by these researchers namely "Communal Mastery Scale" to assess communal mastery and used in this study.

### *1.1. Problem statement*

The recent statistics results showed that achievement levels of technical high school students was very low in the university entrance exam. And it was also observed that low academic achievement, low expectation, and unwillingness to learn were very common among the technical high school students. The aim of this study is to investigate academic motivation levels of technical high school students. Additionally, communal-mastery levels were also examined.

## **2. Method**

### *2.1. Participants*

The sample is consisted of 300 students from vocational and technical high schools, in this work. Participation was arranged voluntarily, with informed consent in the classroom environment. Enough time were given to all students to complete each instrument. Average age was 18 (range 17-22). 49% of the participants were male and 51% were female. This sample may be considered as a very representative one of vocational and technical high school students in Istanbul.

## 2.2. Measures

A nine item questionnaire was developed by researcher and used for demographic variables. Examples for the items; age, gender, whether he/she was happy from his /her school and whether the school was chosen by himself/herself or not. Additionally, two scales were also used in this study.

**2.2.1. Academic Motivation Scale (AMS):** The AMS (Vallerand et al., 1992) consists of 28 items and seven subscales. The scale adapted from English to Turkish (Ünal-Karagüven, 2012) and Turkish form named as Akademik Motivasyon Ölçeği (AMÖ). The scale consists of seven subscales, reflecting one subscale of amotivation, three subscales of intrinsic motivation and three subscales of extrinsic motivation. The items are rated on a seven point scale, ranging from 1 (does not correspond at all) to 7 (corresponds exactly). Examples for the items; “Because I need at least a high-school degree in order to find a high-paying job later on” or “Because I experience pleasure and satisfaction while learning new things” The scale has also one total score. Total score can range from twenty-eight to one hundred ninety six. A high score on scale indicates high endorsement of academic motivation. Total scores of the scale used in this study for each sample. Cronbach's alpha for this group is 0.89 (N=300, n=28).

**2.2.2. Communal Mastery Scale (CMS):** Communal mastery assessed via the CMS (Hobfoll, Schröder, Wells & Malek, 2002) which was developed from two commonly employed measures of mastery (Pearlin, Lieberman, Menaghan & Mullan, 1981) and self-efficacy (Schwarzer, 1993). Turkish form of CMS named as Çevresel Destek Ölçeği (ÇDÖ) (Ünal-Karagüven, 2005; Ünal-Karagüven, 20013).The scale consists of 10 items. Responses were based on a four-point scale from 1 (strongly disagree) to 4 (strongly agree). Students were asked to indicate the degree to which they agreed with the statements. For example, “With the help of those close to me I have more control over my life” or, “I can meet my goals by helping others meet theirs”. Cronbach's alpha was .64 in this study (N=300, n=10).

## 3. Findings

Sample sizes, means, standard deviations and intercorrelations among variables used in the study can be seen from the Table 1. As seen in column 5; academic motivation significantly correlated with all independent variables; gender ( $r=.178, p<.05$ ), school chosen by himself ( $r=.159, p<.05$ ), happy from his/her school ( $r=.229, p<.01$ ), and communal mastery ( $r=.319, p<.01$ ). All intercorrelations among academic motivation and independent variables were mostly positively significant.

Table 1. Means, standard deviations and bivariate correlations among variables

Variable	M	SD	1	2	3	4	5
1. Gender			1	-0.035	0.111	-0.068	0.178*
2. School chosen by himself				1	0.250**	0.047	0.159*
3. Happy from his/her school					1	0.140	0.229**
4. Communal Mastery	28.79	3.79				1	0.319**
5. Academic Motivation	118.59	26.25					1

\*\*  $P \leq .01$ , \*  $P \leq .05$

Hierarchical multiple regression was used to predict academic motivation and communal mastery from three predictor variables. The relative importance of variables in each predictor block was determined by examining significant beta. Beta weights provide an appropriate criterion about predictors. Table 2 depicts these results.

Table 2. Hierarchical regression analysis for communal mastery and academic motivation

Variables	Communal Mastery	Academic Motivation
	Beta( $\beta$ )	Beta( $\beta$ )
Gender	-0.083*	0.16*
School chosen by himself	0.008*	0.12*
Happy from his/her school	0.144**	0.18**
<b>Total R<sup>2</sup></b>	<b>0.2%**</b>	<b>0.8%**</b>

\*\*  $P \leq .01$ , \*  $P \leq .05$

As it can be seen from the Table 2, communal mastery and academic motivation are dependent variables. The independent variables are gender, school chosen by himself and happy from his/her school. As seen in Table 2, academic motivation and communal mastery were separately regressed on the three predictor variables. The absolute magnitude of beta coefficients indicates the relative strength of three variables as predictors of academic motivation and communal mastery. Communal-mastery and academic motivation subscales were separately regressed on three predictor variables. All independent variables are important predictors of communal mastery and academic motivation levels of technical high school students. These findings show that; being happy from his/her school a substantially important predictor of academic motivation and communal mastery, even when other predictors are statistically controlled. It explains a significant amount or increment especially in academic motivation (0.8%, \*\*  $P \leq .01$ ).

Additionally, significant findings for academic motivation showed that the Academic Motivation mean scores were significantly related with gender ( $t=-2.50$ ,  $p=0.01$ ), whether the school was chosen by himself/herself or not ( $t=-2.23$ ,  $p=0.02$ ) and whether he/she was happy from his /her school ( $t=-3.26$ ,  $p=0.001$ ). Boys' academic motivations were significantly higher than the girls. Additionally, willingly and happier students' academic motivations levels were significantly higher than the others. On the other hand, communal mastery scale results were significantly related with being happy from his/her own department of school ( $t=-0.918$ ,  $p=0.05$ ). Happier students' means scores were significantly higher than the others.

#### 4. Conclusion

This study presents the effective factors on a group of high school students' academic motivation levels which is based on Deci and Ryan's self-determination theory. Results indicate that demographic characteristics were more effective than communal mastery in their academic motivation levels. AMS has satisfactory levels of internal consistency ( $\alpha$  value= 0.89). Significantly different results obtained in some variables such as: gender, being willingly to go to this kind of school and being happy to be educated in these kind of departments such as computer or electricity education. Gender differences confirmed that boys' academic motivation levels were significantly higher than the girls. This may be due to the subjects, that are studied; which are found more interesting by the boys rather than the girls. We found that students have high academic motivation and communal-mastery levels if the school is chosen by themselves. Additionally, students have high academic motivation and communal-mastery levels if they are happy from their school. In addition, being happy or satisfied from school was found to be more effective than gender and choosing the school by themselves. This results confirmed that students' academic motivation have been affected by some factors. Findings provide support for the view that demographic characteristics are important for academic motivation. It was reported that motivation levels of university students are affected by some demographic factors such as; their reason to choose the school, the probability of finding a job after graduation, order of preferences, future expectations, distinctive power of testing and measurement activities at school and their desire to do master degree, probability of finding a job, attitude towards the teacher, social circle, level of income, appropriateness of the classrooms, efficiency of the educational material and number of siblings (Celikoz, 2009). Results related with communal-mastery also consistent with previous study that women have high level communal-mastery (Hobfoll, et al., 2002). Findings of this study were similar with other studies' findings as well. It was found that; demographic variables were significant predictors of communal mastery (Ünal-Karagüven, 2005). Subsequent studies of academic motivation should examine different factors not only demographic characteristics but also teaching style and classroom environment. In order to prevent negative effects of motivational problems on academic achievement motivating factors should be used by teachers in the classroom environment as much as possible.

In sum, we believe that the current study provides adequate support for the AMS and gives useful information on the technical high school students' educational research on motivation. Replication with different subjects to determine the influence of different variables on academic motivation and communal mastery is necessary to increase confidence of findings. Similar studies were suggested for the future.

## Abstract

Lately, the Study of Religions as an academic field has become highly attractive for many students. Globalization, among other impacts it has on society, certainly implements principles of multicultural education and religious tolerance into the frames of educational systems. Nevertheless, wide definition of these principles must be given concrete forms, which would reflect the socio-cultural and religious situation in different countries. It is on the scope of this paper to share experiences related to preparation of Study of Religions Curriculum in Czech Republic, a country often apprehended as one of the most secularized countries.

When implementing the education of Study of Religions we are confronted with two general problems. Firstly, believers sometimes reject an academic Study of Religions which is by them apprehended as unable to understand the reality of their religious experience. Furthermore they strive to reach a religiously caused (social) progress. Secondly, there is a wide underestimation of social impacts of religion among non-believing population according to which to deal with the topic of religion is of no use at all. In our paper, we intend to show elementary principles inherent to Study of Religions that need to be respected when educating at the academic level.

*Keywords. religion, religious education, academic study of religion, Czech Republic*

## 1. Introduction

The socio-political changes after November 1989 influenced widely the lives of Czech citizens. More than forty years of communist regime ended with Velvet Revolution brought about a transformation of a state-directed economy into the free market based economy on one hand and the change of a single-party political system to the pluralistic democracy on the other. The human right principle, being a constitutive characteristic of new system, influences significantly the societal organisation as well as many other areas of citizens' everyday lives. Such a radical re-formation of socio-political system had also a crucial impact on social-religious domain.

\* *Email address:* dusan.luzny@upol.cz, petra.tlcimukova01@upol.cz

## 2. *Religion and religious education in democratic pluralistic society*

When we look at the impact of religious freedom principle on the state, we are instantly confronted with fundamental principle of modern state - secularity - which provides the frame of functioning for any religion in contemporary context. Modern state is built upon secular basis which foremost assumes its dissociation from any form of religion and religious tradition. At the same time, this by no means denotes atheism of the state itself, its negative relation or even persecution of religion. We shall strictly distinguish atheism, as a denial and combat against religion (Velký sociologický slovník 1996: 111-112), and secularity that is represented via structural societal organisation, since the foundation of modern European state is tied to secular nationalism.

Modern state of western type and its secular character adhere directly to political liberalism, quasi the protection of human rights and rights of free association of individuals. Thus the state must respect and protect the religious belief of citizens which subsequently leads to protection of minorities' rights (e.g. religious minorities). This principle does not mean that the modern state cuts off or disregards the historically based affiliations to diverse religious traditions whose presence is manifested strongly – that is Christianity and Judaism in case of Czech Republic. These religions particularly form an inherent part of our history and the secular state too must reflect that.

To fulfil this principle in Czech Republic the Charter of Fundamental Rights and Basic Freedoms was incorporated into the Constitutional order, thereby the freedom of religious belief (as well as the freedom to have no belief) in the Article 15 and 16 has been guaranteed.

Basic principles of religious tolerance and constitutional secularism further apply to educational system, too. According to the constitutional secularism principle the state cannot support nor identify itself with any particular religious tradition. Public schools and educational establishment (e.g. crèches), whose founder is either municipality (elementary schools), district office (secondary schools) or state (Institutions of specialized care) are therefore not attached to any kind of religion.

In case of private schools (where the founder is an executive individual or other executive private subject) and church schools (where the founder is a religious organisation) the situation can be rather different. Nevertheless, the Czech state takes the historical significance of Christianity into account and makes it possible to implement the religious education in case of interest. The feasibility to teach religion at the public schools is grounded in Charter of Fundamental Rights and Basic Freedoms, further in Act n. 3/2002 on freedom of religious belief and position of churches and religious organisations as well as in Education Act (Act n. 561/2004 Collection of Law, on Pre-school, Basic, Secondary, Tertiary Professional and Other Education). According to § 15 of Education Act only the registered churches can provide religious education, while they need “special act” permission to teach religion in public schools. Furthermore: on elementary and secondary schools founded by the state, district office, municipality (or its unit) the religion can be taught as a voluntary subject when at least 7 pupils are enrolled. For this purpose to joint pupils from different year-classes or schools is possible. The religious education in most cases practically means the Christian education, for Christianity is a dominant religion of Czech society, or more precisely – Roman Catholicism. Therefore the education is organised and carried out by local diocese and it corresponds to the document “Roman-Catholic Church Curriculum of religious education in 1th- 9th year of elementary school”, which was endorsed by Czech Episcopalian Conference in 2004 (Curricula..., 2004).

Although the Roman Catholicism is the dominant religion in contemporary Czech society, we might consider one distinctive characteristic of religious life in Czech Republic. The majority of Czech citizens claims no belief (they do not affiliate to any religion). Annual Censuses as well as specialised empirical inquiries (e.g. European Value Study or ISSP) illustrate this situation. According to the last Census of Population and Housing

carried out by the Czech Statistical Office in 2011 (Czech Statistical Office, 2011), out of 10,436,560 (total population), only 2,168,952 respondents report themselves as “believers” – that is 20,8 % of the total population. Out of this number of believers, 705,368 respondents declared themselves as “believers, not belonging to any specific religious organization” (6,8 % of population) and 1,463,584 declared themselves as members of a specific church or denomination (14,0 % of population). 3,604,095 respondents, that is 34,5 % of the total population, explicitly checked the option “no religious belief” on the census form and 4,662,455 respondents (44,7 % of population) did not answer at all since the response to the question of religious belief and affiliation was not mandatory (Havlicek & Luzny, 2013).

The number of believers who declare their belief openly decreases on the long-time scale: in 1991 there was 43,9% of declared believers, in 2001 the number fell down to 32,2% whereas in 2012 we had only 20,8% of believers. The following table shows the decline of large churches’ believers and the development of other religious organisations:

**Table: Religious Groups in Czech Republic (1991-2011)**

Religious group	Size (number)		Percentage in the population	
	1991	2011	1991	2011
Roman Catholic Church	4 021 385	1 082 463	39	10,3
Czechoslovak Hussite Church	178 036	39 229	1,7	0,4
Evangelical Church of Czech Brethren	203 996	51 858	2	0,5
Silesian Evangelical Church of the Augsburg Confession	33 130	8 158	0,3	0,1
Orthodox	19 354	26 350	0,2	0,3
Religious Society of Jehovah’s Witnesses	14 575	13 069	0,1	0,1
Islam	-	3 358	-	0
Buddhism	-	6 101	-	0,1
Hinduism	-	2 408	-	0
Judaism	-	1 129	-	0
Jediisms	-	15 070	-	0,1
believers, not belonging to any specific religious organization	-	707 649	-	6,7
Non-believers	4 112 864	3 604 095	39,9	34,2
Unidentified/ did not respond	1 665 617	4 662 455	16,2	45,2

The figure speaks for itself: Czech society is highly secularized with prevalence of non-believers. In spite of such data, we cannot speak of Czech society as being atheistic or having negative attitudes towards religion. Czech population can be rather defined a religiously non-active or apathetic (Topinka & Lužný, 2012; Váně & Lužný & Štípková, 2012).

It is thus not surprising that this religious passivity is reflected also in the means of religious education on elementary and secondary schools. In the scope of elementary education the religion also co-occurs in a thematic area “Human and Society”. Here, the topic of religion shall provide a general “orientation in socio-cultural phenomena and thus foster the respect towards cultural and other differences.” In this respect, the topic of religion is of secondary importance – the primal goal is to educate towards tolerance and respect and thus to follow and support the principles of multiculturalism. On the level of secondary education the system functions in a similar manner – optional form of religious education is lead by registered church, namely a delegated person of the church, and “in accordance with moral and humane principles of education and on the basis of tolerance

and religious plurality” (Directive n. 36). The secular state plays (in the field of education) the role of religious plurality and tolerance protector.

### 3. *The Academic Study of Religion at Universities*

The application of these principles is apparent also in the tertiary education, at the Universities in Czech Republic. Two parallel directions in education can be distinguished: religious education and the study of religions. This coexistence shall be apprehended as a result of the process of secularization, since the academic environment traditionally used to be a place where the religious education had been cultivated. Theological Faculties represented the hard-core of the medieval universitarian education system and only by the time its impact on the functioning of the system had been decreasing.

Today, the Czech education system includes five theological faculties. Three of them - Catholic, Evangelical and Hussite's Faculty of Theology – form a part of Charles University, the oldest university in Czech Republic established in 1348. These faculties also represent the major religious traditions in Czech society. Further, there exist a Sts Cyrilus and Methodius Faculty of Theology at Palacky University in Olomouc (1573) and Faculty of Theology at University of South Bohemia in Czech Budweiss (1991) – both being a part of Roman Catholic tradition.

Certainly, the goal of theological education is to transmit and cultivate the theology itself. It is, however, possible to attend the courses or to get a degree in Study of Religions also at these faculties. The understanding of such education is rather different than at non-theological (secularized) faculties, though. At the Hussite's Faculty of Theology the Bachelor and Master degree in the Study of Religion is available, yet only in combination with Hussite's theology. The Study of Religions is implemented as a teaching the history of religions, while the critical-historic method is applied prevalently. The religions of the Near East and large monotheistic systems (Judaism, Christianity and Islam) are of the main academic interest. Further, the education in at least one source language (Greek, Latin, Hebrew, Aramaic or Coptic) is incorporated in the Curriculum.

In Czech Republic the Study of Religions in its non-confessional form is present at the Faculty of Arts at Charles University in Prague, Masaryk University in Brno and University of Pardubice. Even though in all three cases we can talk about non-confessional and secularized studies which shall hence follow the basic principles of science (humanities or social sciences in general) we can observe significant differences in the approach towards the study of religions.

At the Faculty of Arts at Charles University, the Study of Religions is primarily textually and historically oriented – studying and interpretation of texts mainly in source languages form the core of the Curriculum. The main focus is given to the development of religious thought and philosophical analysis of religion (<http://religionistika.ff.cuni.cz>). Such a conservative approach in the Study of Religions along with the thematic content of education and the methods of scientific work reflects the tradition of Prague Faculty of Arts.

The youngest department of the Study of Religions in Czech Republic was established in Pardubice. There, the teachers' personal beliefs and convictions have a special impact on the form that the Study of Religions has taken. It promotes the religious dialog at the first place, its mission is to search for religious consensus on the base of everyone's personal religious believes, since those who are religious can understand the religion in general sense the best. Thus the Study of Religion as an Academic field serves as a place of religious encounters and the Curriculum focuses on the problematic of intercultural clashes (mainly of Europe and Orient) and the interreligious dialog (<http://religionistika.upce.cz/o-katedre>).

A distinctive conception of the Study of Religions offers the Department at the Faculty of Arts at Masaryk University in Brno. Currently, two different directions of the study and research are being supported and cultivated by the department. While the first one is based on contextual approach, partially influenced by the

sociology and social-oriented scientific approaches in academic study of religion (hermeneutics and interpretation turn), the second is oriented rather cognitively and thus strives to give the education cognitive scientific background. A part of such educational and research attitude is based on experimental and laboratory research (<http://www.phil.muni.cz/relig/>).

#### 4. Conclusion: Academic Study of Religion and Religion at Universities in (Post-)Secular Society

The secularist principle, upon which the actual development of modern western societies is based, lead to the disjunction of religion and public education system, respectively to decreased influence of religious institutions on the education system. Consequentially, the religious education and education about religion has been differentiated. On elementary and secondary schools this situation is reflected as differentiate religious education (optional, but guaranteed by the state to satisfy eventual children's religious needs) on one hand and a transfer of information about religion, that partially form diverse cultural traditions and memory of given nation, on the other. In case of tertiary education this disjunction went even further. Side-by-side there coexist institutionally separated systems focused on teaching and studying religion – theology and study of religions. While the first one – theology – produces religious specialist, the second – study of religions - is a non-confessional independent field of study. The existence of the academic study of religions should be thus apprehended as a demonstration of secular character of the education system itself.

Nevertheless, the secularist principles have been challenged lately and nowadays the tendencies to reinforce the influence of religion in diverse spheres of public life (policy, education etc.) appeared. This period is sometimes referred to as “post-secular” society.

The so called „Culture War” as we know it in USA, where the long-lasting conflict between religious world-view (along with the possibility to include its attitudes into the curricula) and non-religious world-view based on evolution theory, did not affect the Czech environment so powerfully. It is in fact a clash of creationism (also in a form of “intelligent design”) and Darwinism, but in some cases we can even talk about war between religious fundamentalism and atheism. It is still a question how expectable this situation, this ideological conflict, is in case of Czech society and Czech tertiary education. Considering the religious indifferentism of Czech society it seems to be unlikely for such conflict to become more intense. If it arises (which is possible), it will very probably touch the tertiary education only partially. It can embrace a clash between fundamentally oriented religious activists and university teachers on one hand and cognitively (evolutionary) -oriented academicians of study of religions on the other.

Regardless all these problems and potential rise of “culture war” in connection with the topic of religion (and its presence in tertiary education curricula), it is important to protect the fundamental principles that anticipate the existence of academic study of religion itself. Respect to the diversity of religious beliefs and religious tolerance belong to its pre-conditions. Therefore, it is highly eligible for the state (that frames the educational and religious policy) to follow the principle of religious neutrality. In this manner, the state in fact plays the role of religion's and religious minorities' protector, while the particular religions evolve unboundedly in the frame of secularity.

# Accounting education for accounting educators evidence from Italy – the case of SISSIS/TFA (2002-2013)\*

Massimo Costa<sup>a†</sup>, Patrizia Torrecchia<sup>b</sup>, Alan Sangster<sup>c</sup>

<sup>a</sup> Università degli studi di Palermo

<sup>b</sup> Università degli studi di Palermo

## Abstract

This paper aims to highlight the education-training during the early twenty-first century, for future teachers of *Economia aziendale* (“Economic concern”), in Palermo (Sicily, Italy), in a special training school. In Italy, the business disciplines, unitarily, are studied generally under the name of *Economia aziendale*, within which, however, the part of Accounting (*Ragioneria* in Italian) has always played a dominant role. Compared to the usual studies in Accounting Education, this research presents some peculiarities worthy of note. The perspective used is the critical thinking in education.

*Keywords:* Critical thinking in Education; School; Teaching

## 1. Introduction

This paper reports upon an unusual event in Italian accounting education: the change that occurred in the early 21<sup>st</sup> century in the education and training of future teachers of *Economia aziendale* (‘Concern’ or ‘Business’ Economics). This occurred at a special training school established in Palermo, the capital of Sicily, Italy. Although the business disciplines are studied together under the name, *economia aziendale*, in Italy, it is accounting (*Ragioneria*) that has always played the dominant role and, so, the change in education and training of teachers of *economia aziendale* impacted most upon teachers of accounting. This paper contributes to our knowledge of the process of accounting education by looking not, as most studies of accounting education do, at the education of future accounting professionals, but at the education of future teachers of accounting and other business disciplines. In addition, these future educators are being trained to teach, not in universities, but in secondary schools where the age of pupils is from 13 to 19. The teaching of accounting at this level is relatively unusual when compared with where it is predominantly taught in Anglo-Saxon countries, generally at post-high school level. The relative importance of this research, both for accounting education and for the history of our discipline, is that it draws attention to the importance of planning the trainers’ curriculum and not just the curriculum of the trainees. From a normative perspective, this study could inform curriculum designers to the

\* The idea for this research and the bibliography are attributable to a common body of work of the authors. The following sections, however, even with a strong cooperation among them, are due in the main, respectively, to Massimo Costa (2 and 4), to Alan Sangster (1), and to Patrizia Torrecchia (3).

† Corresponding author.

Email address:

possibility of extensions to current curricula that should be beneficial and open the possibility of its generalization to other contexts beyond that investigated here.

But this history can also have an intrinsic historiographical value despite its extreme proximity over time; and we know that this historiographical perspective is relevant in accounting education field.

The third peculiarity is the reference to a particular legal system, that of the Italian school in the last decades.

During the past 30 years, research in accounting education has become established as a distinct branch of research with a global community of scholars (Urbancic, 2009; DeLande and Bernardi, 2013) but accounting education has ancient roots, inherent in the birth of modern accounting itself (Sangster *et al.*, 2007). It was, however, largely uninfluenced by specific demands of practice until two events occurred in the mid-19<sup>th</sup> century: accountants began forming professional bodies to represent their interests (Lee, 1995) and universities in the USA began including accounting in their programmes and their graduates sought jobs in the profession (Van Wihe, 2007a,b).

The birth of accounting education journals, in recent decades has led to the absence of education topics in the main accounting journals, however, it has also created a strong research community (Ravenscroft *et al.* 2008). The present work can be placed within this general framework and, in particular, in studies related to the curriculum or to instruction. In particular, it can be noted that although there has been an explosive growth of studies in accounting education from, roughly, 1997 (Apostolou *et al.*, 2001), some of the themes of the immediately preceding years have failed to develop. Instead there was a great numbers of empirical studies that sometimes seem distant from key issues, such as the strong relation between changes in accounting education and accounting faculty (May *et al.*, 1995), and focus more towards the change in accounting education in which there are “more concepts and less procedures, integration of subject matters, critical thinking” (Ehrenreich, & Hulme, 1992).

Attention towards critical thinking is evident in laboratory studies and case studies, more so than in traditional studies of the procedures, but beyond this, the important thing is that everything is not reduced to an algorithm or a claim of “best practice”. We need to identify the logic, the underlying model, the evidence, and then, if possible, justify it critically (Kimmel, 1995). Some have openly criticized their own university learning (Kinney, 1990), with less attention to rules and more attention to the processes that created the rules themselves. In this respect, the Italian experience reported in this paper may be considered as a reference example for others to note and consider in terms of its relevance to accounting education where they are located.

Accounting education in Italy has a far longer pedigree than elsewhere, dating back at least seven centuries and, through the Italian schools of accounting thought, accounting in Italy has recognized scientific features for at least for two centuries, principally within the discipline of *Economia aziendale* (Lipari, 2012). There are discordant opinions about the influence of this ‘scientific’ conception in the field of accounting education (Chambers, 2005; Mattessich, 2005), but this concept has influenced and continues to be prevalent in Italian accounting practice and accounting education.

The methodology followed in this research is essentially historiographical, with some conclusions of a theoretical evaluation of the proposed curriculum. In general, this paper can be considered more descriptive than prescriptive, with its normative consequences, but we believe that such a distinction is, in our field, more formal than substantial, since it is inevitable to give regulatory guidance arising spontaneously from a case study of this type. Moreover, this paper can be considered more descriptive than empirical, because the evidence supplied is, as would be expected from such as study, often anecdotal in nature, rather than replete with hard facts.

#### *Historical background of the Accounting Profession in Italy*

The accounting profession in Italy can be traced back to 1581, when the Collegio de' Rasonati (College of Auditors) was formed in Venice. In 1620, the profession of “liquidatori giurati” (certified liquidators) was founded in Piedmont and, in 1742, the profession of “ragionati” (accountants) was recognised in Milan. In 1828, accountants were recognised as “ragionieri revisori” (accountant auditors). The profession of public accountants

(“pubblico ragioniere”) was recognised in the Papal States in 1836. Then, in 1906 the Kingdom of Italy granted accountants the status of independent professionals (“libero professionista”).

For many years entry to the accounting profession was available to anyone who had completed high school. However, some entrants were graduates and they founded their own association which separated from the non-graduate group in 1953. This changed in 1997 when the profession became wholly graduate-only with a requirement that to become a professional accountant [*Ragioniere e perito commerciale*], entrants were required to hold a 3-year Bachelor’s degree. To become a “*dottore commercialista*” (the equivalent of a ‘chartered accountant’), a 4-year degree was first required then, from 1999, this was changed to a requirement of a 5-year degree. In 2004, this was again changed to require the holding of a Master’s degree and, in 2005, it was agreed to merge the two professional groups with effect from the start of 2008. From that point forward, all new entrants to the new combined body, the *Consiglio Nazionale dei Dottori Commercialisti e degli Esperti Contabili* (National Council of Certified Accountants and Auditors), were required to be graduates who had completed a period of professional training and passed the necessary state examinations. The profession comprises, therefore, of those with Master’s degrees (following 5 years of university education), the “*Dottore Commercialista*”, and those with Bachelor’s degrees (following 3 years of university education), the “*Esperto contabile*”.

Until the switch to a graduate profession in 1997, Italy had to ensure the presence of secondary business schools [*Istituti Tecnici Commerciali*]. In these schools, despite the emergence of “*Economia aziendale*” during the 1920s following the work of Gino Zappa, up until the 1990s teaching remained divided into two themes: accounting [*ragioneria*] and management [*tecnica commerciale*]. This was also done in other technical schools and in professional schools of business (more practical schools, but still secondary schools), and in secondary schools for tourism, where the themes of accounting and business had a more minor role. In the 1990s, the curricula of these schools were unified into teaching “*Economia aziendale*” with a significant reduction in the hours devoted to these accounting and management and the traditional “secondary business school” [*Istituti Tecnici Commerciali*], became “secondary schools – economics” [*Istituti Tecnici ad indirizzo economico*]. While the accounting profession shifted to requiring a university degree of its new entrants in 1997, accounting continued to be taught in the schools, but the change to a unified system embodied a process of autonomy, both in the teaching and administration, resulting in the schools enjoying relative freedom since 1997 in the content of their courses. These changes were not the only ones to impact the education of future accountants. In 1999, “*Scuole per l’insegnamento secondario*” (Graduate Schools for Secondary Education – SSIS) were established in order to train future secondary school teachers, including those who would teach accounting. This scheme ceased enrolment at the end of the 2007/8 academic year and has since been replaced by the “*Tirocinio formativo attivo*” (TFA). This paper examines the birth of one of the “*Scuole per l’insegnamento secondario*” which was established by the consortium of the three state universities in Sicily. The rest of the paper is divided into three sections. The first reviews the Sicilian SSIS, particularly its curriculum for future teachers of “*Discipline Economico-Aziendali*” (business disciplines). The next section considers its replacement, the TFA, which is endeavouring to maintain the legacy of the SSIS. The final section summarises what has been described and presents some theoretical and practical conclusions.

## 2. The Experience of Sicilian SSIS (2002-2010)

The traditional Italian school, until the twentieth century, had teachers’ methods of recruitment not very efficient. Typically, from time to time, national competitions were banished. In these contexts some ‘applicants’ were considered winners, the first in the standings, and they had tenure, others were still ‘enabled’ to carry out teaching. This system created a pool of temporary workers who could only supply the substitutes in public schools and, more often, in private ones -growing over time- which took the majority of their workforce right from these ‘qualified precarious’. The system did not work well for many reasons. The progressive increase in the number of graduates, and the lack of job opportunities, especially for the humanities and for the depressed regions

of the South and the Islands, over time inflated the population proportion of temporary workers, while private schools, among which very few really qualified, could afford to pay little or nothing their teachers, who were content just to accumulate 'points' to climb the provincial rankings. The public school, in fact, not to upset these teachers, recruited them, for 50% drawing on the list of these temporary workers (that could be 'climbed' through the substitution), and the remaining 50% with the open competitions themselves.

One reason for inefficiency, then, was the fact that even the 'losers' in competitions, doing a lot of substitutions in complacent private schools, could aspire to the chair. Another source of inefficiency was that, from time to time, the state helped even the 'precarious not qualified', reserving to those who had a lot of 'experience', although rejected in all competitions, the 'qualifying courses' that allowed them to override the winners of the competition. But above all, competitions occurred only in a superficial teaching skills of future teachers, especially according to the contents of the disciplines taught. Overall, the system of national competitions, acceptable several decades ago, when the school was still a fact of elite, became in time a sector witnessed, controlled by the unions and highly politicized.

With regard to the field of business disciplines and the territory of the Sicilian Region, the last qualifying competition open to all graduates was banned back in 1990. To overcome this disorder, in 1998, with a Decree of the Ministry of Education, University and Scientific and Technological Research, on May 26<sup>th</sup>, SSIS were also set up. This decree followed up, much later, the Law n. 341 of 1990, which entrusted the training of school teachers to the University. Some real High Schools were established [Scuole di Specializzazione], and they lasted two years after the graduation. The students of these schools were required to undergo a course of 1,000 hours, divided into 700 hours of courses and workshops and 300 hours of practical training at secondary schools, divided into four semesters. These schools had to be divided into different courses or branches, according to the groups of disciplines, and these in turn into "classes of competition".

The teaching hours were divided into two areas:

Area 1 or "Transversal": Teaching of the function of teaching itself, with courses in "pedagogy", "didactics", "psychology", "school history", "school law", "environmental education";

Area 2 or "Disciplinary": Teaching of the function of teaching a particular discipline, with courses on the epistemological, historical and didactic aspects of the discipline itself;

Area 3 or "Teaching Laboratories": Teaching of practical teaching methods of the discipline, through the preparation of teaching modules, lectures, case studies, and so on.

The training, however, was coordinated by a supervisor chosen from among school teachers with particular expertise, and took place at the schools, with participation in all educational activities under the guidance of a school tutor. The establishment of SSIS, started in Italy with the academic year 1999/2000, had some criticism. The universities ran these courses without a clear project, and essentially found themselves unprepared in the face of a world, that of the school, they knew little. Often they just replicated university courses, with a few characterizations really 'didactic'. The distance of university research towards the issues of education and didactics showed here perhaps all its limitations. Moreover, the 'world' of the qualified precarious was not demobilized and, despite a competition in 2000 (in our sector and in Sicily restricted only to competitors who already have qualification), these remained largely in their place, creating a social problem difficult to solve.

However, for the first time in the history of the Italian School, the future teachers were subjected to an organic process of training that, in some experiments, also gave first-rate results. The specialized SSIS went to swell the ranks of 'qualified', but often were preferred to the old precarious teachers for substitutions, because of their preparation, and not a few of them reached the summit of the rankings in a short time and could have tenure, even in the few areas of a sector subject to increasing budget constraints. This happened in Italy and in general.

In Sicily, the three state universities of the Island (Palermo, Catania and Messina), in order to withstand common mode and administrative costs, and in order to plan so common teaching on a regional basis, entered into a Convention in 2000, which gave birth to a Sicilian school for the training of future teachers of school: the Sicilian Inter-university school of Specialization for Secondary School Teachers (SISSIS). In fact, however, apart

from the administration, the three teaching poles would have moved then in complete autonomy from one another.

The SISIS had its headquarter in Palermo and it was divided into three sections, as the number of universities: Palermo, Catania and Messina. It ensured the training of teachers in all the courses of the secondary school, the Grade I (11-14 years old), as the Grade II (14-19 years). It also ensured special courses for the so-called “support”, that is, for those teachers who would assist students with disabilities. Typically these courses were an additional specialization (a kind of 3<sup>rd</sup> year) that some SISIS specialized took in addition to the main specialization.

The teachings of the area 1 that were activated at the SISIS were as follows:

- Institutions of General Didactics;
- General Pedagogy;
- Intercultural Pedagogy;
- Psychodynamics;
- Developmental Psychology;
- General Psychology;
- Social Psychology;
- Sociology of Communication;
- Sociology of Education;
- Teaching and learning technologies.

The teachings of the areas 2 and 3 were divided into 10 branches. Ours was the branch titled “Economics-Law”. The latter, in turn, was divided into two “classes of competition”: Law and Economics [Discipline Giuridiche ed Economiche] and Business Disciplines [Discipline Economico-Aziendali]. The contents of the latter, for long Italian tradition, was and is largely of Accounting.

The aim of the teachings of area 1 of historical and epistemological type was the acquisition of knowledge about the nature and development of specific subjects required teaching qualifications, their historical evolution, the relationship between them, the reflection on the nature of the problems of teaching addressed and of the methodologies used in educational research. In a word, what in the previous point we have defined as the critical thinking related to these disciplines.

The aim of the area 2 teachings of didactic teaching discipline was instead the acquisition of specific skills in the determination of educational objectives, selection of teaching contents and in their effective curricular organization, in the selection and construction also of interdisciplinary teaching strategies and formative assessment of learning outcomes achieved.

The aim of the teachings of area 3 (the “laboratories”) was the practical application of skills acquired in the teachings of area 2.

The internships, however, given the difficulty of actually imparting 300 hours of participation in the school, were divided between an “indirect training” method, in which there were interventions under the guidance of the supervisor also through professional work and writing, and a real “direct training” properly in the schools.

The aim of didactic and professional training was the production of skills related to the effective teaching, the mastery of language and communication processes of teaching and training, the critical use of educational technology and the development of constructive attitudes and behaviours and of collaboration in institutional and social interactions required from professional life.

Distinguishing features of the training were:

- Elaboration, organization, experimentation and evaluation of projects in the school work and educational research, both within the specific discipline and in the interdisciplinary area;
- A close coordination with the activities of the laboratories both of Area 1 and of Area 2;
- Close coordination with the preparation of the final exams.

As a result of the institution of SISIS, the Faculty of Economics at the University of Palermo was so charged with the responsibility to design a curriculum “law and economics” already from the second round of courses, in the academic year 2001/2002. However, the first year of this course was activated only in the course of preparation for the professors of law and economics, completely devoid of Business Disciplines.

The following year (2002/03, III cycle), the specialization course for the teachers training in business disciplines started, and in that of law and economics, two key business lessons were included, among which there was ‘General Accounting’ [Ragioneria generale], made of 15 hours. At first the two courses had some subjects in common and used to vary from one year to another, but after two years the program contents found their stability.

In a mature stage (from the academic year 2004/05, V cycle), the course was then settled in its essential contents. During the ‘parallel’ course for teachers of “Law and Economics” either “Business Economics” and “General Accounting” were abolished and replaced with a single teaching of “Accounting and Financial Reports for Law and Economics” [Contabilità e bilanci per le discipline giuridiche ed economiche], 20 hours course, while in the course for teachers of “Business Disciplines” two courses, unrelated to business matters, were maintained: History of Economic Thought (20 hours) and Didactics of Commercial Law (20 hours).

The other teachings of area 2 were the following:

- History and Epistemology of Business Disciplines (45 hours);
- Firm Economics and Management (25 hours);
- Organization Science (25 hours).

The “Didactic laboratories” (area 3), were instead the following:

- Economics and management of tourist companies (15 hours);
- Accounting and professional technique (20 hours);
- Corporate strategies and policies (25 hours);
- Applied Financial Accounting (training, analysis, review of financial statements) (25 hours);
- Applied Management Accounting (Planning and Control) (20 hours);
- Industrial and commercial technique (production, logistics, distribution) (25 hours).

Simply reading the curriculum can make the idea of the uncommon effort that the local Faculty of Economics produced to train teachers of excellence, with a curriculum and professional never experienced before.

Every year, therefore, no more than 20 specialized teachers were placed on the market for qualified teachers in western Sicily and a number not greater in Messina (the other pole where a similar course was activated) to the east. Some of them, as students with a curriculum particularly strong, were then attracted to other jobs, so that the number of new teachers could after all be consistent with the real needs of professors of accounting and other business disciplines in the Sicilian School. However, the system crashed for the presence, in the provincial rankings, of hundreds of ‘old’ temporary workers, which, with scores obtained in private schools by the thickness more or less ‘doubt’, also threatened to override the excellent specialized SISIS teachers.

The scandal, however, took place with a state law that admitted other temporary workers to the teaching training, even those not qualified, but that taught for some years. This law, the n. 143 of 2004, made it possible, with a special only one-year course at SSIS, to be placed in the same roles in competition with the specialists.

The University of Palermo tried to deal with this political decision in the most correct way. The selections were as strict as possible, but could not prevent the placing, at one time, of about 80 not qualified people that would come out from these courses. These teachers, already been placed in service for many years in school, could add the score of the SISIS to that one resulting from their school experience.

However, the above university tried to subject them to a training process that, although more accelerated compared to the ordinary SISIS, could be as close as possible to it. Being full time workers, courses were held on Friday afternoon and on Saturday morning and afternoon, with serious damage to the quality of the courses themselves.

In 2005/06 thanks to that special law, only the course for the support of disabled people was activated (one pilot course of just 5 subscribers) and the following year the course was activated for all, with about 80 students, as mentioned above.

The basic curriculum, as seen above, was based on a particularly challenging teaching of history and epistemology, as well as on a set of particularly challenging laboratories. Here the lack of the laboratory could be supplied with experience, but how to substitute the course of 45 hours, not feasible for students/teachers now relatively elderly?

There was a didactic experiment relatively important. In the first year (2005/06) a course in International Accounting, 45 hours, was activated with the aim to make these senior teachers familiar with the matter of the IAS / IFRS, at the time completely extraneous to their education. In the second year (2006/07) a course on “Doctrines and comparative accounting systems” was activated (40 hours), which was the version a bit less critical and philosophical and a little more practical than the normal course for SISIS students.

Even with these limitations and deviations, SISIS was representing a story of relative excellence. To give an idea of the contents offered in the most important lessons we propose the essential tracks of its programs in the Appendix to this paper.

This experiment finally met and clashed with the ‘great crisis’ began in 2008 and with the political upheavals that Italy has experienced until now.

By decree of the competent Ministry, the Berlusconi government ‘froze’ in 2009 the activity of SSIS, essentially decreeing their end. They would no longer be reopened. The academic year 2008/09 was carried out on a regular basis, while the next (2009/10) saw only the conduct of the second year for the courses started in the previous year (ninth round) and annual courses for support. Then, the activity of SSIS, and thus also of the Sicilian SISIS, was interrupted, and with it any input into the role of secondary school teaching qualification.

### **3. The Experience of TFA (since 2012)**

The ‘freezing’ of the special schools for the teachers’ training was a result of a real smear campaign through the press by means of which certain dysfunctions of the same or certain excesses were brought to the public as a symbol of a widespread malfeasance. The same items, however, who had complained about the limitations, real or imagined, of SSIS, rose up immediately after against the interruption of the experiment.

In fact, once both special schools and competitions stopped, the Italian school was subjected for several years only to an indiscriminate cutting of funds and chairs. The very few tenures, in fact, inevitably occurred by drawing on the lists of qualified, in which – as we said - there were so much of the few specialized SSIS as the historical precarious, getting older and older. The system was set to become paradoxical. Those who had graduated after 2008 never had any channel to enter teaching world. But even after 2003 graduates who were not able to fit into the SSIS were out. Who was in then? In large part elder graduates who had qualified in the old open competitions (the last in 2000, but in some areas - like ours - even in 1990), or with the aforesaid special law of 2004, and who had never been firmly confirmed. A school that led into very few new teachers, never younger than 40/45 years. A situation, therefore, long-term unsustainable.

Facing all the protests from the world of school as early as 2010, the Ministry intervened with a decree (n. 249) and set new rules for the access to the school. From now on, instead of the old schools of specialization, the 2-year degree courses shall be activated, to address teaching, followed by a year of internship, known as the “active training” [tirocinio formativo attivo, from which the acronym TFA].

For better understanding this, we have to recall that the reform of the Italian university, since 1999, has adopted the “Credits”, and has organized, in general, their university courses in two levels: the first of three years, the second of two years. To date, the three years course is titled “Laurea”, that of the following two years is named “Laurea magistrale”. The idea was to make the three-year graduates (22 years old) directly access to attend

*lauree magistrali* specifically oriented to “high school teaching”, for accelerating their training and rejuvenate the faculty.

To this good intentions, however, actions have not followed. Meanwhile, compared to the previous decree, more than a year passed without any regulatory intervention. When this interjected, with a further decree (November 8<sup>th</sup>, 2011), it set up ‘on paper’ these degree courses, without giving any public resource for their activation. In fact, since then, these degree courses did not arise almost anywhere in Italy.

To face the fact that in the meantime all those who had enrolled at the university had not had the opportunity to enroll in these degree courses, an ‘interim standard’ was then arranged, which, since then, unfortunately, it seems to have become final.

As with the new system, where who aspired to become teachers should have done a course of 2 years of postgraduate degree, plus one year of internship in schools, it was decided to establish a ‘temporary’ internship, of one year, in which, however, instead a real apprenticeship, the student/teacher could make some accelerated studies that, in short, could retrace the content of SSIS, or of the degree courses yet to be established.

In this way, the universities have inherited the legacy of the SSIS and, somehow, they reactivated the ad hoc training courses for future teachers.

Compared to the past experience, there is also to say, this represents a real ‘accelerated’ course, which is more reminiscent of the experience of the Law 143 of 2004 than that of the actual SSIS. The accelerated course, however, despite its lower accuracy, could ensure that the training and placing of workers is faster than the old two-year cycle. Another handicap of the new standard is that the explicit content of lectures on historical and epistemological discipline is no longer present. The rule, in fact, merely provides didactics lessons and educational workshops. Many universities, however, did not intend to lose this heritage of ‘critical thinking’ and have maintained it even in TFA.

The TFA ‘machine’ was thus set slowly in motion at the end of 2011, but only in 2012 it was possible to banish the competition for accessing the new courses, and these are actually fired only at the beginning of 2013, ending mandatory in July of the same year, with an incredible concentration of commitments for those admitted to the courses.

In this framework, the University of Palermo has reactivated some of the courses. The local Department of Economics has reopened the specialization courses in “Law and Economics” and in “Business Disciplines”. But another one was meanwhile added: “Applied Mathematics” (financial mathematics, actuarial mathematics, operational research, calculation of probabilities, elements of statistics, business statistics, and other similar topics).

The qualification course for “Business Disciplines” provides:

18 CFU of Education Science, 6 of which are dedicated to individuals teaching with special needs, and the other 12 in the following areas: General and Social Pedagogy, Experimental Pedagogy, History of Pedagogy; 18 CFU of “disciplinary didactics and educational laboratories” in the specific field of business disciplines, as specified below; 19 credits, equal to 475 hours of training, direct or indirect, 3 credits of which (75 hours) dedicated to students with disabilities; 5 credits for a final thesis about training.

The specific 18 CFU, 8 hours per CFU, were divided among the following courses:

- History of Business Economics Disciplines (6 credits) [*Storia delle Discipline Economico-Aziendali*];
- Elements of epistemology of business economics disciplines [*Elementi di epistemologia delle discipline economico-aziendali*];
- History of Accounting: from its origins to the birth of the *Economia aziendale* [*Storia della Ragioneria: dalle origini alla nascita dell’Economia aziendale*];
- The Italian “doctrinal issue” in Accounting and *Economia aziendale* [*La “Questione dottrinale” italiana in Ragioneria ed Economia aziendale*];
- “Accounting issue” in Italian Accounting [*La “Questione contabile” italiana in Ragioneria*];

- From national and comparative disciplines toward an International Accounting [Dalle discipline nazionali e comparate verso una Ragioneria internazionale];
- The other histories of business disciplines (outline): Management and Organization [Le altre storie di discipline aziendali (cenni): Gestione e Organizzazione]
- Didactic Laboratory of Business organization (3 credits) [*Laboratorio didattico di organizzazione aziendale* (3 CFU)]
  - Calls on the systematic fields of disciplines and main characteristics of the relative didactics
  - Workshop activities in terms of:
    - o organizational theories
    - o organizational structures
    - o organizational processes and characteristics of production systems
    - o Human Resource Management
    - o Business Information Systems
- Didactic Laboratory of Accounting (3 credits):
- Calls on the systematic fields of disciplines and main characteristics of the relative didactics
  - Workshop activities in terms of:
    - o Principles of Business Economics
    - o Elements of the General Accounting and Bookkeeping
    - o Accounting systems, accounting and financial statements for firms, public bodies and non-profit organizations
    - o Planning and control, financial statement analysis
    - o Elements of social and environmental reporting
- Didactic Laboratory of Business Management (3 credits):
  - Calls on the systematic fields of disciplines and main characteristics of the relative didactics
  - Workshop activities in terms of:
    - o Strategic management of industrial and commercial enterprises, analysis of Marketplace
    - o Marketing and Web Marketing
    - o Types of commercial distribution and brokerage in trade
    - o Management aspects typical of industrial, commercial and tourist enterprises
    - o Corporate Communications
- Didactic Laboratory in Corporate Finance and Financial Intermediaries (3 credits):
  - Calls on the systematic fields of disciplines and main characteristics of the relative didactics
  - Workshop activities in terms of:
    - o The financial system, regulation and supervision
    - o Financial intermediaries and typical management aspects
    - o The main banking and insurance operations
    - o The main financial instruments

Not even the start of these courses, however, finally gave certainty to the sector. The State, in fact, to meet the need facing the numerous retirements, related to teachers' age, has launched new competitions for school, again in 2012, without even waiting for the first TFA specialized teachers (expected in 2013).

This competition, formally to be opened every two years, was presented to the public as a tool to "rejuvenate" the Italian school. Actually it is a further paradox. It is open to TFA graduates (which do not yet exist, for obvious reasons). But, to avoid discrimination, it is also open to those who are collocated in the list of tenure, perhaps for having attended the old courses SSIS. Since the latter were activated, as mentioned, around 2000, it took also be without prejudice to all graduates, including non-qualified, with a degree obtained until 2003, because these

elderly graduates could never attend specialized schools that at the times were still not created. The result was that in these competitions a large mass of people born in the 60s and 70s participated, without any specialization, perhaps after decades of semi-clandestine work in private schools of low profile, while the young teachers, released from SSIS to a limited number, are very few. The very young, finally, in the best case just in the course of frequency of TFA, were cut out from this competition.

To avoid 'new' precarious people, however, this competition, unlike the old ones, 'is not' enabling. Aside from the winners, the others will no longer have any rights. The number of enabled is now closed and accessible only by means of the new TFA. It is true that the old graduates are always running, but the hope is that these, sooner or later, for personal reasons will come out of the scene forever.

Just to give an idea of the numerical success of this competition, we have to think that in Palermo (in Sicily) for the Business Disciplines around 3,000 competitors to only 26 places up for grabs. Under the old rules, which are open to all graduates, the competitors were approximately 15,000, of which several hundred were then resulted in possession of qualification.

In a recent and marked by emergency context, it is difficult to give a first critical assessment of this new experience. But it seems that the University of Palermo is doing today a considerable effort to maintain a channel for the training of future teachers of Accounting, and over time has formed a team of professors and scholars who could give contributions of a certain value. And yet it seems that the inattention of the national legislature, as well as the governments that have followed, represent the true risk to make to derail these efforts, however brave they are.

#### 4. Conclusions

The present study shows evidence of a training program for teachers of accounting and other business disciplines in secondary schools. The experience concerns particularly the University of Palermo, inside a frame of rules that are common to the other Italian universities. The evidence showed an interesting experimental curriculum, even in the presence of a strong carelessness on the part of public authorities that are likely to frustrate every effort to build an excellent school.

The key lesson to be drawn from this experience is the ability to create a program aimed for future teachers of Accounting, in particular with an extensive use of non-conventional learning. These can be identified mainly in the following two: workshops and critical thinking. This has favoured the history and philosophy of accounting, themes investigated particularly in the Italian teaching. Some importance, perhaps worthy of greater stress, has also been given to the attempt to internationalize the curricula of the future teachers, as long conceived by the best international literature (Adams, and Roberts, 1994) (Adhikar *et al.*, 1999).

The main implication, for both studies and for practice of accounting education, is the possibility of a fruitful encounter between the studies in the field of business education and the general pedagogical and didactic studies. The student of accounting education should perhaps be a little scholar of education in the general sense. Another possibility demonstrated from this experience is that the critical attitude can also be taught by means of a good alternation between theory and practice. Obviously, however, to complete this type of research an empirical investigation would be needed (Wolcott *et al.*, 2002), which, in our case, should verify the results on teachers out of this type of schools, both in terms of success in finding employment and in terms of quality of their teaching.

Within the limits of this research, however, we draw some insights that may be susceptible to broader generalization. Among these it is at least worth remembering the importance of structuring a training program in the four domains, respectively, of history and epistemology, didactics, educational laboratories and internships in the schools themselves.

Another option identified by this research, finally, is the chance to explore a new field for studies in accounting education: research on 'second level' teaching, that is, the education for educators. This type of

research would have a dignity, scientific and practical, certainly not lesser than that one ordinarily pursued, even if we are fully aware that the present study marks only a first modest step along this promising direction.

## Abstract

Motivation, the powerful force behind our behavior, takes place in various areas of one's life. As globalization has a great impact on the world, individuals not only compete with their peers but also contend with the universe in terms of self-actualization. In psychological terms, self-actualization is a prevalent need for everybody, enabled by the success in different majors. To understand this mechanism, motivation should be considered as an inner force of accomplishments. In this article, achievement and motivation were evaluated thoroughly based on the constructive approaches such as Sternberg's Triarchic Intelligence Theory, Dweck's Implicit Theory of Intelligence, and Achievement Goal Conceptualization. The notion of achievement in educational areas was appreciated with respect to competent-relevant, self-related, relational, demographic, environmental variables and neuropsychological tendencies. They were regarded as the effects on the achievement goal orientations, leading to the processes and consequences of the success. As a result of the analysis in the study, it was observed that in one's academic motivation, mastery-approach, mastery-avoidance, performance-approach and performance-avoidance inclinations provide a meta-analytic insight for him. The suggestions pertinent to these concepts were proposed precisely to the ones dealing with the challenges in this area.

Keywords: Motivation, academic achievement, constructive approach.

---

## 1. INTRODUCTION

Motivation, the powerful force behind our behavior, takes place in every field of our lives. Especially, academic motivation, pertinent to the success in the world of knowledge, is critical in various areas such as education, business, human resources, sports and so on (Elliot and Fryer, 2008). Competitive atmosphere of the business environment not only makes the employers seek this quality but also regulates it among the employees. When we look at the unit of the human resources, it is taken into account the fact that the projects aimed at leading the career progress in the organization causes the academic motivation of the individual to become pivotal. Besides this, in the educational settings, in order to do an effective counseling for the students, who face the struggles at the time of the transitional periods of their development, and who encounter challenges relevant to the process of goal attainment – in particular, the significant achievement necessary for the entrance into the high school, the university and so on, the academic motivation is revealed as an important concept. Therefore, the psychologists and psychological counselors must have a general understanding of this term and its underlying mechanisms contributing to the success of the person.

The purpose of this article was to demonstrate the general picture of achievement motivation based on the different theoretical approaches such as social-cognitive approach, hierarchical model of achievement motivation, Sternberg's Triarchical Intelligence Model and so on. Starting with the definition of achievement motivation, the theoretical models were analyzed in terms of facts, concepts, procedures and strategies in the study. The result of the analysis was demonstrated in a detailed way.

Academic motivation can be depicted as the total of the skills, achievements and effectiveness shown by the individual under the circumstances he is exposed to. According to Elliot (1999), the one forms this concept through directing every thought, behavior, emotion and attribute based on his competences. In other words, it is the usage of one's own perception relevant to his competences in the guidance of his thoughts and behaviors. For Elliot and Dweck (2005), the person needs them so as to adapt the environmental conditions he is part of. Butler (2000) states that the individuals utilize these environments to get an idea about themselves. It means that they try to shape their self-knowledge depending on the degree of their competences evaluated in reference to themselves or the other criteria. In this respect, he focuses on two aspects of information-seeking behavior of the person: namely, "competence acquisition" and "competence assessment". Competence acquisition pays attention to the enhancement of competences and leads the one to search for individual growth. On the other hand, competence assessment involves the process of the social comparison and causes the one to consider the feedback information as an evaluating tool for himself or as a mentoring tool for his improvement. In addition to contemplating both the competence assessment and competence acquisition as spontaneous activities the individual does, they represent the guiding principles for institutional purposes of the agents and personal growth. Yet, he claims that the underlying system behind competence acquisition and assessment resides in the achievement goals embraced by the individual.

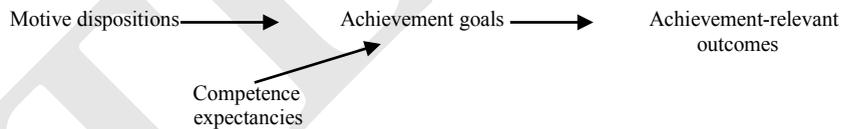

To comprehend the concept of the achievement goal of the person, we need to take into account the achievement goal theory profoundly. This theory reflects a social-cognitive approach trying to understand the goals and the processes followed by the individual in his academic world (Midgley, Kaplan, Middleton, Maehr, Urdan, Anderman, L., Anderman, E. and Roeser, 1998). Specifically, the focal point of the theory is to get the picture of the assessment tool utilized for appreciating one's competences in an endeavor (Meece, Anderman, E. and Anderman, L., 2006). The norms are created by the one who would like to evaluate the degree of the competent-relevant effectiveness in the pathway of achievements. Therefore, in educational circumstances, the goals of the student and the reasons behind his behaviors displayed in various learning activities become an essential research area for the ones who investigate the latent mechanisms of academic motivation (Urdan and Maehr, 1995).

According to Ames (1992), achievement goals are the factors having a fundamental impact on the formation of a successful behavior. For Elliot and Trash (2001), such goals are cognitive systems managing the activities of the person. From their point of view, they represent both the purposes and the inceptions of the conducts. In the "hierarchical model of achievement motivation" proposed by Elliot and Church (1997), they make a distinction between the "goals" and "motives" pertinent to accomplishments. As a result of this, "achievement motives" are regarded as the structures regulating one's success as well as failure. Yet, they play a critical role on endorsing the achievement goals. Thus, as shown in Figure 1, the model presents the variables configuring the achievement goals (Elliot, 1999, p.177).

**Fig. 1. Achievement goals in the context of the hierarchical model of achievement motivation (Elliot, 1999, p.177).**

Moreover, in the hierarchical model of achievement motivation, “..... motive dispositions (achievement motivation and fear of failure) represent higher order motivational constructs, achievement goals (performance-approach, performance-avoidance, and mastery) represent midlevel "motivational surrogates," and task-specific competence expectancies are conceptualized as an independent antecedent of achievement goal adoption.....”(Elliot and Church, 1997, p.219). This relationship was indicated in Figure 2.

**Fig. 2. A hierarchical model of approach and avoidance achievement motivation (Elliot ve Church, 1997, s. 220).**

In sum, the individual sets the standards for his own performances in his academic or business areas, which reflect his achievement goals (Pintrich, 2000). They express his belief in his skills, competencies or abilities. But what are the dimensions of these goals? Which kind of goal leads the one to success, which one contributes to failure? In order to answer these questions, the conceptual features of achievement goals are to be handled thoroughly.

In the achievement goal theory, the keyword – competence - determines the types of achievement goals. The notion of achievement becomes individualized and differentiated depending on his subjective perception of his competent-relevant skills. Based on how competence is defined, there are three kinds of competence: absolute, intrapersonal and interpersonal competence. Absolute competence represents one’s comprehension of the

problem accurately. Intrapersonal competence encompasses the aim of increasing the level of knowledge and abilities. On the other hand, in normative competence, the individual makes great effort to display himself as superior than others. In this respect, performance becomes more essential than the learning activity itself. For normative competence, social comparison takes part in the process of one's attainments. Furthermore, the concept of competence can be divided into two dimensions in accordance with how it is appreciated: approach and avoidance. When the achievement goal emphasizes on the way of obtaining favorable outcomes, it expresses an approach tendency. However, when it pays attention to the means of shunning aversive outcomes, it reflects an avoidance predisposition (Elliot and Thrash, 2001; Elliot, 2005).

In accordance with the interpersonal and intrapersonal feedback from the environment, the individual determines his achievement goal orientation and regulates his behaviors. As it was displayed above, in the hierarchical model, the social, cognitional and emotional variables shape one's manipulation of his academic motivation. It can be interpreted as the formation of self-management.

Depending on the delineations of competence, there are two types of achievement goals: "mastery" and "performance". Mastery goal motivates the one to acquire lots of information from learning activities, which in turn leads to the enhancement of skills, knowledge and abilities. Success is measured with respect to the degree of self-improvement. In spite of facing the struggles, feeling joy in the learning process is prevalent in mastery goal. Yet, performance goal instigates the person to display himself as better than others. He longs for being more successful and excellent than anyone else. Thus, the accomplishment is assessed on the basis of social comparison (Ames, 1992; Meece, Anderman, E. and Anderman, L., 2006; Molden and Dweck, 2000).

Based on the discourse mentioned above, the process of mastery goals and performance goals seems to work in apart. Yet, the individual compares himself with the others in his academic environment and turns to himself so as to determine whether he is close to his achievement goal or not. Performance goal is the information-provider of the mastery goal. Deriving from this understanding, should these two goals be considered as separate procedures of goal orientation? Does mastery goal involve only the intrapersonal process? Does performance goal encompass only interpersonal process?

For Elliot and Thrash (2001), mastery goal involves the drive for self-growth. It portrays the advancement in competence. Therefore, it utilizes task-oriented criteria for appraising competent-relevant behaviors. On the other hand, performance goal includes the intention for self-embodiment. It underlines the aim of manifesting competence in the eyes of others. This idea leads to examination of competencies through normative criteria. In this regard, absolute and intrapersonal competence can be part of mastery goal, while normative competence can be seen as an aspect of performance goal.

Dweck and Leggett (1988) state the fact that the individuals embracing different goals cannot demonstrate similar attributes towards the predicaments. The ones adopting performance goals withdraw themselves when they encounter dilemmas and failures. But the ones pursuing mastery goals do not give up and avoid from the bad situation. Instead, they insist on completing their lacking sides and seeing the challenge as an opportunity for self-development. Thus, mastery goals contain competence acquisition, just as performance goals entail competence assessment (Butler, 2000).

According to Darnon, Butera and Harackiewicz (2007), the previous researches cannot make a definite distinction between mastery and performance goals. For them, the reason lies in the fact that the social environment in which the individual pursues these goals is not taken into account effectively. Especially, the reciprocal interaction with the other ones in the context leads to different outcomes with respect to one's learning progress. Doise and Mugny (1984) claims that "the socio-cognitive conflict" the person is exposed to makes him contemplate about his thinking pathway. This conflict encompasses both the disharmony with others and the loss

of faith in his problem-solving methods. Therefore, how he deals with such a struggle determines his choice of achievement goal. If he wants to learn the subject in hand, he will adopt the mastery goal. Yet, if he wants to display his competencies, he will embrace the performance goal.

In addition to this, Darnon, Butera and Harackiewicz (2007) assumes that the type of the subjects the one copes with also differentiates the kinds of goals. When he deals with a facile task, mastery and performance goals result in similar consequences. However, if the task is uneasy, mastery goals cause him to get a benefit from the situation unlike performance goals. Thus, the degree of ambiguity in the task plays a pivotal role on one's goal orientation. The vagueness brings into the socio-cognitive conflict, which in turn leads to the re-evaluation of the knowledge and skills.

Therefore, in educational counseling, the counselors should be aware of the mastery and performance goals of the students and the educational context they are part of. In this context, the kind of lessons, teachers' methods of teaching and teachers' understanding of success have a great influence on whether the students follow mastery or performance goals. At this point, the counselors should make the students create awareness of where their destination of success is via mastery or performance goals.

When dealing with the concepts of competence and achievement goal orientations, the place of intelligence should be considered profoundly. How is intelligence related to these notions? What makes intelligence unique when it is compared with competence and goal inclinations? To answer those questions, Sternberg's Triarchic Theory of Intelligence is to be analyzed thoroughly.

For Sternberg (2011), intelligence has three components, namely "Analytical", "Practical" and "Creative Thinking" abilities. Analytical process allows the one to criticize and figure out the content in hand. Especially, such a kind of thinking is used in the solution of well-known obstacles. Practical procedure in thinking facilitates the application of opinions in accurate settings. This skill is crucial for the adaptation to new conditions. Yet, creative operation in mind permits the formation of original ideas, contributing to dissolving atypical challenges. In this sense, it highlights the significance of experience in thinking world. Based on this theoretical schema, Sternberg (2011) proposed the concept of successful intelligence. It depicts the fact that the person tries to take advantage of his capacities so as to obtain an achievement. According to Sternberg, the individual identifies his powerful and fragile sides concurrently, and makes great effort to recompense them. Thus, everyone devotes themselves to discover their original way of being intelligent.

In addition to Sternberg's approach, there is another theory addressing the concept of achievement motivation from a different point of view. Especially, Dweck's theory of intelligence clearly explains how the achievement goals are formed by the one who takes part in the academic pathway. According to Dweck (1986), no individual has a similar understanding about intelligence. Some of them consider intelligence as an unchangeable identity no matter what they are exposed to throughout their lives. On the other hand, some of them regard intelligence as a pliable feature. They think that the challenges they encounter cause them to modify their skills as well as their knowledge. In this respect, the first group reflects *entity theory of intelligence*. Yet, the second group indicates the *incremental theory of intelligence*. For Dweck (1986), the underlying mechanism behind the choice of achievement goals resides in the preference of intelligence theory. Thus, for the ones embracing the entity theory, the performance goal becomes pivotal. However, for the ones adopting the incremental theory, the mastery goal / learning goal appears as an important purpose in the attainment of success. Dweck's theory of intelligence and its relation with achievement goals were displayed in Table 1.

Table 1. Achievement Goals and Achievement Behavior (Dweck, 1986, p.1041).

Theory of intelligence	Goal orientation	Confidence in present ability	Behavior pattern
Entity theory (Intelligence is fixed)	Performance goal (Goal is to gain positive judgments/ avoid negative judgments of competence)	If high but If low	Mastery oriented Seek challenge, high persistence Helpless Avoid challenge, low persistence
Incremental theory (Intelligence is malleable)	Learning goal (Goal is to increase competence)	If high or low	Mastery oriented Seek challenge (that fosters learning) High persistence

While Dweck regards a direct one-way relationship between intelligence and achievement, Mayer (2011) interprets these concepts as mutual qualities affecting each other. “Academic intelligence” allows the one to gain “academic achievement” and vice versa. Consequently, the academic intelligence can be assessed via the tests relevant to academic achievement just as the academic accomplishment can be examined through the inventories pertinent to academic intelligence. The link was indicated in Figure 3.

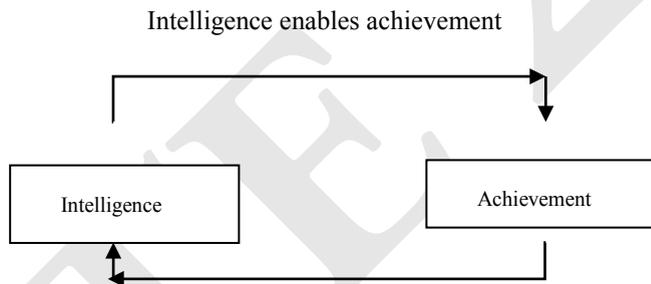

Fig 3. The reciprocal relation between intelligence and achievement (Mayer, 2011, p.740)

In accordance with that formulation, Elliot (1999) and Pintrich (2000) proposed 2X2 Achievement Goal Conceptualization. Despite presenting the same ideas relevant to achievement motivation at different times, both of them emphasized the akin point on this issue. In the model, there are four types of achievement goals: “mastery approach, mastery-avoidance, performance approach and performance avoidance”. “Mastery approach” and “mastery avoidance” concepts emerge as novel structures in the literature. “Mastery approach concept” refers to the idea that the individual has the aim of improving his knowledge, skills and abilities. Yet, “mastery avoidance concept” reflects that the person is afraid of losing these skills and forgetting them. He worries about misunderstanding the materials or tasks given to him. Therefore, the one adopting such a goal organizes his life in accordance with this. He tries not to make any mistakes or miscomprehend the subjects he deals with (Elliot, 2005; Linnenbrink and Pintrich, 2002). The four types of achievement goals best summarized in 2X2 Model by Pintrich (2000) was shown in Table 2.

Table 2. Two Goals Orientations and Their Approach and Avoidance States (Pintrich, 2000, p.100)

Name	Approach state	Avoidance state
Mastery orientation	Focus on mastering task, learning, understanding	Focus on avoiding misunderstanding, avoiding not learning or not mastering task
	Use of standards of self-improvement, progress, deep understanding of task	Use of standards of not being wrong, not doing it incorrectly relative to task
Performance orientation	Focus on being superior, besting others, being the smartest, best at task in comparison to others	Focus on avoiding inferiority, not looking stupid or dumb in comparison to others
	Use of normative standards such as getting best or highest grades, being top or best performer in class	Use of normative standards of not getting the worst grades, being lowest performer in class

Barron and Harackiewicz (2000, 2001) claim that both the mastery and performance-approach goals play an essential role on the progress in one's education. However they differ in terms of the evaluation process the individual engages in his improvement. If he embraces the mastery goals, he will make himself a reference point. Yet, if he prefers the performance-approach goals, the other ones in his environment will become his referee. Besides this, these two goals predict distinctive educational outcomes for the person. For example, the student with high level of mastery goal and low level of performance approach goal is the best one in the educational setting. On the other hand, the student with high level of both mastery and performance-approach goal gets stressed in every examination and behaves like a perfectionist. He cannot demonstrate his abilities efficiently due to the pressure of performance-approach goal (cited in Harackiewicz, Barron, Pintrich, Elliot and Trash, 2002).

In conclusion, the diverse approaches in the literature of achievement motivation lead us to form a qualitative analysis table based on the facts, concepts, procedures and strategies. As it is indicated in Table 3, the models suggested by Butler (2000), Elliot and Church (1997), Dweck and Leggett (1988), Dweck (1986), Mayer (2011), Pintrich (2000) give us a comprehensive look at the concept of achievement motivation.

Table 3. The Qualitative Analysis Table Based On The Theories of Academic Motivation Mentioned In The Article

Comparison units	Butler	Elliot and Church	Dweck and Leggett	Dweck	Mayer	Pintrich
<b>Facts</b>	Competence acquisition = longing for self-improvement  Competence assessment = longing for being the best among others	Achievement motives have a direct effect on the formation of achievement goals unlike competence expectancies.	Mastery goals contain competence acquisition, just as performance goals entail competence assessment.	Entity theory of intelligence regards that intelligence is a fixed identity unlike incremental theory of intelligence.	Academic intelligence and achievement have a reciprocal relationship, which in turn leads to mutual influences among them.	Mastery-approach = Focusing on mastering task  Mastery-avoidance = Focusing on avoiding misunderstanding,  Performance-approach = Focusing on being superior  Performance-avoidance = Focusing on avoiding inferiority
<b>Concepts</b>	Competence acquisition  Competence assessment	Achievement motives  Achievement goals	Performance goals $\leftrightarrow$ competence assessment  Mastery goals $\leftrightarrow$ competence acquisition	Entity theory of intelligence $\leftrightarrow$ performance goals  Incremental theory of intelligence $\leftrightarrow$ mastery goals	Academic intelligence  Academic achievement	Mastery-approach Mastery-avoidance  Performance-approach Performance-avoidance
<b>Procedures</b>	Shaping the self-knowledge depending on the degree of the competences evaluated in reference to oneself or the other criteria -environment	Bringing about achievement goals through being influenced by different variables (competence-based, relationally-based and so on)	Forming the strategies in the face of difficulties, which is constructed by the type of achievement goals (performance vs. mastery)	Building the goal orientations via the preference of entity vs. incremental theory of intelligence	Organizing the goal orientations depending on the level of intelligence, and achievement	Arranging the goal orientations in accordance with the approach-avoidance concepts

Strategies	The individual with the idea of competence acquisition longs for self-improvement. Yet, the one with the opinion of competence assessment consistently compares himself with others and based on this, he organizes his self-growth.	Competence-based and self-based variables are relevant to the formation of mastery goals while relationally-based, environmental and demographic variables are pertinent to the construction of performance goals. Neurophysiological variables have direct effect on the goal orientation (mastery vs. performance)	The ones adopting performance goals withdraw themselves when they encounter dilemmas and failures. But the ones pursuing mastery goals do not give up and avoid from the bad situation. Instead, they insist on completing their lacking sides and seeing the challenge as an opportunity for self-development.	For the ones embracing the entity theory, the performance goal becomes pivotal. However, for the ones adopting the incremental theory, the mastery goal / learning goal appears as an important purpose in the attainment of success.	If the level of intelligence is quite well for the individual, he will compare himself with others based on his achievements. Yet, if the level of intelligence is not efficient for him, he will prefer developing his skills, which in turn enhancing the level of achievement	The individuals with mastery-approach goals search for self-enhancement. The ones with mastery-avoidance goals try to keep his current level of knowledge, avoid losing it. The ones with performance-approach goals long for the best positions in every setting. The ones with performance-avoidance goals devote their efforts not to be claimed as being the worst by the others.
------------	--	--	---	---	--	---

Consequently, in the literature, the components of academic motivation are stated in a different way, depending on the different theoretical approaches. In addition to academic goals and academic motives, the social, cognitive, emotional, relational and neurophysiological factors in the goal orientation shape one's tendency toward the success attainments. Furthermore, competence acquisition and competence assessment have a direct influence on this issue. How one evaluates and regards the competence concept determines one's academic goal. Besides this, Sternberg's Theory of Intelligence and Dweck's Theory of Intelligence claim that the individuals have diverse understandings about intelligence, which leads to the establishment of either mastery or performance goals. Moreover, 2X2 Achievement Goal Conceptualization presents four types of goals (mastery-approach, mastery-avoidance, performance-approach, performance-avoidance) and explains them in a detailed way so as to indicate how achievement motivation can be configured by one's approach-avoidance predisposition.

The models mentioned in the study can be regarded as the ones emphasizing the person's evaluations of his achievements both in the cognitive, emotional, neurophysiological level, which display his internal assessments, and in the social level, which indicate the external factors. Thus, one's management of academic motivation is a two-way street; the feedbacks from inside and outside concurrently direct his choice of occupation, his job status, as well as his academic career. Such a kind of self-regulation requires a socio-cognitive capacity.

However, these models are inadequate in terms of paying attention to one's social goals. As Urdan and Maehr (1995) claim that, the individual possesses "social welfare goals", which shape his academic orientation. These goals include being productive member of the society, living for the family, making the family proud of him, getting praise, and so on. Although 2 X 2 Achievement Goal Model provides lots of information about the process of learning and academic motivation, it cannot bring about the role of social issues residing in the culture. In this respect, besides cognitive studies, the researches focusing on social as well as spiritual factors in the interpersonal relationships should be carried out in order to give a comprehensive way of looking at the academic motivation.

4<sup>th</sup> International Conference on New Horizons In Education

## Activating resources and its use in e-learning

Jiří Dostál<sup>a\*</sup>, Milan Klement<sup>b</sup>, Čestmír Serafín<sup>c</sup>*<sup>a, b, c</sup>Palacký University, Faculty of education, Olomouc, Czech Republic*

---

### Abstract

Education has been always linked with the human kind and it has been undergoing continual development and gradual innovative processes. E-learning became a phenomenon of the second half of 20<sup>th</sup> century and the beginning of 21<sup>st</sup> century; it comprises variety of individual elements which are usually complexly interwoven, creating a comprehensive system and allowing for an effective development of one's personality, mainly – but not exclusively – of its cognitive part. This kind of development should be resulting from active learning when a student dedicates himself/herself to an intensive studying activity arising ideally from his/her own interest, without any apparent pressure or more or less without someone else's help. The activity, however, must be specifically aimed, controlled, guided and provided with feedback. In order for students to be able to learn actively, it is essential to create appropriate situations, involving the activating resources. Modern education technologies represent such resources, which is reflected in this theoretical study focused on activation of a student.

From a technological point of view, the resources can involve extensive full-distance education systems with sophisticated tools securing cooperative learning, but on the other hand, the resources can involve simply support for real-time traditional classes. Nevertheless, e-learning can only be an adequate alternative or part of the traditional education, if it is built upon deep and comprehensive pedagogical analysis of the educational process and all its elements, processes and relations.

Keywords: activation, student, e-learning.

## 1. E-LEARNING TECHNOLOGIES AS A SOURCE OF ACTIVATION POTENTIAL

Modern educational technologies offer a variety of possibilities for more effective learning, if *effective activation of students* is provided; this applies to face-to-face education, as well as distance education, which is specific in many respects. By virtue of the e-learning technologies, everyone can become a distance student. A healthy person or a handicapped one, if he/she is able to study independently on a required level and has his/her own responsibility for the educational process and his/her own goal to achieve. This matter is narrowly related to desired fair opportunities in education.

According to Svatoš (2009), new educational technologies represent progress in development of didactic means supporting educational aims. Their general features are:

- integrity (interconnectedness of individual means);
- multimediality (different pieces of information from one source);
- interactivity (user's active participation in the process of teaching-learning);
- an increased importance between so called hardware and software;
- more independent educational roles (more independency for a student);
- creating of relatively new concepts of education (distance education, e-learning, blended learning, individualized education) based on controlling user's learning activities and his/her self-education.

Due to its high educational potential, e-learning has become a promisingly developing area of pedagogical theory and practise that keeps on being continually, systematically and intensively worked on, both on national and international level. Some of the most important works are: S. B. Eom & J. B. Arbaugh (2011), R. C. Clark & R. E. Mayer (2011), Y. J. Joo, K. Y. Lim & E. K. Kim (2011), A. Mauthe & P. Thomas (2004), J. Anderson & R. McCormick (2005), S. Bennett, K. Maton & L. Kervin (2008), S. Kluge & L. Riley (2008), R. Möhlenbrock (1982), M. F. Paulsen, (2003), D. S. Smith & J. B. Caruso (2010), D. Tapscott, (1998), A. Bates & G. Poole (2003), R. Ramanau, A. Hosein & Ch. Jones (2010), A. Barešová (2003), L. Eger (2002).

There is no doubt that one of the *important aspects of e-learning is the activation of a student*. Other important aspects are interactivity and multimediality. Possibilities of activating students, i.e. individual learners, vary; they cannot be associated only with study fields involving particular educational content. Communication between a teacher and a student, educational activities and educational environment can also contribute to activation. The primary aim of activation is to change passive students into "immediate participants in education" (Kotrba, Lacina, 2007). However, the activation is also related to teachers. Student activity means increased, intensive work, on one hand based on inner motives, spontaneous interests, emotional incentives and life needs, and on the other hand on conscious effort (Maňák, 1998).

From the point of view of formative-educational process and achieving preset goals, the inner activity is important, because it emerges from person's own resources, interests, attitudes and beliefs. Such an activity can be difficult to initiate or direct towards a desired goal in some cases, yet teachers have plenty of possibilities for external activation. It is important to watch over an activity that is illusory, pretended and formal, and thus not effective.

Also passivity of students occurs within e-learning, which is the opposite of activity. Such a state is undesirable and it is necessary to eliminate it. This can be done with help of e-learning technologies which can be considered as one of the conditions of successful student activation.

## 2. POSSIBILITIES OF STUDENT ACTIVATION IN E-LEARNING

Appropriate student activation constitutes an important purpose of a teacher and didactic means, because if student attention is not caught, the acquiring process cannot be effective. All cognitive processes, either perceiving or thinking, are focused on a particular object. The basic attribute of attention is thus its focus on an object, which can be either material or mental (content of our mind), and our concentration on it (Linhart, 1987). Feelings, perceptions, remembering, thinking and imagination belong to mental processes with specific content; attention does not have any specific content, but represents itself within perception, thinking, remembering and other cognitive processes (Pardelt, Boroš, 1979). As soon as attention becomes part of the perception process, the person is not only hearing, but is listening and becoming absorbed, is not only looking, but is watching and contemplating. His/her perception changes into *active* dealing with perceived material and its acquisition for a certain purpose (Rubinštejn, 1964). All this constitutes important moments for creating successful learning process (e-learning).

If we narrow down the issue of attention only to the area of e-learning, it can be concluded that from a psychological point of view, it is justified and desired to make use of sophisticated education systems with a variety of resources. A question emerges why studying through e-learning with multimedial elements attracts student attention. It is known from psychology that every contrast between stimuli catches attention. Education using multimedial resources offers an alternative to students, something new in form of active participation. That is something truly essential for student development, avoiding mere perception of transmitted verbal commentary provided by a teacher. In case of e-learning, the attention of students is caught inadvertently, unintentionally, by the appealing nature of a matter itself and is subjected to immediate interest. This is extremely important for education, because – among other reasons – it is indisputable that intentional attention develops from unintentional attention.

Unintentional attention is not exclusively passive, but involves activity as well. It is unconditionally necessary for a teacher to be able to catch attention of students and to base e-learning on unintentional attention conditioned by immediate interest. Using the influence of multimedial resources for unintentional attention is only one of the options, although an important one. However, it is desirable to support development of intentional attention by using various didactic means. The activation is closely connected to motivation, which is a direct consequence of cognitive and affective-social factors. According to Badinská (2007), the use of information technologies makes the educational process motivating and dynamic.

## 3. MULTIMEDIALITY, INTERACTIVITY AND E-LEARNING

Communication has always been part of our lives and is transferred through various media. According to Sak et al. (Sak, Mareš, Nová et al., 2007), it is possible to differentiate between 4 stages of media existence in human civilization and the current stage can be characterized by using computers and the Internet, and by interconnecting individual media into multimedia through digitalization.

The development happening in the field of communication and communication media takes place also in education, which forms a fundamental part of human existence. Traditional verbal communication between an educator (teacher, trainer...) and a student (or students) has been complemented by other media and technologies, at first drawings, clay plates, papyrus and later by paper, blackboards, book printing, materials for back projectors, educational videos, didactic computer software, electronic educational presentations, educational web portal, e-learning system, e-beam, interactive boards, etc. Today's education can be globally characterized

by continual implementation of multimedial, hyper-textual and hyper-medial educational aids. According to for example Burgerová and Beisetzner (2008), interactive elements on different levels of interaction directly determine the quality of e-learning.

Everyone who participates in e-learning keeps in touch with e-learning tools, either as their user or as their creator. It is necessary to dedicate enough attention to an appropriate use of the e-learning tools in the educational process, because only the right methodological use allows to achieve educational goals more effectively. If a teacher has e-learning tools at his/her disposal, it does not necessarily mean that the tools will be beneficial for acquiring knowledge, skills and attitudes. On the contrary, if they are used inappropriately, they can be counterproductive.

With the beginnings of computer use and spreading of computer use in education, the term *multimedia learning aid* has been becoming more and more common. The multimedia learning aids are important for education, because they contain information expressed in a way that appeals to senses of students, which fulfils the requirement of illustrativeness. The use of multimedia appeals to several sensory receptors at the same time which brings better study results and subject matter is acquired in a more permanent and deeper way.

Generally, multimedia can be perceived as digital aids that integrate different document formats, namely data (e.g. text, tables, animations, figures, pictures, schemes, illustrations, charts, maps, sound, verbal commentary, videos, etc.).

Interactivity allows two-way communication (a student vs. multimedia learning aid) and a student has a possibility to actively engage in the course of a program via its user interface, and not only passively perceive content. Multimedia requires technology for operation (so that a user can interact with the system); usually, the technology includes a multimedia computer with specific peripheral devices.

Multimedia learning aids that are widely used are e.g. educational software, didactic computer games or multimedia educational presentations. If multimedia are used in education, it is referred to as so called *multimedia learning* (Mayer, 2001), but it is not restricted only to this case. For implementation of multimedia training, it is not important whether the learning process involves multimedia (in the form of integrated interactive learning aids) or individual aids in various formats (individual media) which allow to present information (text, images, video, sound...) influencing various human senses simultaneously.

According to the learning theory, the more intensively a student works with study material, the more effective the learning is. In case of printed text, it is possible to highlight and underline important passages, to write down excerpts in margins, put down reformulated thoughts, and moreover, to return to this kind of personalized material at any point later on. Electronic books do not have this possibility (yet). If we took a traditional printed book and transferred it into an electronic form (e.g. pdf format) with all its features, preserving linearity, continuity and finality of the text, it would not offer effective learning options; it is not possible to work with it in any other way than to scroll up and down on a screen. Experience shows that many students prefer to print the content of an electronic book (and even to bind it) and study in the traditional way.

The attractiveness of electronic text for a student can be increased by transforming it into a hypertext form, making the text interactive. In case of transformation of plain text, it is called *hypertext learning aids*, and in case of transformation of text with images, tables and charts, possibly with animations, videos and sounds, it is called *hypermedia learning aids*.

The characteristics of hypertext follow from its virtual nature; in comparison with printed text stored in the form of physical characters on a physical surface, it is stored in electronic virtual codes kept in a computer memory or network systems. Generally speaking, the nature of hypertext as a type of media means that there is no central, main text with subordinate passages, as it is the case of the printed page layout.

Hypertext learning aids make it usually clear which part of text is the main one and where a student should start from when learning (it does not matter whether hypertext content in LMS is stored on a CD-ROM or available on-line). However, other texts can lack any hierarchical structure. An author (teacher) cannot know without explicit instructions what order a student will choose for reading a text, and if a material is shared on-line, neither which other materials will be connected with it (which links will be directed towards the text). The method of study represents the main difference between the traditional text type and hypertext which presupposes multi-sequential reading (Kobíková, 2012). Within hypertext, a reader (student) marks a link (most commonly underlined/highlighted) with a mouse pointer that carries metadata (a hyperlink to another document), activates it, and the respective material appears on a screen. When creating hypertext, it is advisable not to include too many visual materials such as pictures, figures, charts, schemas, etc. that are not directly related to the educational material. There is a risk that student's attention gets carried away.

New educational media can support learning as an active and creative process, convey realistic learning situations and transform learning into an interactive process. However, the question is what form should the educational material have to become a truly interactive tool. According to Hartl (1999), it is necessary to observe whether pieces of information are provided in a linear way or are interlinked, whether they are processed dynamically (e.g. simulations), whether they are provided in a parallel way and whether pieces of information of one type can be transformed into another type.

#### **4. ACTIVATION THROUGH DIDACTIC GAMES**

Study materials for e-learning can have the form of a game. It is thus possible to incorporate gaming activities into the educational process and make it more attractive and natural for students. A game is an activity for one or more persons which does not need to have a specific purpose, but is supposed to bring joy or have a relaxation effect.

Even before the massive development of e-learning, there was a continual growth in availability of computers for children, youth and also adults and along with this growth computer games began to appear. A new way of using computers emerged; computers were no longer used only for working, but also for entertainment, recreation and relaxation. At first, the games were only simple programs with poor quality graphics and only sporadically they involved sound.

Every computer game has its basis in a virtual world (virtual environment) where a player enters through external devices connected to a computer (either common ones such as keyboard and mouse or special ones such as joypad, joystick or wheel) and influences the virtual world through them. The goal of a player is to complete given tasks in the virtual environment as well as possible, e.g. to go through a certain route as fast as possible, to hit the most targets, to choose the best dress, etc. (in this context we speak about so called genres – strategic games, simulators, arcade games, heroic games, adventures...). A computer game can serve for entertainment, but also for improving knowledge, senses and thinking. Games are sometimes used also in medicine or psychology. Through the virtual world of computer games, it is possible to get to know the unreal world (sci-fi, fantasy world), as well as the real world. A computer game becomes a part of the real life environment – an environment which is necessarily needed by a child in the ontogenetic stage of cognition – but which is not immediately available to him/her. However, excessive substitution of the real world by the virtual one is not desirable.

From the growing trend of computer games it might seem that traditional games and its themes have been disappearing. But in many cases mere virtualization occurs – games and toys have been transferred from the real into the virtual one. This is narrowly related to virtualization of education. According to Marešová and Klement (2001), virtual worlds provide educational institutions with a transition from a teacher-led education to education oriented towards a student. This model corresponds to constructivist theories where a learner uses his/her experience to actively contribute to understanding of the matter; this makes more sense for a learner than to be

given study material in an already organized form. In the virtual worlds, students are more actively engaged and stay in the process of constructing meanings on the basis of their experience. The virtual worlds thus provide an opportunity for teachers to implement learner-oriented pedagogical principles which support active, constructivist teaching focused on problem solving.

One of the main features of a game is that it is an activity accompanied by joy and pleasure, but on the other hand there might be also negative emotions in case of a loss. When playing a game, a person is enjoying it, but when learning or working, it is about achieving educational and work goals and fulfilling obligations. When playing games, including computer games, the only goals that are achieved are the goals contained within the game. The so called game goals can be achieved on a certain level of difficulty and quantity and quality of fulfilling such goals become the purpose of the game.

A didactic computer game is a specific type of educational software. It is a computer program that – in an entertaining way – creates conditions for activities aimed at developing one's personality (Dostál, 2009). Regarding the activity that is executed when playing didactic games, it can be stated that a didactic game played on a computer is an activity of an individual (or individuals) which has its basis in the virtual world simulated by a computer and it consists primarily in developing one's personality, whereas it can provide entertainment, recreation and relaxation.

## 5. VIRTUAL CLASS AS COOPERATION SUPPORT

Within e-learning, a virtual class has an activation effect on a student. It is an on-line **study space** where the traditional class environment can be substituted to a certain extent. It makes it possible for a teacher to present subject matter as if he/she was standing in front of a real class. The teacher can provide immediate **feedback and this way control the learning process**. A student of the virtual class is a specific kind of a student, which is documented also by findings of Palloff and Pratt (2003) who use the term “virtual student”.

The virtual class is thus a classroom in virtual space. According to Zlámlová (2006), it is a web-based interactive tool allowing students to meet, communicate and cooperate, without the need to be present in person. It provides the possibility to gain considerable benefits of the on-line electronic education when preserving the benefits of the traditional, in-class education. The way the virtual class works is the following: after a student connects to a class, a window opens with a list of participants and a set of tools allowing on-line cooperation. A tutor (teacher) presents prepared matter on “a blackboard”, creates new content, and works with office software within the environment or surfs on the Internet. Voice communication, e.g. lecturing, is happening through telephone connection. Among others, virtual classes can be used as an authorial tool for creating electronic courses. The virtual class takes place at an arbitrary place and time; the essential requirement for the realization is Internet connection (Mikulecká, Poulová, 2002).

A teacher controls education in the virtual class, determines study matter, procedure and pace. When teaching, he/she can examine students and evaluate them, ask questions, split students into teams and give them individual tasks. Virtual classes involve cooperation and also for example brainstorming. Students can leave the class when needed or they can ask the teacher about things they do not understand. Students can communicate also privately; in the real class, they whisper or send notes or text messages, in the virtual one they have access to a private chat. The teacher prepares materials beforehand and then he/she talks about it and can project it as well (in case of the traditional class, he/she uses a back projector, data projector or an interactive board). He/she can use the board in the virtual class for writing or drawing, and the same can be done by students. He/she can also provide some extra materials to students (Pravda, Barešová, 2004; Tiffin, Rajasingham, 1995).

The virtual class allows the following:

- to present subject matter on the virtual board (the teacher is lecturing while using the presentation, showing content of data files, drawing on the board, etc.);
- two-directional voice and visual communication between the teacher and students (it means that the teacher can communicate with students, can examine them and talk to them directly);
- to practise subject matter by tests integrated in the virtual class;
- a chat with students.

It provides also other options such as an access to supporting materials, plan of an on-going course or more advanced tools for communication with students (desktop sharing, remote access). Virtual classes involve a specific teacher approach towards students (e-students), which was summarized by Pavlíček (2003) as follows:

- orientation towards a student, defining a new role of a student, understanding student needs in the sense of mobility and new communication tools, as well as globalization elements;
- communication, mainly in the written form, but also through telephone or other audio and visual tools, understanding the change of style in communication;
- discussion moderation in the sense of creating and monitoring their scope, suggesting topics, initiating discussions;
- accepting and supporting a virtual community that has been created; virtual communities have their own rules, e-tutor must know them, understand them and comply with them;
- encouraging interaction within a virtual community, leading cooperation in the right direction;
- listening to questions and answering them;
- creating tasks with focus on authentic learning and on tasks with a real basis;
- evaluating tasks and discussing their results;
- monitoring education results and further processing and evaluating them;
- analyzing team composition and team work, understanding the need for appropriate team composition for effective cooperation when solving problems;
- creating ambience of personal contact of remote participants.

According to Ligas (2007), the advantage of virtual classes lies in the fact that students do not need to feel uncomfortable in front of the whole class, because they can simply send a private message to their teacher. This helps in removing constraints and communication becomes more natural.

## **6. USER INTERFACE AND DESIGN OF THE E-LEARNING EDUCATIONAL ENVIRONMENT**

Activation of a student who is supposed to study through e-learning is strongly related to the design of user interface, its spatial layout and interactive options. In spite of that, there is not enough attention paid to this area,

in contrast with foreign countries (e.g. Zhang, Zhan, Du, 2010). To begin with, reliable research in this area is almost not carried out in the Czech Republic and only individual experience is used (exceptions are for example works of Sedláček, 2006 and Hájek, 2003). That is also the reason why many e-learning environments are so different, despite being intended for students with similar characteristics. There is obvious unfamiliarity with pedagogical effectiveness of individual educational environments related to acquiring knowledge and developing skills.

A user interface of an e-learning educational system is one of the key factors which influence the effectiveness and usability of a particular system. On the basis of analysis of educational environments represented by LMS (Learning Management System), didactic computer programs used for student education and published findings, it is possible to determine basic pedagogical requirements that should be met:

- *must be motivational, must not repel a student* – an interest in working with LMS or an educational program must be evoked and supported;
- *must bring a feeling of safety* – a user cannot be exposed to a situation when he is under pressure or is afraid;
- *simplicity and intuitiveness of use* – a user cannot be thinking about the use itself;
- *freedom/control* – a user can make a mistake and for such cases, he/she needs a clear “exit” to get back (this cannot involve a need to go through a set of complex dialogues);
- *less is sometimes more* – information displayed on a screen at a certain time should not contain information that is irrelevant for a particular action or is not necessary for a user (each information unit is in competition with all others and it can decrease clarity and an apparent meaning of other pieces of information (*HCI - Existuje dokonalé uživatelské rozhraní?*[*HCI - Does a perfect user interface exist?*], 2013).

When evaluating proposed user interfaces, it is necessary to take into consideration the following criteria (formulated as questions):

- Will a user know which actions should be/can be done?
- Will a user know which controls are related to individual actions?
- If a requested action is done, will a user understand the feedback?

It is possible to state that a user interface must comply with the following principles (Palloff, Pratt, 2001): be fully functional;

- offer functions necessary for the realization of effective e-learning;
- be simple to use for all participants;
- be user-friendly and visually attractive.

The resulting interface of modern e-learning educational environments should respect the following parameters:

- *interactivity* – a user interface must respond to commands quickly, execute actions and provide adequate feedback to a user;

- *clarity* – objects and elements currently displayed on a screen must provide good possibility for orientation, which also counts for the whole system, and not only to a current screen;
- *transparency* – controlling the system should be easy and system reactions should be intuitively predictable;
- *understandability* – used terminology should be known to users;
- *continuity* – a user interface should be consistent, at least as far as basic features are concern, for the whole system;
- *empathy* – a user should have a feeling that a user interface was specifically designed to meet his/her needs;
- *help* – a user should not have a feeling at any point that he/she is left without any help.

It is obvious that parameters of e-learning educational environments and educational programs must stem from the needs and specifics of users, i.e. mainly students and a teacher. In many cases a universal optimal system cannot be created and that is why it is convenient to create adaptive and flexible systems. On a general level, this matter is dealt with by Human-Computer Interaction (HCI) which is a discipline focusing on evaluation, design and implementation of interactive computer systems that communicate with a human (Zaphiris, Ang, 2009).

## 7. SIMULATIONS AND MODELLING AS ACTIVATION TOOLS

In case of simulation and modelling, a particular “thing” is studied, represented by any object or phenomenon, with the goal of understanding it. This is very closely connected to education, but the models must be obviously adjusted to didactic means, to regularities and possibilities of those who study them.

The principle of modelling, in a sense of a research technique, is substituting a researched system by its model (more specifically by a system that models it) and the goal is to gain information about an original researched system through experiments with such a model (Křivý, Kindler, 2001).

Depending on taking or not taking time into consideration when modelling, we distinguish between dynamic and static systems. When dynamic systems are studied, it is called a simulation. On a general level, from the point of view of the principles of schematicity, it is not possible unambiguously determine whether using static or dynamic systems is didactically more valuable. In connection with modelling, it is always necessary to realize that the studied model is a simplification, i.e. an abstraction of reality; in other words it is imperfect in relation to the reality. The imperfections are, however, marginal and negligible for studying. Simulations can be used for studying any kind of subject; it is not important whether it is from technical or scientific field or humanities. The use of modelling and simulations in education was dealt with for example by the following authors: Hrbáček (2008), Serafín (2009), Bílek, Rychtera and Skalická (2010).

Regarding didactic possibilities, remote internet labs have been gaining importance; they are based on a principle that an experiment is carried out separately from a learner and he/she controls it through a computer network using a web interface, does experiments and measures relevant data. There are no field limitations for experiments; it can be an experiment in chemistry, physics, technology, etc.

Apart from remote labs, there are also virtual labs, but according to Lisalová and Lustig (2004), remote labs sometimes include mere databases of experiments or observations, eventually camera recordings of experiments,

which is not correct. Remote labs and virtual labs are not the same. In case of a remote lab, gained data are real, because they were obtained on a real device.

Remote labs have the following advantages in comparison with the traditional labs:

- free access to a lab (whenever, wherever);
- an experimentalist does not need any real aids;
- an experiment can be repeated several times;
- users work with real measuring devices and measured data are real;
- there is no risk of injury when working with dangerous devices;
- it can be used as preparation for traditional school labs;
- modern approach = an increased student interest;
- time saving for teachers and quick graphical processing of measured values (Látal, 2012).

The very process of learning is based on student active participation and student engagement is supported by dynamic simulations of real phenomena, team work (real and virtual), public presentations and defence of gained results; everything is happening either at a real, present time, or in tele-presence (Lustigová, Mechlová, Malčík, Lustig, 2009). The possibility of connecting a real, currently occurring phenomenon with a computer allows to better grasp the essence of the demonstrated phenomenon and to gain vaster amount of data about the phenomenon (Lepil, 2010).

## 8. ELECTRONIC CONFERENCE AND VIDEOCONFERENCE

An electronic conference represents virtual space for mutual communication of determined participants and communication itself including a communiqué. It is dedicated to a certain topic using electronic support. Accordingly, it can happen through various channels:

- written text;
- audio (audio-conference);
- video (video-conference).

The electronic conference is a social meeting of people in a virtual world, in contrast with a chat, which can be defined as brief communication between two or more people via a communication network.

In case of education, the aim of the conference is not any kind of communication, but communication aimed at achieving didactic-educational goals. Then, the participants are a teacher/teachers and students. From the educational point of view, it is convenient that it also offers means for archiving contributions and their subsequent browsing, or eventually evaluating.

The electronic conference places significant demands on the teacher, mainly because to maintain a discussion during such a conference can be difficult. Some learners can actively participate in guided conferences, some refuse it; many learners can represent completely passive participants of a discussion during an e-conference. Mainly in case of teaching adults, the prevailing experience is that they avoid participating in discussions because they are afraid they might look stupid due to not knowing something or being wrong, etc. (Zlámálová, 2006).

## 9. CONCLUSION:

By using analytical-synthetic approaches, the importance of student activation during e-learning has been shown, but also basic possibilities of activation applied in educational practice have been determined. It seems that the most effective is to use a set of activation means; meanwhile, a synergetic effect manifests itself, having a positive effect on learning.

It is vital to prepare e-learning activities in a way that both initial and continuous activation is ensured. Such activation should be of an intensifying character, because attention during learning tends to decrease. It has been proven that modern educational technologies dispose of a variety of tools for ensuring active learning that is based on the constructivist principles.

# Addressing Spirituality in Experiential Learning

Pavel Veselský\*, Jiří Poslt, Petra Majewská, Michaela Bolcková

*Palacký University, Faculty of Arts, Department of Sociology, Andragogy and Cultural Anthropology,  
Tř. Svobody 26, Olomouc 779 00, Czech Republic*

## Abstract

Experiential learning has had a firm place in Education since the time of John Dewey. Nevertheless in the Czech Republic, due to its isolation during the Communist era, its development has been unique in some respects. This study aims to examine whether experiential learning is capable of addressing spirituality as a significant aspect of human life. The findings of a research survey conducted among participants of two experiential courses show that a kind of spiritual experience did occur, although it was not intended in the original design of the course. An insight into the question of addressing spirituality through experiential learning is thus provided.

*Keywords:* experiential learning; winter experiential course; spirituality; spiritual experience.

## 1. Introduction

Experiential learning represents a fairly distinctive approach to Education theory and practice. Although the concept has been quite elaborated in terms of theory and its approach has been very solidly verified in terms of practice, at least one aspect of experiential learning has been so far neglected: that is, the question whether experiential learning can also address spiritual elements in human experience. A deeper analysis of the spiritual dimension in experiential learning is entirely absent (Schmidt & Little, 2007).

Our contribution intends to further the debate on this issue. It focuses on an orientational introduction of experiential learning, including concepts which may possibly encompass spiritual experience. Since we rely on empirical data obtained in the Czech environment, where experiential learning has undergone specific development, we also explain these specifics. Nevertheless, the kernel of the text is the presentation of a research survey from two experiential winter courses, whose goal did not consist in inducing a spiritual experience, yet the participants evidently did experience one. In the final part, we select two theoretical frames of experiential learning and interpret them with regard to their potential inherent affinity to spiritual concepts—in order to be able to support the findings of our research survey by means of theoretical reflection.

## 2. Experiential learning in the Czech Republic and its specifics

We acquire knowledge and practical skills on the basis of our life experiences. We learn about ourselves, our abilities, limits, and possibilities. We change with increasing experience and transform our view of the world and our attitudes. No wonder that experiences are considered to be the most essential components in the process of learning. The concepts of learning through experience have been developed in the English-speaking world since

the 1930s. The works of John Dewey (1938), the pioneer in this area, and Kurt Lewin (1935) have played the most significant roles. Dewey, in his attempt to reform pedagogy, was the first to articulate a theory of learning through experience, which involves three stages: 1) Observation of the surrounding environment after a stimulus is provided; 2) Recollection of knowledge and previous experience in similar situations in the past; 3) Judgment which puts together what is observed and what is reflected and recalled to see what they signify (Dewey, 1938). Today, however, rather than Dewey's concept, the model of experiential learning by the German emigrant Kurt Lewin is being used. During a series of courses applying experiential learning, Lewin noticed that it is convenient to complement the cycle with a discussion, which allows the participants to reflect on their experience, to compare their impressions with external observers, and share them with other participants. This results in a more effective generalization of the concrete task to the level of an abstract rule and allows an acceleration of the learning process. The essential stage of feedback was thus added into the cycle. This model plays the central role in the system created by David Kolb in the 1980s, and although the cycle of experiential learning had been conceived by Lewin, today we are used to referring it as Kolb's cycle or model. In addition to Dewey and Lewin, Kolb was also inspired by the theory of cognitive development of Jean Piaget (1999) which the process of development from the concrete solutions to the abstract solutions of given tasks and the ability of generalization are very similar to processes used in the stage of reflection in experiential learning. Kolb's experiential learning model, as it is used today by practitioners in various fields, involves the following: Concrete experience—Reflective observation—Formation of abstract concepts and generalization—Testing the concepts in new situations to see what results (Kolb, 1984, p. 21). Apart from the application of Kolb's cycle, the methodology of experiential learning also uses the mechanism of comfort zone expansion. The comfort zone is the area in which we spend most of our time, and which gives us a sense of security, as we have scenarios ready to use for all our activities in the zone. By means of a specifically targeted adjustment of the activity, however, a person can be made to step out from their comfort zone and enter an area with new and intense experiences. They are forced to take action and develop new scenarios. Therefore, this zone is referred to as the learning zone. A person can acquire new experiences here and subsequently include them in their ready-to-use storage of knowledge, thus expanding their comfort zones. The experience occurring in the learning zone may have both positive and negative qualities. Stepping out too far brings us into the panic zone, where new experiences are not perceived in an optimal way.

Nonetheless, these concepts began to find their way into the Czech Republic no earlier than in the beginning of the 1990s, together with the opening of its borders after the Velvet Revolution. This does not mean to say that experiential education has been employed only in the last two decades. Quite the contrary, experiential learning has been developed for a long time in the Czech Republic. The practical application of experiential learning in the Czech Republic, however, has had a number of unique characteristics, and there are several reasons for this. First and foremost, the former Iron Curtain did not allow conducting a dialogue across various international approaches; second, the Czech Republic is a relatively highly urbanized country, which does not have large areas of wilderness like the United States, enabling the instructors to expose their students to natural conditions for a longer period of time. This is why a way had to be found which would make it possible to achieve the same results in a shorter time and in a smaller space. Furthermore, the terminological aspect has to be taken into consideration in the Czech context as well. The English word "experience" can have several strictly distinct meanings, and the diverse interpretations of its meaning imply various applications in practice. The terminology has been clarified in the Czech context by Jirásek (2004) and Dočekal (2012). In accordance with their interpretations, we will consider the term experience to be a result of reflection and generalization of an experienced event, which can be potentially used in future decision-making. One of the specifics of the Czech experiential learning model is that the courses are aimed at precisely specified goals and make use of dramaturgy. The term "dramaturgy" has been adopted from art education and carries the specific meaning of pedagogical work with a place, time, goals, themes, program means, people, etc. The experiences in intensive courses are arranged with respect to achieving the maximum intensity of the program. Unlike abroad, various phenomena

such as play are characteristically employed in the Czech environment (Hanuš & Chytilová, 2004). The Czech approach also typically aims at reaching maximal developmental potential in diverse dimensions and to intervene in the structure of personality in terms of its development, rather than orientation on knowledge and skills. This approach has been classified as experiential education, which stands apart from similarly oriented approaches, such as leisure education, adventure education, or outdoor education (Jirásek, 2004).

Experiential learning and its theory have developed into an independent discipline, yet its practice has adopted several concepts from other disciplines, especially the psychological theories on motivation and the functioning of the mechanism of group dynamics. Herein two concepts dealing with individual experiencing and potentially covering the area of intersection between experiential learning and spirituality should be mentioned. The first of them is the theory by the psychologist Mihaly Csikszentmihalyi (1994) on absolute immersion in an activity—the concept of flow. Csikszentmihalyi explored the relationship between skills and challenges and claimed that our involvement in activities ranges from boredom (due to a low level of challenge) to anxiety and fear of failure (due to a high level of challenge). In order to achieve the desired flow state, activity must be balanced, so that the challenge of the task matches the skill of the group or individual. Therefore, our goal in practical experiential learning is to remain in the zone where optimal experience is possible. The other concept relates to the level of experiencing as well. It deals with so-called peak experiences, i.e., states in the moments of exceptional happiness or excitement. The term was first used by Abraham Maslow in the 1960s, who described it as an uplifting state of mind, which brings a sense of integration and meaningfulness, “being-values” as values related to being, and creative energy (Maslow, 1994). A peak experience is perceived as very intense and becomes a stimulus for prospective changes. This is why the design of a course or any such program may purposefully include activities containing the potential for being experienced as Maslow’s peak experiences.

### **3. Spirituality in the dramaturgical design of a concrete experiential course**

The possibility of addressing the theme of spirituality by means of experiential learning was verified by a research survey. The sample for the survey was composed of the participants of an experiential learning course, which consisted in a winter field trip on snowshoes and was entitled “Life Is a Gothic Trek”. This course has had a long tradition in the Czech Republic. The participants trekked along the ridge of the Bukovské Hills in eastern Slovakia, following a route longer than 100 kilometers (more than 60 miles). The declared goals of the course included, most of all, staying for two weeks in demanding outdoor conditions, camping and traveling in the winter landscape, with the necessity to carry all their gear in rucksacks on their backs. Another level was constituted by the aspect of self-knowledge. The course was conceived as an opportunity to look at oneself with different eyes, in a spirit of earnestness and within an authentic experience. Needless to say, the revelation of spiritual aspects was not among the explicit goals of the course. Nevertheless, the provided opportunity for being free from common worries and having plenty of time “to be oneself”, including the specific conditions in which the course took place, contained the potential for the spiritual mode of experiencing. This potential was investigated in our research survey.

#### *3.1. Methodology*

Our investigation was conducted during a weekend session in September 2012. The participants of the previous two years, 2011 and 2012, were asked to form the research sample, which eventually consisted of 13 persons. The research focused on the question whether, and in what form, the participants experienced moments which might be regarded as spiritual. The sample group consisted of 2 women and 11 men. Their ages varied between 20 and 55 years, with the majority in between 25 and 35.

In the course of the investigative meeting, the phenomenon of spirituality in relation to the course Life Is a Gothic Trek was explored by means of several methodological tools. With respect to the nature of our theme and

the number of present respondents, most of them had a qualitative, heuristic character (Miovský, 2009). The findings were mostly grounded in individual semi-structured interviews. The interviews always began with the same inquiry (“We would like to know whether anything really touched you during the course.”). The initial query was formulated neutrally, so that there was enough space left for the phenomenological development of the theme in the discussion. We presumed that should a moment of spiritual experiencing occur during the course, it was something that had really touched and influenced the participant, and such an experience would be carried on. Once it became obvious that our intention was to discuss the spiritual aspects of the course, we let the participants reflect on this theme in group discussion (a focus group) at the end of the weekend session. In order to have a form of feedback verification by a reliable research tool, we used the Prague Spirituality Questionnaire (Říčan, 2005; Říčan & Janošová, 2004; Říčan & Janošová, 2005). This questionnaire tests the tendency for the spiritual mode of experiencing by means of 36 statements with which the respondents express their degree of identification or non-identification. Although the validity of this questionnaire is still being questioned (Jandásková & Skočovský, 2007), the neutral formulation of its questions, without association to any specific religion, seemed to provide valid results in terms of our target group.

### 3.2. Findings

In order to better understand the context of the situation described in the respondents’ statements, one must realize that trekking on snowshoes is, most of all, physically very demanding. Even with the snowshoes on, the weight of the human body and the carried weight make one sink into the snow. The strategy of advancement is to walk in line, one after another, and keep to the track, trampled by the footsteps of those in the front. This causes a separation of the individual wanderers, who are not in immediate contact with each other, even though they walk in a group. From the perspective of a person used to the excess of stimuli typical for the life in the modern society, this situation—your only activity is to follow the footsteps of the person walking in front of you—unfolds an unusual space for immersion into oneself. This situation was reflected upon by a majority of the respondents in the interviews:

“Many times, I just went on and ceased to perceive anything and became absorbed in myself.”

“I have a very strong, long-lasting experience of having abundant time to think of what I do, how I do it, what I want to do... For the first time in my life, I stopped, somehow... I have realized now I don’t even have the time for that in normal life...”

During the long monotonous walk and due to the lack of communication and stimuli, they had plenty of time for introspection. Of course, it did not always necessarily involve deep spiritual contemplations. Nonetheless, thinking of the importance and purpose of things, pondering on one’s own search for values, reflecting on one’s own thoughts and feelings, meditating upon oneself and the purpose of one’s own life in such moments of calming down and stopping may be considered spiritual. For even the respondents themselves used such expressions:

“What was happening? Some kind of reconciliation, contemplation on where I am, why I am here, why I want to be here, thinking if my school and family make sense, feeling some kind of energy compelling me to become a better person...”

“Concentration on myself, on my inner world, my inner voice, arranging my thoughts, making my mind to leave out this and stop doing this and focusing on that.”

On the other hand, the moments of “solitude” were matched by the participants’ development of their sense of belonging to the whole—both nature and the other people. This relationship was established under the influence of intense and authentic contact. The sense of a strong bond with the group resulted in abandoning of the patterns of everyday interactions and elimination of ever-present protective barriers in interpersonal contact.

“You only deal with what is here and now, with the people who are with you, as there is nothing else... And the morning exercises, when we hugged, in such an intense group of people—I have never experienced anything like it, it was so purifying, the day suddenly received a whole new dimension, you had an immense sense of belonging to the group... You felt great in your soul.”

“I somehow overcame my own blocks in relation to other people, as I used to keep such a distance... as if perceived the others from distance... all of sudden you have no energy for that anymore, the constant protection of yourself.”

“The protective bubble suddenly breaks, and you simply *are*...”

The breaking of these barriers allows the individual to see him/herself in a new light. A deeper understanding of oneself is attained and an imaginary Johari window is opened (Luft & Ingham, 1955). The joint influence of several factors—such as, apart from the above-mentioned, sensory deprivation while walking through the mist on the white, snow-covered ground as well as the long-term exposition to radically different climatic conditions than we are commonly used to—enables the participants to achieve the transcendental mode of experiencing, which may be sometimes difficult to describe:

“You can somehow overcome all the physical challenges, but there’s something behind them, something that can be... I don’t know what it is, I haven’t found out. Anyway, the physical simply doesn’t matter...”

“I take the world as it is and I am open to it, and it comes to me, and it’s a deeper connection with the world, a sense of integration, unity, because you’re not somewhere else, you don’t look from the outside on what is happening: you are inside everything. You experience the world through yourself, and it suddenly opens before you.”

While some interviewed respondents confirmed the occurrence of the theme of spirituality in their experience, we should also call attention to those who never referred to any spiritual experience. It turned out that what we refer to as spiritual may be expected to occur only with individuals who have been adjusted to such a type of experiencing. In other words, the specific setting and conditions of the experiential course open the vertical dimension rather with people who are ready to see and experience the setting and conditions as such. That is to say, we did not find any such experience which could be considered as spiritual, for a portion of the respondents. This fact has been confirmed by the results of the Prague Spirituality Questionnaire, which showed that approximately one-third of the respondents declared a high degree of identification with statements testing the particular possible dimensions of spiritual experiencing (Řičan, 2005); one-third identified with the statements only partially, and the rest assumed a reserved or even negative attitude to the statements.

Should we come back to the research question as to whether the aspects of spirituality occurred among the participants of the course *Life is a Gothic Trek*, the answer is that despite the fact that it was not so in all cases, the spiritual mode of experiencing was confirmed in several instances. The setting of the course providing experiences sharply contrasting with the common lifestyle of the 21st century human—experiences of solitude as well as almost intimate contact, challenging both physically and mentally—became a breeding ground for the human vertical (that is, spiritual) dimension. This was manifested in several areas.

## 4. Spirituality in experiential learning

### 4. 1. Spirituality in education and experiential learning, including the Czech experience

For quite a long time, the theme of spirituality in Education has been pushed to the periphery of interest by the predominantly scientific and secular society, or even totally suppressed. As Wane and Ritskes pertinently noted: “For too long spirituality has been an underexplored, often misunderstood aspect in the field of education” (Wane & Ritskes, 2011, p. xv).

In the West, a certain breakthrough with a relatively unrestrained growth of spiritual development beyond the formal educational system was achieved. When Yves Bertrand (2003) composed his overview of contemporary theories of Education, he could not ignore an educational trend which gained power in the beginning of the 1970s and was oriented towards spiritual renewal. Bertrand refers to thinkers who were beyond the mainstream, and being interested in spirituality, they formulated their ideas on spiritual Education (e.g. Harman, Leonard, Fotinas), and pondered upon the essence, goals, and principles of spiritual theories of Education. The theme of spirituality in Education is similarly legitimized—with reference to the increase of interest in spirituality, often non-religious—by several contemporary authors as well (e.g. Hunt, 2009). In the present time, the theme of spirituality has been explored by a number of Western authors (English, 2003; Miller 2000; Palmer 2007; Tisdell 2003).

The situation in the Czech Republic was, similarly to other countries of Central and Eastern Europe, affected by the events of the World War II and mainly by its subsequent membership in the Communist Bloc. The Communist era was soon after the Velvet Revolution of 1989 replaced by the era of consumerism, and the two ideologies—ultimately, both materialistically oriented—had a strong impact on many essential areas of life (Jirásek & Veselský, 2013). Since this has been so in the area of Education to no lesser extent to the present day, the issue of spirituality in Education is almost never discussed. After all, the same applies to experiential pedagogy, in which the vertical dimension of “educating toward experiencing” or spirituality emerges only very rarely or not at all (Jirásek, Hanuš & Kratochvíl, 2009).

### 4. 2. Conceptualizing the intersection of two experiential learning and spirituality concepts

As it turns out from our research survey, however, especially experiential learning—in the form that it has acquired in the Czech Republic—has a certain potential for encompassing the theme of spirituality in a meaningful way. Nevertheless, this assumption on the possibility of addressing the spiritual dimension of human life by means of experiential learning does not rely only on the experience of the participants of the experiential course *Life Is a Gothic Trek* (the research findings seem to be augmented by the fact that spiritual experiences occurred repeatedly, even though this was not included in the objectives of the course dramaturgy), but also on the very nature of experiential learning, which touches on the elementary characteristics of spirituality in some of its aspects. Namely, we will at least focus on two such aspects, which can initiate the debate on the experiential learning of spiritual experience: the emphasis on direct experience and stepping out of the comfort zone.

Experiential learning and spirituality cannot be more thoroughly introduced without being perceived as the conditionally direct and immediate experience of a concrete individual. Experience is the most self-evident and basic constitutive element of experiential learning. Similarly, personal experience is the most essential condition in the area of spirituality; it may be the only way how to credibly touch upon this theme. One of the most authentic spiritual authorities in recent history, Shri Ramakrishna, emphasized the need to relate to spirituality through experience, using the analogy of a spoon burned deep in sugar. The inanimate spoon will never taste the sweetness of sugar, nor will an individual, who does not take the courage for a direct spiritual experience, ever surpass the unsatisfying superficiality of his or her spiritual knowledge (Gupta, 2003).

In this respect, spirituality—as a concept relying on a direct individual experience—can be perceived in contrast to religiosity. This perspective has been confirmed by Zinnbauer’s research on the relationship between religiosity and spirituality, which showed that a significant part of respondents associated spirituality with the experience of connection, relationship to God and mystical experiences, whereas religiosity was associated with personal faith, religious activities, and affinity to an institutionalized religion (Paloutzian & Park, 2005). This difference between the prevalingly inner (experiential, spirituality) and the prevalingly external (ritual, religiosity)—and about the need to transcend the external description of spiritual experience to the experience itself—has been mentioned in some original spiritual traditions. Buddhists, for instance, use the analogy of *a finger pointing to the moon* (Veselský, 2011). It would be a mistake to think that the finger pointing to the moon is the moon itself; it would be equally problematic to confuse the rational/discursive knowledge in the area of spirituality with the experience itself. The Buddhist tradition considers words to be “mere guideposts and markers identifying the recognized reality” (Nyanatiloka, 1993, p. 8). He does not mean to point out that (using the Zen hyperbole) the finger and the moon need to be distinguished. The objective of the spiritual approach is not oriented discursively to the concepts that we apply to the recognized reality but, above all, to what may be considered genuinely real—one’s own experience.

Direct experience, which has a transformative impact on the life of the person who has had it, is then the cornerstone of both experiential learning and spiritual life. It is more than obvious that experience mediated through experiential learning needs not automatically be of a spiritual nature. At the same time, as is also confirmed by the findings of our investigation, it is possible to point out the fact that experiential learning has a potential for individual development in the area of spirituality.

Apart from the common emphasis on experience, the potential of experiential learning also seems to address the spiritual dimension in the fact that spiritual experience necessarily requires stepping out of the comfort zone (albeit this movement is called otherwise and has a different form in some respects). In terms of spirituality, this movement may be connected to the elementary nature of spiritual experience, which arises is grounded in transcendence; from the Latin *transcendere*—to overcome, to surpass. This surpassing of the commonplace of everyday safe and comfortable life and concurrent opening to the horizon of insecurity and seeking within spiritual experience happens on the borderline of “two worlds”, which can be more than a metaphor according to Eknath Easwaran: “In a sense, there are two worlds. One is the land of ever-changing phenomena, of birth and death, cause and effect: the world of duality, which of all of us believe is our real home. It is not. Our native land is altogether beyond these: a world which is the very source of light and life, beyond all change and therefore beyond death. In this land there is only one inhabitant, the Self. Read the writings or teachings of any great spiritual figure: this is the theme...” (Easwaran, 2000, p. 176)

As regards the movement from the world of duality and seeming safety to the world of fullness and genuine safety, from the world of transience to the world beyond changeability, from the world of conditional happiness taking turns with unhappiness to the world of unconditional happiness or bliss (according to the terminology of particular spiritual traditions), the one who surpasses is the one who sets out on the journey of transcendence, who directly or indirectly steps out of the individual comfort zone, and acquires spiritual experience.

The experience may have a clearly evident and very dramatic form in some spiritual traditions. The spiritual practice of the followers of the pre-Buddhist Tibetan tradition of Bön, for instance, was to undergo a stage of deep sensory deprivation, which they maintained for a long time, meditating in total darkness. The process of sensory deprivation was supposed to bring them close to the experience of death as well as prepare them for death (Kalweit, 2004). Similarly, shamanic initiation afflictions are on the border with mental disorders, and the shamanic adepts are often not so far from physical death in the initial stages of their initiation (Peters, 1994).

Stepping out of the comfort zone in other spiritual traditions seems to have a more subtle character, yet it does not mean by any chance that becoming an adept of Buddha’s teaching or a follower of Christ or a disciple of any other serious religious tradition, one can do without abandoning the horizon of the self-evident, safe, or comfortable. Sensorial temperance (food, sexuality), discipline in the relationships with others (not hurting by

deed nor word), deflecting the adept's attention from the world of duality and enabling him or her to initiate movement and transcend this world, represent quite common requirements for those who aspire for a spiritual experience. As Paul Brunton noted on the nature of such a discipline: "It cannot be bought cheaply. Relinquishments of distracting activity must be made, disciplines must be brought in, the work on oneself must be done, the hands which want to hold others unclasped and solitude embraced..." (Brunton, 1986, 2/7/18). Spiritual traditions consider this transcendental discipline to be a necessary price, a prerequisite so that the adept learns something fundamental about him/herself, about the world of duality and the world beyond duality. The objectives of spiritual life are a different matter, but regardless of them, the same can be said about experiential learning, where the expansion of or stepping out of the comfort zone is a prerequisite for entry into the learning zone.

Despite the fact that both experience and stepping out of the comfort zone can be considered as fundamental conditions for individual development, this similarity with experiential learning cannot obviously be overestimated. Since the objectives of spiritual practice are so specific and the focus of experiential learning is so wide-open, we assume that it is realistic to narrow the question, as to whether experiential learning in its openness is able to embrace some form of spiritual experience development. We believe that it can indeed, as confirmed by our empirical research of spiritual aspects during an experiential course.

## 5. Conclusion

The conducted research investigation confirmed the possibility of addressing spirituality by means of experiential learning. Although it was not a part of the objectives of either of the two annual experiential courses *Life Is a Gothic Trek*, the participants reported on spiritual experience occurring in the context of the course's dramaturgy. At the same time, the combination of methodological tools (individual semi-structured interviews and the Prague Spirituality Questionnaire) provided the finding that spiritual experience only occurred with individuals who had been adjusted to such a type of experiencing. They tended to perceive themselves more introspectively, to reflect on their previous life, to relate to others more authentically, to be open to what happens in the group, and in some cases, to achieve a transcendental experience (unity, integration with nature). The potential for the application of experiential learning towards spirituality has been confirmed by the affinity of certain concepts: the emphasis on direct experience and stepping out of the comfort zone.

## Abstract

The growing trend in the interconnectivity of knowledge, ideas and change dynamics is not a preserve of the pedagogical process rather, it is fundamentally driven and sharpened by all forms of andragogical processes. Globally, it is observed that the impact of illiteracy is usually transmitted and predicated on the adults in the society. This then measure the extent of stability, peace, cohesion and sustainability of development. The amount of knowledge acquired by the adults in a knowledge society determines the impact of change, adaptation to change and management of change which may be derived from science, economy, environment, technology, education, peace and literacy itself. There is no doubt therefore that adults contribute significantly to the global dynamics of change and development. Hence, the context of adult learning in terms of what, how, when and where they learn is critical to the new education horizons given the divergence in educational ideas from different societies. This paper therefore takes a comparative perspectives on adult learning, change dynamics in adult literacy and the impact as a new stance in educational global best practices.

*Keywords:* Horizons; Adult Learning; Adult Literacy, Comparative Higher Education, Change Dynamics; Best Practices

---

## Introduction

Adult learning in the context of comparative higher education focuses on the quantum of knowledge that the adult population acquire to navigate the global challenges of sustainable development. It is evident that education globally is predicted by four core elements, namely; engagement, empowerment, experience and evidence. These are manifest in the adult population who must have been exposed to higher education of divergent interests. The impact of higher education on these four variables of learning can only be measured in terms of the comparative advantage they bear on the adult through their engagement with sustainable expectations, empowerment for self-reliance, experience that is evident in practice. Therefore, comparative education that enables scholars to examine education in one country (or group of country) by using data and insights drawn from the practices and situation in another country or countries. This is with a view, according Noah (1985) and Joubish (2009) must:

- describe educational systems, practices or outcomes that are related to adult learning;
- assist in the development of educational institutions and practices that are adult learner oriented;
- highlight the relationships between education and society that is, evident based learning among adults; and
- establish generalized statements about education that are valid in more than one country such as andragogy and conscientization in adult learning context.

Email: oghenevwokephds@yahoo.com

Given these frame, comparative higher education then serves as means of data generation for the drawing of insights as to what adult learning is able to enhance in terms of engagement, empowerment, experience and evident in all countries of the world.

## 2.1 Adult Learning in Perspectives

While writing on adult learning emerging perspectives on learning, Conlan, Grabowski and Smith (2003) observed that there are conflicting perspectives on adult learning as it relates to and separates itself from pedagogical development practices and overall approaches to learning. This paper does not wish to engage in these conflict of reasoning, rather, the focus is on the fact that, styles of learning are applicable and adaptable to both pedagogy and andragogy with differences evident in the use of the style based on the learning environment which compels a comparative analysis and clarification. In his submission on andragogy, Knowles (1968) was said to have popularized this European concept about three decades ago to mean “the art and science of helping adults learn” (Knowles 1980 cited in Merriam, 2001).

As an art and science of helping adult learn, Merriam and Caffarella (1999) observed that this emerging technology is based on six andragogical assumptions of the adult learner.

- **Need to Know:** Adults need to know the reason for learning.
- **Experience:** Adults draw upon their experiences to aid their learning.
- **Self-Concept:** Adults needs to be responsible for their decisions on education, involvement in planning and evaluation of their instruction.
- **Readiness:** Readiness to take on a new social role as predicting learning
- **Orientation:** As an adult learns new knowledge, the individual wants to apply it immediately in problem solving.

Hence, andragogy is very self-centred and allows the learner to take charge of his or her learning. It is very broad based and the method can be implemented in a variety of educational situation including higher educational settings. This perhaps informs the view of Merriam (1999) that learning opportunities for adults exist in a variety of settings ranging from a formal institution to a place of employment. One therefore submits that the acknowledgement of prior knowledge and experiences of learners; including their ability to recognize their own skills as lifelong learners is critical to any higher educational provision. It is against this expectation that higher education occurs in a corporate environment involving a variety of training processes and as such, trainer facilitators in such environment need to have a working skill set to meet the demands of fast-paced, changing environment as new trends in adult learning involve instructional designers and facilitators becoming long-term assets to training departments in higher institution of adult learning. The direct consequences are for trainer to arrive not only with delivery skills, but also with design experience, application and adaptation of adult learning theories in a variety of settings (Meyer, 2003).

Training in higher education for adult learners is therefore critical in five areas which (Riddle (2000) identified as stimulating creativity, assessing innovation option, focusing on the clientele, designing new learning services and implementing change. Therefore, to address the growing unemployment, economic strangulation, illiteracy and insecurity in our global communities, it is evident that adult learning provides opportunities for engagement (dialogue), empowerment (acquisition of self-reliance skills), experience (literacy development) and evident (adaptation to change and management of change been the end product of a literate and humane society). There is no doubt that adults contribute most significantly to the global dynamics of change, hence, what, how, when and where they learn is critical to the new thinking given the divergence in educational ideals for the attainment of stability, cohesion, and sustainability development that is derived from and predicated on lifelong learning that is essential for sustainable growth and development.

### 3.1 Comparative Higher Education

Comparative education is a fully established field of research which examines education (at all levels) in one country (or group of countries by using data and insights drawn from practices and situation in another country, or countries. Programmes and courses in comparative higher education are offered in many universities throughout the world, and relevant studies and research are published in scholarly Journals. The field of comparative education according to Altbach (1998) is supported by many research projects associated with United Nations Educational Scientific and Cultural Organisation (UNESCO) and national education ministries and universities of various nations.

Besides, the Comparative and International Education Society (CIES) which was founded in 1956 is to foster “cross-cultural understanding, scholarships, academic achievement, and societal development through the international study of educational ideas, systems, practices, innovations and philosophies”. This can only be achieved through higher educational research that is driven by: critical analysis of issues associated with cross-cultural values in education; proper examination of bodies of educational ideas and thoughts; clarification of concepts, terminologies; facts and assumptions held by education comparativist; evaluation of educational ideas, systems, and practices as evident across the globe; synthesis of various schools of thought associated with comparative education and juxtaposition of educational objectives, vision, mission statement, systems, practices and ideas in order to attain a coherent, consistent but generalized statements about education global.

It is therefore valid to apply the tools of philosophical analysis to the discourse on comparative education with a view to ascertaining the influence of an educational system on another in a comparative perspective. This is evident as the field of comparative education, at least in some parts of the world, has drawn strongly on the theoretical bases of the social science. To some extent, Bray (2003) made us to understand that shifts in dominant paradigms within the social sciences have been reflected in shift in the field of comparative education. While this shift led to a rise in positivism in the 1960s and 1970s, as well as the popularity of postmodernism in the 1980s and 1990s (Psacharopolous1990) Epstein, 1994; (crossly, 2000; Paulston, 2000), comparative education scholars in the view of Bray (2003) have tended to use a fairly limited set of tools from the social sciences to gain deeper understanding of this subject matter (Rust, Soumare, Pescado and Snbuya, 1999).

### 3.2 *In the Beginning of Comparative Education*

To place on scholarship reasoning, it is critical to sketch some dimensions of the historical evolution of comparative education. It is commonly noted that the origins of a clearly defined scholarly activity of comparative education lie in 19<sup>th</sup> century France (Berrio, 1997; Leclerg, 1999). Bray (2003) also reported that the field then spread to other parts of Europe and the United States of America (USA) before been entrenched in other parts of the world.

Another view has it that the field of comparative education has multiple origins (Halls, 1990; Zhang and Wang, 1997; Bray and Gai, 2001), but it is not a controversy to state that, significant scholarly work was developed in Europe and the USA as the first university level course on comparative education held in 1899 as taught at teachers college, Cohumbie, USA (Bereday 1964a) and a famos 1900 speech by Sir Michael Sadler in the UK (Sadler, 1900). Other research as include those of Yu (1917), Standford (1918) and Kandel (1935) which focused on china, Germany, France, UK, the USA, Canada Denmark and Russia respectively.

Most importantly, irrespective of the origin and the scholarly work already done, a global body in comparative education, that is the World Council of Comparative Education Societies (WCCES) was formed in 1970s as evolved from an International Committee of Comparative Education Societies as convened by Joseph Kata of the University of British Columbia in Canada in 1965 (Epstein, 1981). The WCCES is a body of five continental based comparative education societies namely:

- (a) The Comparative & International Education Society (CIES) of the USA, founded in 1968;
- (b) The Comparative Education Society of Europe, (CESE), founded in 1961;
- (c) The Japanese Comparative Education Society (JCEs), founded in 1964;
- (d) The Comparative & International Education Society of Canada (CIESC), founded in 1967; and
- (e) The Korean comparative Education Societies (KCES), founded in 1968.

As at 1998, the WCCES had thirty-one constituent societies, while six had ceased to exist by 2001, additional five from the Asian region had joined the council. The most obvious academic activities of the WCCES have been the organization of periodic World Congress of Comparative Education with the first of its kind held in Canada in 1970s, followed by ones in Switzerland (1974), United Kingdom (1977), Japan (1980), France (1984), Brazil (1987), Canada (1989), Czechoslovakia (1992) Australia (1996), South Africa (1998), and South Korea (2001), Cuba (2004) among others (Bray, 2003). The WCCES therefore serves as an advocacy body that is affiliated to UNESCO an a Non-governmental Organisation (NGO) with focus on interconnectivities of global educational institutions and ministries.

However, the mission of comparative education in a globalised educational environment particularly, that which conceives adult learning within the foci of the core educational elements as noted in (Sanz 1998, Burbules and Torres, 2000; Tickly, 2001; Welch, 2001; Camoy and Rhoten, 2002) must recognized the following issues:

- **Analytical framework:** that is, the location of nation-to-nation comparisons in wider spectrum relative to divergences based on geographical locale.
- **Units of analysis:** that is, the inadequacies prevalent in the traditional ranking of nation in comparative view is becoming unrealistic due to globalization.
- **Focus on cross-border international education:** cross-border transaction in international education has become an important issue of research in higher education itself. Such transaction raises questions about the identities of adult learners, about the attribute required for facilitators, institution and systems. Issues of comparative interest include tensions between pedagogical practices- and national cultures, andragogical pace of multi-media learning communities:
- **Forms of identify-** Globalization opens up a new potential for forms of identify other than national identity. The traditional focus on the nation-state downplayed supranational cultural and religious identities which limits intra-national regional variety in adult learners participation, resourcing and outcomes.
- **Globalization at the National Level-** Modern education systems are still organized locally and nationally, subjected to national regulation. The trends of increased mobility and cosmopolitanism have major implication for policies on the preparation of citizen in education, particularly in terms of engagement, empowerment, experience and evidence or practice.

Therefore, it is important that comparative higher education takes into account the global influence in the organization and training of adult learners for individual learning engagement and empowerment.

#### 4.1 Adults Learning for Inclusion And Employment

The Comparative Index no doubt, we are in a globalized world driven by knowledge society. The basis of adult learning for any comparison is best explained in its goals of inclusion and employment. That is why, this paper has consistently harp on engagement, empowerment, experience and evident. It is also obvious that all adults have their wealth of experience, but to deploy such asset will depend on motivation and conviction that the outcome is worthwhile. Consequently, eventhough there is no universal formulation of the goals of adult learning, some notion do arise frequently in policy documents. For example, organization for Economic Cooperation and Development (OECD) noted that there is ample agreement that adult learning somehow serve the objective of inclusion or social cohesion (OECD, 1997), and thus the fights against the exclusion of individuals and groups from society.

Also related to this social inclusion is the prevention of conflict, referred to as “learning to live together” (UNESCO, 1996) as well as education for a culture of peace (UNESCO, 1997). A critical analysis on the objective of inclusion is central to the attainment of sustainable development. Ravens (1999) wrote that inclusion can be pursued on three levels, namely:

- **Economic-** participation in the labour process, which also define positive engagement in rewarding activities;
- **Social-** full participation in social life aptly contextualised as empowerment in all ramifications of life; and
- **Civil** participation in the democratic process, which defines experience and evidence.

These three levels or domains of participation relate to one another as economic participation is the basic. It is essential, according to Ravera (1999) to survival on a minimum level of prosperity and enhanced individual participation socially. This, in turn, is both a goal in itself and a condition for the higher goal of participation in democratic processes which ultimately constitute the premise of adult learning.

Adult learning is therefore critical for the sustenance of knowledge society. This has been positively acknowledged as new ideas about the creation of knowledge and competencies have come into focus. Nonaka and Takeuchi (1995) have drawn the attention to the fact that knowledge is not only found where looked for during research work in laboratories and libraries. Knowledge as evidence is often the unintended and even unnoticed result of interaction in the work place between colleagues, between suppliers and customers and between various actors in the social systems. Besides, learning as a creation of competencies is an ongoing process in the flow of work and strategies which can be designed through higher educational programmes to further improve the work place as a learning environment. There is therefore the corporate curriculum which Kessels (1996) emphasizes as the motivation area of the learning triangle.

#### *4.2 Adult Learning for Inclusion And Employment: Comparative Case Studies*

In Germany and the Netherlands, the sector (a collection of firms in the same branch of industry) is more than elsewhere. This provides an important level for the co-ordination adult learning, education and training. This sector level thus provides economies of scale which serves as a potent platform for influencing the content and requirements of regular vocational tertiary education.

In Anglo-Saxon countries, the training of workers (adult learner) is on the average- more under the influence of the market mechanism than elsewhere in the world. Government tends to leave work-related higher education to the forces of the free market, more than elsewhere, as the learners own financial contributions are generally higher in comparative context to the German and Dutch experience.

In France the training system is state driven as there is a role for the sector-level and the market. Still, France has distinguished itself by a public policy that set a clear national framework for *education permanente*. For example, the 16 July 1971 Law stipulates that firms (where adults work) should financially contribute to adult learning and that empowered individuals to participate in training activities at the tertiary level. Such policy supported lifelong learning policies among adults of different segments of the French society. Nevertheless, a more recent French policy instrument, designed for young adults (age 16-25) is the credit formation individualist of 1989, which, by the way, resembles the system of youth training credits in the United Kingdom (1990). These learning policies instruments are more realistic and affordable than lifetime learning and also seem to run lesser risk of misallocation than the French, Australian and Dutch fund approach.

Meanwhile Ravens (1999) recalled that the Japanese system of vocational education and training (for adult learners) resembles the Anglo-saxon system, which is the result of the US influence after world war II. The Japanese's system is guided by a philosophy of lifetime employment in large enterprises. Once an individual gets a job, one is confident to have it for lifetime and to enjoy all the privileges that comes with it, such as lifelong learning of higher orientation. However, in the Japanese culture, learning is regarded as something geared at spiritual development rather than utility. Thus, the high Japanese standards of productivity and quality are mainly the result of the organization of the work process and of the dedication and loyalty of the adult worker.

In Nigeria among other African nations, the philosophy of higher education for adult learning is that of self-reliance development through empowerment that is attained by learning specific skills and driven by public policies. Higher education for adult learning also address the issue of egalitarianism, self efficacy, fundamental human right, good governance as enshrined in democratic value and social justice.

In New Zealand, Findsen (2006) wrote that tertiary education sector embraces all learning that occurs in the post-school world. It covers all forms of adult learning and training in all training establishments, workplaces and local communities. According to the New Zealand Tertiary Education Commission (TEC, 2002), there are six goals for a more collaborative and cooperative tertiary system of learning for adults. These are:

- Economic transformation;
- Social development;
- Maori development;
- Environmental sustainability,
- Infrastructural development and
- Innovation.

All these goals fall in the domain of andragogy and not necessary pedagogy as these expectations are consistent with the andragogical framework for higher education. Findson (2006) then noted that, aligned with the goals above are some strategies among which are:

- strengthen research, knowledge creation, and uptake for our knowledge society;
- develop skills New Zealanders need for our knowledge society;
- educate for pacific people's development and success
- raise foundation skills so that all people can contribute to our knowledge society; and
- strength system capability and quality.

The example of New Zealand higher education provision aligned with Ravens' (1999) perspective of adult learning for total inclusion in terms of social, employment and participation in socio-economic activities.

#### *4.3 On Adult Learning And Inclusion Debate*

The justification for adult learning in the context of comparative research, knowledge creation and uptake of knowledge for a literate society is highly justified arising from challenges below.

Indeed, Chang (2008) contended that, universities are at an important crossroad. They have the critical mass for making the potential difference to critical global needs with a leaner population of 200 million by 2030. While higher education have to produce graduates who have skills to operate effectively in a globally competitive environment, it is also widely recognized that their fundamental challenge is to provide an ethical knowledge base (through adult learning) responsive to societal needs, and so contribute to the common wealth (not just financial or economic wealth), and social-well-being; where, social-well-being is a function of equity, employability, efficiency, flexibility, social demand satisfaction and other variants of immeasurable items.

Re-focusing the role of universities; the way knowledge is being produced, including a review (through comparative analysis), of what knowledge is essential in building what kind of society as well as how higher institutions define their role in this regard, is indeed necessary and critical if tertiary institutions are to be of any relevance to society.

Statistically, the current modern capitalist economy while enhancing considerable benefits for many people in terms of longer life expectancy, more access to learning facilities, more equality in terms of gender, race/ethnicity, class etc, more consumerism and consumer choice, and some extension of guided human rights and political freedom; it is also evident that the system has brought about much disparity, destruction, hatred, and exclusion of many people. Some of this destruction manifest in various forms of violence, loss of cultural diversity and critical fundamental values, human/psychological insecurity, terrorism, competition and increasing consumerism, materialism and individualism.

Ramonet (1999) reminded us of more evidence of such worsening inequalities and exclusion which higher education needs to address in its' re-envisioning process. According to Ramonet (1999), exclusion is overwhelming as two hundred and twenty-five (225) of the richest people in the world had a combined wealth of more than 1 trillion equal to the annual income of the poorest 47% of the earth's population estimated at 2.5 billion people. As at today, consumption has increased six-fold in the last twenty-five years and doubled in the last fifteen years. Yet one billion out of the 2.5 billion have been left out of the consumption boom of the past 20 years. While, over 20% of the world's population accounts for 86% of global consumption (UNDP, 1998), people in Europe and North America spend \$37 billion a year on pet food, perfumes and cosmetics with its attendant health risks. Comparatively this same amount is enough to provide basic adult education, water and sanitation, as well as basic health and nutrition to all those who are now deprived of these needs particularly in developing and under-developed economies and still leave \$9 billion.

One is also aware that among 4.4 billion people in developing countries, almost three in every five lack basic education, a third have no safe drinking water, a quarter have inadequate housing; and a fifth are undernourished

(HDR, cited in Huckle 2002). Indeed, in a comparative analysis, UNICEF (1999) recorded that nearly a billion of people entered the 21<sup>st</sup> century unable to read a book and/or sign their names. Hence, inequality, poverty, insecurity and exclusion are pervasive despite the abundance and prosperity amongst some of us.

My submission is that adult learning of higher education programming on inclusion is capable of bridging the existing gap between exclusion and inclusion. This is on account that, exclusion is not just a lack of material resources. It is, according to Walker and Waker (1997) “the dynamic process of being shut out, fully or partially from any of the social, economic, political or cultural systems which determine the social integration of a person in society”. (p. 8). Today, people are excluded not only from access to education and learning, health, work or resources like land, but, from life itself. The forces of economic, social, technological, globalization, and political control over the majority world by forces of global capital have generated and continue to evolve new forms of exclusion and disempowerment.

### 5.1 Conclusion And Hypotheses

In conclusion, adult learning has its’ comparative efficiency in the management, if not, elimination of exclusion through the development and implementation of appropriate higher education strategies which must focus on re-inventing the core element of adult learning in a knowledge society. These elements are engagement, empowerment, experience and evidence. Comparative higher education that addresses adult learning provisions, policies and programme across international frontiers within the framework of the above will

- ensure a deliberate creation of awareness and commitment among all learners to be personally and collectively engaged for economic reasons and job-oriented learning;
- bring about personal and collective empowerment among adults for social inclusion in decision-making and civil advocacy for effective participation in knowledge society;
- ensure full active participation in the democratic processes that influence good governance, equality, transparency, accountability and participatory development;
- promote experiences that can be brought to bear in adult citizens’ collective engagement in the work place and social systems;
- be evidence based in practices and attainment of the variants of social-well-being as encapsulated in the UN millennium Development initiatives.

The task before comparative higher education in adult learning in all parts of the world must be research, centred in areas of multiculturalism and interculturalism programmes to combat illiteracy, the balancing of vocational and general adult education, care for target groups such as migrants regionalization of adult learning and strategic international and comparative research.

# Analysis for why the emphasis of China's higher education research is theoretical speculative

Fan Wei-Wei\*

*School of Education, Lanzhou University, Lanzhou, 730000, China*

## Abstract

China's higher education research showed the characteristics of great importance to theoretical speculation. The reasons for this phenomenon are three aspects—traditional culture, social culture, researchers own: The impact of traditional culture expresses as the cultural tendencies of contempt for rational inquiry and empirical spirit, and a tendency of fuzzy thinking; Social structure's effects perform the tendencies of "convergence" of the same class and the influence of official position of different classes; The impact of the researcher's own expresses as the intervention for the higher education research orientation by survival inner anxiety generated by the pressure to survive and the further developed pride.

*Keywords* : Higher education research; Theoretical speculation; Traditional culture; The pressure to survive

China is recognized as a great power of higher education research. Compared with the western research, the study of higher education arose in China with a unique subject form. Since 1978, from small to large, China's higher education researches create fruitful works. Every year tens of thousands of research papers are produced in recent years, professional researchers reach into the thousands, research institutions blossom everywhere on the land in China(Hu Jian-hua, 2003). It appears from the analysis of the history of our higher education that China's higher education research showed mainly the main theoretical speculation characteristics(Ding Xue-Fang & Zhou Yan, 2009). Theoretic reasoning is logically suitable for some great master who is in the field of research for many years with rich experience in person. They can write their own unique thoughts with many years of research experience. Why has the study of higher education in China shown widespread speculative tendency? For the analysis of the reasons, we can carry out from three aspects—the vertical time, the lateral environment, the inner self. Specifically, it appears as the influence of Chinese traditional culture, the characteristics of Chinese social structure and the researcher themselves.

## 1. Longitudinal analysis of time—the influence of Chinese traditional culture

Although the feudal traditional culture has been greatly weakened its influence in the impact of modern China's social revolution, reform and the ideological trend of western culture, the accumulation of thousands of years has deepening in Chinese people's mind, in academic research also shows its traces, the main impact lies in culture tendency and mode of thinking.

\* Corresponding author.  
Email address:

### *1.1. Influence of cultural tendency*

The Chinese traditional culture with Confucian culture as the representative has a contempt for rational inquiry tendency and positivism. The Mohist in old China's Spring and Autumn period has attention to experimental and logical manner, and holds some scientific and technological achievements, but is defeated in the contest with Confucian. This is one of the reasons that caused the backwardness of the modern science and technology in China. Even in the higher education research area for which China has originality, the Confucian culture has also affected the development of positivism. China's traditional culture pays most attention to maintain social stability and personal accomplishment raise, but despises the quest for the truth of nature and precise logic. And the characteristics that higher education itself have the uncertainty and complexity make the cultural tendency more easily recognized. Another point is the tendency of justice hold by Chinese traditional Confucianisms who show disdain for the utility and efficiency, which is inconsistent with the scientific demonstration with pursuit for efficiency and innovation. This makes the China's study of higher education show a trend of humanity research rather than scientific research.

### *1.2. The influence of the way of thinking.*

Chinese traditional culture showed a way of thinking that pays attention to the global rather than the local, focuses on the fuzzy rather than the precise. Most of outstanding researchers in this country's history tend to present exquisite views on social life and the universe at the station in the commanding heights of the thinking rather than to carry on the empirical explore for a microscopic world. In the Chinese traditional culture, we can find such characteristics: The ancients actively promote comprehensive thought but take a certain escape attitude for careful analysis. This way of thinking helps to grasp the research object as a whole but easily lead to a superficial understanding. Especially when higher education research relates to education, economic, political and other factors, to grasp the convex overall shows that we are good at comprehensive strengths, which is helpful to the study of macroeconomic theory but in the concrete has not close contact with reality. Another point, with the fuzzy thinking mode in Chinese traditional culture, polysemy, ambiguity, puns and other characteristics can be found in Chinese words, which is a sharp contrast to the accuracy of western language. This also makes the research of our higher education easy to lose accuracy and be less empirical.

## **2. Analysis of lateral environment—The impact of China's social structure**

The study of higher education in a country must be affected by the government, constitution and characteristics of social structure. Although China is a socialist country, but the traces left by feudal rules of thousands of years still reflect in the layout of social structure and the idea of Chinese people by an implicit way. China's current society inherits the traditional way of composition in a certain extent, with a performance of distinct hierarchical distribution structure. As the society has performance for the "convergence" tendency at the same level, its members have a common mode of thinking and living. And between levels, it shows a higher management level of official standard, the upper class is responsible for the lower classes, lower must obey the arrangement. The two characteristics make a quite impact on the study of higher education in China.

### *2.1. Effects of "convergence" tendency in the same class*

The empirical research not only requires a group of experts and scholars who pay attention to practical problems, but also need that social ethos is in favor of academic research. China's lack of the pursuit of individuality and the atmosphere of pluralism existed in western society. Academic researchers and ordinary people are considered to be two different classes that are separate in ordinary people's consciousness. Chinese people generally believe that academic research just exists in the ivory tower, and social life, which has a set of intrinsic mode, does not need to be studied. As you can imagine, when researchers full of enthusiasm go to interview and survey, often get the disdain with wondering eyes. Even if there is willing for some partners, they will take this as a joke, not serious. This will not only affect the validity of the empirical research results, another recessive negative effect is to make the researchers take a blow, which drives them into the ivory tower. You can say that, empirical studies require researchers and the public closely linked, but the intentional or not separation in the conception of people makes study orientation towards theory thinking direction that does not need the close connection of them.

### *2.2. The influence of official position of different classes*

Because of the reason of history and social reality, a lot of people in China have thoughts of official position, academic field is no exception(Han Qing-xiang, 1996). Theoretical interpretation is a speculative forte for officials to write a report, which are inseparable with the nature of work of the administrant. As academic and administrative areas have a close relation in China, the ideas of official position easily appear in academic field. The thought of official position—He who excels in study can follow an official career—affects the development of higher education research as in other academic areas. In addition to academic studies, often there are also significant demands on administrative affairs for researchers in China. A lot of scientific research personnel have administrative duties, in turn many administrative staff have contribution in the field of academic research. This feature is more apparent in the field of higher education research that involved many administrative aspects. The effect of administration for researches also reflected on their research orientation, makes it present the characteristics of "the administrative style", which makes a favor for theoretical research related to administrative work. But it is important to note that this should be apart from some behaviors that mean to get academic achievements with administrative power, which affect the quality of academic achievements rather than orientation of research.

## **3. The problems of researches themselves—anxiety and arrogant**

In addition to historical and social reality, the researcher themselves also is an important aspect that affects research orientation. Compared with western researchers, the contact between academic research, the survival and development of researchers appears to be closer in China. This is inevitable when our country is still in the primary stage of socialism. When we take academic study, we can not only meet the curiosity and thirst for knowledge, but also consider the reality of existence and the influence on research mentality. In China many

researchers' inner have two complexes—*anxiety* and *arrogant*. The role of *anxiety* stems from the survival pressure, *arrogant* bases on the superiority of winners and self-comfort on losers. The two seemingly very different mindsets have a common root—the pressure to survive, which encourages higher education research orientation towards theory thinking direction that is relatively easy to get results .

### *3.1. The effects of anxiety*

When compared the Chinese higher education research with American, we can see that higher education research in the United States is based on the researchers' interest, which can extend to the whole style and feature of academic research in America with abundant financial resources and support of relaxed political atmosphere. While our research on the one hand is affected by the political and social intervention, on the other hand, by the survival and development of researcher themselves. Most, especially young, researchers' first target for research is trying to remove the inner anxiety that comes from the survival pressure, rather than meet the thirst for knowledge, which embodies on the research achievements a certain academic fickleness derived from the researches' existence. Paper production of higher education research in China is great, but the quoted rate is not high. While there is no lack of wisdom spark collision in the crystallization of researchers' hard work, keen critics put forward that there is a feeling of armchair strategist. Nowadays the general mood of society of utilitarianism also increases the impact that manifests the phenomenon of quick buck in academic research field. Theoretical speculation is apparently more convenient than empirical research as the former just requires the researchers focus on literature analysis and design train of thought, without requirements for money, interpersonal relationship, transportation and so on that empirical study needs, so gets popularity.

### *3.2. The influence of arrogant*

The researchers who strive for survival usually get two results. One is successful to get enough resources for survival, then the superiority compared with someone who not. The other is to fail in the competition because of various reasons, and the comfort for themselves with a lofty academic attitude. Both are prone to generate arrogant that belong to researchers. In addition, the fashion of “Burnished inferior, only to read.” in China also partly constitutes the cause of the focus for theoretical speculation on higher education research in our country. Mentioned earlier, the researches engaged in research for many years are suitable for the work on the theoretical analysis as they have rich experience and profound thoughts. But nowadays many young researches, including some students, think themselves also have the qualification to grasp the higher education research in a macro view. They easily lost themselves in their works and ignore the disadvantages. Yet we also cannot against young people on the study of theoretical speculation. As less constrained by traditional culture, they tend to be easier for innovative research. Construction of references

# Analysis of Latvian organizational culture in relation to leadership gender roles

Irena Kokina<sup>a\*</sup>, Jelena Davidova<sup>b</sup>

<sup>a</sup>*Daugavpils University, Faculty of Education and Management, "Daugavpils", Latvia*

<sup>b</sup>*Daugavpils University, Faculty of Education and Management, "Daugavpils", Latvia*

## Abstract

The paper is concerned with the investigation of organization culture and it sees organization as a complicated social mechanism, which is an especially topical issue in matters of state administration. Many researchers consider that organization culture is the principal potential for the survival of an institution, because organization culture is a factor that creates a sense of security and stability among the employees, it shows why people become members of this organization, how their mutual relationships are formed, what norms and principles of organization life and activities they adhere to; what, to their mind, is good or bad, and what image about the organization in general they present to a wider public. Besides, the quality of organization culture, being a substantially specific essence that affects the employees' motivation, often shows how the organization copes with the problems of external adaptation and internal integration.

The authors of the paper study these essential issues in relation to the problem concerning the competence and ability of contemporary women to occupy leading and important positions, which is often questioned in the labor market. The prevailing opinion as well as the existing perceptions and stereotypes about a male as a more capable organization or institution manager than a female, and also the perception that there is a connection between gender-roles and the quality of organization culture served as the basis for the selection and detailed analysis of this research theme.

The "OCAI" methodology developed by Quinn and Cameron (Cameron, Quinn, 1999) was applied in the research on organization culture. The authors analyze the connection of organization culture with gender-roles of managers in various institutions of Latvia and evaluate other criteria of the organization profile as well – determine the criteria of the organization effectiveness, clearness of strategic goals, award system, the prevailing atmosphere in the organization, whether the organization complies with its goals or whether the culture of the organization has to be changed so that it should comply with its goals and should be effective.

The research comprised 20 various state and local-government institutions with similar spheres of activity – 10 of them were managed by men, 10 – by women. Besides, the research involved 357 respondents: 174 employees – women, 183 employees – men. To make a more detailed analysis of the data, all respondents were subdivided into 3 age-groups: the 1st group – from the age of 25 to 34; the 2nd group – from the age of 35 to 44; the 3rd group – older than 45.

To help the institution managers better understand their professional activity at creating the organization culture of the institution, in this research, the authors of the paper underline the role of gender differences and the influence of the employees' age- criterion at resolving such problems.

## 1. INTRODUCTION

Gender integration is one of the principal strategies adopted by the European Union and its member states in order to achieve gender equality. Latvia is among those European countries that already in 1918 recognized that both sexes have equal rights to hold leadership positions in state administration institutions. In Latvia, women hold 41% of leading positions in various institutions and enterprises. It turns out to be the best indicator in the European Union, because even in Great Britain this number is only 35% and in the EU 32% on the whole (Latvian Statistics Year-Book, 2004).

At involving women in the administration of institutions and organizations the usual “gender division of labor” stops to be universal. It appears that men and women are able to do different jobs equally well, and changes in the nature of activity inevitably affect psyche and self-confidence (Hofstede, 1980).

There is no proof that female and male characteristics as such really exist. All attempts to generalize the leadership traits or abilities that would be typical only of women and never of men have failed at a more detailed investigation (Adair, 2002).

The prevailing opinion, as well as the common perceptions and stereotypes in organizations, that a man is a more capable leader of enterprise or organization than a woman, and also the perception that gender roles relate to the quality of organizational culture have provided the basis for the choice and a detailed analysis of this research theme.

Having studied the scientific terminology used in different sources (Ashmore & Del Boca, 1979; Mead, 1985; Basow, 1992; Bern, 1993; Paludi, 1999; Paludi, Paludi & Doyle, 2000), we have come to the conclusion that the words “gender” and “sex” are often used synonymously. However, the differentiation between them is significant in principle: sex is a systemic set of biological qualities which differentiate a male from a female, but gender is a social sex, thoughts and identities determined socially. Consequently, fields of activity involving men and women do not depend on sex differences but rather on the social organization of the society.

As the gender does not come from nature but has been developed socially, it determines the development of self-confidence and self-determination. Gender identity is a basic, fundamental sense of one’s belonging to a definite sex/gender, of being aware of oneself as a male or a female. Quite possible are cases of gender identity “re-coding” from female to male and vice versa, thus taking upon oneself the needed social gender role model. This phenomenon is often observed in leader roles, which affects the peculiarities of organizational culture.

Gender stereotypes, that are views about inherent female and male qualities, are based on prejudices, uncritical assumptions and non-objective evaluations. Just gender stereotypes often provide the basis for gender

discrimination, denying the representative of one or the other gender the right to choose a specific employment or behavior (Ashmore & Del Boca, 1979; Basow, 1992; Neimanis, 2004). Gender stereotypes instruct what a man and what a woman should be like. If people do not conform to these traditional stereotypes, they may experience a negative attitude towards themselves.

Gender stereotypes tightly relate to social norms that regulate the behavior of people in the society. Sets of norms that contain aggregated information about qualities characteristic of each gender are called gender roles. European stereotypes involve assumptions that a) men are more oriented to authoritarianism, women – to democracy; b) for men, the directive management style oriented towards problem solving comes easier, for women – interactive management, and they often underline the contribution made by their subordinates, quite often diminishing the importance of their own role for a common result, which, thus, creates the “team spirit” and promotes the growth of employees.

The gender role, the leader has taken on in the organization he/she manages, determines, to a great extent, the quality of organizational culture.

In studies by different authors (Hofstede, 1980; Schein, 1992; Brown, 1998; Cameron, & Quinn, 1999; Black, 2004 etc.), organizational culture is viewed as the basic potential for organization life, because organizational culture is just the thing that creates the sense of security and stability in the employees, it shows what is it the people become members of this organization for, how their mutual relationships are formed, which stable norms and principles of life and activity of this organization they observe, what perceptions about the organization in general they spread in the society.

In the initial empiric research on organizational culture (Dalton, 1959; Sayles, 1964; Stewart, 1967a, 1967b; Reddin, 1970; Mintzberg, 1975; Handy, 1976), it has been treated as the instrument for motivation to encourage the employees to work properly and, thus, to increase the productivity of labor in the enterprise. The findings of the above mentioned research have confirmed that within the organizations there exists a special substantial essence which affects employees' motivation.

Further research (Cameron, Quinn, De-Graff & Thakor, 2006; Waterman; Ouchi, 1978; Deal & Kennedy, 1982; Ouchi & Wilkins, 1985; Parker, 2000) paid a special attention to various traditions, customs and rituals practiced in the organization, and the distinction and evaluation of external features of organizational culture started to be studied.

The research by G. Hofstede (Hofstede, 1980; Hofstede, Pedersen & Hofstede, 2002) and A. Berio (Berrio, 2003) comprised demographic indicators: sex, age, and also profession and length of service in the organization. The authors came to the conclusion that from his/her national culture an individual receives a series of attitudes in the form of fundamental values and that these attitudes apply to all spheres of individual's life, including the organization he/she works at.

In “*Organizational Culture and Leadership*” E.H. Schein (Schein, 1992) has distinguished indicators for determining a much wider organizational culture: behavioral stereotypes and human cooperation; group norms; declared values; formal philosophy of a group; game rules at working in the organization; climate in the organization; the existing practical experience of organization members; way of thinking, mental models and/or linguistic paradigms of organization members; psychological compatibility of organization members; “base metaphors” or integration symbols used in the organization.

The comprehensive nature of organizational culture, like a specific social adhesive, holds all employees together and gives the employees the sense of shoulder and guarantees them social support (Schein, 1992). In his work E. H. Schein describes how organizational culture develops: he speaks about four ways of the development of organizational norms, basic assumptions and values:

1. Organizational culture is developed by leaders of the organization. The employees gradually start imitating the behavioral style, manner of speech and behavior, customs of leaders and, of course, adopt their values;
2. The development of organizational culture is influenced by critical moments and situations of crisis, which directly relates to the indicators of its development and effectiveness;
3. Organizational culture (especially customs, norms and rituals) is determined by the necessity to achieve certain job results and success level;
4. Organizational culture is formed by the internal environment which determines its forms and specificity of activities in the field.

If we speak about the factors of the development of organizational culture in perspective, it is especially vital to emphasize the uniqueness of organizational culture: according to K. Cameron & R. Quinn (Cameron & Quinn, 1999), the success of an organization depends on such unique abilities of organizational culture as: to reduce the level of uncertainty in the organization, to establish public order, to ensure integrity, to create a feeling in people that they belong to the organization, a feeling of loyalty to a common cause; to create a vision of future.

At analyzing various classifications of organizational culture (Harrison, 1972; Denison, 1990; Cameron, Quinn, 1999) the authors of this research base themselves on the conception by K. Cameron and R. Quinn (Cameron & Quinn, 1991), paying attention to types of organizational culture in relation to the peculiarities of leadership gender roles.

**Research object:** types of Latvian organizational culture.

**Research aim:** to investigate the relatedness of types of organizational culture of Latvian organizations to leadership gender roles.

**Research question:** how do the types of organizational culture relate to leadership gender roles in Latvian organizations?

## 2. METHODOLOGY

To make an analysis of organizational culture types in relation to leadership gender roles, an investigation in 10 different organizations with similar field of activities (state and municipality establishments, including educational establishments) and functioning in different regions of Latvia (Latgale and Vidzeme) was carried out in 2012. As regards to leadership gender roles, the organizations were selected according to the following distribution: five with predominantly male gender roles in leadership and five with predominantly female gender roles in leadership. The gender roles were determined by using a survey of employees of the above mentioned organizations.

The relatedness of the types of organizational culture to leadership gender roles was studied by employing "OCAI" methodology for determining the organizational culture type developed by K. Cameron & R.Quinn (Cameron & Quinn, 1991), because to our mind this methodology is the most appropriate for studying the current situation in Latvia.

K. Cameron & R.Quinn (Cameron & Quinn, 1991) distinguish four organizational culture types:

1. *Clan culture* is characterized by a great unity, by a complete unity of the collective, by common goals and values. The basic assumptions of a clan culture are as follows: the best results can be achieved by working in a team and increasing employees' efficiency; the main task of management is to delegate authority to employees, which would contribute to their loyalty to the job and organization.
2. *Adhocracy culture* has structures that can be quickly re-configured, thus adapting them to new conditions. The basic goal of this type of organization is to speed up the process of adaptation to situations which are typically uncertain, ambiguous and/or overloaded with information, thus ensuring flexibility and creative approach to work. Adhocracy does not use centralized power and authoritarian interactions: the emphasis is laid on individuality, on encouraging risk, on creativity in work, which would promote the implementation of innovative ideas. Great importance is attached to readiness for changes in environmental conditions, to a future perspective within the context of a sustainable development of the organization.
3. *Market culture* is oriented towards results, profit increase, ultimate results, forces on the market and a stable base of consumers, which on the whole characterizes an aggressive strategy. Criteria of effectiveness in a market culture are: achieving the goals, winning the competition, increasing a market share and the level of a financial turnover.
4. *Hierarchy/bureaucratic culture* is characterized as a formalized and structured work place: all human activities are managed through procedures; the organization work is based on formal rules and official policy. Criteria of effectiveness in hierarchy/bureaucratic culture are: profitability, everything done in due time, smooth functioning and predictability.

The differences between organizational culture types according to the criteria by K. Cameron & R.Quinn (Cameron & Quinn, 1991) are presented in Table 1.

Table 1. Differences between organizational culture types according to uniform criteria

Criteria	Clan	Adhocracy	Hierarchy/ bureaucratic	Market
<b>Structure</b>	Team work	Short-term, dynamic (project principle)	Rigid, hierarchic specialization	Individualism
<b>Typical goals</b>	Positive psychological climate	Rapid growth and offering of unique goods	Equability, stability of the organization	Profit, achieving goals
<b>Leader's type</b>	Educator, parent	Stimulating creative processes	Organizers	Good employers, fierce rivals, exacting
<b>Employees</b>	Having social needs, collectivists, those who can and wish to work in a team	Creative	Like a stability, do not like to undertake initiative	Individualists, active, ambitious, having initiative
<b>Dominant values</b>	Loyalty, traditions	Innovation, ability to predict	Stability, internal control	Competitiveness, productivity
<b>Oriented to</b>	Internal environment	Future perspectives	Fulfillment of the procedure	Environment, results
<b>What success ensures</b>	Team work, collective decisions	Creative approach	Relatively low costs, stable quality	Aggressive policy, orientation to market needs

“OCAI” methodology allows determining the type of organizational culture and helps to see the general picture of how the organizations work and to what values priorities are given in them.

### 3. SAMPLE

357 respondents took part in the questionnaire survey: 174 employees – women, 183 employees – men, which makes up 90% of all those working in the organizations participating in the survey. To make a more detailed analysis of the obtained data, all the respondents were split into three age groups: the 1st group – from 25 to 34; the 2nd group from 35 to 44; the 3rd group – over 45.

### 4. RESEARCH RESULTS

On summarizing the data according to “OCAI” methodology, the types of organizational culture were determined depending on the predominance of male or female gender roles there:

Table 2. Types of organizational culture depending on the predominance of male or female gender roles, expressed in percent (N=357)

<b>Organizations with a predominantly female gender role in leadership</b>		
<i>Organizational culture types</i>	<i>Present culture</i>	<i>Preferable culture</i>
Clan	11	18
Adhocracy	15	22
Hierarchy/bureaucratic	29	28
Market	45	32
<b>Organizations with a prevailing male gender role leadership</b>		
<i>Organizational culture types</i>	<i>Present culture</i>	<i>Preferable culture</i>
Clan	16	11
Adhocracy	9	16
Hierarchy	21	34
Market	54	39

The data obtained show that in organizations with a predominantly female gender role in leadership the prior present type of organizational culture is a market type (45%). This implies that a) the organization is results-oriented; b) the main thing is the fulfillment of the set goals; c) the employees of such organization are purposeful and compete with among themselves; d) the leader is strict and demanding. In the assessment of a preferable culture the priority was also given to a market organizational culture type (32%). As the least important type of organizational culture, both present and preferable, in organizations with predominantly female gender role in leadership, the respondents mark clan organizational culture type (11% and 18% respectively). This means that in organizations with a predominantly female gender role in leadership such things as the consolidation of the collective, team work, and delegating work tasks to others are not much supported. These results are in contradiction to the stereotypes dominant in the society concerning the peculiarities of a predominantly female leadership.

What concerns the organizations with a predominantly male gender role in leadership, the prior type of the present organizational culture is also a market type (54%), the preferable type of organizational culture is also a market type, but with a lower percent indicator (39%). As the least important present type of organizational culture the respondents mark adhocracy (9%). This implies that in organizations with a predominantly male gender role in leadership, such things as uncertainty, ambiguity and overloading with information, encouraging risks, creativity in work that would promote the implementation of innovative ideas are not much supported. In

respondents' opinion, the least important preferable type of organizational culture is a clan type (11%), which agrees with their opinion concerning the organizations with a predominantly female gender role in leadership.

If we speak about a hierarchy type of organizational culture, organizations with a predominantly female and male gender role in leadership yield almost similar results, and they make up almost a third of respondents' extractions. This testifies to the fact that the employees do not want to have a formalized and structured work place and that they do not highly value formally dictated regulations and strict hierarchy in the organization. Only approximately a third of employees are oriented to work in the organizations of such type.

This research looks at how in the organizations under the research women and men assess organizational culture in both organizations with a predominantly female gender role in leadership and with a predominantly male gender role in leadership; and the assessments given by women and men are differentiated also according to the previously mentioned age group distribution.

Speaking about the assessment of organizational culture in organizations with a predominantly women gender role in leadership given by women, we see that 42% of women assess this organizational culture as a market culture, while 30% of them – as hierarchy culture. The most preferable cultures for them would be a market culture and a hierarchy culture – 34% and 30% respectively. One fifth of women (21%) would like to have adhocracy culture at their work places. Very few women wish to have clan culture either as a present culture (13%) or as a preferable culture (15%).

Men, too, assess a present culture mainly as a market culture (48%), leaving hierarchy culture in the second place (28%). Very few men assess a present culture as a clan culture (9%) or as an adhocracy culture (15%). The assessment given by men to a preferable culture is quite interesting – the respondents' opinions are almost equally distributed among the four organizational culture types: 30% of men mention market culture as a preferable culture, 26% - a hierarchy culture, 23% - adhocracy culture and 21% - clan culture of organization. We have to admit that the assessment given to the organizational culture by men shows that a present type of organizational culture considerably differs from a preferable type of organizational culture.

In the research, the analysis of the assessments of organizational culture in organizations with a predominantly female and male gender role in leadership, given by respondents of different age groups, was made (1st age group – to 34 years; 2nd age group – from 35 to 44; 3rd age group – over 45).

Concerning the organizations with predominantly female gender role in leadership, the greatest difference between the assessments of a present and a preferable culture exists in the first age group: for 44% of women the dominating present organizational culture is market culture, but the preferable organizational culture is a clan culture (41%). Besides, the assessment of hierarchy culture is very close to both the assessment of the present organizational culture and the assessment of a preferable organizational culture: the difference is minimal (4%). The women of the first age group wish to have more features of clan and adhocracy organizational type in their workplaces than they are in reality at present.

The assessments made by the second and third age groups are quite interesting: both a present organizational culture and a preferable organizational culture are assessed quite similarly (about 40%), because the respondents of these groups give a high assessment to market organizational culture. We have to add that the assessments of a present and a preferable organizational culture given by women do not differ much in the above mentioned age groups.

Speaking about the assessment of organizational culture in organizations with a predominantly female gender role in leadership made by the corresponding age groups of men (having the same distribution as above), it should be mentioned that, compared to the views expressed by women, there are more considerable differences between the assessments of a present and a preferable organizational culture: the biggest differences between the assessments of a present and a preferable organizational culture are observed in the second and the third age groups. The assessments of a present organizational culture, given by all men age groups, include market culture (from 46% to 50%). It is the most dominant (50%) in the age group from 35 to 44 years.

The most considerable differences in the assessments made by various age groups are seen in the extractions of adhocracy organizational culture: men of the second age group see features of adhocracy culture only in 10% of cases, but those of the first and the third age groups in 17% and 18% of cases, respectively. A similar picture is observed in the assessment of hierarchy culture: it is 31% in the assessment of the second age group, but 27% and 26% - of the first and third group, respectively.

Now let's look at the assessment of organizational culture in organizations with a predominantly male gender role in leadership.

The assessment of organizational culture made by both men and women is quite similar: 53% of women and 55% of men have assessed the present culture as being a market culture. Adhocracy culture as a present culture has also been assessed similarly in both groups – in women's assessment it is 10%, in men's assessment – 8%.

Bigger differences can be seen in the assessments of hierarchy and clan cultures. In women's assessment hierarchy culture is assessed by 19%, while men's assessment is 4% more – it is 23%. The assessment of clan culture is similar: women assess it as 18%, but men – 14%.

The analysis of the assessments of a preferable organizational culture made by the representatives of both genders indicates that correspondences can be observed in the assessments of market and clan organizational cultures – 39% and 11% respectively. The assessment of a preferable hierarchy and adhocracy organizational culture differs: 6% more men than women prefer features of adhocracy organizational culture in their work places, while 6% more women than men – features of hierarchy culture.

What concerns the assessment of organizational culture made by women about a male gender role in leadership, the assessment of the present market culture given by all three age groups is similar – it is from 52% to 54%.

The assessments of a preferable culture show an interesting extraction dynamics in all three age groups: women of the second and third age groups want to see more features of market and hierarchy organizational type in their work places than they actually function at present. Women of these age groups wish a more formal work environment and feel greater need for a strict and demanding leader: this could testify to the fact that with years, women pay less attention to the atmosphere and traditions in their work place and do not feel a special need to work creatively.

The analysis of assessment of organizational culture performed by men concerning a male leadership gender role in organizations indicates that like in the assessment given by women there are considerable differences between the assessments of a present and preferable organizational culture.

The most insignificant differences are in the second age group of men, which implies that men in the age group of 35 - 44 are more satisfied with the present organizational culture type than respondents in other age groups.

Men of the first age group are considerably less satisfied with the present organizational culture. They want to lessen the features of market and clan cultures by 11% and 9% respectively. But at the same time, men of the first age group want to increase features of adhocracy and hierarchy cultures in their work places by 13% and 8% respectively.

The men of the third age group do not want to change the features of clan culture in their work places. What they want to change most of all is to decrease the features of market culture by 24%, which means that men of this age group are not satisfied with demanding leaders and with concentration on the set goals. Men over the age of 45 wish to considerably change features of adhocracy culture increasing them by 18%, which indicates that they want to work creatively. However, at the same time they want to increase the features of hierarchy culture by 5%.

## 5. CONCLUSIONS

- At summarizing the research results about the assessments of the present organizational culture, we can conclude that in all investigated organizations the most predominant culture is market culture, but in organizations with predominantly male gender role in leadership the market culture is more dominant (by 11%). Hierarchy culture, too, greatly dominates in all organizations, especially in those with a predominantly female gender role in leadership. Clan culture is more dominant in organizations with a predominantly male gender role in leadership. Adhocracy organizational culture prevails in organizations with predominantly female gender role in leadership. However, the difference between indicators of organizations with a predominantly female and those with a predominantly male gender role in leadership is not so great to be statistically significant.
- At summarizing the research results about the assessments of the present organizational culture, we can After summarizing the respondents' views about the assessment of a preferable organizational culture, we infer that the employees of organizations with both a predominantly female and predominantly male gender role in

leadership most of all want to have market and hierarchy cultures, however a more convincing result is shown in organizations with a predominantly male gender role in leadership. Features of clan and adhocracy cultures are preferred more in organizations with a predominantly female gender role in leadership. The results of data analysis display such a tendency: the employees of organizations with both a predominantly female and a predominantly male gender role in leadership want that less attention should be paid to work results and there should be a greater demand for a creative activity. This might imply that in their work places people wish to express their personality, work creatively, but under the current conditions of the increasing tempo of life in Latvia it is not always possible.

- In organizations with both a predominantly female and a predominantly male gender role in leadership, the opinions of women about the assessment of organizational culture in different age groups show such tendencies: in the age group from 35 to 44 and in the group with the age over 45, the assessments of the present and the preferable cultures are similar, which testifies to the fact that women whose length of service is considerable do not want to change the situation at work place, they accept the present situation. Whereas women who are under the age of 34 years, by their assessments of the present culture as a market and a hierarchy culture, display a tendency indicating that they would more willingly work in organizations with adhocracy culture. This raises hopes that the younger generation is oriented towards future perspectives, towards innovative and creative activity, and they are ready to work in teams having leaders who promote creative processes.
- In organizations with both female and male gender role in leadership, the opinions of men about the assessments of organizational culture in different age groups reveal the following picture: the assessments given by age groups show a reverse situation if compared to those given by women, because in their assessments of the present and the preferable cultures men under the age of 34 take a constant attitude – for them it is a market culture; whereas in the age group from 35 to 44 and even more predominantly in the age group over 45, men express a wish to work creatively, to contribute to innovations, to be able to predict and be development- oriented.
- The research results revealing that the assessment of the present organizational culture is in favor of a market culture (especially according to the opinions expressed by women and men in older age groups) can be attributed to the fact that under the current situation of crisis, the Latvian society is oriented to market demands, productivity, to achieving the goals, competitiveness and profit.

# Analysis of problematic mobile phone use, feelings of shyness and loneliness in accordance with several variables

T. Assist. Mustafa Öztunc\*

*\*Sakarya University Faculty of Education, Sakarya, Turkey*

---

## Abstract

This research aims at determining the effect of several variables on problematic mobile phone use, and the feelings of shyness and loneliness. In this research conducted on university students, T-test and Anova test, which approaches one of the variables as dependent and others as independent, have been used. In the study, Problematic Mobile Phone Use levels of university students and their shyness and loneliness levels were taken as dependent variables, whereas gender, grade level, internet use and place of residence were taken as independent variables. In the research, Problematic Mobile Phone Usage Scale, UCLA Loneliness Scale and Shyness Scale were used. According to research findings, significant relationship were found between dependent variables, discussed as problematic mobile phone use and shyness and loneliness level, and some independent variables. It was seen that male students used more problematic mobile phones than female students, female students feel more sense of loneliness than male students, students staying at dormitories use more problematic mobile phones than students staying at home and carry more sense of shyness. In addition, it was also discovered that students, who do not use internet, feel lonelier than students who use internet. In our study, those who come from villages to study at university are more shy than those who come from cities.

Key Words: Problematic Mobile Phone Addiction, Sense of Shyness, Sense of Loneliness, Gender, Grade Level, Internet Use and Place of Residence.

---

## Introduction

While, on the one hand, rapid changes in technological areas facilitates, on the other it also brings a lot of negativities along with it. Tools, mobile phones and internet in particular, are being widely used all over the world. These tools of communication takes all the people, young or old, under their influence and are also being used to satisfy a number of needs in addition to communication. These tools, allowing many activities such as watching television, playing games, messaging etc., due to very rich programs they contain, are thought to isolate people since they personalize them, and worst of all, render them addicted. This addiction is estimated to be more especially among young people.

There are various opinions about how this addiction occurred. Behaviorists explain it as such: "If satisfaction and a pleasant situation (positive reinforcement) are being achieved after a certain behavior or if behavior helps to get rid of a negative behavior (negative reinforcement) such as tension and stress, thus that particular behavior increases and individual continues to repeat that behavior in order to get rid of a negative behavior" (Cüceloğlu,1993). If we try to explain the situation from behaviorist point of view, use of mobile phones, since

\* Mustafa Oztunc

E-mail address: oztunc@sakarya.edu.tr.

they meet with people's needs, give pleasure and keep individual away from stress and worries by letting them play games, take photos, and chat online. Especially with the use of smart phones, everyone easily reach various services offered (booking bus and plane tickets, using them as a navigation device in the car, etc..) and thus they provide satisfaction and reduces their anxiety.

In Jacobs' (1988) general theory of addiction, the formation of addiction was described as a situation in an individual in order to maintain balance. According to Jacobs, low or high stimulations, low self-esteem as well as negative early childhood experiences lead to negative feelings and upset the individual's homeostatic balance (items necessary in order for living beings to survive such as body temperature, oxygen, water and blood sugar). Therefore, in order to escape from these negative feelings and to ensure the homeostatic balance, individuals turn to behaviors that tend to cause addiction (Jacobs, 1988). People, using mobile phones at high ratios, have low self-esteem level and these individuals are seen to use mobile phones frequently in order to increase their self-esteem (Phillips, Ogeil and Blaszczyński, 2011). According to Hollander, mobile phone addiction is expressed as a disorder, similar to obsessive compulsive disorder, causing worry or forcible behavior in order to eliminate an impulse. However, there is a difference between these two behaviors. According to this, while obsessive compulsive behavior carried out mostly for reducing anxiety, behaviors, like problematic mobile phone and internet use are practiced for enjoyment (Şar, Işıklar, 2012).

The concept of "loneliness," in our society, is known as individual's state of being alone. Loneliness or staying alone is a sense that is a mixed with a feeling himself/herself detached from the world and a human being's feeling empty. Human beings that are suffering from loneliness feel themselves to be isolated from the society. They experience difficulties in establishing meaningful contact with other people. Lonely people are filled with feelings emptiness and detachment. In several literatures, too, the concept is generally defined as "an offensive and psychological condition arising from the difference seen between the social relations that individual lives and the relations he/she wishes to live" (Peplau and Perlman, 1982). When evaluated from this aspect, loneliness, as perceived in social literature, is not a feeling that is as easy as individual's state of being alone. As can be understood from these statements, inefficacy of experienced social relations and low level of satisfaction as opposed to intended level of satisfaction from these relations can determine the basis of a sense of loneliness (Öztunç, 2012).

Gerson and Perlman (1979) found out that communication skills of university students who are suffering from constant loneliness are more inadequate than students who are suffering from situational loneliness. In another study, Jones et al., (1981), in their study, identified that university students who are feeling lonely evaluated others negatively in comparison with students who do not feel lonely and they also expect to be negatively evaluated by others.

Moore and Schultz (1983), researching sense of loneliness on adolescents, identified that adolescents frequently use these methods such as watching television or listening to music; finding something to keep himself/herself busy with and talking to each other, in order to cope with loneliness.

Conducting research on the determination of the feelings of loneliness of university students in our country, Demir (1990) obtained some considerably significant findings. According to his findings; it is observed that male students experienced feelings of loneliness more than female students, academically unsuccessful ones more than successful ones, ones spending free-time alone more than ones spending with others, ones considering their monthly income insufficient for social activities more than ones considering sufficient, those who do not get social support from their environments more than those who get social support, those who have less intimate friends more than those who have many, those who are unwilling to establish social relations more than those are willing, those who consider their social skills inadequate more than those who consider them adequate, and those who do not share their problems with other more than those who share them.

Sense of shyness is a major problem affecting interpersonal relationships. Shyness is defined as sense of uneasiness and limitation experienced in the presence of others (Jones, Briggs & Smith, 1986). Shyness is seen as

the most important factor in rendering it difficult for individual to meet with new people, to make new friends and to get enjoyment from different experiences (Zimbardo 1977). Enç (1980) defined shyness as an uncomfortable feeling which is experienced during relationships with others and which frustrates right behavior.

Carducci (2000) considers shyness to be an interpersonal problem resulting from excessive shyness during interpersonal relationships, low self-esteem and fear of rejection. Shyness is suggested to be a universal concept, and exists in every culture even though it is not experienced at the same rate and is not defined in the same way (Carducci & Zimbardo 1995).

In literature, there are studies evaluating shyness from different aspects. Some of these studies are related with psychological responses that shyness cause in the body. Shyness is felt as a mixture of feelings such as fear, concern, tension and pleasantness. Increase in heart rate and blood pressure physiologically accompanies these feelings (Hyson & Van Trieste, 1987). In addition, restlessness, reactions of frustration and anxiety, excessive awareness towards oneself and remaining silent in the presence of others are quite apparent in shyness (Jones, Briggs & Smith, 1986).

The period in which shyness is experienced most intense and interactions with other individuals are most affected is the period of adolescence (Carducci & Zimbardo, 1995; Alm & Lindberg, 1999). There are great changes not only in individual's physique but also in his/her social life. Shyness can become a major problem of adolescent period, a process in which individual can meet with his/her basic needs such as belonging to a group, being approved by a group, expressing himself/herself and understanding others and thus recognizing himself/herself. The most important anxiety of adolescent period is acquiring identity. Shyness negatively affects individuals' chance to develop successful identity and their psychosocial developments (Hamer & Bruch, 2002). This situation makes it essential to take protective measures that will enable adolescents to cope with shyness, make them feel psychologically better and need more social support (Williams & Galliher, 2006).

Booth, Barlett & Bohnsack (1992) characterize lonely students as individuals who are probably restricted socially and thus whose interpersonal skills are not developed. It is assumed that people with sense of shyness have less number of friends since they do not participate much in social environments. This is known to push them further into loneliness. Rejection arises from shy individuals' not participating in social environments and not having sufficient social skills (Carducci 2000). Shy individuals are doomed to loneliness as a natural result of estranging themselves social environments (Carducci & Zimbardo 1995).

The purpose of the study is to examine the effect of problematic mobile phone use on the feelings of shyness and loneliness in accordance with several variables. For this purpose, answers to the following questions are sought:

- 1- Is there any significant difference between Problematic Mobile Phone Use and the feelings of Shyness and Loneliness in terms of gender?
- 2- Is there any significant difference between Problematic Mobile Phone Use and the feelings of Shyness and Loneliness in terms of place of accommodation?
- 3- Is there any significant difference between Problematic Mobile Phone Use and the feelings of Shyness and Loneliness in terms of internet use?
- 4- Is there any significant difference between Problematic Mobile Phone Use and the feelings of Shyness and Loneliness in terms of place of residence?
- 5- Is there any significant difference between Problematic Mobile Phone Use and the feelings of Shyness and Loneliness in terms of grade level?

## Method

### Research Model

Research is a correlational study that aims at explaining relationship between Problematic Mobile Phone Use and some selected variables.

The dependent variables of the research are Problematic Mobile Phone Use, Shyness and Loneliness and its independent variables are gender, grade level, state of accommodation, whether internet is used or not and place of residence.

### Study Group

In data collection phase of the research, 273 students, studying in Education Faculty and Faculty of Science and Letters at Sakarya University in the academic year of 2012-2013, were given surveys. Of the respondents, 62.3 % of them were female students, 37.7% of them were male students.

### Tools of Data Collection

#### 1- Problematic Mobile Phone Use Scale

Problematic Mobile Phone Use Scale was developed by Bianchi and Phillips and scale's validity and reliability were tested (Bianchi and Phillips 2005). Scale was published as 27 items. In the calculation of the internal consistency of the scale Cronbach's Alpha was calculated as 0.93. This result indicates that scale has quite a high reliability, options were homogeneous in terms of internal consistency and were quite related with the structure of problematic mobile phone use. In another study conducted on reliability, relationship between problematic mobile phone use and weekly-time spent on the phone was examined. In the calculation of Pearson correlation coefficient used in the research, correlation coefficient was obtained as  $r=0.45$ ,  $p < .001$ . This result shows that there is a strong correlation between problematic mobile phone use and weekly-time spent on the

phone. In a study conducted on validity, problematic mobile phone use scale was used together with another mobile phone addiction scale with high validity and reliability. Correlation coefficient was calculated as  $r=0.34$ ,  $P < .001$  in both applications. This coefficient indicates that there is a strong relationship between these two scales. Scale was one-dimensional and this structure, consisting of 27 items, explained 74.45% of total variance (Bianchi and Phillips 2005). After obtaining necessary permission from the developers of this scale, Adriana Bianchi and James G. Phillips through e-mail for starting adaptation works of the scale, adaptation procedure related to this scale was commenced. After creating Problematic Mobile Phone Use Scale in 27 times, necessary changes were made upon obtaining opinions of specialists. It took almost 25 minutes to fill the scale. Participants of the scale marked their participation level in each statement found in the scale between it doesn't describe me at all (1) and it describes me very well (5). In the marking process, the score of 1 at lowest and 135 at highest can be obtained. Higher scores indicate higher problematic mobile phone use (Şar, A. H., Işıklar, A.. 2012).

The process of translating scale into Turkish was carried out by researchers. After having been translation by researchers, scale, transformed into a structure containing original item, translated item, and proposals to be taken, was distributed to specialists in order to obtain their opinions. For obtaining specialist opinion, it was given to 9 specialists working in the fields of Guidance and psychological counseling (4), English language (2),

Turkish language (1), Computer and Instructional Technologies (1) and Measurement and Evaluation (1). In the forms given for expert opinions, appropriate and inappropriate statements were included for each item and specialists were asked to mark whether each item is appropriate or inappropriate. Experts were divided into two as language specialist and field specialist and their opinions were evaluated accordingly. For each item, 80% of appropriateness was sought and items, receiving below this rate, were corrected in accordance with the suggestions obtained from experts. The structure of the scale was prepared as: it does not describe me at all (1), it describes me a little (2), it describes me quite well (3), it describes me well (4) and it describes me best (5). After these changes, scales were distributed again to get their opinions and the result at the minimum 80% of appropriateness was achieved for all items (Şar, A. H., Işıklar, A.. 2012).

## 2. UCLA Loneliness Scale

Being developed by Russel, Peplau and Ferguson (1978), UCLA Loneliness Scale (University of California Los Angeles Loneliness Scale) was, later on, revised by Russel, Peplau and Cutron (1980) and items of the scale were re-arranged in a way that half of the items would be positive and the other half would be negative (cited by Demir, 1989). For example, one of the items of the scale is "I feel in harmony with the people around me." The adaptation work of the scale was carried out by Demir (1989), the internal consistency coefficient was as  $\alpha = .96$ , and test-retest test reliability was found to be  $r = .94$ . UCLA loneliness scale consists of 20 items of which 10 were directly coded and other 10 were coded in the opposite direction. Individuals were asked to indicate at what frequency they experience situations found in items on a four-point Likert-type scale. Scale was marked by giving scores to items containing statements in positive direction such as "I never experience it" 4, "I rarely experience it" 3, "I sometimes experience it" 2, and "I often experience it" 1, whereas the items containing negative statements were marked in exact opposite of this such as: "I never experience it" 1, "I rarely experience it" 2, "I sometimes experience it" 3, and "I often experience it" 4.

## 3. Shyness Scale

The shyness level of students was determined by using a 20-item "Shyness Scale" developed by Güngör (2001). Shyness Scale, originally developed by Cheek and Buss in 1981 as a 9-item scale, and later on, number of its items were increased to 13 by Cheek in 1983, was used with the purpose of revealing the shyness levels of the individuals. Standard scale method was chosen in the validity process of original scale and Social Anxiety Scale was used as a standard scale. As a result, correlation of .77 was found between shyness and social avoidance and that of .86 were found between shyness and social anxiety. In addition, individuals were asked "how much is shyness problem for you?" and a correlation of .68 was obtained between the responses received and shyness scale scores. In the reliability work of the scale, Cronbach Alfa, which was calculated in order to determine internal consistency, was found as .90. The second method used for determining the reliability of the scale was test-retest test method. Scale was applied twice with the interval of 45 days and a correlation of .88 was found between these two applications.

In Turkey shyness scale was adapted into Turkish by Güngör (2001) and its validity and reliability were confirmed. In the process of adapting scale, firstly, scale was translated into Turkish and expert opinion was referred to in order to measure whether statements in this translated scale reflect "shyness" or not. Secondly, 300 university students were asked an open-ended question of "at which situations they feel shy?" and thus a list was made. Items that are same or similar to the list created from the responses students gave and to the items in Cheek's shyness scale were taken out and 7 items obtained from the responses students gave were added to

Cheek's 13-item scale and thus a new 20-item scale was created. Güngör, (2001) found the reliability coefficient of scale obtained by test-retest test method as .83 and Cronbach Alfa coefficient, calculated with the purpose of determining internal consistency as .91. For scale's validity, "Related Validity" method was used and "Self-Assessment Inventory in Social Situation" was used for this purpose. The relationship between them was found to be .78. Factor analysis, conducted with the aim of construct validity, concluded that scale would be assessed as one-dimensional. Shyness scale is a 5-point Likert-type scale consisting of 20 items, containing statements with the aim of determining how shy individuals perceive themselves to be and feelings and behaviors they can manifest. Scale is applied by asking individuals to choose one of the choices found next to statements in the scale such as "Never Applicable," "Not Applicable," "Undecided," "Appropriate," and "Very Appropriate." Shyness scale was scored by giving scores following statements: "Never Applicable" 1 (One), "Not Applicable" 2 (Two), "Undecided" 3 (Three), "Appropriate" 4 (Four) and "Very Appropriate" 5 (Five). Highest score that can be achieved from the scale is 100, whereas the lowest score is 20. Individual with high score indicates that he/she perceives himself/herself to be "shy."

### Analysis of Data

In this research, whether problematic mobile phone use and feelings of shyness and loneliness differ or not is being examined. During data analysis, t test was used in the analysis that was aimed to determine whether there is a meaningful difference between the averages in the cases of two variables and ANOVA test was in the cases of multiple variables and Tukey test was used in determining the source of difference in cases where difference was present. SPSS 15.0 package program was used for processing data.

### 3. Findings and Comments

#### *1- Is there any significant difference between Problematic Mobile Phone Use and the feelings of Shyness and Loneliness in terms of gender?*

Table 1: Mean averages, standard deviation and t-Test results related to the scores of Problematic Mobile Phone Use, Shyness and Loneliness in terms of gender.

		N	X	SS	Sd	t	p
PMK	Female	166	47.83	13.92	267	-2.70	.007
	Male	103	53.25	18.80			
Shyness	Female	166	50.48	15.21	260	-1.71	.088
	Male	103	53.80	16.01			
Loneliness	Female	166	50.78	5.54	267	2.62	.009
	Male	102	48.86	6.26			

p<.05

As can be seen in Table 1, significant difference was found between problematic mobile phone use and gender variable. It can be stated that male students use mobile phones more than female students. Significant difference was found between feeling of loneliness and gender variables. It can be seen that female students experience the feeling of loneliness more than male students. No significant difference was found between the feeling of shyness and gender variable.

**2- Is there any significant difference between Problematic Mobile Phone Use and the feelings of Shyness and Loneliness in terms of place of accommodation?**

Table 2: Mean averages, standard deviation and t-Test results related to the scores of Problematic Mobile Phone Use, Shyness and Loneliness in terms of place of accommodation.

		N	X	SS	Sd	t	p
PMK	Home	145	48.17	16.45	267	-1.91	.05
	Dormitory	124	51.93	15.60			
Shyness	Home	148	50.03	15.07	270	-1.98	.04
	Dormitory	124	53.78	16.98			
Loneliness	Home	146	49.53	6.03	267	-1.58	.11
	Dormitory	123	50.67	5.67			

$p < .05$

Significant difference was found between problematic mobile phone use and place of accommodation variable. It can be stated that students living in dormitories use mobile phones more than students living at homes. Significant difference was found between feeling of shyness and place of accommodation variable. It can be seen that students living in dormitories experience the feeling of shyness more than students living at homes. No significant difference was found between the feeling of loneliness and place of accommodation variable.

**3- Is there any significant difference between Problematic Mobile Phone Use and the feelings of Shyness and Loneliness in terms of internet use?**

Table 3: Mean averages, standard deviation and t-Test results related to the scores of Problematic Mobile Phone Use, Shyness and Loneliness in terms of internet use.

		N	X	SS	Sd	t	p
PCP	Yes	222	49.48	15.16	267	-.92	.35
	No	47	51.93	20.24			
Shyness	Yes	225	50.89	15.64	270	-2.04	.045
	No	47	55.78	14.76			
Loneliness	Yes	222	49.94	5.81	267	-.631	.50
	No	47	50.57	6.28			

$p < .05$

Significant difference was found between problematic mobile phone use and internet use variable. It is seen that students, who do not use internet, experience more shyness than students who use internet. No significant difference was found between the feeling of loneliness and internet use variable as well as problematic mobile phone use and internet use variable.

**4- Is there any significant difference between Problematic Mobile Phone Use and the feelings of Shyness and Loneliness in terms of place of residence?**

Table 4: Tukey Test Results according to place of residence and shyness.

Place of residence	Type of Place	Mean Difference (I-J)	Standard Deviation	p
City Center	District	-1.46	2.00	.883
	Town	1.03	6.45	.999
	Village	-8.75*	3.37	.049
District	City Center	1.46	2.00	.883
	Town	2.50	6.48	.980
	Village	-7.28	7.03	.148
Town	City Center	-1.03	6.45	.999
	District	-2.50	6.48	.980
	Village	-9.78	7.03	.506
Village	City Center	8.75*	3.37	.049
	District	7.28	3.42	.148
	Town	9.78	7.03	.506

A significant difference was found between place of residence and feeling of shyness in Tukey test conducted for determining the source of difference between students' place of residence and sense of shyness. It was seen that students living in villages were shyer than students living in cities. No significant relationship was found between students' place of residence with problematic mobile phone use and the feeling of loneliness.

**5- Is there any significant difference between Problematic Mobile Phone Use and the feelings of Shyness and Loneliness in terms of grade level?**

Table 5: ANOVA Results According to Grade Level

Feature	Source of Variance	Total of Squares	St.d	Mean Average of Squares	F	p
PCT	Inter-groups	947.46	3	315.82	1.214	,305
	Within-groups	68963.22	265	260.24		
	Total	69910.68	268			
Shyness	Inter-groups	710.763	3	236.921	,976	,405
	Within-groups	65057.222	268	242.751		
	Total	65767.985	271			
Loneliness	Inter-groups	126.071	3	42.024	1.215	,305
	Within-groups	9168.093	265	34.597		
	Total	9294.164	268			

As shown in Table 4 above, no significant difference was found between grade levels that students study with problematic mobile phone use and loneliness and shyness variables in the ANOVA test conducted.

### Discussion

Significant findings were obtained from the factors causing increase in the feelings of loneliness and shyness in the individuals in various scientific studies conducted. Zimbardo (1977), explaining the way shyness affect social relationship, states that “shyness makes it difficult to think clearly and to establish effective communication.” Shy individuals are concerned not with social life, environment they are in, or other people, but are constantly concerned with their own behavior. When they remember their negative believes, they feel quite stressed and their shyness increases (Carducci & Zimbardo 1995).

The research, which we conducted, revealed that students, who grew up in rural areas (Village-Town), were shyer than students who grew up in cities. Individuals, who grew up in villages, fall under the influence of culture they grew up with and the way of growing up. This finding that we obtained supports the opinions mentioned above.

In a research discussing the effect of social skills training program on the shyness level of adolescents, it was seen that social skills training programs have positive impact on the shyness levels in coping with shyness (Kozanoğlu:2006). In our research, it was seen that students living in dormitories carry more sense of shyness than students living at homes. This fact makes it essential to prepare a variety of functional types of programs in order for students living in dormitories to be able to spend their time effectively and to develop their social skills. Looking at the results of this study, it is thought that there will be a significant decrease in shyness levels provided that social skills training program are prepared for students of higher education and students participate in these programs. At the same time, this will also reduce problematic mobile phone addiction.

In a research conducted by Öztunç (2012) on the effect of loneliness and shyness on problematic mobile phone use, when shyness and loneliness correlations, which are taken as predictor variables, were examined, it was identified that there is a positive meaningful relationship between shyness and loneliness ( $r=353$ ). In this case when shyness increases, loneliness also increases. It is seen that shy individuals prefer to be alone and refrain themselves from making friends or remaining in that environment.

Again in the same research, a positive significant relationship was determined between shyness and problematic mobile phone use ( $r=232$ ) and it was concluded that when shyness increases, problematic mobile phone use also increases. There is also a positive significant relationship between loneliness and Problematic Mobile Phone use ( $r=225$ ). When loneliness increases, problematic mobile phone use also increases considering this situation. According to results obtained from data, it is observed that, generally speaking, states of shyness and loneliness increase the problematic mobile phone use. It became the subject of our research to determine at what extent various variables such as gender, place of accommodation, grade level, internet and environment of birth and bringing up affect problematic mobile phone use, and situations of loneliness and shyness. In general context, even if not much effect of these variables was seen, some results that were obtained support the results of the above-mentioned research.

### **Conclusions and Recommendations**

It is not a desirable situation to see that feelings of shyness and loneliness show continuity in the individual. It is also known that individuals are not pleased with the feelings of loneliness and shyness that they experience. Adolescence is a period in which shyness is intensely seen and shy individuals are most affected. Therefore, shyness is very serious problem for university students who are in the last period of adolescence and at the beginning of adulthood (Öztunç,2012). Öztunç, in a study he conducted, found significant relationships between shyness and loneliness, shyness and problematic mobile phone use and loneliness and problematic mobile phone use. It was observed that when feelings of loneliness and shyness increase in individuals, problematic mobile phone use also increases. In our study, we found a significant relationship between gender factor and problematic mobile phone use. It was also observed that male students use more problematic mobile phones compared to female students. The reason for this is not really possible to predict. No significant relationship was found between gender factor and feelings of loneliness and shyness.

Significant difference was found between problematic mobile phone use and place of accommodation. It was seen that students living in dormitories use more problematic mobile phones than students living at homes. Similarly, it was seen that students living in dormitories carry more feeling of shyness than students living at homes. It is assumed that limited facilities of students living in dormitories in comparison with students living at homes, entering-exiting times, rules and insufficiency of dormitory facilities for students to pass their time can cause them to turn to problematic mobile phone use. No significant difference was found between feeling of loneliness and place of accommodation variable.

In our research, significant difference was found between feeling of shyness and internet use. It is seen that students, who do not use internet very frequently in their daily lives, feel much shyer than students who use it. Students, who communicate with others and develop their social aspects by frequently using internet, are expected to carry less sense of shyness. In a sense, it can be interpreted that using internet reduces the feeling of

*Mustafa ÖZTUNÇ/ Procedia - Social and Behavioral Sciences 00 (2012) 000–000*

shyness. No significant difference was found between feeling of loneliness and internet use variable and between problematic mobile phone use and internet use variable.

As can be seen in Table 4 above, no significant difference was found between students' grade level and problematic mobile phone use, loneliness and shyness variables in ANOVA test conducted.

No significant difference was found between place of residence and feeling of shyness in Tukey test conducted with the aim of determining the source of difference between students' place of residence and feeling of shyness. Those who grew up in rural areas like a village were seen to be shyer than those who grew up in cities. The reason for this is thought to be arising from effects of village life being more closed and controlled, the way families raise their children and of social and cultural life. No significant relationship was determined between students' place of residence and problematic mobile phone use and feeling of loneliness.

If an overall assessment is needed to be made in terms of the effects of several variables on problematic mobile phone use, and feelings of loneliness and shyness, students can be suggested to get psychological counseling and guidance services adequately primarily in pre-school, primary school, secondary school and high schools in order to cope with these negativities. It is necessary to render guidance services more active and to healthily carry out student personality services at schools. Most of the students in primary, secondary, high school and higher education have mobile phones with internet access and they spend time with their mobile phones even during the class. This prevents them from acquiring sufficient academic skills and behaviors. This situation, which is thought to increase addiction, also contributes to the increase in feelings of shyness and loneliness in individuals. Our children and young people use internet more as tools of fun and chatting rather than accessing information. This prevents them from using their leisure time effectively and efficiently. At the same time, this constitutes an obstacle to socialization and also hampers students' reading books, sportive activities and studying their regularly. Increasingly widespread use of mobile phones in our country has come down to the level of primary school students. It is necessary to impose limitations on problematic mobile phone use. It is suggested that students studying at higher educational institutions should be encouraged to participate in social activities and advisory services and especially student personality services should be conducted in a healthy manner.

In the studies to be conducted after this, it can be suggested that variables such as provinces where institutions of higher education are located, campus areas where schools are situated and facilities universities offer to students etc., should be discussed, their effect on the states of loneliness and shyness should be researched and whether these variables increase problematic mobile phone use or not should be examined.

# An assessment of critical thinking skills based architectural project course in terms of student's outputs

Gözde Çakır<sup>a\*</sup>, Bengi Yurtsever<sup>b</sup>

<sup>a</sup>Karabük University, Safranbolu Fethi Toker Fine Arts and Design Faculty, Department of Industrial Design, Karabük 78600, Turkey

<sup>b</sup>Yıldız Technical University, Graduate School of Natural and Applied Sciences, Programme of Architectural Design, İstanbul 34349, Turkey

## Abstract

There is a judgment and interrogation deed in the origin of the word of criticism. This interrogation is a process that could occur by asking questions, by establishing empathy. Critical thinking requires thinking a lot of things at the same time. Therefore, to see that only the positive or negative aspects of a thing might not be enough. Important point is to see both aspects at the same time, be able to make transition between them and at this time is to find a “new” one.

Being with a critical approach to the design process in architectural education is thought to include a loop that keeps the process alive, to make dynamic training process. Constantly, rapidly opening of different subject to be discussed nowadays, adopt to this speed and nor using the existing data rethinking in multiple environments may be realized with critical thinking skills.

In Karabük University Safranbolu Fethi Toker Fine Arts and Design Faculty Department of Architecture, 2011-2012 academic term, fall semester, ARCH305 Architectural Project 5's term project includes varies exercises with the aim of to boast the students' this skills. Mentioned with varies exercises emphasized that students could make criticize for familiar situations, could look to them by interrogating. There was a competition whose subject was criticized of housing estate organized by TMMOB Chamber of Architects Ankara Office. The competition subject was decided the main project subject of the semester. At the end of the process a student in this class won a prize.

Target of this study is to discuss the importance of critical thinking skills in architectural education with supporting term project. In this way both architectural educations will be rethinking and to discuss how to approach can be found a “new” one in architectural education nowadays.

Keywords: critical thinking, architectural education, architectural competitions.

## 1. Introduction

Architecture is defined by the following statement; “the making of architecture calls for clear thinking, but this is a specific embodied mode of thought that takes place through the senses and the body, and through the specific medium of architecture” in the book, named “The Eyes of the Skin”, which is written by Pallasmaa (2011). He remarks that freethinking is the core of the architecture, and the process of experience and expression of this freethinking can be satisfied via senses. In architecture, the freedom of these senses is important. This freedom provides critical thinking about environment. To look with an investigating and interrogating eye, and to experience the environment with such a point of view have a potential to product “new”s on that environment. Otherwise, all of the products will be same with each other, whereas architecture should be a discipline which can be expressed with individual view. One of the most important aims which are expected to be earned by students during the education process is getting over their frame, and having awareness about requisiteness of

\* Corresponding author. Tel.: +0370-712-87-07.

E-mail address: cakrgozde@gmail.com

multiple points of view. Ponty states that the mission of Cezanne's paintings is "to make visible how the earth touches us". Pallasmaa (2011) adopts this view and states that architecture's mission is also similar.

It is emphasized by Pallasmaa (2011) that the architect is in a contrary perspective continuously. Actually, this contrary perspective is a point of view which people should have at the process of their own investigation. Reaching to a conclusion by considering the statement of Aalto, which indicates that "in every case one must achieve a simultaneous solution of opposites", by the help of the mutual interrogations forms the basics of the comprehension of the architecture.

Architectural education in Turkey possesses some contradicting points in itself. The links between some related processes are broken, so these processes, which should be handled as a whole, are alienated from each other. In this context, the main aim of these studies is to convey a process about the experience between educational and practical environment, the absence of which is one of the most serious problems of the educational system. The following questions are interrogated by project team; how can the integrity between the theory and the practice be provided and how can the students become aware of the relations with their environments. Sharing the term project process that is supported by Pallasmaa's ideas is also aimed.

## 2. Architectural Education

The architectural environment of the present time has a set of problems, which are especially related to the education. However; the rapid lifestyle, which has been adopted during the last century, prevents the interrogation of these problems and causes the acceptance of them as they are. When the problems are not seen from a critical point of view, the products that are constructed become identical one with another, whereas it is required that the qualifications of these products should have variances due to the variation of the environmental factors. The students should adopt the awareness of this fact in the first place, so that they can interrogate and think about the variation of necessities for different environments. Increasing this awareness and transforming it to experience and consciousness is a personal gain, the effects of which can be varied from person to person. This gain is notably important for the process of architectural education.

In this context, one of the most important problems is that the fields of architectural education and of the practical area are not supporting each other. However, the architecture is a pattern that should collate these two fields. Summer practices, which are done to provide the integration between the fields of practice and education, are limited only with a little learning of technology related to the work (Yürekli and Yürekli, 2004). Nowadays, the architectural education, which covers the theoretical aspects, ignores the practical aspects. Final products are constructed with the theoretical basis provided by the universities. In fact, not only the final products, but also the process used to achieve these products is important. But each institution has its own approach, and there are some institutions which do not have a process like this. On the other hand, in the field of practice, the mechanism of the capitalist approach is dominant in the applications, and mostly the process is ignored. For this type of a final production, which does not have an apprehension, the identicalness and the qualifications of the products are seen to be insignificant, but quantity is at the foreground.

In this education system, students are pushed into a dilemma at the debut of the undergraduate studies. The students, who get the feeling of the necessity of the choice between these two situations, adopt the practical field in order to choose the real one but cannot link that field to educational knowledge. So they don't care the education and ignore it. At this point, the students mostly adopt the concrete products, because samples that they experience from their environment provide such a mechanism or a thinking way of architecture. However; it is emphasized that the architecture should has a holistic point of view and involve both abstract and concrete approaches together. For this reason, it is required that the qualifications of the architectural education should possess this type of an integrative point of view.

From frame of this theoretical basis, in this report one semester studio with juniors of the Department of Architecture of Karabuk University Safranbolu Fethi Toker Fine Arts and Design Faculty will be shared. At that experience process, a competition subject was given to students as their semester studio project topic, which was launched nearly at the same time. Notice that, the same topic is analyzed in different universities in Turkey at the

same semester. At the end of the process, a lot of subjects, which are thought to be unrelated by students, are discussed on the content of unity. Sharing about semester, process, team and studies are discussed under the title of “Term Information and Project Process” in detail.

### 3. Term Information

One semester of architectural project education program, which was prepared for the junior students of the Department of Architecture in the Safranbolu Fethi Toker Fine Arts and Design Faculty in Fall semester in 2011-2012 Academic Year, was examined in this study.

At the beginning of academic semester, a meeting was organized by academicians; Prof. Aydan Balamir, Asst. Prof. Timuçin Harputlugil, Lect. Fatih Dökmeci, Lect. Elif Köse, Res. Assist. Bengi Yurtsever, Res. Assist. Gözde Çakır. At the end of the meeting, the purpose of architectural project was determined as the concept of housing and existing housing environment to be interrogated by thinking the concept of social in Turkey and alternative idea project to be obtained. Accordingly, it was aimed at developing alternatives models of housing for social housing applications in Turkey.

As part of Urban Dreams Project Idea Contest, “sosyal@sosyalikonut” national student idea project competition was organized by the Chamber of Architects Ankara Branch Office (Url-1, 2013; Figure 1). This competition has chosen project course subject because aim of course was parallel to that of competition; students of architecture would catch a chance to compare themselves to other participating students in competition; experience of competition would provide positive contributions in their architectural profession; and competition would increase motivation to work for the period.

Figure 1. “sosyal@sosyalikonut” competition web site.

### 4. Project Process

The first week in semester the project subject was announced to students and specification of competition was distributed. Second week, group of project organized a technical trip to Ankara Mamak Municipality which is field of project (Figure 2, 3). Students explored the field of project, obtained maps and information about Mamak region from the municipal authorities. Students got information about their expectations from urban transforming by interviewing with the habitants of “Mamak” region (Figure 4, 5).

Figure 2. Mamak, competition's project area.

Figure 3. Mamak, competition's project area.

Figure 4. Technical trip to Mamak.

Figure 5. Technical trip to Mamak.

Students analyzed of the region by dividing into groups. They learned intense of the current population, rates of young population and unemployment, and the values of the area, public transport networks, and the existing buildings. By using this information, they prepared analysis presentations and abstract model. Once groups had given own design decisions, students divided in order to begin individual design stage.

By the time the semester finished, students had continued getting critics about their projects. In addition to project subject, academicians focused on ecological problems of current architecture; students were given readings on ecology. At the end of these readings “room with garden” and “60m<sup>3</sup>” projects were studied, students were asked to use knowledge, obtained from these studies, on their projects.

During the period students watched social housing documentaries, including housing applications of famous architectures and providing physical and social transformation at the same time. Students prepared reports concerned with these documentaries at the end of the semester.

34 student projects were evaluated by academician at the final exam and successful students were encouraged in order to participate in the competition (Figure 6, 7). Although some students are successful in final exam, they didn't want to participate in the competition.

Figure 6. Final jury.

Figure 7. Final jury.

In this competition, 43 student projects were evaluated and as one of our students, Eyyüp Türker's project was awarded and this condition satisfied his lecturers and friends (Figure 8, 9, 10). In addition, students had a chance to see other projects which were exhibited in competition colloquium.

## 5. Conclusion

Observation and experience of different approaches of the process of solving the problems on architectural education is very important. The semester which is experienced with the students of Karabuk University is also important in this context. On the other hand, this does not mean that "this problem can easily be solved with a simple competition". But it has been an intermediary which focuses the students to their architectural projects, also providing them to pass a pleasant semester. Getting involved in the subject always supports products of project at this process. Every participant compares their locations, problems, user components related with the project in a multi suggestion environment. This situation develops a way of thinking in a critical way and this critical point of view is not only directed to their own projects, but they also think about the other's projects. Students achieve awareness about the problem which is related to architectural environment, and one of the most important results of this may be that, they interrogate and search with their own ideas. Additional works, readings, movies which are done in semester, have always been in a supportive contribution to these productions. One year later, in another semester, with different students, another competitive project strategy is given, because of the positive effect on the process of previous semester. It is observed that similar gains are occurred at that semester too.

In short, it is thought that arguing over competition subject in the content of courses provides to students to feel closer to their own projects and to study in a more pleasant way. Generally, it is possible to say that the process' gains are in a "positive" way. But, it is thought that this process can be enriched by trying some alternative options. Actually, "critical thinking" is not observed only on the general study process of students, but

also observed on instructors with evaluating their approaches, and this makes this process holistic. In other words, the gains of this process are not on one way or static which is adopted only by students, but it is also adopted by instructors, so it is dynamic. By this way, this process becomes an act which has mutual gains pervasively.

## Abstract

Teacher education has always been a main concern in the English Language Teaching (ELT) domain. Starting from the very beginning of educating student teachers from their freshman year, ELT departments want to show their students who are prospective language teachers the best new techniques and approaches in ELT. Thus, ELT departments design their curriculum according to the latest developments in the field so that their students can benefit the utmost and apply their academic knowledge in their future teaching careers. This leads naturally to continuous learning and development in teachers' careers. Teacher training programs are held in order to remedy this issue. The aim of this study is to evaluate the effectiveness of these teacher training programs, to what extent instructors who work at both public and private universities benefit from these trainings, and finally attempts to find out if there is any other factor that influences the effectiveness of these programs.

**Keywords:** teacher training programs, effectiveness of teacher training programs, continuous learning and development.

## 1. Introduction

The world of education is getting more and more technical and more complex day by day and that is why teacher education is paid the utmost attention: To raise competent educators who are able to follow the latest innovations as well as being creative when tailoring curricula according to the needs of their learners. To raise a competent teacher is an issue for faculties of education. However, no matter how feasible a curriculum for prospective teachers is when designed during their university education, the need for lifelong learning and continuous improvement for teachers continues to be a necessity to incorporate the many rapid and comprehensive innovations in the world of teaching.

In the world of English Language Teaching (ELT), teachers often feel the need to refresh themselves with the newest teaching techniques and approaches to make the most of their teaching for their learners. In today's ELT world, it seems almost impossible to stick with one approach or technique for every kind of learner. The innovations are vast, and keeping up with them is thus hard work, particularly if teachers do not have a notion of how to benchmark and implement new ideas and teaching approaches in their classrooms and teaching philosophies. For teachers of English to have relevant views and to raise awareness in them is the fundamental aim of approaching ELT in an eclectic way both for teachers and curriculum designers alike. A language teacher

is required not only to be proficient in using the target language, but also to be knowledgeable about the rules and conventions that govern its use in an authentically communicative context (Liyanage & Bartlett, 2008, p. 1829).

As mentioned above, Teacher Development (TD) as a whole is considered to be one of the main goals within the domain of ELT. “Much of the impetus for change in approaches to language teaching came about from changes in teaching methods. For this reason, the quest for better methods was a preoccupation of many teachers and applied linguists throughout the twentieth century” (Richards & Rodgers, 2001, p. 1). Therefore, to train creative practitioners of the eclectic approach in the world of ELT, a lifelong process of TD is needed for better outcomes in terms of teaching in different environments. Teachers should be willing to evaluate and reform their teaching under the influence of TD. TD is crucial in following the latest innovations in their domain, designing and evaluating their curricula, and finally being a reflective educator. This is the reason why being a “reflective” and creative teacher is the desired outcome of many teacher training programs (TTP). The best answer to the quest for one’s own personal and integrated understanding of how people learn a second language is an eclectic application of methods: “[T]here is no single theory or hypothesis which will provide a magic formula for all learners in all contexts. [The] teacher will be urged to be as critical as he can in considering the merits of various models and theories and research findings” (Brown, 2000, p. x). However, as Brown suggests “the problem of raising capable teachers who are creative enough to tailor their lessons according to their learner needs still remains unsolved” (p. x). What teachers learn as pedagogic content knowledge at university programs may not be readily viable in the actual teaching world (Liyanage & Bartlett, 2008, p. 1829). Thus, a well-designed TTP to suit teachers’ needs plays a vitally important role.

However, this answer is not as easy as it seems. Being able to learn the best techniques and approaches along with theory does not necessarily mean that they have been internalized properly to the level needed to actualize them in the classroom. “In clear terms teacher development is the process of becoming the best teacher you can be. It means becoming a student of learning, your own as well as that of others” (Scrivener, 1994, p. x). This brings into mind the concept of continuous learning and, therefore, it should be a part of a teacher’s life. “One of the most invigorating things about teaching is that teachers should never stop learning so as to be beneficial to their learners” (Brown, 2001, p. 426). Studies also reveal that teachers exercising more advanced teaching behaviour in their classrooms have better student outcomes. Advanced teaching behaviour comprises the skills concerned with new teaching approaches and differentiation (Kyriakides, Creemers & Antoniou, 2009, p. 12).

The act of teaching is essentially a constant processing of options. “At every point in each lesson a teacher [is required to entertain a great array of options and fulfilments], they can decide to do something, to do something else, or to do nothing at all. In order to become a better qualified teacher it seems crucial to be aware of as many options as possible” (Scrivener, 1994, p. 1). As Davis (cited in Scrivener, 1994) puts forward in his unpublished paper, teacher development is a voluntary process. Moreover, he defines that process as holistic, long term, ongoing and continual. Within that process there is an internal agenda along with awareness based, angled towards personal growth and the development of attitudes and insights. It is definitely non-compulsory and a bottom-up approach. Furthermore, teacher professional development might be of help with the dynamic character of effectiveness since not only do they move to a higher level but it also helps refresh the ones who drop to a lower level for several reasons including burnout (Kyriakides et al., 2009, p. 13). On the other hand, teacher development as learning is carried out by practitioners in collaboration with their colleagues. As many related studies suggest, “teachers must rethink their teaching role in order to facilitate communicative situations suited to the peculiarities of various interactions” (Guasch, Alvarez & Espana, 2010, p. 199).

The term teacher development was coined in the 1980s as something separate and different from teacher training and in reaction against over-rigid and over-behavioristic models of teacher training. The distinction made is between initial pre-service (training) versus continuing in-service (development). Today, the two terms are often used with more specific, contrasting meanings; implying differing approaches to the nature of professional learning (Finocchiaro, 1988, p. 2).

Continuous learning as Brown describes it, takes form in several ways. It can either be through in-service training or special courses which are held by globally-recognized institutions. The process of continuing to develop professional expertise as a teacher is sometimes difficult to manage alone. In a similar point of view, Brandl (2000) states that “having a second method course would further support the notion that becoming a teacher is a long-term process that requires ongoing training and that it constantly changes according to trainees’ developmental stages” (p. 368). The challenges of teaching in a rapidly changing profession almost necessitate collaboration with other teachers in order to stay on the cutting edge (Brown, 2001, p. 426).

Much has been said and written about the importance of continuous learning in teachers’ careers. In language teaching, where major developments arise with surprising rapidity, there is no doubt that teaching professionals need to ‘refresh’ and revise their teaching styles throughout their professional lives. When teachers are exposed to various methods and asked to reflect on their principles and actively engage with their techniques, they can become clearer about why they do what they do. They become aware of their own fundamental assumptions, values, and beliefs (Freeman, 2000, p. x). Taking this one logical step further, Prabhu (1990, cited in Freeman, 2000) states that interacting with others’ conceptions of practice helps keep teachers’ teaching alive. Interaction in this way helps prevent it from becoming stale and overly routinized. Such continuous revitalization should be made regardless of the experience they have acquired (p. x).

As Arends (1998, cited in Freeman 2000) summarizes, “knowledge of methods helps expand a teacher’s repertoire of techniques. This in itself provides an additional avenue for professional growth, as some teachers find their way to new philosophical positions, not by first entertaining new principles, but rather trying out new techniques”(p. x). All in all, teacher development is for everybody who wishes to keep themselves up-to-date regardless of their experience teaching. Last but not least, Larsen-Freeman (1991), sums the situation up nicely: “teachers are not mere conveyor belts delivering language through inflexible prescribed and proscribed behaviours but they are professionals who can, in the best of all worlds, make their own decisions” (Freeman, 2000, p. x).

### ***1.2 The Aspects of Foreign Language Teachers.***

In his research, Borg (2006) nicely puts forward how being a foreign language (FL) teacher is different from being a teacher of another subject. To start with, being a foreign language teacher is in many ways unique within the profession of teaching. “FL teaching is the only subject where effective instruction requires the teacher to use a medium the students do not yet understand” (p. 5). Secondly, effective FL teaching requires interaction patterns, which means group work or pair work is essential. There is also always a “challenge for teachers of increasing their knowledge of the subject” (p. 5). Simultaneously, in some institutions FL teachers may experience the feeling of isolation more than that of teachers of other subjects because of the absence of colleagues teaching the same subject. It is widely accepted that “FL teachers have to find ways of providing extracurricular activities through which naturalistic learning environments can be created” (Borg, 2006, p. 5). At that point the issue of “how” comes to mind. Although there might be many different possibilities, teacher training programs (TTPs) play a key role in meeting this ‘naturalistic learning environment requirement. Due to the reasons mentioned above, TTPs can really be beneficial, as the contents of the sessions are designed according to the needs of the FL teachers (p. 27).

Finally, FL teachers must find ways of creating good teaching and learning environments; creating a good learning environment through tasks is the major concern of TTPs (Borg, 2006, p. 5). All in all, TTPs, if designed according to the principle of fit-for-purpose, may well contribute highly to the development of ELT professionals.

Various reasons have been mentioned above why continuous learning must take place in FL teachers' careers. Therefore, this study aims to shed light on the outcome of TTPs from FL teachers' points of view, thereby attempting to describe: How FL language teachers benefit from TTPs, why they do not feel satisfied after

attending certain TTP sessions, and whether they really feel that there has been any enhancement after attending TTPs.

In other words, the aim of this study is to evaluate the effectiveness of teacher training programs. In particular, this study intends to investigate how much teachers of English as a foreign language benefit from these training sessions, and in which direction their perception improves in accordance with the relevance of these trainings. This study also attempts to find out if some specific factors such as gender, experience and education level influence the effectiveness of the training sessions. The study, therefore, seeks to find answers to the following questions:

1. Do the instructors who have attended teacher training programs (TTPs) feel that they have benefited from these programs?

2. Do certain variables such as gender, experience and education level, affect subjects' attitudes towards teacher training programs?

## **2. The Study**

### **2.1 Population and Sampling**

The population of this study comprises 306 English Language Instructors (all non-natives) selected from 25 University Preparatory Schools in Turkey. In this study, the subjects have been chosen from 25 Participant Universities both private and public. These universities are as follows:

Arel University, Ankara University, Atılım University, Başkent University, Beykent University, Boğaziçi University, Çankaya University, Dokuz Eylül University, Erciyes University, Hacettepe University, İstanbul Aydın University, İstanbul Commerce University, İstanbul University, İzmir University, Kavram Vocational School, Karadeniz Technical University, Maltepe University, Marmara University, Melikşah University, Okan University, Özyeğin University, Sabancı University, TOBB University of Economics and Technology, Yeditepe University and the Air Force Academy.

Convenience sampling method was used to choose the appropriate sample for the current study. Convenience sampling is a non-probability sampling technique where subjects are selected because of their convenient accessibility and proximity to the researcher. The subjects are selected just because they are easiest to recruit for the study. As Castillo puts forth, this sampling method is also used when the researcher is unable to gain access to a wider population, for example, due to time or cost constraints. Thus, convenience sampling generally assumes a homogeneous population, and that one person is pretty much like another, since the sample was colleagues who work in similar environments (Castillo, 2009).

## 2.2 Subjects

The sample of the study was chosen through convenience sampling method from University Preparatory School Instructors in Turkey. Table 1 describes the instructors involved in the study.

**Table 1 Descriptive Statistics of the Sample**

Variable	Groups	<i>F</i>	%
<b>Gender</b>	Female	204	66,7
	Male	102	33,3
<b>Graduation</b>	Faculty of Education	175	57,2
	Faculty of Art and Sciences	131	42,8
<b>Education</b>	BA	159	52,0
	MA	126	41,2
	Ph. D.	21	6,9
<b>International Certificate</b>	Holders	125	40,8
	None holders	181	59,2
<b>Occupational Seniority</b>	1-5 year	100	32,7
	6-10 year	109	35,6
	11-15 year	54	17,6
	16 year and above	43	14,1
	<u>Minimum</u>	<u>Maximum</u>	<u>Mean</u>
<b>Working Hours (Weekly)</b>	4	35	20,1

As is seen from the table above, 66.7% of the foreign language instructors are female and 33.3% of them are male. While 57.2% of the instructors graduated from an education faculty, 42.8% of the instructors are from a faculty of arts and sciences. Participants in the study work between 4 to 35 hours weekly with a mean of 20.1 hours.

## 2.3 Data Collection Instrument

In this study, a questionnaire with two main parts was designed to obtain data about university preparatory school instructors' attitudes towards teacher training programmes (TTPs) at both public and private universities. In the questionnaire a 5-likert scale was applied. The questionnaire is comprised of two parts: one section focuses on subjects' academic and personal background and the other has 45 questions specifically

designed to elicit relevant answers and attitudes towards TTPs. All of the questionnaires were pilot tested with 20 English Language Instructors. The layouts of the questionnaires were designed accordingly before the actual study. Before the questionnaires were handed out to the instructors, a cover sheet explaining the purpose of the study, asking for their cooperation and assuring that their responses would be kept confidential was added in order to make the study meaningful for the subjects.

After the pilot study questionnaires had been completed, it was found that 5 extra questions had to be added in order to cover all research questions. Out of 50 questions, 16 of them are reverse questions and the rest are direct questions. The questions in the questionnaire were mixed up in order to elicit the true attitudes and feelings of those who attended teacher training programs. The reverse questions were also included for the same reason during the design of the questionnaire.

## 2.4 Data Collection Procedure

Twenty five universities were found to be available to circulate the questionnaires to be answered by the instructors. After that, the questionnaires were printed out and sent via post to addressees throughout Turkey. After a couple of weeks' time the institutions started to post the envelopes back to the researcher's address. A total number of 306 subjects answered the questionnaires and sent them to the researcher. The participation number for each institution differed. Out of 25 Universities some contributed to the study with 30 subjects, whereas some sent 15 or so back because the questionnaires were completed on a voluntary basis. Some of the instructors failed to complete questionnaires due to various reasons.

### 2.4.1 Occupational and Personal Information Form

In this form, instructors' gender, faculty in which they studied, educational degree, international certificates (if there are any), occupational seniority and working hours (weekly) were asked (Table 1).

### 2.4.2 Effectiveness of the Teacher Training Scale

In the second part of the questionnaire, instructors were asked the effectiveness of the teacher training programmes, seminars and/or workshops in their profession. Fifty questions were asked on a 5-type likert scale (1=totally disagree/never to 5=totally agree/always). The scale's items, mean scores and standard values are given below in Table 2.

**Table 2 Means and Standard Variation Values of the Items**

ITEMS	<i>X</i>	<i>sd</i>
1. I feel adequate in reading analysis	4,30	0,68
2. I feel competent in the conduct of reading in-class activities.	4,15	0,75
3. I give reading homework as follow-ups to be used in reading courses.	3,59	0,84
4. I utilize authentic materials in reading courses.	3,59	0,87
5. I do "warm-up" activities in reading courses.	4,47	0,75
6. I prefer audio-lingual method in grammar teaching.	3,14	1,13
7. I use teacher-centred approach in reading courses.	3,51	1,06
8. I use content-based teaching.	3,83	0,74
9. I give homework for writing as the follow-up of reading courses.	3,36	0,87
10. I do grammar-based activities in reading courses.	3,40	0,94
11. I hold "student-centred" teaching approach in reading courses.	3,80	0,78
12. I give homework for pre-reading activities.	3,10	1,15

13. I use grammar-translation method in grammar courses.	3,52	1,01
14. I conduct speaking activities as follow-ups in reading courses.	3,84	0,72
15. I practise “step-by-step” method in writing courses.	3,96	0,78
16. I do not consider the necessity of doing “schemata” in reading courses.	3,31	1,52
17. I do “warm-up” activities prior to reading courses.	4,28	0,85
18. I hold the necessity of “schemata” in listening courses.	4,40	0,77
19. I explain the rubrics in listening courses.	4,09	0,96
20. I give homework in the aftermath of reading courses.	3,21	0,91
21. I do not consider “student-centred” activities necessary in listening courses.	3,40	1,45
22. I hold the necessity of the activities for guessing meaning from context and vocabulary from context in reading courses.	4,64	0,59
23. I feel competent about the various activities learned to be used in listening courses.	3,84	0,82
24. I ask students to do synonym, antonym, vocabulary and phrasal words activities in reading courses.	4,03	0,76
25. I ask the students to do writing works during the writing courses.	2,97	0,95
26. I extend the post-listening activities into speaking and writing courses.	3,68	0,80
27. I utilize schemata activities in writing courses.	4,01	0,85
28. I believe in the necessity of Q&A, role plays and related in-class activities as a part of speaking courses.	4,29	0,85
29. I don't consider process-oriented approach as proper in writing courses.	3,46	1,52
30. I conduct activities for the improvement of essay-writing.	4,05	0,81
31. I conduct activities for sentence-construction in writing courses.	3,57	0,90
32. I consider that student studies be evaluated as “holistic” in writing courses.	2,45	1,04
33. I do not take “culture-gap” into consideration in speaking courses.	3,48	1,45
34. I think sentence-construction is enough for paragraph-making in writing courses.	3,61	1,24
35. I utilize adequate authentic materials in speaking courses.	3,45	0,80
36. I hold that students' studies be “analytically” corrected in writing courses.	3,87	0,77
37. I evaluate speaking course activities within pronunciation, fluency, word selection and content criteria.	3,85	0,87
38. I find the writing correction much time wasting.	2,79	1,32
39. I use error correction symbols in the control of students' writings.	3,63	1,16
40. I extend post-speaking activities into writing homework as follow-up.	3,56	0,94
41. I believe that writing skills learned in L1 could well be utilized in English writing practices.	3,53	1,05
42. I get students to do speaking practices in compliance with lexical competence.	3,68	0,78
43. I feel adequate in a great variety of activities that I have learned through workshops, and/or on the job and in-service trainings.	3,99	0,81
44. I conduct a student-centred approach in speaking courses.	4,04	0,76
45. I feel adequate in various activities that I have learned to utilize in speaking courses.	3,90	0,76
46. I have gained a creative teaching philosophy in the aftermath of TTPs that I have so far attended.	3,86	0,89
47. I can create a variety of activities, apart from those already learned, for speaking courses.	4,03	0,77
48. I am open to different activities even while I hold a student centred approach in writing courses.	4,32	0,77
49. I change the flow of the course, as I find necessary, to draw students' attention.	4,42	0,63
50. I believe that there has been development in my teaching philosophy as the result of TTPs.	4,11	0,98

## 2.5 Data Analysis Procedure

For this study, quantitative data were gathered via a questionnaire. The data gathered via questionnaires were coded and entered to the SPSS 17.0 (Statistical Package for Social Sciences). Afterwards, the descriptive analysis was used to investigate the demographic characteristics and background information of the subjects. Through descriptive statistics frequencies, means, percentages and standard deviations were calculated. The reliability of each scale and sub-scales were calculated as well as the analyses of each research question.

Descriptive research describes and interprets the present. Its primary purpose is to analyze trends that are developing as well as current situations. Thus, data derived can be used to diagnose a problem. For this reason, it can be inferred that descriptive research is designed to solve present day problems. Information relevant to the present condition is a prerequisite in solving problems (Taylor, 2005, p. 93). That's why this study is a descriptive study which tries to describe the present issues of FL teachers' perceptions of TTPs. Under various headings they were asked to show their attitudes towards the sessions they had attended.

In this study, the survey method was used to gather data from the sample. The data obtained from the instructors were analyzed with SPSS 17.0 (Statistical Package for Social Sciences). The statistical techniques below were used to summarize the findings:

1. Demographics of the sample summarized with frequency ( $N$ ) and percentage (%).
2. In order to see foreign language instructors' perception of the effectiveness of the teacher training programs on factors, mean scores ( $\bar{X}$ ) and standard deviation ( $sd$ ) were calculated.
3. An independent samples t-test was conducted in order to determine if gender and faculty of graduation of the instructors significantly affect their level of perception of the effectiveness of the TTPs.
4. One-way analysis of variance (ANOVA) was applied to see if educational degree and occupational seniority of the instructors significantly affect their level of perception of the effectiveness of the teacher training programs. When a significant difference was found with ANOVA, a post-hoc Scheffe test was conducted to determine between which groups there was a significant difference.

Occupational seniority's groups were re-arranged as; '1-5 years', '6-10 years' and '11 years and above. The significance level for all statistical analysis was found to be .05. Since the significance level stayed at lower than .05, the differentiations between independent variables were accepted as "significant" and results were evaluated accordingly.

## 2.6 Factor Analysis and Reliability of the Scale

After researching the literature, interviewing professionals about the subject and conducting a pilot study with the foreign language instructors, whether the developed scale consisted of a single or multiple dimensions was tested with an explanatory factor analysis.

**Table 3 KMO and Bartlett's Test**

Kaiser-Meyer-Olkin Measure of Sampling Adequacy		0,778
Bartlett's Test of Sphericity	Approx. Chi-Square	3858,510
	df	1081
	$p$	0,000

*Kaiser Meyer Olkin (KMO)* test showed that the data obtained with the scale was sufficient and reliable to conduct a factor analysis ( $KMO=.778$  ve  $p<0,001$ ).

After Kaiser-Meyer-Olkin Measure of Sampling Adequacy test, the conducted Principal Component Analysis and Varimax with Kaiser Normalization statistics indicated that 50 items of the scale were gathered

under 5 factors. In order to determine in which factor the items were gathered, the minimum loading value accepted was 0.30 or greater (Leech, Barrett&Morgan, 2005, p. 83-86).

Seeing items 8, 14, 25, 32 and 36 of the scale were not gathered under any factors, they were omitted from further analyses and the factor analysis was repeated with the remaining 45 items. After the second factor analysis, it was found that item 49 was loading more than two factors, thus it was omitted in this stage from the other analyses, too. It was also found that after the third factor analysis of all the remaining 44 items of the scale were loading under 5 factors (dimensions).

### 3. Results

#### 3.1 Results of Descriptive Statistics

**Table 4 Descriptive Statistics for Instructors' Perception of the Factors**

<b>Factors</b>	<b><i>N</i></b>	<b><i>Min.</i></b>	<b><i>Max.</i></b>	<b><math>\bar{X}</math></b>	<b><i>sd</i></b>
Efficiency of the TTPs	303	2	5	3,98	0,67

<u>OPTION</u>	<u>OPTION</u>	<u>SCORE RANGE</u>
Totally disagree	Never	1,00-1,80
A little	Seldom	1,81-2,60
Somehow	Sometimes	2,61-3,40
Mostly	Often	3,41-4,20
Totally agree	Always	4,21-5,00

From a general perspective, it is seen that the general attitude of the subjects in the survey was positive; however, the attitude did not reveal the “totally agree” level. It can also be seen that at no sub-category was the “always/totally agree” response given.

### 3.1.1 Results of the Instructors' Perception of the Factors Regarding Their Gender Differences

**Table 5 T-test Summary Table Comparing Instructors' Gender Groups on Scores of the Factors**

Factors	Gender	n	$\bar{X}$	sd	t-test		
					t	df	p
Efficiency of the TTPs	Female	20	4,1	0,6	2,24	30	0,016*
		2	3	9			
	Male	10	3,8	0,6			
		1	2	3			

\*Significant at .05 level.

It was also found that there was a significant differentiation as regards the effectiveness of TTPs between female and male subjects and that this differentiation favoured female subjects with ( $t=2.24$  and  $p<.05$ ). The data analysis also revealed that female subjects considered the effectiveness of the TTPs higher than male subjects ( $\bar{X}_{Female}=4.13$  and  $\bar{X}_{Male} = 3.82$ ).

### 3.1.2 Results of the Subjects' Perception of the Factors Regarding Their Graduation

**Table 6 T-test Summary on Instructors' Perception of the Factors Regarding Their Graduation.**

Factors	Educational Degree	n	$\bar{X}$	s	t-test		
					t	Sd	p
Efficiency of the TTPs	Faculty of Education	17	3,	0,	0,	30	0,166
		5	97	68			
	Faculty of Arts and Science	12	4,	0,			
		8	00	67			

\*Significant at .05 level.

There is no significant difference between the graduates of Education faculties and Arts and Sciences faculties regarding the effectiveness of TTPs ( $t=0.94$  and  $p>.05$ ). It is derived from the table that subjects'

perceptions of the effectiveness of TTPs in connection with their graduation level is not significantly different ( $\bar{X}_{Faculty\ of\ Education} = 3.97$  and  $\bar{X}_{Faculty\ of\ Arts\ and\ Science} = 4.00$ ).

### 3.1.3 Results of the Instructors' Perception of the Factors Regarding Their Educational Levels

**Table 7 One-way Analysis of Variance Summary Table Comparing Instructors' Educational Levels on Scores of the Factors**

Factors	Groups		$\bar{X}$	sd	ANOVA		Post-hoc Scheffe
	Educational Degree	n			F	p	
Efficiency of the TTPs	BA (1)	158	3,97	0,64	0,91	0,40 3	-
	MA (2)	124	3,97	0,73			
	PhD(3)	21	4,01	0,60			

\*Significant at .05 level &. \*\*Significant at .001 level.

It was found that education level did not reveal a significant differentiation in the perception of the effectiveness of the TTPs ( $F=0.91$  and  $p>0.05$ ). In other words, in connection with their education levels, the perception of the subjects of the effectiveness and benefits of TTPs stayed very close to one another ( $\bar{X}_{BA}=3.97$ ,  $\bar{X}_{MA}=3.97$  and  $\bar{X}_{PhD}=4.07$ ).

### 3.1.4 Results of the Subjects' Perception of the Factors Regarding Their Occupational Seniority

**Table 8 One-way Analysis of Variance Summary Table in the Perception of the Subjects' Occupational Seniority**

Factors	Groups		$\bar{X}$	sd	ANOVA		Post-hoc Scheffe
	Occupational Seniority	n			F	p	
Effectiveness of the TTPs	1-5 Year (1)	100	3,92	0,61	1,13	0,32 4	-
	6-10 Year (2)	109	3,95	0,72			
	11 Year and above (3)	94	4,01	0,			

---

\*Significant at .05 level & \*\*Significant at .001 level.

It was found out that occupational seniority did not produce a significant differentiation in the perception of the effectiveness of TTPs ( $F=1.13$  and  $p>0.05$ ). As is gathered from the table, the perception of the subjects about the effectiveness of TTPs in connection with their occupational seniority remained almost the same ( $\bar{X}_{1-5\text{ year}}=3.92$ ,  $\bar{X}_{6-10\text{ year}}=3.95$  and  $\bar{X}_{11\text{ year and above}}=4.01$ ).

#### 4. Discussion

After evaluating the results, there are some items justifying the efficiency outcome of TTPs. Here are some of them as follows: For the item *“I conduct a student-centred approach in speaking courses”*, 253 of the subjects claim that they prefer a student-centred approach in speaking courses. As seen up to this point TTPs seem to have reinforced instructors’ positive attitudes in terms of teaching speaking. For the item *“I feel adequate in various activities that I have learned to utilize in speaking courses”*, the attitudes of the subjects reflect positive outcomes for the activities they learnt after TTPs. For the item *“I feel adequate in reading analysis”*, 281 subjects said they found themselves adequate in reading analysis. With this item a general question was asked and the responses seemed to be fairly satisfactory for the subjects who participated in TTPs in terms of reading skill. For the item *“I feel adequate in a great variety of activities that I have learned through workshops, and/or on the job and in-service trainings”*, Of the 306 total responses, 227 of them indicate that they feel adequate in a great variety of activities that they have learnt through workshops, seminars or in-service trainings. Finally, TTPs in general worked well with instructors’ professional development, which further consolidates subjects’ philosophy in line with latest improvements. For the item *“I have gained a creative teaching philosophy in the aftermath of TTPs that I have so far attended”*, 221 of the subjects claim with deep contentment that they have gained a creative teaching philosophy in the aftermath of TTPs. On the other hand, by taking a closer look at the statistics not all of the subjects are very content with TTPs. The reason why some of the subjects have been left out might be because of not taking a fit-for-purpose principle into consideration. For the item *“I believe that there has been development in my teaching philosophy as the result of TTPs”*, 235 of the subjects indicate with a marked composure that they believe there is a development in their teaching philosophy as the result of TTPs, while 53 of them indicate that they feel little development in their teaching. Although the subjects have recorded low mean scores with some of the items in terms of sub-skills, on the whole it is understood that they feel competent after TTPs.

##### 4.1 Discussions on the Results of Descriptive Statistics

**Research Question 1:** Do the instructors who have attended TTPs feel that **they have benefited from these programs?**

Subjects evaluated highest t mean value for the question of “the benefit from TTPs” with 3.98. Hence, it is seen that subjects consider themselves all the more proficient as the result of the TTPs they have received ( $\bar{X}_{\text{Effectiveness of teacher training}}=3.98$ ). As is seen, after attending TTPs the instructors who took part in the study have the belief that they have benefited from the sessions.

From a general perspective, it is seen that the general attitude of the subjects in the survey was positive; however, the attitude did not reveal the “totally agree” level. It can also be seen that at no sub-category was the “always/totally agree” response given.

**Research Question 2:** Do certain variables such as **gender, graduation, education level and occupational seniority** affect subjects’ attitudes towards TTPs?

#### 4.2 Discussions on the Instructors’ Perception of the Factors Regarding Their Gender Differences

A significant differentiation between male and female attitudes towards writing was found and that differentiation was in favour of females with ( $t=2.65$  and  $p<.05$ ). The statistical analysis revealed that female subjects developed a more positive attitude towards TTPs. In another study, Yavuz (2005) claims that female EFL teachers displayed greater efficacy than males because of a common belief that language teaching is a feminine task since this field has mainly been dominated by female language teachers (p. 81). Although some of the studies reveal such data, this might still not be the reason why female instructors display greater efficacy since EFL/ESL teaching is not only a feminine but also a masculine task.

#### 4.3 Discussions on the Subjects’ Perception of the Factors Regarding Their Graduation

It is derived from the table that subjects’ perceptions of the effectiveness of TTPs in connection with their graduation level is not significantly different ( $\bar{X}_{Faculty\ of\ Education}=3.97$  and  $\bar{X}_{Faculty\ of\ Arts\ and\ Science}=4.00$ ).

#### 4.4 Discussions on the Instructors’ Perception of the Factors Regarding Their Educational Levels

The ANOVA test shows us that education level is a significant predictor for two factors ( $F_{Writing}=6.43$  and  $p<.05$  &  $F_{Listening}=10.11$  and  $p<.001$ ). In order to inspect the significant differences among the groups, a post-hoc Scheffe test was conducted. It was found that for both factors, instructors with BAs scored lower than the other two education groups. The mean scores in reading for instructors with a BA were lower than that of instructors with an MA and instructors with a PhD ( $F=6.43$  and  $p<.05$ ). The post-hoc Scheffe test (Table 18) displays that there is a significant differentiation between Group 1 and Group 1-2. Instructors with a BA degree have a lower level of positive perception about the effectiveness of the TTPs on reading than the other two education groups ( $\bar{X}_{BA}=3.76$ ,  $\bar{X}_{MA}=3.93$  and  $\bar{X}_{PhD}=3.95$ ). Table 17 shows that subjects’ perception of listening in connection with their educational degree is found to be significantly different ( $F=10.11$  and  $p<.001$ ). In accordance with the Post-hoc Scheffe test (Table 18), subjects with a BA (Group 1), graduate subjects (Table 2) and PhD graduate display a significant differentiation in terms of listening. The mean scores in listening for subjects with a BA displayed a lower level of perception about the effectiveness of the TTPs on listening than the other two education groups ( $\bar{X}_{BA}=3.72$ ,  $\bar{X}_{MA}=3.96$  and  $\bar{X}_{PhD}=4.02$ ).

This data demonstrates that the more educated the subjects, the better they benefited from reading/listening sessions in TTPs. This may also prove, just like the data on perceptions of subjects regarding the faculties they graduated from, that subjects who hold Masters and PhDs may not have had high expectations before attending TTPs because they may have thought that they did not have more to learn from those reading/listening sessions. It can also be concluded that the TTPs which subjects attended may have lacked the necessary needs analysis for the BA holders who may have had other needs than that of the topics of the TTPs. All in all, as mentioned several times in this study, without a seriously conducted needs analysis it is less likely that TTPs can reach the desired outcome for anyone.

#### 4.5 Discussions on the Subjects’ Perception of the Factors Regarding Their Occupational Seniority

In accordance with the ANOVA test, which was conducted in order to find out if there is significant differentiation in the perception of the subjects' occupational seniority, a significant difference was found.

There was a significant difference regarding subjects' occupational seniority ( $F=4.01$  and  $p>0.05$ ). According to a post-hoc Scheffe test for subjects with 1-5 years of experience (Group 1), those with 6-10 years of occupational experience (Group 2) and for subjects with 11 years and more experience (Group 3), a significant difference was discovered.

## 5. Conclusion

To start with, some problematic areas may stem from needs analyses not being carried out prior to designing the TTPs. Sessions should be relevant to the instructors' home context and also they need to be included in the design process unless the trainers or department heads want the training to go over the instructors' heads. Teachers are less likely to be convinced with knowledge that is irrelevant to their local context. They want it to be specific, contextualised, observable, and testable. This may demonstrate that the TTPs that the instructors took part in for the study did not pay attention to the concept of fit-for-purpose.

The concept of being competent from the instructors' point of view is to be able to adjust themselves into new contexts as well as peculiarities. The conclusion can be drawn that instructors may not have felt very competent and this could be the reason why they were never at a "totally agree" level in this study. Then again, they might have attended those TTPs which were way beyond their home context or lacked the concept of adjusting the activities to new situations.

As seen from the above statistics, the instructors who have less experience than others claim that they have not benefited much from listening, reading and writing sessions in TTPs in comparison with those who have more than 6 years and above field experience. There are two conclusions that can be drawn from this fact. Given the instructors who have less than 6 years of experience are considered as younger instructors than the other subjects in the study, it can be concluded that they graduated from their schools having learned the latest innovations, techniques and/or approaches since they have had the most up-to-date ELT education so far. If these subjects had cutting edge techniques, then one can ask the question if the TTPs they attended failed to keep up with the latest innovations in the profession and could not convey these new approaches to the sessions or if these TTPs did not conduct any needs analysis prior to the sessions. In either case it can be seen that less experienced instructors may not have been covered as a significant target group in TTPs, according to the statistics. Hence, TTPs should be able to keep up with the latest innovations in the profession and keep their programs flexible as well as conducting needs analysis for particular audiences.

Taken from this perspective, there does not seem to be any prejudice against TTPs from any age group. The core of the discussion is that sessions should cover the needs of the audience. Stated briefly, the instructors who have less than 6 years of experience should be considered as the most important group to cover since they may need important clues and approaches for their professional careers. The second important group to take into consideration prior to designing TTPs is the ones who have more than 11 years of experience since this group of language teachers may have lost the latest track of the profession due to not having taken part in any research or academic study.

On the other hand, further study is needed after a needs analysis to elicit the real needs for experienced teachers' classroom practice. This time the study should aim to include instructors who have 16 years and more experience in the profession.

# An assessment on media literacy education in Turkey and the problems experienced in practice

Sibel Karaduman<sup>a\*</sup><sup>a</sup>*Asst.Prof.Dr., Akdeniz University, Faculty of Communication, Antalya, 07070, Turkey*

---

## Abstract

Media exists in every area of our societal lives, together with the fast improvement of novel communication technologies. Produced media texts reach to individuals via mass communication tools with very different contents, from newspapers to television programs and from news to cartoons. In this cyclical process of communication, the segment that might each be in the status of a passive receiver by being exposed to the negative influences of media texts is children and young people. Therefore, because of this role of the media that increases each day, many countries have developed a national education policy about media literacy in the education system. Instead of a protective approach about the contents of media texts; creating awareness, increasing the consciousness level, preparing basis for students to be able to comprehend the skill of critical approach are among the goals and gains of the education that will be given in this area. Improving the ability of questioning, commenting and evaluating media messages is only possible through a media education centered on critical thought.

This study aims to investigate the media education given under the elective course named “media literacy”, which started to be taught in primary education 6th, 7th and 8th classes since 2006 in Turkey with the cooperation of RTÜK (Radio and Television Supreme Council) and MEB (Ministry of National Education), and aims to develop recommendations by identifying the problems in operation.

Key Words: Media education; media literacy; Turkey

---

## 1. Introduction

Alongside the process which started with the systematized address of media in education since the 1920s and its recognition as an education subject, lecturers at primary and secondary levels together with communication scholars nowadays stress that information and awareness raising in media must start at very early phases. (İnal, 2009: 16-17) Although “Media literacy” is a new Notion, it has a past which goes back to the start of the 20<sup>th</sup> century as a discipline (İnal, 2009: 15). It has initially been taken up in Great Britain during the 1930s as an educational tool aiming at protecting individuals, especially children, from the detrimental effects of media (Taşkıran, 2007: 91).

Media literacy is defined as a pedagogy which ensures the analysis of media codes and traditions, criticizing media’s values and ideologies, construal of messages generated by media texts, assessing and selecting media

\* Corresponding author. Tel.: +90 2423102194; fax: +90 2422275987.

E-mail address: sibelkaraduman@akdeniz.edu.tr

content, becoming aware of the effects of media and a reasonable use of media. (Uysal, 2007:47) One of the two constituent notions of media literacy is media, while the other is the mass which can develop its literacy skills.

The following principles have been agreed on as regards what must be taken into consideration in the analysis of media messages in light of the models developed under the leadership of English and Canadian academicians on the matter of media literacy which is a developing field being subject of conceptual discussions “media messages are constructed within a certain generation process, media messages are generated in an economic, social, political, historical and aesthetical context, while how we construe the message and the meaning we perceive from that message manifests itself as an outcome of the interaction between the receiver of the message, sender of the message, text/ message and culture; media uses a language peculiar to itself. This language characterizes various communication forms, types and symbol systems, while media representations play a role in people’s grasp of social reality. (Quoted from Aufderheide: Algan,2006:38)

Hobbs analyzes the problems and discussions which focus on various education philosophies as well as the education provided by these lecturers in their classes in media and those which guide the education they provide by reference to seven questions. These discussions are continued around the following questions: Must education in media literacy aim at protecting children and youngsters from the negative effects of media? Must media production be a basic trait of media literacy? Must media literacy focus on popular culture texts? Must media literacy have a more direct political and ideological agenda? Must media literacy focus on school based primary and secondary educational environments? Must media literacy be taught as a specialized subject or placed within the context of current subjects? Must media literacy entrepreneurs be financially supported by media organizations? (Hobbs, 2004:122-140). These discussion topics are meaningful in terms of showing us that the notion is taken up in the US within the framework of education problems. Media literacy is seen as an umbrella notion with a wide spectrum composed of different education philosophies, theories, frameworks, practices, environments, methods, targets, purposes and outcomes (Hobbs, 2004:134).

It is possible to speak of two approaches in the relation between media and education. The first approach uses media as a tool. I.e. articles published in newspapers and magazines as well as programs broadcast on radio and television are utilized in general education branches of primary and secondary education, especially in history, geography, Turkish and sociology classes. The second approach however analyzes media by discussion in detail. News sources, mechanisms comprising the news or program are researched; tendencies or interests guiding these sources and mechanisms are determined. Thereby, students learn to think critically and assess the media. The said two approaches differ significantly from one another (Topuz, 2007: 18). In particular with the change gone through in media education after 1960s, media which has been viewed from an instrumental viewpoint has come to be replaced by learning about media.

Individuals who start to learn about media become able to acquire the skill in viewing the media messages they encounter from a much more critical viewpoint. On this basis, education in media literacy, going beyond protecting students from the negative effects of media messages, assists students in developing their skills in critical thinking and problem solving. It aims at teaching students to ask basic questions while sorting out media messages:1- Who has generated this message?2- Which techniques have been used in this message to draw my attention?3- How might other people have understood this message in divergence with how I have understood it?4- Which lifestyles, values and views have been included in this message and which others have been neglected?5- Why has this message been sent? (Quoted from Jolls and Thoman by: Toker Erdoğan, 2010:54)

This circumstance of the media points at the importance of the development of a critical media awareness. This process has especially in the post 1980 period been accompanied by the wear-out of the understanding in public services media or public broadcasting being the requirement of the social state approach alongside the rapid rise in the global media market. Mass communication instruments which have also been used as one of the significant instruments of modernization during 1960s and 1970s has arisen as a source by which social change and democratic participation will manifest. The development of communication technologies accompanying all

these developments had further increased the discrepancy between those who can reach technology and those who cannot reach technology, initiating the processes expressed as digital separation. Another dimension of media literacy is thought of as a new pedagogy to eliminate the difference between those who reach information and those who cannot reach information.”(Uysal, 2007:47)

This study, after questioning the requirements of media education pursuant to all these discussions, aims at analyzing and evaluating the educational program of media literacy, which has been practiced in Turkey since 2007, over the content of the program model’s content. Problems concerning the implementation of the course program shall be set forth and suggestions for the solution thereof shall be developed.

## **2. Why is education in media necessary?**

We can base the foundations of the idea of media education on discussions in the effects of mass communication tools and how these effects may be utilized positively in education experiences.

The target of media education is to raise individuals who can read media messages correctly, question what they see and watch, assess these from a critical viewpoint and who have developed analysis skills. “The development of media literacy education with a critical viewpoint will provide an important contribution to individuals’ interpretation of media messages. In other words individuals will acquire skills of assessing media messages, thereby becoming able to discern the differences between the “truth” and the “reality” provided by the media. Individuals with critical media literacy, will be able to become aware of the roots of messages circulated in media texts in daily life alongside reading these messages” (Binark and Gencil Bek, 2007: 103).

For the model being applied in Turkey which pioneers many projects in this area, UNESCO, the studies of which are used for the preparation of guides, has organized various international meetings and has assumed an important place in the conceptualization of media education. UNESCO, which points out that “The purpose of media education is to research and assess the place of media in society and its social implications in all areas and throughout history, had in 1982 introduced the importance of education in media literacy with the “Grünwald Media Education Declaration” for all national audiences.

The purpose of media literacy is to render students proficient, critical and literate in all kinds of media; thereby ensuring that students are the controllers of what they see and hear and not the ones who are controlled thereby (quoted from Jolls and Thoman: Toker Erdoğan, 2010:53) In line with the increasingly student focused approaches in the education area, autonomy and active participation also in the education of media literacy is gaining in importance.

According to Renee Hobbs (1998), who is closely interested in education in media literacy with its studies and projects in the US, media literacy encompasses the skill in generating its own messages by reading and writing, speaking and listening, access to new technologies, critical watching and the use of a great variety of technologies. According to Hobbs, practical implementation within the scope of education in media literacy ensures that children bring out their creative skills while expressing themselves and provides the opportunity to inform oneself about the media industry. For students to become critical watchers in its real sense, they must go through various experiences such as photography, acting in front of the camera or writing a news story. Unless such practical implementations are used throughout the education in media literacy, education in media literacy is not considered to have taken place in its full sense. (Hobbs, 2004:122-140)

During the implementation stage of the media literacy project in Turkey, the then Vice Director of the Board of Education and Discipline of the Ministry of National Education, Vahap Özpölat speaks of the importance of developing criticizing skills in students as regards media’s possible disinformative and manipulative messages, their skills in analytical thinking, and their awareness raising for them to be informed of the truth that there may be a certain cultural, conceptual or even ideological context behind media messages. (Özpölat, 2007:61)

Accordingly, in order to educate individuals who can observe with a more conscious and critical view against structured media messages, the necessity of media education is indispensable.

The media education centered around critical thinking which is needed for the development of media and society relations in a healthy and democratic environment has also brought about discussions as regards ‘how one can become a good media literate’. In fact, the importance of media literacy course whereby the social role of media has come to be discussed for a long time after its initial gain in such an effective standing in the public area was initially brought to life in 2007 with the problems experienced in practice as a belated project in Turkey.

### 3. The media literacy project in Turkey

**3.1. Start of the Project:** With the protocol signed between the Radio and Television Supreme Council and the Board of Education and Discipline of the Ministry of National Education in 2006, the medial literacy course, which was taken into the primary schooling program was primarily brought to life as a pilot project in five cities. In the 2007-2008 schooling year however, it has been aimed that 1.5 million students attending 6<sup>th</sup>, 7<sup>th</sup> and 8<sup>th</sup> grade of elementary education take media literacy courses; however according to the research of the Radio and Television Supreme Council this number could not be reached and a total 388 thousand students could take this course. (RTÜK, 2008) When one looks at the official website called *medyaokuryazarligi.org.tr* however, no up to date information could be seen on the number of students taking this course during the current term across Turkey.

In order to educate lecturers teaching media literacy however, the three days media literacy lecturer education seminar was organized in Ankara by the end of the 2006-2007 schooling year. A total of 103 social science teachers representing all cities have attended the said seminar and during the 2007-2008 schooling year, teachers selecting this course were trained by these lecturers (RTÜK, 2007a). When we look at the official website, we see that the course’s target population is separated into four sections. These are; “adults, teachers, students and media employees”. The materials which comprise the content of the course within the project and which were used for the lecturing of the course are mentioned under the titles of teachers and students. In the part related to teachers we see the page for “media education manual, annual plan, teaching plan, teachers’ guide, manual, pool of activities and the project page. The part reserved for teacher activities is however not yet filled in. Under the title related to students in the website however are the media literacy manual for students, schooling program, useful links and games. The teachers’ Handbook for Primary School Media Literacy Course, Media Education Handbook for Teachers prepared for teachers and the Media Literacy Handbook for Students prepared for students are the Turkish translations of texts prepared by UNESCO. Said materials are uploaded in the media literacy web site set up by the Radio and Television Supreme Council.

**3.2. Analysis of the Content of the Schooling Program:** The method of qualitative content analysis was used when analyzing the content of the program. During the qualitative content analysis, the formative sub titles of the media literacy schooling program were looked into. Therefore the content of the program and the sub titles predicated on were analyzed. These are the “media literacy course schooling program approach, general purposes of the program, the basic approach of the program, the structure of the program, skills which are aimed to be acquired, values which are wished to be vested, measuring and assessment, activities and the subject headings of the course, i.e. the units specified”.

**3.3. Schooling Program Approach :** “Research and assessments made on such research set forth that children, who are unprotected receivers against visual, audial and written media must be raised in their awareness against media by starting therewith during primary education. Thereby the student; shall become able to read the

media, reach the consciousness level to deconstruct the language of media and participate in the notion of communication as an active individual instead of being a passive receiver against media.” (Commission, 2007a) These expressions are an indication of the definition of media literacy by the notions of “protection” and “control” and in a sense points at the fact that the didactical understanding of education based on learning “correct thoughts” by heart could not be deserted. In the foreword of the Teachers’ Handbook of Media Literacy in Primary Education, it was stated that “... perhaps the most effective way of protecting children from the negative effects of mass communication tools is to let them gain media literacy skills”, thereby displaying a protective understanding again. (Toker Erdoğan, 2010:80) It is understood by the language used in the preparation of the Program and the Guide that the priority was attached to a protective approach. It is obvious that effort has been spent to draw attention to the adverse effects of the media by the explanation in the Guide quoting “The earlier individuals start learning and grasping the difference between the present reality and the reality provided by the media, the more they shall reduce the adverse effects of media on themselves” (2006: 6). Therefore the program stands close to the media literacy approach rather than critical media literacy. Mainstream media literacy displays a character which is far from questioning present media structure and which sees media merely as a message content and which aims at protection from media and attachment to values especially when children are the case.

**3.4. General Purposes of the Education Program:** The program has generally aimed at vesting certain basic skills and values alongside overall targets and yields and that students acquire these skills and values through accomplishments. The overall purposes of the program however were stated as follows: “by reading media from different angles he raises his awareness to become sensitive to the environment he lives in, aware of the problems of his country, processes what he sees in the media through the sieve of reason, reaches messages in television, video, cinema, commercials, written media, internet and similar environments, whereby he acquires the skills of deconstructing, assessing and transmitting these, acquires a critical viewpoint towards the written, visual and aural media, puts a transition from finding answers for the generation of messages and the analysis thereof towards questioning on the agenda, becomes a conscious media literate, participates in social life more actively and constructively, contributes to awareness raising for carrying public and private broadcasting forward to more positive points. (2006: 7) When the overall purposes of the program are assessed, it is seen that an attitude towards raising individuals who can look at media with a critical point of view comes to the forefront. However, this viewpoint contradicts the “protective approach” which comes to the forefront at many stages of the program and the guide. Moreover, the question as regards how this critical viewpoint shall be gained in practice is not expressed clearly even when one analyzes the in class activities part formed within the annual plan. It is obvious that the critical thinking skills of the teacher will effectively guide students’ conceptualization. Therefore, the matter of educating the lecturer preserves its importance especially in fields centered on critical thinking such as media literacy. Adopting a critical pedagogy understanding is an attitude which a lecturer in media education must have.

**3.5. Basic Approach of the Program:** The basic approaches of the educational program are stated to be as follows: “it ensures the development of knowledge, skills and values, thereby putting learning and the actualization of learning in the forefront, induces students to observe, research and see their environments with a critical viewpoint, aims at raising students as healthy and happy individuals in physical and emotional terms, aims at students’ development in spiritual, moral, social and cultural aspects, provides students with the opportunity to use their experiences during the learning process and interact with the environment, takes the multiple intelligence theory as well as the variety in the methods and techniques for learning and educating in order to reach students, provides the opportunity to assess learning and teaching processes within their progress by looking into the student study files to be drawn up (2006: 6-7). When we look at the overall attainments of the program, we can say that they display parallel traits with the attainments of any primary school education

program. However, attainments which develop a viewpoint peculiar to the positioning of mass communication tools in social life by students must be placed under this titling.

**3.6. The Structure of the Program:** Director of the Education and Programming Department of the Ministry of National Education Mehmet Akif Sütçü has stated that the program has been prepared by a constructivist approach based on an activity based education strategy and predicating on multiple intelligence theory, that students shall associate information he had observed in his environment in near or distant past by this approach, data he had transformed into knowledge or information he had obtained by various courses in the educational institutions he has attended with the knowledge he shall acquire in this class, that thereby with the guidance of the teacher he shall reach certain brand new skills and values. (Sütçü, 2006:55) What is important in Sütçü's statement here is whether students who while in practice read media with an analytical viewpoint will acquire a critical questioning skill with respect to the messages they watch, see and encounter. Only by this principle can the structure of the media literacy education program be effective in letting students gain skills in using an analytical viewpoint when integrating theory and practice.

**3.7. Skills Which are Aimed at being Acquired:** Another field for which the question as to "how" remains vague in practice is basic skills which are aimed to be vested in students such as "skills in observation, research, critical thinking, creative thinking, communication, problem solving, using information technologies, entrepreneurship, using Turkish correctly, beautifully and effectively as well as skill in social and cultural participation". (2006: 7-8) These are shown as "skill targets" yet no explanations have been given as regards how these targets will be met. Therefore these need detailed study.

**3.8. Values Which are Aimed at Being Attained:** Within the scope of the program; respect for the privacy, aesthetical sensitivity, honesty, responsibility, loyalty to ethical rules, respect for differences, sensitivity to enlivening cultural heritage, attaching importance to inter family communication, conscious consumption, active participation in social life, being scientific, equality, solidarity, helping each other and sharing have been stated as values which are wanted to be vested in students (2006: 8). The media has an important function in the generation and circulation of cultural values and social behavior codes. Therefore, we see that the media literacy program aims rather at vesting students with common cultural values. It is not very clear with which meaning the value of "equality" from amongst these values is used. However, the role of media literacy in ensuring social gender equality cannot be neglected. When we look at the course units, it is striking that social gender discrimination is not mentioned. This field is the one where ethical infringements are committed most frequently. It must be added to the educational program both as a value to be acquired and as an approach for social gender equality.

**3.9. Measurement and Assessment:** It has been stated in the "Measurement and Assessment" part that this course shall not be graded and that only the name of the course shall be mentioned in students' school reports. Therefore the tools for measuring and assessing this course are tools other than grades. (2006: 16). For example, it is striking that some of the tools and methods for measuring students' success over the annual plan are observation, open end questions, self-assessment forms, group assessment forms, performance home works and student portfolios. In the "units, attainments, activity samples and descriptions" sections present respectively in the annual plan, describes what the attainments for each unit are as well as what must be borne in mind when making assessments for in class activity samples and the said unit or doing home-work or a project. In the "Units, attainments, activity samples and descriptions" section, explanations have been made as regards attainments for

each unit, activity samples, matters to be taken into consideration as well as measuring and assessing methods (2006: 32-39). Activities related to the attainments have been included although the activities have not been assessed.

**3.10. Activities:** It is utmost significant that the present attainments in an education program are made to be acquired in an effective, permanent and meaningful way and activities are designed in line thereto. When we look into the in class activities included in the annual plan of the media literacy course, we see that the activity designs have been included by diversifying the unit headings according to the mass communication tools. When we look at works such as surveys, individuals or group performances, banner works, drawing up one's own newspaper, observations after watching a 15 minutes media product, word hunt or puzzles for finding notions related to communication we see that these are activities which increase student participation and ensure active individual participation. However, it is possible to say that such great variety of activities is too much to be included in a weekly one hour course. For activities to be performed efficiently in line with the attainment, the student must get more than an hour's course on media literacy.

**3.11. Media Literacy Course Subjects / Units:** In order to realize the said goals, the following units were included in the Selective Media Literacy Course Educational Program: *“Introduction to Communications; Mass Communications; Media; Television; Family, Children and Television; Radio; Newspapers and Magazines; Internet (Virtual World).”* As may be understood from the unit topics, the subjects are generally selected on the mass communication tools basis and mostly for the presentation of the said tools. However, the preparation of course contents in conformity with the requirements of critical pedagogy as a basic approach of the media literacy educational program will be much more appropriate for the real *raison d'être* of this course and its purposes.

#### **4. Problems determined in the implementation of the media literacy project and suggestions for the solution thereof:**

When we bear in mind that the idea of media literacy is being discussed throughout the world since 1930s, it is obvious that Turkey has been lagging behind in terms of education in media literacy. We may list the problems determined in the practice of media literacy project and solution suggestions for said problems as follows: 1-) It is observed that the media literacy course, which has been included in 6<sup>th</sup>, 7<sup>th</sup> and 8<sup>th</sup> grade elementary schooling programs for the last six years in Turkey, is insufficient primarily in its critical dimension. It is striking that the approach of “how can we protect children and youngsters from the adverse effects of media” prevails both in the education program and in the manuals and guides prepared for teachers. We know that the media literacy course are directed towards education programs and course contents whereby the protective approach is being deserted and the road of critical questioning is being paved throughout the world, that there is a tendency for student centered active participation to come to the forefront. Therefore, the need for the development of the schooling program in Turkey in this direction is the case. 2-) Media literacy course in Turkey is provided as a selective course. The teaching of the course as a selective course lowers the importance level of the course in terms of its scope and efficiency. Likewise, when we look at western countries we see that the media literacy course is included in the schooling programs as must courses or associated with other disciplines. Moreover, by leaving media literacy course merely at the 6<sup>th</sup>, 7<sup>th</sup> and 8<sup>th</sup> grade levels, it might have been late for the critical reading of media messages. However by taking steps in associating with the contents of other courses as an intermediary discipline at the first stage, elementary education will lay the bases for providing a much more efficient and effective media literacy education with the course to be taken at the second stage. Thereby the continuity of media literacy education will also be ensured. 3-) The lack of grading for the assessment and measurement of this

course may decrease the student's interest in the course. Moreover, as stated before, the weekly one hour course is insufficient for the several number of activities included in the education program and for vesting the students with a critical viewpoint in this field. 4-) The fact that the Media Literacy Course Teachers' Guide is the same for all three grades (the 6<sup>th</sup>, 7<sup>th</sup> and 8<sup>th</sup> grades) is another problem being endured. The guiding book must be drawn up and developed separately for all three grades. The lack of a printed source as a course book for students impedes students to gain information on the subject beforehand. Only one printed source in the form of a course book has been encountered. It is suggested that studies are made in this direction. 5-) It is striking that media literacy course program is based on informative grounds as regards the introduction of mass communication tools and the means for protection against the negative effects of these tools rather than an education in media. It is necessary in this field especially to follow up on the developments in the US and western countries and revising the education program by taking the shortcomings into consideration. Although there are different approaches therein, it is very important, as stated by Renee Hobbs, that one must focus on ensuring "critical questions on what we watch, see and read" in the media literacy field and the educational understanding adopting a critical pedagogical approach. 6-) Media literacy requires being taken up as a life-long educational process. Media literacy is a skill which includes the skill in reading media messages correctly. Therefore, it must be developed not only at the primary school level but also to encompass the pre-school period and parent cooperation, while interest in this area must be kept alive especially through guidance in parental education. 7-) It is important that students are induced especially to generate their own media, and learn through experience. An adequate budget to be used in the activities as well as those to be supported by out of school activities will ensure positive contributions in this process. 8-) Another dimension of the studies in media literacy is comprised by the training of educators to assume duty in the media literacy education program. Media literacy courses are being taught by social science teachers in Turkey. Social Science teachers were given the authority to teach the course provided they undergo a three-day media training. (There are teacher who haven't even been given the said training) However, media literacy classes must be taught by Communication Faculty graduates having a pedagogical formation. 9-) For the quality of this educational process, teacher will have to undergo a qualified in service training in media literacy and supported by quality publications. 10-) For the education of teachers, providing must and selective courses on media literacy at undergraduate, graduate or doctoral levels especially in Education Faculties an academic studies in the field will make significant contributions.

## 5. Conclusions and assessment

This project which is tried to be brought to life in Turkey with the cooperation of the Ministry of National Education and the Radio and Television Supreme Council is a belated yet significant step for Turkey. Therefore, it has been determined that problems are encountered in the functioning of this media education project when putting theory into practice, i.e. in the implementation thereof. This study assesses the point arrived at by taking up both the standing of the media education provided in elementary schools within the media literacy project which has a six years past in Turkey and the problems encountered in practice. Media education which provides a multi directional perspective for becoming a conscious citizen who can analyze the thousands of messages generated by the media in the information age as we encounter on a daily basis and who can think critically, is a field which may make very significant contributions in the formation of a healthy democratic environment. Therefore problems determined in practice, discussions made for the determination of setbacks lay the bases for a better media education. The suggestions made within the scope of his study are directed towards this goal.

---

## Abstract

In this paper, we propose an approach that automatically aligns words extracted from paired sentences in English-Korean parallel corpus. Word-to-word mappings from aligned sentences are easily accomplished if a bilingual lexicon is provided. However, newly coined words cannot be aligned automatically since they are not registered in the lexicon. For automated alignment of newly identified words, we introduce new heuristics to align maximal number of words, using structural transfer patterns between the two languages. Provided maximum word alignments together with paired sentences in a parallel corpus, Korean learners of English can benefit from recognizing distinctions on sentential structures as well as vocabularies between the two languages.

*Keywords:* Parallel corpus; ESL learner; maximum word alignment

---

## 1. Introduction

A parallel corpus is one of the richest resources from which various kinds of linguistic knowledge can be extracted. It is indispensable for building a statistical machine translation system as well as building a bilingual lexicon. A bilingual concordance system consists of a parallel corpus and a few programs that can retrieve a list of pairs of sentences including a user's query and make a view exactly the way a user wants to see them. A bilingual concordance can be a great mechanism for bilingual lexicographers, human translators, and second language learners for studying the two languages in question since they can acquire similarities as well as differences between the languages by comparing them on a sentence-by-sentence basis (Elke, 2001, May & Xu 2002, Wu et al., 2003).

Although a widely accepted objective of a bilingual concordance is to present a list of paired sentences to users, second language learners can benefit from additional information such as word alignments provided by a bilingual concordance. Especially when self-learners begin to learn a new domain in a language, word alignments along with aligned sentence pairs provide an opportunity for them to learn vocabularies occurring in the domain of the two languages.

A word alignment can be automatically established if a bilingual lexicon is provided. However, newly recognized words cannot be coined automatically since they are not registered in the lexicon. Figure 1 below shows an example of an aligned sentence pair between English and Korean collected from a news article.

Samsung Electronics is developing technologies to introduce OIS (Optical Image Stabilization) and shutter functions to the Galaxy Note 3.

삼성전자가 갤럭시노트 3에 손떨림 보정 (OIS), 셔터 기능 등을 채택하기로 하고, 기술 개발을 추진 중이다.

Fig. 1. The sample of a pair of sentences (English vs. Korean) with basic alignments.

The gray boxes show the words aligned by exact string matching and a bilingual lexicon lookup. Most of the proper nouns in this example cannot be aligned because they are neologism and not registered in the bilingual lexicon. The verb ‘introduce’ in the sentence also cannot be aligned since its meaning has been paraphrased in Korean.

Presumptive maximum alignments are marked with blank boxes as in Figure 2 below.

Samsung Electronics is developing technologies to introduce OIS (Optical Image Stabilization) and shutter functions to the Galaxy Note 3.

삼성전자가 갤럭시노트 3에 손떨림 보정 (OIS), 셔터 기능 등을 채택하기로 하고, 기술 개발을 추진 중이다.

Fig. 2. The sample of a pair of sentences with presumptive maximum alignments.

The alignment is performed by applying several heuristics which presume as many word alignments as possible, rather than by referencing the bilingual lexicon. In this paper, we introduce these heuristics in order to automatically align words between English and Korean even though they are not listed in a bilingual lexicon. Key factors of the heuristics include structural transfer patterns between the two languages and corresponding positional information in the structures.

Parallel documents are easily accessible from Internet nowadays. As they include not only proper nouns but also various neologisms, they become one of the useful resources from which second language learners can learn a modern usage of languages. We propose a prototype which can automatically perform a sentence-level alignment as well as a word-level alignment for a parallel document. In addition, we suggest how to make a view for maximum word alignments along with aligned sentences. This interface helps ESL learners to recognize distinctions on sentential structures as well as vocabularies between the two languages.

## 2. Word alignment for a parallel corpus

### 2.1. Overall procedure

Creating bilingual concordances undergoes several steps. The overall procedure of preparing a parallel corpus for bilingual concordances is depicted in Figure 3.

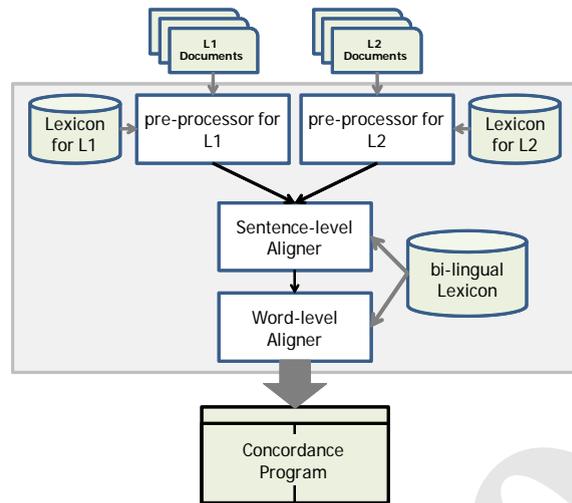

Fig. 3. The overall procedure

First, a pair of parallel documents written in the languages,  $L1$  and  $L2$  is processed separately. A pre-processor segments a document into sentences, and lemmatizes each word in a sentence, using a mono-lingual lexicon. Part-of-speech tagging is then performed, which is followed by a sentence-level alignment between the two documents. The Champollion algorithm (Ma, 2006) was adopted for aligning sentences. The algorithm maps  $n$  source sentences to  $m$  target sentences. A word-level aligner aims to do a word-to-word mapping by referencing a bilingual lexicon. A result of sentence-level alignments accompanied with word-level alignments is used as an input to be fed to a bilingual concordance program.

## 2.2. Presumptive maximum word alignment

A presumptive maximum word alignment algorithm (Lee, 2013) is described in Table 1. The algorithm aims at producing as many alignments between  $L1$  and  $L2$  as possible. It presumes word-level alignments by using structural transfer patterns between  $L1$  and  $L2$ . An input to this algorithm is a collection of words which could not be aligned when a basic word-level alignment was performed. A list of a pair of words in  $L1$  and its presumed translation in  $L2$  is an output of the algorithm. Prior to the explanation of the algorithm, we define the functions  $R()$  and  $L()$  as follows. Subscripts ' $a$ ' and ' $u$ ' refer to 'aligned' and 'unaligned', respectively in the functions.

$R_a(W)$ : A left-most **aligned** word which is located at the **R**ight side of word  $W$ .

$L_a(W)$ : A right-most **aligned** word which is located at the **L**eft side of word  $W$ .

$R_u(W)$ : A left-most **un**-aligned word which is located at the **R**ight side of word  $W$ .

$L_u(W)$ : A right-most **un**-aligned word which is located at the **L**eft side of word  $W$ .

Table 1. A Maximum Word Alignment Algorithm.

```

01 // Presumptive Maximum Word Alignment Algorithm
02 // INPUT: L1_unaligned_list & L2_unaligned_list
03 // OUTPUT: presumptive_word_alignment_list
04
05 for each Ws in L1_unaligned_list:
06
07     WLL = Lu(Map(La(Ws)))
08     WLR = Ru(Map(La(Ws)))
09     WRL = Lu(Map(Ra(Ws)))
10     WRR = Ru(Map(Ra(Ws)))
11
12     Wi = best_presumptive_alignment(Ws, WLL, WLR, WRL, WRR)
13     if Wi != None:
14         add [Ws, Wi] into presumptive_word_alignment_list
15

```

‘Map()’ is an aligning function which maps a word in *L1* to a corresponding word in *L2*. For instance, ‘*W<sub>LR</sub>*’ is a candidate word in *L2* for an alignment, which is located at the right-hand side of an aligned word in *L2* to a left-hand side word of *W* in *L1*. It can be a presumptive translated word of *W*. From line 7 to 10 in Table 1, four possible candidate alignments are calculated. Figure 4 below shows four possible candidate words *W<sub>LL</sub>*, *W<sub>LR</sub>*, *W<sub>RL</sub>*, *W<sub>RR</sub>* for aligning a word *W*.

Fig. 4. Four possible candidate nodes of *W*'s alignment.

A function ‘best\_presumptive\_alignment(·)’ in line 12 decides the best candidate alignment out of *W<sub>LL</sub>*, *W<sub>LR</sub>*, *W<sub>RL</sub>*, *W<sub>RR</sub>* in *L2*, using heuristics. The heuristics uses structural transfer patterns described in Table 2.

The heuristics can be explained with a graphical example. Figure 5 shows a result of basic word-level alignments linked each other.

Fig. 5. A result of basic alignments.

Table 2. Structural transfer patterns and their preferences. (LexTrans means a Lexical Translation)

	English/Korean structural transfer pattern		preference
(1)	W/noun	<b>X</b> /noun → LexTrans(W) Y	Ru(Map(La(X)))
	<b>X</b> /noun	W/noun → Y LexTrans(W)	Lu(Map(Ra(X)))
(2)	<b>X</b> /adv	W/verb → Y LexTrans(W)	Lu(Map(Ra(X)))
	W/adv	<b>X</b> /verb → LexTrans(W) Y	Ru(Map(La(X)))
(3)	W/noun [of from]	<b>X</b> /noun → Y [의 에서부터] LexTrans(W)	Lu(Map(La(X)))
	<b>X</b> /noun [of from]	W/noun → LexTrans(W) [의 에서부터] Y	Ru(Map(Ra(X)))
(4)	W/verb [by as with]	<b>X</b> /noun → Y [에 의해 로서 로 와] LexTrans(W)	Lu(Map(La(X)))
	<b>X</b> /verb [by as with]	W/noun → LexTrans(W) [에 의해 로서 로 와] Y	Ru(Map(Ra(X)))
(5)	W/adj	<b>X</b> /noun → LexTrans(W) Y	Ru(Map(La(x)))
	<b>X</b> /adj	W/noun → Y LexTrans(W)	Lu(Map(Ra(X)))

The alignments are achieved, referencing a normal bilingual lexicon. A list of bold-faced unaligned words [‘Lauder’, ‘Gucci’, ‘brand’s owner’] becomes an input to the algorithm described in Table 1. In a word-level alignment, we exclude functional words representing a grammatical relation in a sentence. Figure 6 represents how to decide the alignment word for an unaligned English word ‘Lauder’.

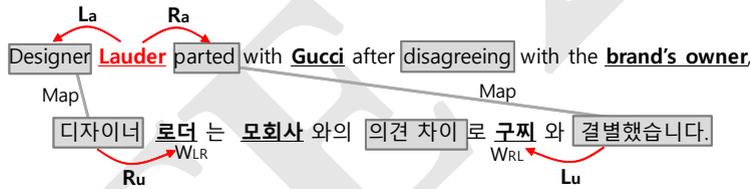

Fig. 6. A presumptive alignment using a preference  $R_u(\text{Map}(L_a(\cdot)))$ .

In this case, both  $R_a(\text{'Lauder'})$  and  $L_a(\text{'Lauder'})$  are possible for an alignment in L1, English. Obtaining possible Korean candidates for an alignment of ‘Lauder’ are twofold: 1)  $W_{LR}$  by applying  $R_u(\text{Map}(L_a(\text{'Lauder'})))$ , and 2)  $W_{RL}$  by applying  $L_u(\text{Map}(R_a(\text{'Lauder'})))$ . To determine the best candidate, a function `best_presumptive_alignment(·)` utilizes a structural transfer pattern. In this example, sub-structures ‘Designer/noun Lauder/noun’ or ‘Lauder/noun parted/verb’ can be considered as structural transfer patterns of the source language. Since pattern (1) in Table 2 can be applied to this example, a preferred presumptive alignment can be determined by applying  $R_u(\text{Map}(L_a(\cdot)))$ . As a result, [‘Lauder’,  $W_{LR}$ ] becomes a pair of a presumptive word-level alignment.

The list of the heuristics introduced in Table 2 is a collection of frequently used structural transfer patterns between English and Korean. While the left-hand side of an arrow represents English sub-structures, the right-hand side is the same structures transferred to Korean. Among the notations of the patterns, ‘W’ refers to an aligned word and ‘X’ is an unaligned target word. The ‘preference’ column indicates which word should be preferred as an alignment of ‘X’ for a sub-structural transfer pattern.

The structural transfer patterns and their preferred alignments are built manually. In order to write the patterns, a parallel corpus had to be annotated with sentence-level and word-level alignments. Annotation is achieved semi-automatically with the support of a statistical machine translation system Moses (Koehn, 2010). Moses

can automatically generate a phrase mapping table between a source language and a target language if a parallel corpus is provided. A pair of a source sub-structure and a target sub-structure is automatically collected from the annotated parallel corpus. The collected transfer patterns are a list of pairs that are always mapped to each other whenever an alignment is performed. A corresponding node in a transfer pattern and a preference rule to trace its correspondence are automatically extracted from the corpus. Finally, a human annotator selects a list of structural transfer patterns and their preference rules, as shown in Table 2.

### 3. Interface of a bilingual concordance

We can easily access various kinds of parallel documents from Internet. A bilingual concordance system that we implement is designed to handle any kind of parallel documents. The system preprocesses a parallel document to annotate with sentence-level and word-level alignments by using a module described in Section 2. A parallel document annotated with both sentence-level and word-level alignments is fed as an input to a bilingual concordance. Figure 7 shows an interface of a bilingual concordance of when a user's query is 'parted'.

The family	<b>parted</b>	during the 1950-53 Korean war.
Several years ago, she bitterly	<b>parted</b>	with her dearly beloved per dog because
together till dawn and finally	<b>parted</b>	ways, but you called me at around 11:00
economic adviser to Roh, but has	<b>parted</b>	company with him on this issue.
Designer Lauder	<b>parted</b>	with Gucci after disagreeing with the brand's
가족들은 1950-53년 한국전쟁 때 헤어졌다.		
몇 년 전, 그녀는 알레르기 때문에 아끼던 강아지와 별거하는 아픔을 겪었다.		
작년에 형이랑 새벽까지 술 먹고 헤어졌는데 아침 11시쯤인가 형이 전화를 했어.		
그는 노대통령의 경제 자문가로 오래 재직했는데, FTA 협상에 대해서는 뜻을 달리하고 있다.		
디자이너 로더는 모회사와의 의견 차이로 구찌와 결별했습니다.		

Fig. 7. A resultant view of bilingual concordance with a query 'parted'.

When a user clicks a pair of sentences in the interface, a list of word-level alignments is displayed for the selected pair of sentences on another window. A view of (a) in Figure 8 shows basic word-level alignments for the selected pair of sentences, and (b) presents presumptive maximum word-level alignments.

1	Designer	디자이너	1
2	Lauder	로더	
3	parted with	는	
4	Gucci	모회사	
5	after	와의 의견 차이	6
6	disagreeing with	로	
7	the	구찌	
8	brand's owner	와 결별했습니다	3
9	.	.	

(a)

1	Designer	디자이너	1
2	Lauder	로더	2
3	parted with	는	
4	Gucci	모회사	8
5	after	와의 의견 차이	6
6	disagreeing with	로	
7	the	구찌	4
8	brand's owner	와 결별했습니다	3
9	.	.	

(b)

Fig. 8. A resultant view of bilingual concordance with word-level alignments.

Each English word is assigned with its own identifier number. An aligned Korean word is specified with its corresponding English identifier number. In order to make a distinction between basic alignments and presumptive alignments in the interface, a presumptive alignment is marked with a light color while a basic alignment is marked with a darker color. The design of interface for the app is completed and to be implemented with further work.

#### 4. Conclusion

In this paper, we suggested an algorithm to presume word-level alignments using structural transfer patterns between the two languages, English and Korean. A word-level alignment can be easily achieved if a bilingual lexicon is provided. However a newly-coined words occurring in documents cannot be aligned automatically because it has no translated target word in a bilingual lexicon yet. Structural transfer patterns can give a clue how to correspond the nodes between the two structures. Utilizing the transfer patterns, we can find a presumed translation for a newly coined word. As a result, we generate maximal number of word-level alignments between the two sentences. A bilingual concordance provided with maximum word-level alignments can enhance ESL learners' abilities to acquire the language.

The algorithm proposed in this paper is yet to cover multiword-level alignments. A future research will focus on how to presume a multiword-level alignment between the two languages.

# An evaluation of the educational software about precipitation titrations

Nilgün Secken<sup>a\*</sup>, Nazan Kunduz<sup>a</sup><sup>a</sup> Hacettepe University, SSME Division of Chemistry Education 06800 Beytepe, "Ankara", Turkey

---

## Abstract

The aim of study is to evaluate the views of student chemistry teachers about an education software concerning precipitation titrations. The participants are 13 student chemistry teachers. The study employs the method of survey and the data were collected through the use of "the scale of educational software evaluation" developed by Kara (2007). The reliability and validity study of the scale was also carried out. The scale has a total of five dimensions, namely content, easiness of the use, technical specifications, educational specifications and personal views. After the analysis of the data, it is observed that, computer-assisted teaching material has an important effect on understanding the subjects.

Keywords: computer-assisted teaching, educational software, evaluation of educational software, evaluation criteria

---

## 1. INTRODUCTION

In order to improve the quality of the learning-teaching process the efficient use of teaching technologies in concept teaching has become significant. One of the advantages of the use of computers as a teaching tool is that computers address more than one sense, improving the learning level and quality. It is stated that learning environments in which animation, sound and picture are used together are not traditional settings and improve the level of learning (Clark & Craik, 1992).

Developing countries have been completing their work on infrastructure for computer-assisted teaching. Uşun (2000) argued that there are some problems related to computer-assisted teaching and the educational use of computers. Major problems in this regard are as follows; equipping schools with computers whether or not quality education is provided; limited number of software and no consistency between the content of software and educational programs, time consuming process of development of high-quality and appropriate software, teachers' and school administrators' lack of training in using software and inefficient software.

One of the most significant problems is the need for high-quality software (Saka & Yılmaz, 2005). The ministry of national education has began to equip schools with technology classes in which computer-assisted education is delivered. However, software for such classes is mostly translated from foreign language materials, indicating the insufficient research and development activity in this regard. Software that is developed without necessary academic studies and research cannot meet the educational needs and expectations. (Dulger, 2004 cited in Kolomuç, 2009) Therefore while selecting a software educators should be careful. Educators should select a software that is the most appropriate for the concepts to be taught. However, there are other points to be taken

\* Corresponding author. Tel.: +90 312 297 86 01; fax: +90 312 297 86 00.  
E-mail address: nsecken@hacettepe.edu.tr

into consideration while choosing a software, including educational potential of computers. (Simsek, 1998) In fact there are four major points used in evaluating educational software: appropriateness of content, easiness of use, technical competency and educational competency. These are briefly given as follows: (Kara, 2007)

***Appropriateness of content:*** Appropriateness of content refers to the fact that software includes necessary contents and topics for the educational activities planned. It may be evaluated based on the following points: up-to-date content, correctness of the content, no unnecessary and redundant information, content closely related to objectives and desired behaviour, appropriateness in terms of educational program, appropriateness in terms of students' readiness, content written in an intelligible language, content with integrity of ideas, modular organization and opportunities for further learning.

***Easiness of use:*** An efficient software should be appropriate for students and teachers and should be easily adopted to the educational program. This feature can be evaluated through the following points: easiness of installation, being used by inexperienced students, provision of supplementary materials, opportunity for users to continue their study whenever they want, opportunity for users to make corrections, instructions, appropriateness of instructions, selecting window and easiness of exit, efficiency of menus.

***Technical competency:*** Technical competency refers to the correct functioning of the software. The points to be taken into consideration in evaluation of the software in this regard are as follows: being used with different operating systems, correct functioning, fast initiation, using different screen representations, having proper colours, choosing screen representation, correct functioning of instructions, having sounds that improve the listening skills, setting the sound level and opportunity to restart.

***Educational competency:*** Education competency of software refers to the fact that it provides appropriate educational activities that are in parallel to the objectives of the course. The points that can be used to evaluate the software in terms of its educational competency are as follows: covering different methods, being appropriate for age- and development-level of students, having educational animations, feedback system and provision of multi-question asking forms, being related to objectives, provision of reinforcement, having achievement test, having questions and having complementary activities.

Teachers play a significant role in successful use of the computer-assisted teaching activities. Student teachers should be informed about these activities and materials. In addition their views about the computer-assisted teaching are significant. They should also be given opportunity to express their views about the newly developed materials (Kutluca & Birgin, 2007).

Therefore, the aim of this study is to evaluate an educational software concerning precipitation titrations based on the views of student chemistry teachers. The topic of precipitation titrations is covered in the course of analytical chemistry at the university level and in the course of quantitative chemistry at the secondary level.

## 2. METHOD

Descriptive studies provide a description of the situation at hand and have the aim of describing it as it is (Karasar, 1993). This study is a descriptive research in that it tries to describe the existing situation of the software of precipitation titrations.

### 2.1. Participants

The participants of the study were thirteen student teachers who were taking the course of analytical chemistry II at Hacettepe Universities' chemistry education branch during the academic year of 2012–2013 Spring semesters.

### 2.2. Data collection tools

The data of the study were collected through the administration of a survey questionnaire, named the “scale of evaluation of the educational software”, developed by Kara (2007). The scale is made up of five major categories, namely appropriateness of content, easiness of use, technical competency, educational competency and personal views regarding the software. The scale includes a total of 47 items with a five-Likert scale. The items are evaluated one of five options.

### 2.3. Procedure

Before the evaluation, the participants were informed about the computer-assisted teaching, the aims of the study, the evaluation of educational software, and the administration of scale.

The software was installed and each participant worked on it independently. The courses were delivered through class discussions. However, the participants are allowed to work independently. Therefore, they were given opportunity to repeat the topics, make experiments, develop graphics, solve problems and answering a multiple-choice test. Finally student teachers were asked to evaluate the software. For this aim a questionnaire, named the “scale of educational software evaluation”, was administered to the participants.

### 2.4. Data analysis

The data obtained were analyzed through descriptive statistics. The answers to the items in the scale were scored as follows: 1.00–1.79 very weak, 1.80–2.59 weak, 2.60–3.39 moderate, 3.40–4.19 good, and 4.20–5.00 very good.

## 3. FINDINGS

The findings of the study are given in this section. Table 1 indicates the participants' views about the appropriateness of the software in terms of its content. It is seen that the views of the participants fall in the range of 4.20-5.00 in terms of up-to-date content, correctness of the content, no unnecessary and redundant information, appropriateness in terms of educational program, appropriateness in terms of students' readiness, content with integrity of ideas, modular organization and opportunities for further learning. Therefore, the software was evaluated to be “very good” by the participants in these regards. However, in terms of content closely related to objectives and desired behaviour, and content written in an intelligible language the software was evaluated by the participants as “good” indicating the score range of 3.40–4.19.

Table 1. Participant views about the content appropriateness of the precipitation titrations software

Content QUALITY	S	X
Content is appropriate to realize objectives and desired behaviour.	0.760	4.08
Content is in parallel to educational program.	0.519	4.54
Information covered by the software is up-to-date.	0.832	4.23
Information covered by the software is correct.	0.660	4.54
Software is appropriate in term of students' readiness level.	0.725	4.23
Software was written in a clear and understandable language without any spelling error.	0.899	4.15
Topics are presented in a fluent and integrated way.	0.725	4.23
Software does not cover any unnecessary information.	0.832	4.23
Content is organized into modules.	0.519	4.54
Software provides the students with the opportunity to learn further and get more detailed view about the content.	0.870	4.38

Table 2 shows the views of the student teachers about the easiness of use of the software. The scores given by the participants to the software are higher than 4.20 in terms of easiness of installation, use of software by inexperienced students, provision of additional materials, easiness of menu, choice over screen and easiness of exit. Therefore, the software was regarded as "very good" in these points. The mean score of the software ranges between 3.40 and 4.19 in terms of provision of opportunity to make corrections, instructions and appropriateness of instructions and provision of opportunity to resume work whenever users want. The software was regarded as "good" in terms of these qualities.

Table 2. Participant views about the easiness of use of the precipitation titrations software

Easiness of use QUALITY	S	X
Software can be easily downloaded.	0.776	4.46
Software can also be used by students who have no intensive experience of computer use.	0.630	4.31
Software includes helpful tools such as dictionary and calculator.	0.376	4.85
Software provides the students with the opportunity to make corrections.	1.387	3.62
Software provides the students with necessary instructions when they have difficulty.	1.000	4.00
There is help menu explaining the steps to be followed that is easily accessible.	0.376	4.85
Instructions to use are brief, simple, clear and consistent.	0.760	4.08
Software provides the students with the opportunity to use another screen when needed.	0.630	4.69
Software provides the students with the opportunity to resume their work.	1.441	3.92
User can exit from the software easily when they wish.	0.599	4.77

Table 3 shows the participant views about the technical competency of the precipitation titrations software. As can be seen, the participants considered the software to be “very good” in terms of being supported by different operating systems, correct functioning, easiness of restart, screen, correct functioning of instructions, and fast functioning. It was regarded as “good” in terms of using different screens, colours, quality of sounds and setting the sound level.

Table 3. Participant views about the technical competency of the precipitation titrations software

Technical competency QUALITY	S	X
Software can be used with different operating systems.	0.855	4.31
Software correctly functions whenever it is used.	0.660	4.46
It can be easily restarted.	0.660	4.54
There are different screens in the software.	0.862	4.08
The colours used in the software do not distract attention.	0.801	4.15
The screen representations used in the software do not distract attention.	0.751	4.31
Instructions function properly.	0.506	4.38
Pages can easily be viewed.	0.480	4.69
The sounds used in the software can improve the listening skills.	1.450	3.54
User can set the sound level of the software.	0.927	3.77

Table 4 shows the participant views about the educational competency of the precipitation titrations. The participants considered the software to be “very good” in terms of provision opportunity to study in accordance with the pace of students, and being age- and developmental-level appropriate. It was regarded as “good” in terms of clear objectives, involving different methods, reinforces, question formats, feedback, animations, additional activities and achievement test.

Table 4. Participant views about the educational competency of the precipitation titrations software

Educational competency QUALITY	S	X
Educational objectives of the software are stated clearly.	0.760	4.08
The software includes various methods of teaching.	0.707	4.00
Topics and skills involved in the software are age- and development-level appropriate.	0.599	4.23
The software provides the students with opportunity to study based on their own pace.	0.439	4.77

Reinforces included in the software improve student motivation.	0.832	3.77
The software includes animations that are in parallel to the objectives.	1.450	3.54
At the end of the software, there is an achievement test.	1.251	3.31
There are multi-question forms such as multiple choice, Coorrect or False, etc.	1.127	3.54
When student gives incorrect answer, s/he is given feedback about the correct answer.	1.266	3.46
The student provides the students with the opportunity to deal with additional activities about the topic.	0.961	3.62

Table 5 indicates the personal views of the participants regarding the software. It is seen that the software was regarded by them as “very good” in terms of being instructional, student achievement, motivation, being a complementary material, being used to provide complementary information and instruction. It was considered to be “good” in terms of being used as an exercise opportunity.

Table 5. Participants’ personal views about the precipitation titrations software

Personal views Quality	S	X
I believe that the software is instructional.	0.870	4.38
I believe that the software will improve student achievement.	0.947	4.31
I believe that the software will increase students’ motivation to learn.	0.947	4.31
I believe that the software is helpful as a complementary material.	1.182	4.31
I believe that the software can be used to complement missing information of the students.	0.480	4.69
I believe that the software can be used as an exercise opportunity.	1.573	3.85
I believe that the software can be used to teach the topic.	0.855	4.31

The answers of the participants indicate that the software is considered to be “vey good” (Table 6). More specifically, they regarded the software as “very good” in terms of content, easiness of use and technical features. It was viewed to be “good” in terms of educational competency.

Table 6. Views of the participants about the software

	Item no.	S	X
Appropriateness of content	10	0.737	4.32
Easiness of use	10	0.939	4.35
Technical competency	10	0.874	4.22
Educational competency	10	1.043	3.83
Personal views	7	1.019	4.31
EYDÖ	47	0.941	4.20

#### 4. CONCLUSION AND DISCUSSION

The aim of study was to evaluate the views of student chemistry teachers about an education software concerning precipitation titrations. The findings of the study indicated that the educational software is viewed as “very good” in general terms.

Since the software was regarded as “very good” in terms of content, easiness of use and technical features, it can be argued that it functions correctly and facilitates the interaction with users. On the other hand, it was viewed to be “good” in terms of educational competency. Therefore, the software includes necessary activities that reinforce the educational objectives.

The findings also suggest that the software was developed well in terms of general design features such as screen, colour and sound. Furthermore, the software is user-friendly in that it has help menu, instructions and flexibility in using the screens. In addition, the software is both instructional and helpful since it involves variety of animations and pictures, up-to-date topics and interesting questions.

The views of the participants indicate that the software is very well developed and can be employed in accordance with the criteria stated by Hannafin and Peck (1988).

One of the advantages that educational software offer is that they provide the students with the opportunity to study based on their pace. (Kara, 2007) Since the software analysed in the study also provides such an opportunity it was regarded as efficient by the participants.

Research suggests that teachers lack of competency in developing materials and providing optimal learning environment. (Akdeniz, Yiğit & Kurt, 2002) Therefore, such software may assist them in their attempts to develop learning materials. For instance, they may use the software to develop other software or similar techniques for other chemistry topics. The software as evaluated by the participants seem to meet the needs of teachers.

In terms of student needs, other educational software can be developed for other units, facilitating the learning. Research suggests that appropriate educational software improve both student attention and motivation. It is also reported that using non-traditional learning environments for the subjects that are not liked by students is helpful in improving student achievement (Bakar, Tuzun & Çağıltay, 2008; Teyfur, 2010; cited in Gül & Yeşilyurt, 2011).

In short given that educational software should meet the needs of teachers and students, it should be evaluated by them to develop much more effective software. However, it should also be reviewed by technical experts in order to meet the needs of students.

## Abstract

IRT models have many advantages over CTT. However, the model-data fit should be verified as a prerequisite to use IRT models. Therefore, in this study it is aimed to investigate which IRT model will provide the best fit to the data obtained from SBS 2009 science subtest. For goodness-of-fit analysis, first the model assumptions and then the expected model features were tested. The model assumptions unidimensionality and local independence were investigated. In the expected model features part the invariance of ability parameter estimates and invariance of item parameter estimates were analyzed. To determine the best model, the results of the chi-square statistics of  $-2 \log$  likelihood values of models were compared. The results suggested that three parameter logistic model is the most appropriate model for data fit.

## 1. INTRODUCTION

The science of psychological tests is known as psychometrics. Psychometrics had its origins in the mid to late 1800's as part of an effort to quantify cognitive and affective attributes in humans (Crocker & Algina, 1986). Psychological tests scores are calculated, they can be used to compare achievement results at the student, school or state level. The scores then analyzed in a way that their results can be appropriately interpreted. The classical test theory and item response theory are used in practice. In classical test theory, the model of measurement error is based on the correlation coefficient. The correlation coefficient, developed by Charles Spearman, attempts to explain error using two components: a true correlation and an observed correlation (Crocker & Algina, 1986). Mathematically, this can be written as  $X_p = T_p + E_p$  where  $X_p$  is the observed score,  $T_p$  is true score and  $E_p$  is the error associated with the score. The observed score is the actual score an individual received on that particular test and the true score is the average score an individual would receive on a test if they repeated it many times. Unfortunately, classical test theory is limited to simply describing the total test score for one particular test and group of examinees.

The initial theoretical groundwork for an alternative to the CTT paradigm known as Item Response Theory (IRT) was laid down in the 1940's by D. N. Lawley (McDonald, 1999). A more comprehensive theoretical framework for IRT was subsequently developed and shaped from the 1950's to the 1970's by a number of prominent psychometricians and statisticians, including Frederick Lord, Georg Rasch and Benjamin Wright

(Baker, 2001; McDonald, 1999). The mathematics and computational algorithms of IRT are far less tractable than CTT and therefore the practical implementation of IRT had to wait until the 1970's and 1980's for the development of computers that could carry out the necessary computations for IRT.

Item response theory differs from classical test theory by focusing on measuring some latent trait possessed by the examinees, usually ability. The key feature of IRT that sets it apart from CTT is the explicit mathematical modeling of the stochastic relationship between the performance on an individual item and the underlying continuous scale of the latent construct that the item is theorized to be measuring (Embretson & Reise, 2000; Hambleton, Swaminathan, & Rogers, 1991). IRT uses a mathematical model to express the probability of an examinee answering an item correctly as a function of the examinee's ability. These functions (for each item) are the item response functions (IRFs) which serves as the mathematical model linking the observable data (item performance) to the unobservable data (ability). One useful feature is that of the test characteristic function that is the sum of the item characteristic functions that makes up a test and can be used to predict the scores of examinees at given ability levels. If the test is made up of test items that are relatively difficult, then the test characteristic function is shifted to the right and examinees tend to have lower expected scores on the test than if easier test items are included.

Unlike classical test theory models, the model parameters in IRT can be adjusted to account for different ability distributions possessed by the examinees. This is known as the invariance property. That is item parameters estimated using one group of examinees can be transformed to match those from another group of examinees. If the item is binary (the item is either correct or incorrect) then the IRFs are commonly assumed to be monotonic, unidimensional, and locally independent. Monotonicity means that as the examinee's ability increases, the probability that the examinee will respond correctly (for a particular item) also increases. Unidimensionality means that only one ability or trait is necessary to explain for examinees' test performance. Item response models that assume a single latent ability are referred to as unidimensional (Hambleton & Swaminathan, 1985). The assumption cannot be strictly met since there are always other factors affecting the test performance. Therefore, the requirement for the assumption is to have a dominant factor. Local item independency means that an examinee's responses to different items in a test are statistically independent. For this assumption to be true, an examinee's performance on one item must not affect, either for better or for worse, his or her responses to any other items in the test (Hambleton & Swaminathan, 1985).

The item analysis in the item response theory consists of (a) determining sample-invariant item parameters using relatively complex mathematical techniques and large sample sizes, and (b) utilizing goodness-of-fit criteria to detect items that do not fit the specified response model. The property of sample invariance inherent within IRT means that test developers do not need a representative sample of the examinee population to calibrate test items. They do, however, need a heterogeneous and large examinee sample to insure proper item parameter estimation. Also IRT requires larger sample sizes to obtain good item parameter estimates, the test developer must ensure that the examinee sample is of sufficient size to guarantee accurate item calibration (Hambleton & Jones, 2005).

However, measurement specialists cannot benefit from the advantages mentioned above unless model data fit is achieved (Hambleton, Swaminathan, & Rogers, 1991). Although there are several studies that investigated model-data fit, few studies investigated the fit of IRT models to data obtained from achievement tests administered to elementary school students. Therefore, in this study model-data fit investigations were conducted on the data obtained from examinees that were preparing for Seviye Belirleme Sınavı (SBS) in Turkey.

INTE 2013

## 2. METHOD

### 2.1. Study Group

This study examined SBS science subtest data for 2009. SBS is administered to 8<sup>th</sup> grade students. Total of 1 million 15 thousands of students took the 2009 SBS and all of them were responsible for answering questions in science subtest constitute the population of the study. Among the students took the exam, 1964 students were randomly selected as the study group. Among 1964 subjects, 56.2 % of them is male and 43.8 % of them is female.

### 2.2. Instrument

The data set was obtained from the 8th grade examinees that took the SBS 2009. SBS composed of four subtests which are Turkish, Science, mathematics and social sciences. In this study the science subtest of the SBS was used. The science subtest consist of 20 items. However, the result of factor analysis showed that to make it unidimensional, 5 of the items were deleted and the analysis was done with 15 items.

### 2.3. Design of the Study

Methods for assessing goodness of fit were presented by Hambleton et al. (1991). Checking model assumptions and checking expected model features were two important goodness of fit investigations. In the first part of the analysis in which model assumptions held was investigated through analysis of unidimensionality and local independence. In the second part, degree to which desired model features were obtained was investigated through analysis of invariance of item parameter estimates and invariance of ability parameter estimates.

### 2.4. Assessment of Goodness of Model-Data Fit

Item response models offer a number of advantages for test score interpretations and reporting of test results. However, the advantages will be obtained in practice only when there is a close match between the model selected for use and the test data. This can be examined through two step processes: checking the model assumptions and model features.

#### 2.4.1. Checking Model Assumptions

There are two main assumptions which are unidimensionality and local item dependence.

*Unidimensionality:* To check the unidimensionality assumption factor analysis was conducted. Eigenvalues and obtained scree plot were investigated in order to determine whether there was a dominant first factor. According to Hambleton, Swaminathan, and Rogers (1991) a dominant first factor is needed to satisfy unidimensionality assumption. In other words, there should be a large difference between the first eigenvalue and second eigenvalue. Moreover, a significant drop in the contribution of the factors between the first and second factors can be seen as an evidence for unidimensionality. To do the factor analysis to the binary science items STATISTICA computer program was used to get the tetra choric correlation matrices.

*Local Item Independence:* According to Hambleton Swaminathan, and Rogers (1991) when unidimensionality assumption is met the local independence assumption is also satisfied. Therefore, the clues for the unidimensionality was used also for the local item independence.

### 2.4.2. Checking Model Features

*Invariance of Item Statistics:* Invariance of item statistics can be defined as item statistics are obtained that do not depend on the sample of examinees used in the calibration of test items. To investigate the degree to which the property of invariance held for the item difficulty and item discrimination parameter estimates, the difference is that extreme ability groups (e.g. random groups, high vs. low ability groups) were formed and item parameter estimates in the two samples were compared.

*Invariance of Ability Estimates:* Invariance of ability statistics can be defined as examinee ability estimates are obtained on the same ability scale and can be compared even though examinees may have taken different sets of test items from the pool of test items measuring the ability of interest (Hambleton & Swaminathan, 1985). To investigate the degree to which the property of invariance held for the ability parameter “ $\theta$ ” estimates, by administering examinees two or more samples of test items that vary widely by means of some parameters (e.g. difficult vs. easy, even vs. odd items).

To do the IRT analysis to check the invariance of item and ability statistics BILOG computer program was used.

## 3. RESULTS

### 3.1. Checking Model Assumptions

To test the unidimensionality assumption of IRT, factor analysis was conducted with 20 science items. The results showed that the test did not meet the assumption of unidimensionality. Therefore, five items were deleted and the final results were satisfactory. Both the initial and the final factor analysis results are at Table 1.

Table 1. Total Variance Explained

Component	Initial Eigenvalues			Final Eigenvalues		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	7.31857	36.59285	36.59285	6.728082	44.85388	44.85388
2	1.55727	7.78633	44.37918			

As stated before, local item independence is met with the satisfaction of unidimensionality (Hambleton, Swaminathan, & Rogers, 1991). Therefore, no extra analysis were done to check local item independence assumption.

### 3.2. Checking Expected Model Features

Invariance can be thought as both item and ability levels. If a test is scaled with IRT, then it can be used many times to different examinees without any change in item parameters and examinees' ability can be measured although by taking different items. To examine the invariance of item and ability statistics, all the items were scaled by means of three item response models which are 1-, 2-, and 3-PL models. The summary parameters are in Table 2.

Table 2. The summary of Item Parameters Scale Values

Model	Parameter	Mean	Sd	Min.	Max.
1PL	b	0.141	0.524	-0.757	1.069
2PL	a	1.396	0.379	0.777	1.883
	b	0.184	0.605	-0.658	1.505
3PL	a	2.547	0.783	1.481	3.972
	b	0.514	0.510	-0.403	1.412
	c	0.173	0.035	0.118	0.234

*Invariance of Item Statistics:* To investigate the degree to which the property of invariance held for item parameters under each model, correlation analysis was conducted on samples (random group and high-low ability group). The results are in Table 3.

Table 3. The Correlation Coefficients of Item Parameters from Different Ability Groups

Model	Parameter	Groups	
		Random groups	High-Low Ability
1PLM	b	0.991	-
2PLM	a	0.934	-0.322
	b	0.988	0.178
3PLM	a	0.788	-
	b	0.986	-
	c	0.705	-

Before the interpretation of the results of invariance of item statistics, it can be seen from the Table 3 that there is no values for the high-low ability group for 1- and 3-PL models. Since b parameter for 1PLM and a,b and c parameters for the 3-PLM for low ability group could not estimate through the analysis done by BILOG, their correlations with the high ability group could not also estimated. There is another point can be seen from the Table 3 that the estimated correlations for the 2-PLM for high-low ability groups were very low. Therefore, only the results of random groups were used for the evidence of invariance of item statistics.

All results obtained from random sample group for the item difficulty parameter “b” showed very strong correlation coefficients (the lowest 0.986 and the highest 0.991). These strong correlation coefficients are excellent indicators of invariance.

Compared to other IRT models, correlations under 1- and 2-PLM were quite strong; therefore invariance property was best achieved under 1- and 2-PLM. Moreover, among the three models, the lowest coefficients were obtained under 3PL model but it is still very high. Invariance of discrimination parameter “a” was also investigated on random group samples. Correlations under 2-PLM was much stronger compared to 3-PLM. In addition, correlations obtained for invariance property of discrimination parameter were weak compared to correlations obtained for item difficulty parameter. Moreover, as the variability in sample increased the correlation coefficients obtained for invariance property of both item difficulty and item discrimination parameters decreased. Compared to 3-PLM, 2-PLM provided well fit when invariance property of discrimination parameter is considered.

*Invariance of Ability Parameter Estimates:* To investigate the degree to which the property of invariance held for the ability parameter estimated under each model person statistics obtained on samples (difficult-easy and odd-

even samples) was correlated. For all the IRT models the correlations of ability estimates on odd-even sample was high enough for 1- and 2PL models (see Table 4). However, for 3PLM, the coefficient was weak compared to other two IRT models. For all the IRT models the correlations of ability estimates on difficult-easy sample was not very high but it is enough to hold the invariance property.

Table 4. The Correlation Coefficients of Ability Parameters from Different Item Groups

Model	Items	
	Od-Even	Difficult-Easy
1PL	0.715*	0.621*
2PL	0.731*	0.625*
3PL	0.629*	0.649*

\*Correlation is significant at the 0.05 level (2-tailed).

### 3.3. Best Model Fit to Data

To determine which model best fit to the data, the maximum likelihood method was used to get -2Log Likelihood values. These values are in Table 5.

Table 5. -2 Log Likelihood Values for the 1-, 2-, and 3-PLM

Model	-2 Log Likelihood Values
1PLM	34182,0708
2PLM	33874,0544
3PLM	33460,4634

The differences of the values given at Table 5 was important to decide the model appropriate to the data. Therefore the differences between the -2 Log Likelihood values and the decisions were taken and given at Table 6.

Table 6. The Results of Model Differences

Model Differences	Result
$(1PLM - 2PLM) = (33874,0544 - 34182,0708) = 308,0164 > 24,99579$	2PLM is better than 1PLM for model-data fit.
$(2PLM - 3PLM) = (34182,0708 - 33460,4634) = 413,591 > 24,99579$	3PLM is better than 2PLM for model-data fit.

As a result, we can conclude that, for the model investigated, 3 PLM is best fit.

## 4. DISCUSSION AND CONCLUSION

The purpose of this study was to investigate which IRT model would provide the best fit to the items from SBS 2009 exam science subtest through various goodness of fit analysis. By means of goodness of fit analysis, both the IRT model assumptions and expected model features were investigated.

Investigations of IRT model assumptions indicated that after deleting five items, the unidimensionality assumption was met. As a result of this situation, it was assumed that the local item dependence assumption was also met.

The invariance of ability and item statistics obtained by each IRT model was also tested. The calculated correlations under each IRT model for ability and item parameters are strong enough. Therefore, it can be stated as the invariance property of ability and item parameters was held.

The analysis presented that 3-PLM provides the most appropriate fit to science subtest data. In other words the 3PLM provides the best item and ability parameter invariance which can be get after the model-data-fit is satisfied.

Finally, the deleted items may reduce the content validity of the subtest. Therefore, validity of the test should also be investigated and if necessary the analysis should be done via the multidimensional models.

4<sup>th</sup> International Conference on New Horizons in Education

# An investigation of the relationship between performance in the problem-solving laboratory applications and views about nature of science of pre-service science teachers

Hatice Güngör Seyhan<sup>\*a</sup>, Gülseda Eyceyurt Türk<sup>b</sup>

<sup>a</sup>Assoc.Prof.Dr., Cumhuriyet University, Faculty of Education, Department of Chemistry Education, Sivas, Turkey

<sup>b</sup>Research Assist., Cumhuriyet University, Faculty of Education, Department of Chemistry Education, Sivas, Turkey

## Abstract

Teacher education programs have met with limited success in improving teachers' understanding of the nature of science (NOS). Research suggests that such efforts could be enhanced by addressing NOS in pre-service teachers' science courses (Hanuscin, Akerson, & Phillipson-Mower, 2006).). In the extent of the study it has been aimed to search, a) students' views about nature of science, b) the effect of problem solving applications in the science laboratory on 40 pre-service science teachers' knowledge and their perceptions about nature of science. In the study, Evaluation Form of Problem Solving Skills (EFPSS), Evaluation Form of Student Reports (EFSR), The Beliefs about Science and School Science Questionnaire (BASSSQ) and Views of Nature of Science Questionnaire (VNOS-C) have been used as data collection tools. The knowledge of the students about the Nature of Science was determined by evaluating the answers of the students to BASSSQ subsequent to the problem-solving implementations within the context of science laboratory.

Keywords: Nature of Science, Problem solving, Science laboratory applications

## 1. INTRODUCTION

One of the main reasons why students receive science education is to bring them to a literacy level in science. Scientific literacy is defined as to know the nature of science, to understand how knowledge is obtained, to comprehend that knowledge depends on known facts, which change as the new proofs are collected, to know the basic concepts, theories and hypothesis in science and to perceive the difference between scientific proofs and personal opinions (Ayas, Çepni, Johnson & Turgut, 1997).

There are different definitions for problem solving in many literatures. Gagne (1970) differentiated problem solving as the highest level of learning from the problem solving skill as the unavoidable life skill. According to Wheatley (1984), problem solving is what you do when you don't know what to do. Gagne (1977) expressed problem solving as a thinking process, where students discover the composition of previously learnt principles to solve a problem. Ashmore, Frazer and Cassey (1979) defined problem solving as the result of the implementation of certain knowledge and principles to understand a problem. Perez and Torregróse (1983) considered problem solving as a scientific research task. Mayer (1997) perceived problem solving as a synonym of thinking. Heppner

\* Corresponding author. Tel 00903462191010-3252.

E-mail address: hgunsey@gmail.com

(1982) used problem solving as a synonym for coping with problems. According to Cardellini (2006), problem solving is more than integrating numbers into well-known formulas. It is related to creativity, comprehensive thinking and formal knowledge (Temel, 2009).

### *1.1. Problem solving approach in the laboratory*

According to Chiappetta and Koballa (2002), various approaches have been developed in recent years to increase the productivity of laboratories along with turning them into environments where meaningful learning occurs. One of these approaches is the problem solving approach in the laboratory. By using this approach, chemistry curriculum has been revised to allow for more purposeful utilization of laboratories (Wilson, 1987). Laboratories are ideal and productive environments to implement technical concepts into the real life contents (Gallet, 1998). However, traditional chemistry experiments are carried out in a way that does not require much thinking or preparation. Students participate in laboratory activities in the same way as following the instructions of a recipe (Neeland, 1999). With the aim of correcting this mistake, certain chemistry educators reached to better conditions by using the problem solving approach in the laboratories (Wilson, 1987).

### *1.2. The Nature of Science*

The nature of science has become the basic component of chemistry education programs in certain countries such as the USA (AAAS, 1990; 1993; NRC, 1996) and the UK (DFE, 1995, Millar & Osborne, 1998). Various researchers emphasize that the nature of science is closely related to the science education. Understanding the nature of science and overcoming both social and scientific events is the basic purpose of the science education (Tao, 2003; Sadler, 2004; Bora, 2005). The nature of science and the nature of scientific knowledge construct the two dimensions of the scientific literacy (Meichtry, 1999). A scientifically literate person is defined as an individual who can make conscious decisions using scientific knowledge, concepts, laws and processes in terms of science and technology (Abd-El-Khalick, Bell & Lederman, 1997).

Showalter (1974) made use of the terminology as uncertain, general, repetitive, probable, humanistic, single, holistic, historical and experimental in defining the nature of scientific knowledge. Having scanned the literature on the scientific knowledge, Rubba and Anderson (1978) united these nine factors under a 6-factor model called the nature of science model. These factors are: moral (scientific knowledge cannot be judged as good or bad), creative (scientific knowledge is partly a product of an individual's creativity), developmental (scientific knowledge is not the absolute truth), simple (scientific knowledge is not complex), testable (scientific knowledge could be tested through experiments) and united (specific sciences could contribute to the relevant laws, theories and concept webs).

### *1.3. The purpose of the study*

This study aims to determine i) the problem solving performances of science teachers participating in the problem solving applications in the chemistry lab; and ii) its relationship with their opinions on the nature of

science along with their beliefs about the nature of science and science teaching as variables. Therefore, answers to the following sub problems were sought for:

- How are the performances of student teachers affected following the problem solving applications at the chemistry lab?
- Are the opinions of student teachers on the nature of science and their beliefs about science teaching significant variables to interpret their performances at the problem solving applications at the chemistry lab?

## 2. METHOD

### 2.1. Sampling

The study was participated by 40 student teachers studying in their 3rd year at the Science Teaching Department during the spring semester of the 2012-2013 academic year. Single group posttest model was made use of for the study.

### 2.2. Data collection tools

#### 2.2.1. Evaluation Form of Problem Solving Skills (EFPSS)

EFPSS is a form, where student teachers are assessed individually (Lynch, Wolcott and Huber, 2000). The problem solving skills of student teachers are evaluated according to the measures in the form (differentiating the nature of the problem and the relevant knowledge, organizing an open-ended problem, reorganizing an open-ended problem). All skills in the form were scored between 0 and 4 according to the quality of the skill. The set up and content validity of the form were obtained through taking expert opinion. For the reliability of the form both researchers filled this form for each student teacher and the consistency between the two scores was looked at. The Pearson Correlation analysis concluded that the consistency between the scores of the two researchers was .89 (Temel, 2009).

#### 2.2.2. Evaluation Form of Student Reports (EFSR)

EFSR ([chem.ntci.on.ca/sch4u/InquiryRubric.pdf](http://chem.ntci.on.ca/sch4u/InquiryRubric.pdf)) is a form that is adapted by the researchers to evaluate the reports prepared by the groups as their products following their laboratory studies. The assessment measures in the form (purpose, materials and procedure, hypotheses, discussion) were scored from 1 to 4. For the reliability of the form, both researchers filled in this form according to the experiment reports of the groups and the consistency between the researchers' scores was evaluated. The Pearson Correlation analysis concluded that the consistency between the two researchers was .87 (Temel, 2009).

### 2.2.3. Nature of science and science teaching beliefs scale (BASSSQ)

To determine the beliefs of students about the nature of science and science teaching in the study, the survey developed by Chen et.al (1998) was used. BASSSQ is a two dimensional 5-point Likert-type scale developed to evaluate the opinions of students about science and the nature of science at school (Macaroğlu, Taşar & Çataloğlu, 1998). The first section of the survey called the “Opinion of the Teacher about Science” consists of two sub dimensions. The first scale is the scientific inquiry process and consists of 10 questions. The second scale is about the absoluteness of the scientific knowledge and it consists of 10 questions also. The scoring of the responses to the survey questions is as follows: strongly agree =5, agree=4, neutral=3, disagree=2 and strongly disagree =1. The scoring was reversed for the negative statements (strongly agree =1, agree=2, neutral=3, disagree=4 and strongly disagree =5). The internal consistency of the survey was found to be 0.51 for the first section and 0.81 for the second section (Aldridge, Taylor & Chen, 1997).

### 2.2.4. Opinion survey on the nature of science (VNOS-C)

To determine the opinions of student teachers about the nature of science, the “Opinion Survey on the Nature of Science” developed by Lederman et.al (2002) was administered. The responses of the participating students were evaluated after both applications and their general opinion profile was created. The survey consisted of three versions (VNOS-A, VNOS-B and VNOS-C). This study made use of the final version of the survey. During the development process the VNOS-B form was modified by Abd-El-Khalick (1998) and extended with the addition of new items. A commission of experts provided the content and range validity was obtained (Lederman, Abd-El-Khalick, Bell & Schwartz, 2002).

## 2.3. Teaching Process

Problem Solving Applications at the Chemistry Lab (PSACL) started with the pre test administration of BASSSQ and VNOS-C. Before the administration, students were informed by the researchers about the importance of scientific process skills and science teaching through scientific research along with their importance at the laboratory practices. These skills are important elements of the mental development and set the basis of the laboratory practices (Ayas, Çepni, Johnson & Turgut, 1997).

Problem solving applications at the chemistry lab consisting of 5 steps was realized within 6 weeks with the participation of 40 science teachers (YÖK World Bank, 1997). After the pre test application, student teachers were asked for their opinions on what problem solving means, the importance of problem solving process and how it is realized through a small discussion. Next, they were informed about the problem solving applications at the chemistry laboratory, the steps of these applications, and how to proceed according to these steps to introduce the application to the student teachers during the first week of the study. Student teacher groups were asked to form groups of four and five. The initial phase of the application (the problem case) was also proceeded in this week. Each group was given a problem case. For ensuring meaningful problem solving, problem cases were chosen among daily life events. Student teachers were informed they would determine their problems by the second week. A total of 10 problem cases were presented to all student groups. The second week when the

second phase starts (identification of the problem), groups simplify their problems and differentiate events to analyze from the events that do not require analysis. They divided the problems into steps or sub problems and expressed their problems in a clear language. The researchers controlled the problems determined by the groups. The third phase of the application in the third week (establishing hypothesis) involved the determination of all technical and theoretical questions they needed to solve their problems. Later, all groups shared responsibilities among their members and started to seek potential solutions to their problems. With this aim, groups made use of the library and various resources to collect information about their pre-problems. After the data collection week, the solutions suggested by the groups were collected and one among them was selected for each group to be tried. The researchers checked these solution ways. Groups established their hypothesis for solving their problems and presented the solution way of their choice in the form of an experiment suggestion. The fourth step was (trying the solution way) the experiments done by the students at the chemistry lab under the supervision of the researchers. During the experiment phase, the groups doing their experiments generalized the results they obtained and expressed them in their own words. In the fifth and final phase of the study (repeating), the groups, who failed to obtain results according to the hypothesis they established, revised their solution steps and the whole process was repeated starting from the step that the failure occurred. During PSACL, researchers evaluated each participant according to their performances in the phases (differentiating the nature of the problem and the relevant knowledge, organizing an open-ended problem, reorganizing an open-ended problem) using EFPSS and scoring all skills in the form with points changing between 0 and 4. After PSACL, BASSSQ and VNOS-C were administered as the post tests. Additionally, the groups in this week submitted their reports on their targets, observations, data analysis, hypothesis, work plans, and their conclusions. In evaluating the individual reports of all group members EFSR was utilized and the evaluation measures in the form (purpose, materials and procedures, hypothesis, conclusions, discussion) were scored from 1 to 4. The all scores which obtained from EFPSS and EFSR were included out of 100 score for evaluation of students' performances.

### 3. FINDINGS

#### 3. 1. Nature of science and science teaching belief scale (BASSSQ)

The pre and post test results of the BASSSQ, which is a Likert-type scale, were compared according to the paired sample (t) test and the results are displayed on Table 1.

Table 1. Dependent paired sample t-test results regarding BASSSQ-teachers' opinions on science section ( $p < .05$ )

	N	X	S	t	p
Pretest	40	3.2088	,3368		
Posttest	40	3.4150	,2919	-4,771	.000

“Nature of Science and Science Teaching Belief Scale” pre and posttest results indicated a significant difference favoring the posttest ( $p < .05$ ). As a result of the problem solving application, students’ beliefs about the nature of science improved in a statistically significant direction.

### 3.2. Survey of opinions on the nature of science (VNOS-C)

To determine students’ opinions on the nature of science the VNOS-C was administered as the pre and posttest and the results are displayed on Table 2 in frequencies and percentages. The responses of the students to the “Survey of Opinions on the Nature of Science” were classified as “good”, “medium” and “weak” as indicated in the resources (Milwood and Sandoval, 2004; Thye and Kwen, 2003) and the evaluations were made accordingly.

Table 2. Percentage frequencies of student responses to VNOS-C

Items	GOOD		MEDIUM		WEAK		FALSE		BLANK	
	pre test	post test	pre test	post test	pre test	post test	pre test	post test	pre test	post test
1	10	30	30	48	60	22	-	-	-	-
2	0	45	40	30	60	25	-	-	-	-
3	20	48	45	40	30	12	5	-	-	-
4	19	63	30	28	53	9	-	-	-	-
5	10	53	33	30	40	17	14	-	3	-
6	0	35	24	30	58	23	8	-	10	12
7	14	49	25	20	48	28	5	-	8	5
8	0	43	25	28	65	21	-	-	10	8

10	8	58	35	28	48	8	10	-	-	6

Students responded to the first question of the survey as “what is science according to you? How does science (or a scientific discipline such as physics, biology or etc.) differ from the other inquiry disciplines (such as religion and philosophy)?” which is displayed on Figure 1. 60% of the students responded at the “weak” category in the pretest, while the percentage of the “weak” category dropped down to 22% at the posttest.

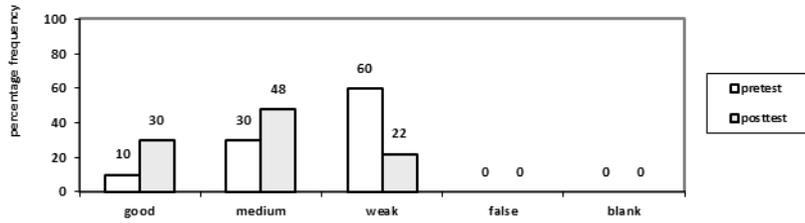

Figure 1. Distribution of students' responses to the 1<sup>st</sup> question

The second question on the survey, as “What is an experiment?”, was responded by the students as displayed in Figure 2. While none of the students responded at the “good” category in the pretest to this question, the percentage of responses at the “good” category increased up to 45% at the posttest. Similarly, 60% of the students responded to the same question at the “weak” category, while this percentage dropped down to 25% at the posttest.

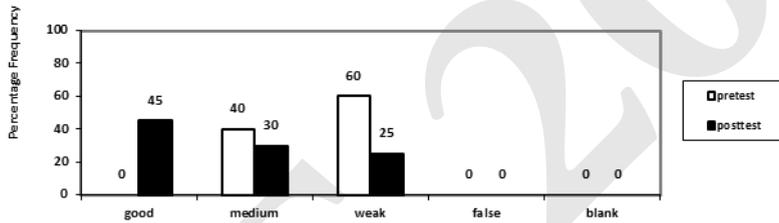

Figure 2. Distribution of students' responses to the 2<sup>nd</sup> question

The fifth question on the survey, which was “Is there any difference between the scientific theory and scientific law? Please explain using examples”, was responded by the students as Figure 3 displays. While 20% of the students responded at the “weak” category in the pretest to this question, the percentage of responses at the “weak” category decreased down to 6% at the posttest.

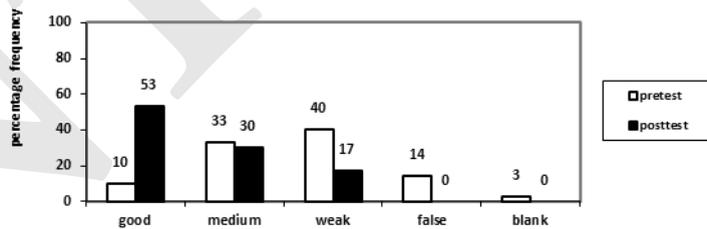

Figure 3. Distribution of students' responses to the 5<sup>th</sup> question

Students responded to the eighth question of the survey, as “It is believed that the dinosaurs became extinct 65 million years ago. Two of the hypothesis established by the scientist on the reason for extinction received great support. The first one was introduced by a group of scientists. According to that, the crash of a meteor to the

earth, which resulted in a series of events including the extinction of dinosaurs? The second one suggests that the reason for extinction was the volcanic explosions. Although the same data were used by all two groups of researchers to develop their hypothesis, how could there be different conclusions?”. As Figure 4 displays, none of the students responded at the “good” category in the pretest, while the percentage of the “good” category increased up to 43% at the posttest. The same question was responded by 65% of the students at the “weak” category while this percentage dropped down to 21% at the posttest.

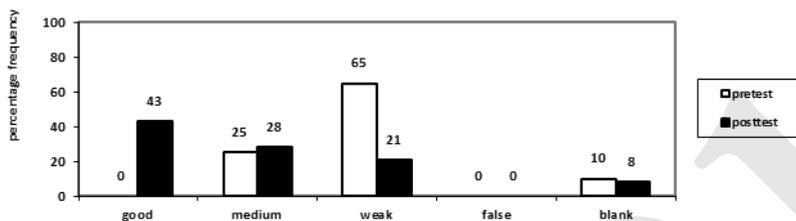

Figure 4. Distribution of students' responses to the 8<sup>th</sup> question

The ninth question on the survey, which was “Some people claim that scientists are affected by the social and cultural values. This means that science reflects the intellectual norms, philosophical hypothesis, social and political values. Others claim that science is universal. This means that science goes beyond the national and cultural borders; and therefore is not affected by the cultural norms, social, political and philosophical values”, was responded by the students as Figure 5 displays. While none of the students responded at the “good” category in the pretest to this question, the percentage of responses at the “good” category increased up to 52% at the posttest. The same question was responded falsely by the 7% of the students in the pretest, while there were no false answers at the posttest.

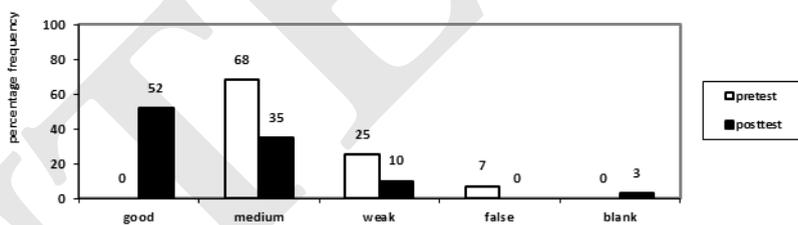

Figure 5. Distribution of students' responses to the 9<sup>th</sup> question

#### 4. CONCLUSION AND DISCUSSION

Following the problem solving application at the chemistry lab, student teachers' knowledge levels about the nature of science increased statistically. Data analysis concluded that these applications could extend student teachers' knowledge about the nature of science. Similarly, Küçük (2006) used direct reflective observation technique in his study, which increased knowledge levels of students about the nature of science. The results of

our study are in line with the findings of studies by Akerson and Volrich (2006). Akerson and Volrich (2006) focused on the nature of science in their study, where a student teacher made applications aiming to improve his/her peers' opinions on the nature of science in the training class. Class observations made by the student teacher were used as the data collection tools. The interviews of the student teacher with his/her peers at the beginning and end of the application showed that there were positive improvements in the opinions of student teachers regarding the nature of science.

The statistical analysis of the responses of the student teachers to the nature of science and science teaching belief scale indicated that the aforementioned applications lead to a significant increase in the knowledge levels of student teachers on the nature of science. The results of our study are in line with the findings of studies by Morgil, Temel, Güngör Seyhan and Ural Alşan (2009). The responses of the students to the survey of opinions on the nature of science proved that students were insufficient at questions 1., 2., 5., 8., and 9. These negative results are similar to various studies in the literature. For instance, Murcia and Schibeci (1999) researched the concepts 73 student teachers knew about the nature of science. The results showed that they did not comply with the modern opinions. Responses of student teachers in general displayed that they had an insufficient and lacking approach towards the scientific method. Moreover, the responses showed that students had a weak level of understanding about the scientific theories. The study concluded also that students were not conscious about the nature of science and the studies of the scientists. Abd-El-Khalick and Akerson (2004) analyzed and evaluated the effects of a direct and reflective educational approach on improving student homeroom teachers' opinions on the nature of science. Student teachers were administered the VNOS-B survey and they were made individual interviews. The changes in the students' opinions at the beginning and end of the teaching process were analyzed. The results indicated that the student teachers did not have much information on the nature of science. Similar to the studies abroad on the nature of science, there were studies in Turkey on the same topic (Gürses, Doğar, & Yalçın, 2005; Bora, 2005; Tufan, 2007). The results of the study and other studies in the same field showed that student teachers lacked sufficient knowledge about the nature of science. This result indicates that the education student teachers receive before university on science cause these insufficiencies, which could not be compensated during the university education. Therefore, determination of student teachers' opinions on the nature of science is very important along with planning learning activities, which would compensate students' misconceptions. According to the research (Brickhouse, 1992; Moore & Foy, 1997; Neathery, 1997; 1998), when teachers implement the nature of science accurately and ensure that they develop positive attitudes towards science, their achievement in science classes increase (Mugaloğlu, 2006). Our study concluded that elements regarding the nature of science, which were found to be insufficient in students according to VNOS-C, could improve as a result of the applications made. Data obtained from the posttest are supportive of this suggestion. Similarly, in the study by Schwartz, Lederman, and Crawford (2004), perceptions of student teachers about the nature of science were tried to be improved at the training classes for middle school student teachers of science. Opinions of trainees on the nature of science were evaluated through the VNOS-C survey. As a result, important improvements in the opinions of various student teachers on the nature of science were observed. The results of BASSSQ, which was implemented to assess the beliefs of student teachers about the nature of science, proved that the applications used in the study improved student teachers' beliefs. Macaroğlu, Taşar and Çataloğlu (1998) administered the BASSSQ survey to determine student teachers' beliefs about the nature of science. The quantitative results of the study showed that student teachers believed scientific knowledge was objective and could change in time. The results obtained in our study and the other studies mentioned before have proven that the opinions on the nature of science could be improved with the help of various educational applications. Laboratories enable students to see the uses of their theoretical knowledge in practice and make generalizations in the light of the evidence they obtain.

The study concluded that aforementioned relationship was statistically significant. The regression analysis results showed that the attitudes of student teachers of science towards teaching science were significant indicators of their opinions on the nature of science.

## 5. SUGGESTIONS

Among the targets of the science education program implement in the recent years include enabling students to learn about doing scientific research while learning science and about methods of acquiring scientific knowledge while doing scientific research (Bağcı Kılıç, 2003) along with becoming scientifically literate and understanding the nature of science. For students to develop their scientific process skills and succeed in learning science, appropriate curriculum and well-trained teachers are required. When teachers receive an education that would provide them with a modern scientific approach and enable them to overcome their misconceptions about the nature of science, they could act according to the nature of science in programs to implement in their classroom as well as the teaching strategies they choose (Bora, 2005). For experiments and project-based lab applications to be integrated into science classes, the experiences of the teachers are quite important and should be taken into consideration. Therefore cooperation with more experienced teachers to implement in-service and pre-service professional development programs would be essential. Teachers should be provided with working environment, where they could work in small groups through programs and educations to introduce this approach. They should be observed in terms of how they would implement their experiences or attainments in their classrooms and the results should be evaluated with their participation. If teachers have modern approaches towards the nature of science, they could ensure that students understand scientific concepts accurately. In-service trainings should be designed to present required knowledge on the nature of science. Implementations on developing students' knowledge and beliefs about the nature of science should be utilized at all levels of education, not only at the university level. Misconceptions of students emerge at the initial phases of education. Therefore, effective science education should be implemented starting from the initial level of primary school education. For students to interpret the learnt knowledge and transfer them into their daily lives, they should be acknowledged about the nature of science as well as the importance of scientific knowledge. Therefore, more activities should be included in the curriculum to allow for increasing beliefs and knowledge about the nature of science.

## Abstract

Faculties of Theology in Turkey are institutions of higher religious education. These faculties linked to the Ministry of Education before 1980 and after 1980 to the Council of Higher Education are 4-year higher education colleges. There was a "Compulsory Arabic Preparatory Program" during the one academic year in the faculties' schedule. A number of regulations have been made about these faculties' schedule in the different time periods by the authorities. In this context, it had been implemented "Compulsory Arabic Preparatory Program" in all of the faculties' syllabus form 1982 to 1997. This program had been removed in the period between 1998-2010. In some faculties, there was "English Preparatory Course" as an elective or compulsory program between 2005 and 2010 academic year. Today, Compulsory Arabic Preparatory Program is brought into force from the beginning of the academic year 2009-2010, again. This program is carried out almost all of the theology faculties which have ongoing training in Turkey. Looking at short history of faculties of theology in turkey, it can be seen that it has been made a set of arrangements on these faculties by authorities. As far as we could observe, these arrangements showed that there is not an institutionalization and traditionalism in the higher religious education in Turkey as yet.

Key Words: Language Education; Compulsory Arabic Preparatory Program; Faculty of Theology; Turkey

---

## 1. Introduction

Faculties of Theology in Turkey are institutions of higher religious education. Students who graduated from these faculties mainly are employed as a religious education teacher in the Ministry of National Education (MEB) and religious officials in the Presidency of Religious Affairs (DİB). They provide qualified religious services to citizens within the law.

Faculties of Theology in Turkey that linked to the Ministry of Education before 1980 and after 1980 to the Council of Higher Education are 4-year higher education colleges. There was a "Compulsory Arabic Preparatory Program" during the one academic year in the faculties' syllabus. It is made a number of regulations about these faculties' syllabus in the different time periods by the authorities. In this context, it had been implemented "Compulsory Arabic Preparatory Program" in all of the faculties form 1982 to 1997. This program had been removed in the period between 1998-2010. In some faculties, there was "English Preparatory Course" as an elective program (e.g. in Ankara University, Faculty of Theology) or compulsory program (e.g. in OMU Faculty of Theology) between 2005 and 2009 academic year. Today, Compulsory Arabic Preparatory Program is brought

\*Corresponding author Tel.: +90 364 234 63 58 / 11 77; fax: +90 364 234 63 57

E-mail address: costuyakup@hotmail.com

into force from the beginning of the academic year 2009-2010, again. This program is carried out all of the theology faculties which have been ongoing training in Turkey.

In this paper, it will be focus on the adventure of faculties of theology in Turkey and “Compulsory Arabic Preparatory Education” in their schedule. Doing this, it will be try to investigate Arabic language teaching (teaching methods and techniques, used materials, etc.) with reference to the sample Compulsory Arabic Preparatory Program in the Faculty of Theology, Hitit University.

## 2. A Brief History of the Faculty of Theology in Turkey

The first higher religious education institution in Turkey is the Faculty of Theology in Istanbul University (*Darulfunun-i Sultani*) that is established in 1924. The aim of establishment of this faculty was that “to train higher religious experts”. This faculty was closed in 1933 and then, 16 years later, Ankara University Faculty of Theology was opened in 1949. Opening reasons of this faculty were that to satisfy a need of religious education teachers in the primary and secondary schools and religious officials in the mosques. In the later years, “High Islamic Institutes” were opened depending on the Ministry of National Education such as, Istanbul High Islamic Institute in 1959, Konya High Islamic Institute in 1962, Kayseri High Islamic Institute in 1965, Izmir High Islamic Institute in 1966, Erzurum High Islamic Institute in 1969 (This institute was an active as a Faculty of Islamic Sciences, Ataturk University during the 1971-1982 years), Bursa High Islamic Institute in 1975, Samsun High Islamic Institute in 1976, Yozgat High Islamic Institute in 1979 (This institute is closed in 1982). Students who graduated from these Islamic Institutes were employed as a teacher in the Ministry of National Education and religious officials in the Presidency of Religious Affairs (Ayhan 2004).

In 1982, with the decree is issued, High Islamic Institutes depending on the Ministry of National Education are linked to The Higher Education Council/Universities. Thus, the number of faculty of theology has eight in 1982 (in Ankara, Marmara, Ataturk, Selçuk, Erciyes, Dokuz Eylül, Uludağ, Ondokuzmayıs Universities) (Aydın, 2000). In later years, the numbers of these faculties have twenty-three (in Sanliurfa in 1987, Sakarya in 1993, Rize in 1993, Malatya in 1993, Diyarbakır in 1993, Isparta in 1993, Van in 1993, Çorum in 1994, Elazığ in 1994, Adana in 1994, Sivas in 1994, Canakkale in 1995, Istanbul/Istanbul University in 1996, Kahramanmaras in 1997, Eskisehir in 1997) (Aydın, 2000).

In 1998, it has been made a set of arrangements on faculties of theology by the Higher Education Council. In this context, with the decision of the Higher Education Council held on July 11, 1997, it has been regulated on the theology degree program. From the academic year 1998-1999, there are two different programs in the faculties of theology; religious culture and moral knowledge education degree program and theology degree program. Religious culture and moral knowledge education degree program was opened in some faculties such as in Ankara, Marmara, Uludag, Dokuz Eylül, Selcuk, Ondokuzmayıs, Erciyes, Cukurova, Ataturk and Dicle universities. With this new arrangement, Compulsory Arabic Preparatory Class and courses of pedagogical formation were removed from the faculties’ syllabus (Kaya, 2003).

With the decision of general meeting of the Higher Education Council held on May 26, 2006, it was made an arrangement on the Program of Religious Culture and Moral Knowledge. With this decision, the Program of Religious Culture and Moral Knowledge in the faculties of theology in Ankara, Ataturk, Cukurova, Dokuz Eylül, Istanbul, Marmara, Ondokuzmayıs, Selcuk and Uludag Universities were decided to transfer to faculties of education affiliated to universities as a “Department of Religious Culture and Moral Knowledge”. Also, the Program of Religious Culture and Moral Knowledge in Dicle University Faculty of Theology was closed. Thus, students who graduated from faculty of education are employed as a religious education teacher and from faculty of theology are religious officials (Kaya, 2003)

With the decision of general meeting of the Higher Education Council held on May 10, 2012, Department of Religious Culture and Moral Knowledge reattached to Faculty of Theology/Islamic Sciences from Faculty of Education in the same university.

In recent years, the number of this type of faculties has been significantly increasing which are depending on State Universities and Private/Foundation Universities. As far as we have detected, there is more than one faculty in Istanbul, Ankara and Izmir, and also, information about these faculties in Turkish universities in the following table.

Table 1: Faculties of Theology in Turkey

Abant İzzet Baysal University/ Bolu	Faculty of Theology	Mardin Artuklu University/Mardin	Faculty of Theology

From 1949 to the present day, it has been made a set of arrangements on the faculties of theology in Turkey. Among these arrangements, there are various regulations about syllabus and period of study of bachelor's degree. One of them, “English Preparatory Class” took place as a compulsory program in the Faculty of Theology Ondokuzmayıs University, Samsun. It was implemented “Compulsory English Preparatory” program in this faculty’s syllabus between 2005 and 2009 academic years. We have done a longitudinal research on it. We have interviewed with first students in this program, two times at the beginning and the end of the 2005-2006 academic year and once at the end of the 2009-2010 academic year. In these interviews implemented in different times have been investigated that their thinking and attitude changes about the program and contributions of this program on their vocational and academic skills. In the first interview, it is reached that most of students choose this faculty did not have any information about compulsory English preparatory class. For this reason, they regretted to register for this faculty, and wanted to take away this English preparatory class (Çoştu, 2007). In the second interview, it has reached these findings that targeted aims about the opining program couldn’t have been completely achieved and the program failed partly (Çoştu, 2011).

### 3. An Investigation on Arabic Teaching: The Sample Compulsory Arabic Preparatory Program in the Faculty of Theology, Hitit University

Faculty of Theology at Hitit University opened in 1994 depending on Gazi University, Ankara, and then with the establishment of Hitit University in Çorum in 2006, it is connected to the that university. It has been also carried out curriculum and program content changes at this faculty. In this context, the Compulsory Arabic Preparatory Program had been implemented in this faculty's curriculum between 1994 and 1998 and removed in 1998 until 2010 and taken part of its curriculum since 2010-2011 academic years. The purpose of this program s defined as follows: "The aims of teaching Arabic are that to teach student the basic rules of Arabic, to develop Arabic vocabulary, to understand reading Arabic texts and listening Arabic conversations, to provide expressing verbally and writing in Arabic" (Education and Examination Guidelines of the Compulsory Arabic Preparatory Program, 2010: article 6)

As of the 2012-2013 academic years, there are 145 students in daytime education and 154 students in evening education and 299 students in total. Arabic teaching has been carried out by two Arabic origin instructors and ten non-native speaker lecturers in faculty staff. Arabic courses are 28 hours per week. These courses are seen following table.

Table 2: Course and Its hours per week in Compulsory Arabic Preparatory Program

Courses	Hours Per Week
Arabic Morphology (Sarf)	4
Arabic Syntax (Nahiv)	6
Arabic Writing	2
Arabic Reading	8
Arabic Speaking	6
Arabic Understanding	2
<b>Total</b>	<b>28</b>

(Source: Student Office of the Faculty, 2013)

According to Arabic instructors specified that the contents of Arabic courses in that program are as follows:

*Arabic Morphology (Sarf)*: This lesson includes the rules of Arabic language such as word derivation and verb inflection in Arabic.

*Arabic Syntax (Nahiv)*: This lesson also includes the rules of Arabic language like Arabic Morphology. As distinct from Morphology, it has Arabic syntax and syntactic analysis of Arabic sentences, etc.

*Arabic Writing*: This lesson includes translation methods and techniques of oral and written from Turkish to Arabic.

*Arabic Reading:* In this lesson, it is taught that translation techniques from Arabic to Turkish and grammar practices.

*Arabic Speaking:* This is practical Arabic speaking lesson. This lesson carried out by two Arabic origin instructors.

*Arabic Understanding:* In this lesson, students listen to Arabic mass media productions such as movies, cartoons, documentaries, and so on according to their language levels.

Table3: Weekly Schedule for Class A (2012-2013 Academic Years)

	1.Course 8:30- 9:15	2.Course 9:25- 10:10	3.Course 10:20- 11:05	4.Course 11:15- 12:00	Lunch Break 12:00- 13:20	5.Course 13:20- 14:05	6.Course 14:15- 15:00

<b>Tuesday</b>	Arabic Syntax (b) <sup>x</sup>		Arabic Speaking(d) <sup>x</sup>		---	Arabic Writing (e) <sup>x</sup>	
<b>Wednesday</b>	Arabic Reading(f) <sup>x</sup>		Arabic Reading(g) <sup>x</sup>		---	Arabic Reading(h) <sup>x</sup>	
<b>Thursday</b>	Arabic Morphology (a) <sup>x</sup>		Arabic Reading(h) <sup>x</sup>		---	Arabic Syntax (b) <sup>x</sup>	
<b>Friday</b>	---		Arabic Speaking(i) <sup>x</sup>		---	Arabic Understanding(i) <sup>x</sup>	

<sup>x</sup> Each different letter indicates to a different course instructor.

(Source: Student Office of the Faculty, 2013)

It is known that it is aimed to develop the four basic skills in foreign language education. These skills are reading, listening, speaking and writing. It is trained to student the rules of Arabic language in the courses of morphology and syntax and skills of writing, reading, speaking and understanding are in the other courses. Looking at the weekly hours of these courses, it is seen that focused on Arabic grammar and insufficient skills of writing and listening. Also, according to reports of students, in these courses teach predominantly translation techniques and methods more than speaking and writing skills.

During the Preparatory class, there are 784 hours of training in Arabic. According to my interviews of Arabic instructors in faculty, they specified used course material and language teaching methods and techniques as follows:

“In each Arabic course, it has been used different course materials such as Arabic grammar books, audio-visual materials, etc.”

“In these lessons, it has been followed an active learning and *student-centered teaching methods such as small group discussion, interactive lecture demonstrations, concept mapping, etc.*”

Looking at language learning infrastructure systems of faculty, it appears to be insufficient. There is a computer laboratory in the faculty. But, this laboratory is not used for language training. In addition to this, there are computer, projection equipments and a few smart boards in the classrooms. Within the framework of these facilities, it has tried to teach Arabic language in the faculty.

In the measurement and evaluation of language skills of students who are in preparation classes, some measuring techniques are made such as four midterm exams, four quizzes and two projects. In the end of the year, there is also a proficiency test. This test has two parts. In the one part of it, students are tested in Arabic morphology, syntax, writing and reading. Other part of it includes speaking test which is done by Arabic origin instructors. Calculation of final grade bases on 70% of written test exam result and 30 % of the oral exam. Student's overall grade bases on 40% of the exams point average within the year and 60 % of the proficiency test. In the calculation of the student's passing grade is required to obtain at least sixty score over a hundred points. Students who have below this score is considered unsuccessful, but they continue their bachelor's degree providing to pass proficiency test until end of the degree program. (Education and Examination Guidelines of the Compulsory Arabic Preparatory Program, 2010: article 14).

There are two hours compulsory Arabic lessons (Arabic Language and Literature I and II) in fall and spring semesters in the second class of bachelor's degree within the Undergraduate syllabus -with Arabic preparation course. During the four-year bachelor's degree program, there are a total of four hours of compulsory Arabic lessons. In the first year of bachelor's degree, there are not any Arabic lessons in the syllabus. The third and fourth years of bachelor's degree, there are only elective Arabic lessons such as, "Contemporary Arabic Text I and II", "Language of Arabic Media", "Poetry in Arabic Literature", "Prose in Arabic Literature", "Arabic Literature and Rhetorics I and II" in the syllabus (Student Office of the Faculty, 2013).

With reference to above information, it is seen that it has not been sufficiently supplement Arabic language skills obtained in the preparatory class during the four-year bachelor's degree. As far as we could observe, this issue causes a significant problem in terms of language teaching. In that language learning bases on the continuity and repetition, this should have a negative impact on the students' language skills. This issue has been indicated by both students and Arabic instructors in my interviews with them. Besides, Arabic instructors in the faculty specified that it is necessary reorganization of faculty syllabus to continuity of Arabic language skills.

#### **4. Conclusion**

Looking at short history of faculties of theology in turkey, it can be seen that it has been made a set of arrangements on these faculties by the Ministry of National Education prior to 1980, the Council of Higher Education after 1980. As far as we could observe, these arrangements as showed above, there is not an institutionalization and traditionalism in the higher religious education in Turkey as yet. It is no doubt that, students studying in these faculties are most affected by this situation. It is so important that modern and contemporary policy of the higher religious education is determined by authorities.

To achieve the intended purposes of compulsory Arabic preparatory program in the Faculties of Theology in Turkey, we can make the following suggestions with reference to our investigations on the Compulsory Arabic Preparatory Program in the Faculty of Theology, Hitit University:

1. Arabic Preparatory education is professionalized in the faculties of theology. In this direction, it should be getting support from private and public language training organizations.
2. It should be organized a one-week orientation program included both about faculty and aims and goals of compulsory Arabic preparatory program to newcomer students.
3. It should be considered that language skills as reading, writing, listening, speaking during the foreign language training and regulated equally these skills in the preparatory program.
4. It should be reinforced sufficiently knowledge of Arabic grammar obtained in the preparatory class during the bachelor's degree (4 years). In this context, at least four credit compulsory Arabic courses should be included each term of four-year bachelor's degree.
5. It should be established computer-assisted language laboratories in the faculties.

6. It should be provided exchange of students within the under the special agreements or Mevlana Exchange Program, etc. In this regard, successful students should be sent to Arabic countries short or long term.

## Abstract

All oral and written works, which are prepared in accordance with their own developmental characteristics of childhood's phases from early childhood phase to the end of the period of adolescence; fairy tales, stories, novels, memories, biographical works, travel writings, poems, books explaining science and nature events, children art books etc., all of these works are referred as children's literature. In this sense, children's literature has a kind of wide range, has research and study area specific to these kinds. Art books for children, which are among the classification of instructive and informative books are a kind of children's literature, which is increasing rapidly in number, but discussed little in a scientific sense. However, it is of importance and necessity to determine the necessary characteristics of children's art books to be included, to develop the contextual and formal criteria about the review of these books and to produce an example of scientific review in accordance with these criteria in the context of preparing a scientific ground for new children's art books and benefitting in an efficient way from these books. Based on this importance and necessity, in this study, a children's art book about visual arts is reviewed in the contextual and formal aspects in the light of pre-developed scientific criteria.

Keywords: Children's Art Books; Book Review; Art Education

## 1. Introduction

The first encountered term in research about children's books is "children's literature". In fact, both "child" and "literature" are difficult words to define and to compromise since both of them consistently include transformations and differences from culture to culture, from period to period. And the concept of children literature that is a combination of both is perceived differently in every culture and every period. But, if it is needed to make a general definition without getting into too deep, "children literature is all of verbal and written works for the imagination, emotions and thoughts of people in childhood (Oğuzkan, 2001:3)". According to this, a great deal of works from fairy tales to stories, novels, folk epics, biographical works, travel writings, poems, books explaining science and natural events are included in the definition of children literature.

Lukens (2007) makes a classification related to children's literature by indicating that the classification of products of children's literature having such a wide range under certain species would be useful for the organization of ideas in this area. According to this classification, children art books are included under the title of "information books" as the books address the real issues in order to inform the readers with the books such as biography, history, travel, science and technology books. In this kind, which we can translate as "bilgilendirici kitaplar", a classification was made again by Russell (2009: 277), this kind of book is divided into four categories in itself: history & culture, science & nature, human growth & development and art & leisure.

Actually, the combination of art & leisure books in this classification is the indication that art is perceived as leisure activity for most people. Unfortunately, in our country, art is still perceived as a luxury or a hobby for most people. In fact, this situation is also applies to foreign countries. As a matter of fact that according to Russell (2009), when school budgets are narrowed, art programs are firstly affected. However, art is an indispensable part of children's education. Art books increase the interest to art and taste taken from it by reinforcing the experiences related to art. "Just as taste, aesthetic appreciation also develops at an early age depending on the cultural circumstances experienced by the child. Books, especially literary quality books are the most crucial elements, which should not be prevented from being seen for the development of creativity and aesthetic sense of a child. Child develops both his/her creativity by means of these books, which inform, entertain and provide them having a good time and aesthetic sense by means of language and various opportunities of language used in these books" (Demirel, 2010: 40).

According to Şirin (1998), children's books in the context of art education are the first step in the physical sense and children begin to recognize art elements like color harmony, composition, line and develop an aesthetic judgment through these books. Shortly, children's meeting with the eligible art books prepared for them from their early ages, affects their relationship with art and supports them to become an individual with high artistic taste in the following years.

Although in our country the number of children's books increases in recent years, it is seemed inadequate in terms of quantity when it is compared to fields in children's literature, such as children's novels, stories. Additionally, when the related literature field was scanned, a research on art books, which examines the existent art books in certain criteria, has not been met.

However, as well as children's books are very different from books written for adults both in terms of content and formal aspects, they must have very different characteristics for each age group targeting (Erdal, 2007). In this sense, each field in the assessment of children's books should carry out extensive research by developing its own criteria. This situation becomes even more important, especially when it comes to a different discipline like art. In our country, lack of a research based on certain criteria examining the art books of children makes this situation more vulnerable. In this study, on the basis of shortage and necessity in the field, the children's book named "Keşfedin Sanat", which is published by Türkiye İş Bank Cultural Publications, written by Rosie Dickens, is a continuation of the series of children's books, like "Keşfedin Gezeganimiz", "Keşfedin Matematik", "Keşfedin Deniz" written by different authors was examined as part of formal and contextual criteria.

## 2. The Review of Children’s Art Book Named “Keşfedin Sanat”

In the study of children's book review named "Keşfedin Sanat", the main criteria topics and criteria questions formed in advance (Bolat Aydoğan, 2013) were based on. These contextual and formal criteria grounded on are formed on the basis of the data obtained as a result of literature review covering theses, books, articles and papers prepared for the review of children's book in different fields. With the adaptation of these data to visual arts' field, the criteria questions that would guide the review were prepared. The review is primarily divided into two categories as contextual and formal. Each category was also addressed separately according to main criteria titles pre-determined in itself. Each of the main title, related sub-title and criteria questions were presented in this study with the help of tables and figures.

### 2.1. The review of book named “Keşfedin Sanat” in formal aspects

In this research, in order to review of children’s art books in formal aspects, criteria grouped under three main titles were utilized. The main titles related to formal criteria are shown in Figure 1.

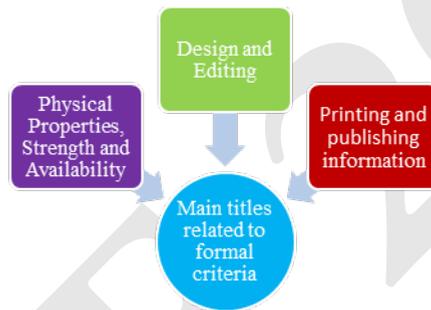

Figure 1. Main titles related to formal criteria (Bolat Aydoğan, 2013)

In table 1, criteria questions, which were developed prior to the study of book review, related to the review of children's art books in formal aspects are included. These criteria questions were developed in accordance with children’s art books considering the recommendations and criteria in Aşlıoğlu (2011), Demircan (2006), Güleç & Geçgel (2006), Güzel & Adıbelli (2011), İlhan (2000), Kaya (2007), Kaya (2011), Kıbrıs (2010), Koyuncu & Kaptan (2005), Nas (2004), Oğuzkan (2001), Özer (2007), Özgider (2010), Russell (2009), Sarı (2006), Seven (2010), Sever (2012), Tosunoğlu & Kayadibi (2007), Zengin & Zengin (2009).

**Table 1. The formal criteria related to the review of children's art book (Bolat Aydođan, 2013)**

Main Titles of Formal Criteria and Criteria Questions

Criteria Main Title	Sub-title and Criteria Questions
<i>Printing and publishing information</i>	- Book title and cover picture (front/inside cover),
	- Name of the author/ illustrator/ translator (front/inside cover/ the spine of a book),
	- Background of author/ translator (back cover),
	- Name of publishing house, place/year of publication, number of prints (front/inside cover),
	- Information of target age group,
	- Is the information about permissions related to book included?
<i>Physical Properties, Strength and Availability</i>	- size of the book,
	- form of the book
	- weight of the book
	- binding type
	- type of cover, robustness of cover
	- Are the properties of paper (opacity/ brightness, quality, type) suitable for the target age group?

---

Page Design

- Text/ visual rate
- Row spacing
- Gaps in the top-bottom and right-left of page
- The placement of text and images into the page
- Is the page numbering appropriate for design guidelines/ target age group?

Book Organizing*Design and Organizing*

- Table of contents, glossary, index, footnotes, etc. supporting sections,
- The museums where the books are included and copyright permission information
- Number of pages appropriate for target age group
- Is there an appropriate ranking of book layout like blank page before the front cover, blank pages, inside cover, inside pages, back cover?

Visual Design

- Are the quality of book printing and clarity of images enough?
  - Is the design of book cover appropriate for book content and attractive?
  - Is the support of page with visual images (photos, tables, diagrams, illustrations etc.) provided?
  - Are aesthetic quality and attractiveness of visualizations included in the book sufficient and appropriate?
  - Are letter size and character appropriate for target age group and the principles of design?
- 

*2.1.1. Printing and publishing information*

The book named “Keşfedin Sanat” (ISBN: 9786053600220) published by Türkiye İş Bank Cultural Publications in 2011 is the Turkish translation of “Lift The Flap Art” (2010) written by Rosie Dickins (this information is located at the spine of the book and behind of front cover). The illustrator of the book, which is translated into Turkish by Sevgi Atlıhan in the editorship of Nevin Avan Özdemir, is Georgian Overwater and designer is Nicola Butler.

Rosie Dickins is the author of most of children's art books -existent in small quantity- in Türkiye. Except this book, the books named İlk Resim Kitabım (Tübitak Publications), Ünlü Resimler (Sıfıraltı Publications), İlk Sanat Kitabım (Doğan Egmont) on the market at the moment with the books named Benim Sanat Kitabım (İş Bank Cultural Publications) and Sanat Hazinesi (İş Bank Cultural Publications), which are not on the market anymore, are also Turkish translations of author's books published in abroad. The information about the background of author or the information related to these books or other books of the author is not included. In the same way, exclusion of the information related to the other works of illustrator and publishing house, inclusion of the names of illustrator and publishing house only on the front cover and at the behind of back cover, indication of printing year and place of book at the behind of back cover show that there are some deficiencies about transformation of printing and publishing information.

At the same time, indication of target age group on the front cover, inclusion of publishing house information on all of the covers, indication that the book has passed all health checks and indication of paint and paper used in accordance with standards specified in EU can be regarded as positive features.

Figure 2. Front cover, spine and back cover of the book “Keşfedin Sanat”

### 2.1.2. Physical Properties, Strength and Availability:

The rectangular book approximately 22 x 28,5 cm in size has paperback and 6 cardboard sheets inside (12 pages in total). Due to a lightweight material, the book weighting approximately 600 gr is appropriate for target age group with its shape, size and weight. The binding of the book having carton robust covers is in adhesive form. Although sewing as more binding is generally recommended in order to make robust, this type of binding seems to be appropriate due to that this age group is not too small and inner pages are also made of thick cardboard.

The book has many colorful images and it is seemed that the quality, opacity of cardboard used for pages are appropriate for the printing of these in a good way, there is no brightness on pages, colors are pressed bright and without scattering. Additionally, selecting the carton in appropriate thickness shows that the book is well designed in terms of the strength and availability in order not to be torn of the openable windows designed on pages by a child after a while.

Figure 3. The top and side view of the book ‘Keşfedin Sanat’

### 2.1.3. Design and organizing:

In children’s art books, page layout is one of the top issues necessary to be considered about design and organizing. “Page layout is related to the subjects like the placement of text and images on page and arrangements of gaps on top-bottom, heads of paragraph and between lines (transferred from Özçivelek by Güleç & Geçgel, 2006: 168).

Moreover, text/visual rate is an issue to be dealt with in the page layout. Text and image rate, which should be included in the children's books, varies according to target age group. For example, while 75% text and 25% image are recommended for 3rd grade students, image rate can decrease beginning from the 4th grade and it is

stated that there is no need to image unless it has a descriptive text quality for 7th and 8th grades (Kıbrıs, 2010: 40). Furthermore, children's art books intended for visual arts have very higher visual percentage than text. Thus, the criteria that visual rate should be at least 50% is the rate necessary to say for these books. In this sense, this book prepared for 9-15 age supports the criteria owing to including more than 50% visuals. The important point here is the placement and accordance of text and visuals.

In this 12 page book, a crowded page layout (Figure 4) was formed by bringing together 28 visuals, a lot of illustrations and texts, which are belonging to art works. While mobility provided with drawings, visualizations and illustrations including vivid colors make the book attractive, it also creates a visual density. So, book has a more crowded page layout according to other art books. Despite this, texts do not stay behind the visuals since the lowest font size is 10 (Times New Roman). On behalf of efficient use of page, gaps at the top-bottom and right-left of page were not left too much. This situation, like on 10th page, caused overlap of page number with visual and omission of page number. Line spacing, which is another issue in page layout, has neither too wide nor cramped structure in accordance with font sizes.

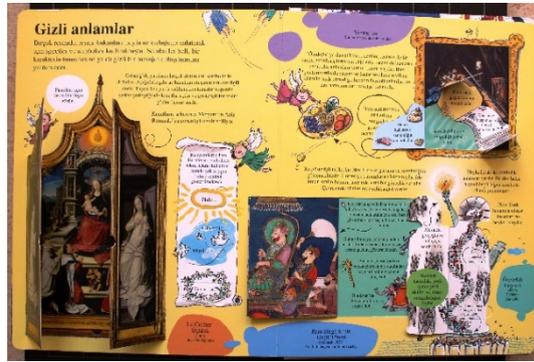

Figure 4. An example related to page layout of the book 'Keşfedin Sanat' (Page 10 and 11)

Although it is recommended to put in an order as blank page after the front page, then inside cover, book pages, blank page and back cover at the end in a book layout, it is seemed that this arrangement is not included in the book named "Keşfedin Sanat" and the content of the book begins immediately from behind the back cover. Back cover comes after 6 cardboard sheets (12 pages in total) and back cover's other side looking into inside part is still used as the book page.

In this sense, the children's art book named "Keşfedin Sanat", which has a different book layout, has also "table of contents" and "glossary" (they are used as words of art in this book) parts that most of informative child's books should have. Besides contents and glossary parts, index, footnotes/ end note, time tape, which Russell (2009) also recommended for informative books, are not included in this book. In addition to these, the information related to museum, gallery, art library, archive etc, where the permission was taken for the visuals of artworks, is located under the title of "Thanks" (on the other side of back cover). The page number of book is such a relatively small number as 12 due to the cardboard sheets. The books having many page numbers are not recommended due to being tiring, large and heavy in size for children's age. Due to the fact that this book has few pages, it does not cause such a problem.

Visual design of children's book is as an important issue to be dealt with as the issues addressed in the book. Especially, art works and illustrations related to visual arts selected for child's books are sometimes more important than the text itself. The visuals included in the child's book, primarily cover are an important part of the relation of children with the book. Therefore, children's developmental characteristics should be considered whether they are designed by an illustrator for the book or they are the works of famous artists got involved in art books.

According to Sever (2006), who indicated that pictures in books should be appropriate for appreciation and perception level of children, the pictures responding to needs of children to recognize and learn new things, caressing the child's appreciation with an artistic language also provide significant contribution to the emotion and thought training of children. "So, it should be considered that the pictures in children's books should be drawn very well to reveal child's creativity, especially its interest and ability" (Demirel, 2010: 69).

The artworks in the book named "Keşfedin Sanat" have an attractive quality that can take child's curiosity with attractive forms or vivid colors in visual meaning by being in harmony with the subject explained or with the compositions, which are appropriate for target age group and not complicated. The illustrations and lines (Figure 5) done by illustrator also make the book entertaining and provide to draw attentions to the details in order to make the artworks and described topic informative and to increase the attention.

Figure 5. A detail from 5th page of the book 'Keşfedin Sanat' Figure 6. An example for openable windows in book

The most different side of the book "Keşfedin Sanat" from other children's art books is that it includes windows (Figure 6), which can be opened and viewed from the bottom in its visual design. While these windows, which were designed to take the attention to details in art works, give additional information and strengthen the attention of children to art, they also provide efficient use of the page area. Since the texts are located at the additional areas that are below the windows above visuals, both the page is not filled out with text so much and the attention is focused firstly on visuals, then texts. Except these windows, movable designs related to art works (Figure 7) are also included in this book. Moving item in art works can be expressed better via these designs.

Figure 7. Movable designs at the 6th and 7th pages of the book 'Keşfedin Sanat'

In this sense, the visual design of book is very successful in terms of supporting the text. Additionally, the book, which does not include insufficiency in terms of clarity and print quality of visuals, has very successful studies in the context of aesthetic quality and attractiveness. For the design of front cover, brightness inside the

book is also reflected to the cover by including both bright colorful and entertaining pictures and visuals of four art works in the book. Similarly, the crowded layouts on the inner pages are also on the front cover. This can also lead to design problems, which cause texts to overlap with visuals (like the overlap of dog illustration with the name of publishing house).

One of the criteria to be considered in visual design is that the appropriateness of font size and character used for text for target age group and design principles. The most important criteria for the determination of font size is children's hand-eye coordination and legibility. In this sense, 2.6 mm height approximately (14 points) and 4.5 mm line spacing for first grades, 2 mm, height and 4 mm. line spacing for second and third grades and 1.8 mm height and 3.6 mm line spacing for fourth grades are conveniently accepted (transferred from Akyol by Seven, 2010: 106). Times New Roman, which is simple, easy for eyes, in this sense, balances the vitality of visual design was selected as the font character of the book "Keşfedin Sanat". The main title on page was written with larger than 40 points, explanation paragraph under the title was written 14-16 points, main text paragraphs were written with 12-13 points, book name was written with 12-13 points, artist name and explanatory small notes were written with 10 points. Since the smallest font size is 10, font character and size is suitable in the context of compliance with target age group.

## 2.2. The review of book named "Keşfedin Sanat" in contextual aspects

Many issues, like topics addressed in a child's book, expression form of these topics, word and sentence structures from these expressions, content of selected artworks, appropriateness of these artworks and text, artistic achievements obtained, determine the quality of the content of the book. So, the review of children's art books in contextual aspects requires the evaluation from different perspectives. In this study, the book "Keşfedin Sanat" was reviewed in contextual aspect under 3 main topics (Figure 8) as part of the pre-determined criteria.

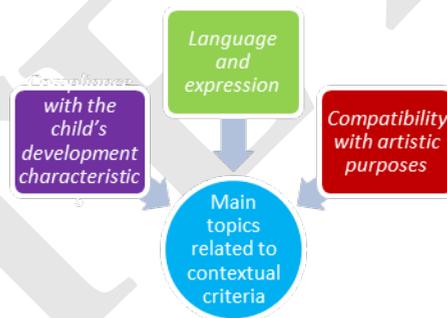

Figure 8. Main topics related to contextual criteria (Bolat Aydoğan, 2013)

### 2.2.1. Compatibility with artistic purposes:

Some criteria questions (Bolat Aydođan, 2013) were developed before the study in order to review the content of children's art books in terms of objectives. There has been a general review of many children's art books obtained while these criteria questions were created. The criteria questions related to compatibility with artistic purposes of children's art book were developed on the basis of the purposes of art education expressed in Grtuna (2007), Kırıřođlu (2009), Peřkersoy & Yıldırım (2009) and general information about children's art books obtained as a result of these assessments. At this part of review, the book named "Keřfedin Sanat" was assessed in terms of compatibility with artistic purposes on the basis of the questions on the following Figure 9.

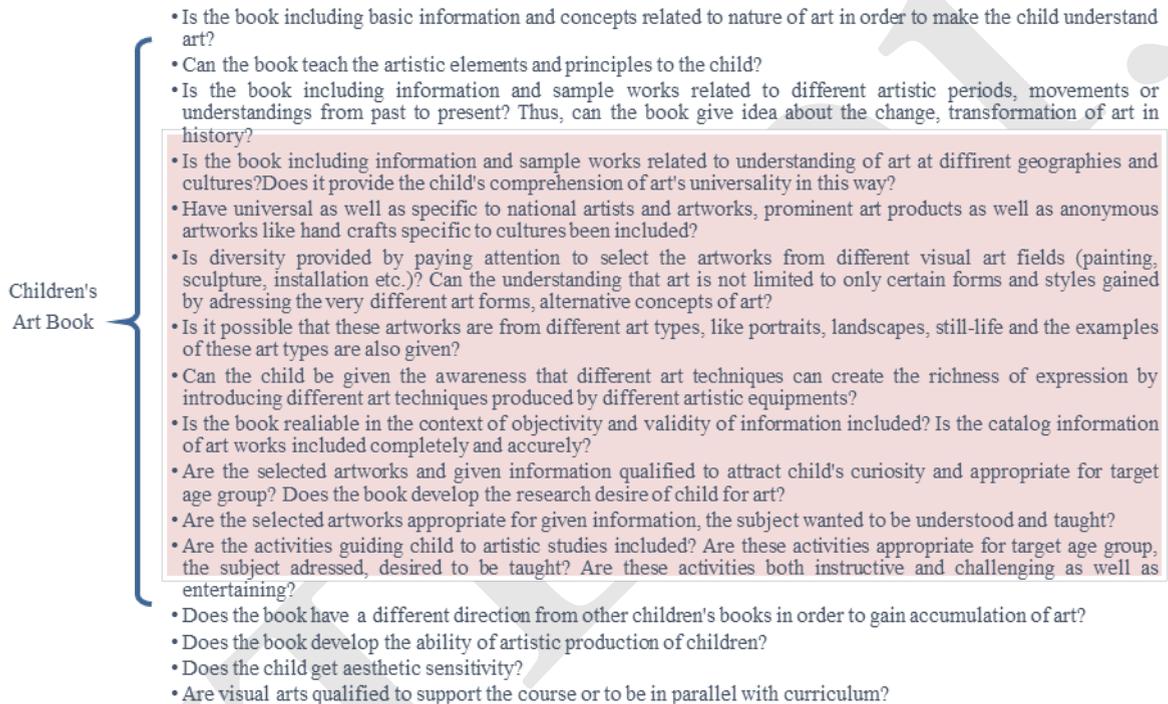

Figure 9. The criteria questions related to compatibility of artistic purposes of content of children's art book (Bolat Aydođan, 2013)

The content of "Keřfedin Sanat" constitutes of 7 main titles. It is emphasized that art is not only related to produce something, art is related to ideas; thus it is tried to be made a general perspective about the nature of art by giving examples related that art works can be in very different styles and sizes under the title "Discovering art". In the part with the title "Artwork", different art techniques and works produced with these techniques were introduced by indicating that art is not simple, it requires ability and work. In the part named "Colorful ideas", basic terms and concepts related to color were tried to be explained by focusing on "color" as one of the artistic element and giving examples about different usage of color in art. In "Moving compositions", the examples related to which methods artists tried to catch the movement in artworks were given, thus the information about basic art elements, "motion" and "line" was given. In the similar way, one of the artistic elements, "light" element, addressed in the part named "Bright lights" over different examples. In the part named "Secret meanings", it is emphasized that there may be some hidden meanings, which cannot be seen in art works, through

giving examples from the meanings of signs and symbols in some art works. In the following part “Art detectives”, examples were given about how the cues in art works were discovered with science and technology. In conclusion, there is a small art dictionary under the title “Art words”.

Except the terms in this dictionary, while this book also includes some art concepts and terms in the explanation, like art, artist, artwork, painting, painter, sculpture, sculptor, 3-D relief, oil painting, table, brush strokes, pattern, drawing, design, printing, wood printing, color pigments, paint additives, color wheel, hot/cold colors, symbols in art, the terms, installation, collage, contrast (complementary) colors, puantilism (pointillism), triple, naturemorte, vanitas are defined separately. Basic art elements, like color, light, movement are also explained.

Making an oil painting table, making a wooden printing and making bronze sculpture are explained by the help of illustrations as artistic techniques in the book. In the light of these data, we can say that this book includes basic information and concepts about the nature of art to make the child understand the art, gives information about some artistic elements and principles even if not all, provides the opportunity to recognize the expression richness created by different art techniques. When we list these to make an assessment related to artworks and artists in the book, we can have a table like the following:

Table 2. List of artworks and artists in the book

No	Name of artwork	Name of artist	Date	Technique/type
1	Bicycle Wheel	Marcel Duchamp	1913	Ready made
2	Snail	Henri Matisse	1953	Collage
3	Mona Lisa	Leonardo da Vinci	1504-14	Painting
4	Little Dancer of 14 Years	Edgar Degas	1880-81	Sculpture
5	Winter Garden	Jean Dubuffet	1968-70	Installation
6	Irises	Vincent van Gogh	1889	Painting
7	Red Fuji	Katsushika Hokusai	1830	Printing picture
8	The Thinker	Auguste Rodin	1881	Sculpture
9	Boats in the Harbour, Collioure	Andre Derain	1905	Painting
10	Sea	Howard Hodgkin	2002-03	Painting
11	Summer	Howard Hodgkin	1997	Painting
12	Marilyn	Andy Warhol	1967	Printing picture
13	Beautiful White Froth Orange Peel Pink Frill Red Blood Painting	Damien Hirst	2008	Painting
14	Dynamism of a Cyclist	Umberto Boccioni	1913	Painting
15	Stringed Figure (Curlew)	Barbara Hepworth	1956	Modern Sculpture
16	Cataract 3	Bridget Riley	1967	Painting
17	Haystacks, Morning Effect	Claude Monet	1891	Painting
18	Haystacks, Sunset	Claude Monet	1891	Painting
19	Haystacks, Snow Effect	Claude Monet	1891	Painting
20	The Orrery	Joseph Wright	1766	Painting
21	Electric Prisms	Sonia Delaunay	1913	Painting
22	Sunday Afternoon on the Island of La Grande Jatte	Georges Seurat	1884-86	Painting
23	Le Cellier Altarpiece	Jean Bellegambe	1508	Altarpiece
24	Procession of Ram Singh II of Kota	An Indian Artist (anonymous)	1850	Painting
25	Statue of Liberty	Frederic Bartholdi	1886	Sculpture
26	Vanitas	Simon Renard de Saint-Andre	1600 c.	Painting
27	Madonna of the Pinks	Raffaello Santi	1506-07	Painting
28	Patch of Grass	Vincent van Gogh	1887	Painting

As seen on Table 2, in the book, there are 28 artworks belong to 24 different artists. Short information about the art works of Pablo Picasso, Yves Klein, Anish Kapoor is included although the visuals of their works are not included. In this sense, 24 men artists and 3 women artists (Barbara Hepworth, Bridget Riley and Sonia Delaunay) are mentioned in the book. Additionally, when we look at the geography and culture where artists and their works come from, only 2 of the books (Red Fuji and Procession of Ram Singh II of Kota) are not from Western art, all of the other 26 works are from the Western Art. Therefore, a Western centered concept of art comes to prominence, literally universality cannot be provided.

The artworks included in the book have the dates between 16th century and 21st century. Book includes artistic studies from a wide historical period from 16th century to present-day which would be understood more clearly on Figure 10 showing the distribution of artworks by dates. But it is seemed that the artworks belong to 19th and 20th century are the most common.

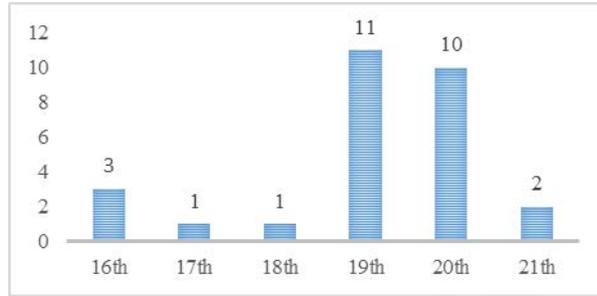

Figure 10. Distribution of works in the book by date

In this book, which includes art works from Renaissance a period that Western-based art was born in real terms; art separated from craft and gained fully an autonomous identity to present-day, plan is not based on a chronologic order, there is no linear advancing narration on the historical change of art since it is constructed under specific titles thematically. But, a richness that could suggest to child about the transformations in art as part of including examples of concepts of art from different periods was provided. An example of installation art like "Winter Garden" by Jean Dubuffet and "Bicycle Wheel" by Marcel Duchamp (Figure 11), which are considered as alternative approaches in art except traditional concepts of art, like painting and sculpture, are also quite good choices to show that art is not limited to certain forms and styles. Furthermore, the existence of a very wide range of topics of artworks from portrait to landscape, from abstract works to religious paintings provides good opportunities on the behalf of making child recognise different types of art.

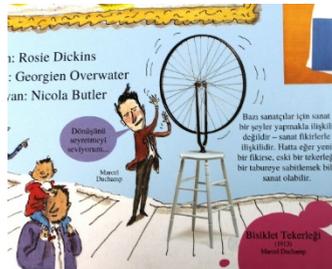

Figure 11. 'Bicycle Wheel' of Marcel Duchamp included in the book

Meanwhile, absence of catalogue information about the size of works, lack of crafts specific to variety of cultures, absence of information about the lives of artists and of works of art from pre-16th century, lack of national arts and absence of activities, which give guidance children for artistic studies constitute the limitations of the book.

Besides knowledge in children's book, including activities provides important contributions on the behalf of developing artistic production by encouraging children to make artistic production. In this sense, absence of activities is the most remarkable one among the limitations of this book. Nevertheless, it can be said that the book named "Keşfedin Sanat" is qualified to support the visual art courses in schools as part of being reliable, the validity, objectivity of the information included; being appropriate for target age group and to take attention of child's curiosity with the support of selected work and given information, illustrations as well. In particular, this kind of books providing interactive learning, having an entertaining visual design, keeping the interest alive reinforce the interest of children in art with a non-boring narrative and fiction.

### 2.2.2. Language and expression:

Language and expression of author determines the quality of book as well as the subjects, works included in a children's art book. In this sense, there are some language and expression characteristics that a qualified children's art book needs to have. Most of this characteristics are general features that all types of children's literature should have. In this review study, four main title was determined in order to introduce the criteria related to language and expression in children's art books. These titles and criteria questions related to these title are on the following Table 3. These criteria questions were developed by taking the recommendations and criteria on Demircan (2006), Güleç & Geçgel (2006), Güzel & Adıbelli (2011), Kıbrıs (2010), Lukens (2007), Nas (2004), Oğuzkan (2001), Özgider (2010), Russell (2009), Seven (2010), Sever (2012), Tosunoğlu & Kayadibi (2007), Yalçın & Aytaş (2011), Zengin & Zengin (2009).

Table 3. The criteria questions related to the review of children's art book in terms of language and expression (Bolat Aydoğan, 2013)

Main titles related to the review of language and expression and the criteria questions	
Main Title	Criteria questions
<i>Style and Language</i>	- Were the topics addressed in a simple uncomplicated plan? Was a path from simple to complex, from concrete to abstract, from whole to piece followed in expression?
	- Are the messages and information that the book wants to give clear and understandable in such a way that to avoid from confusion and paradox?
	- Is the expression qualified for keeping the interest alive, entertaining and fascinating?
	- Is a familiar language close to the spoken language used in the book?
<i>Paragraph, sentence structure and suitability of word</i>	- Are the main thought/theme wanted the child to comprehend given by making them feel instead of giving advise/lesson?
	- Is the title of book appropriate for the content and attractive?
	- Are the words used appropriate for vocabulary of target age group? Or Does it enrich their vocabulary?
	- Is the use of adjective, preposition and conjunction, metaphor sayings which would make the children's understanding difficult avoided?
	- Are the old and difficult to pronounce words avoided?
	- Are the paragraph length and number appropriate for target age group?
	- Is the sentence structure appropriate for target age group?

<i>Technical and foreign words, translation</i>	<ul style="list-style-type: none"> <li>- Have unnecessary use of technical words and terms been paid attention unless it is required?</li> <li>Has the explanation been done in the necessary cases?</li> <li>- Have Turkish equivalents been used with them or Turkish explanations been given instead of foreign words?</li> <li>- Have suitable writing of foreign words been watched out?</li> <li>- Have Turkish pronunciation of foreign words/names been also written?</li> </ul>
<i>Compliance with grammar rules</i>	<ul style="list-style-type: none"> <li>- Have the spelling rules been obeyed?</li> <li>- Has the necessary importance to punctuation rules been given?</li> </ul>

### 2.2.2.1. Style and Language

When we looked at the plan of "Keşfedin Sanat", first of all, art was addressed in a general manner, then different artworks, art techniques were introduced, later than artistic elements constituting the artworks were introduced in more detail and finally abstract meanings in art were discussed.

As can be seen, a path was followed from whole to piece, from concrete to abstract in the book. Hence, seven main titles also previously mentioned were determined and "what is art?", "how are artworks produced?", "how and why is the color used?", "By which methods is effect of moving obtained?", "how do artists use light in their works?", "what is the meaning of symbols and signs in art?", "how does science help to discover art?" questions tried to be answered in a plain language via different artworks and conceptions of art. While it was underlined that art had different narration opportunities throughout the book, given information were presented with simple and short expressions and via limiting to specific examples without giving details. Especially, with the speech bubbles added to illustrations (Figure 12), plain and boring expression was prevented and an entertaining and humorous style was achieved.

Figure 12. A detail from 5th page of the book

Moreover, the book, in which visuals are more than text, has an expression referring to an understanding mostly by the review of the visuals instead of presenting the information directly. These explanations have already been usually directed towards visuals surrounded with arrowed lines on the page, thus the information is provided not only just reading but also from the visuals in the book. Thus, both visual and verbal intelligence of child are operated together. This provides the given information to be more understandable and permanent. In addition to these, questions were also directed in the expression (not too many) for the development of child's thinking skills and to make the child more active. Shortly, when we evaluate the book in terms of style and language, we can say that it is a child book, which informs about art with short descriptions via a simple, clear, understandable language, with attractive expressions, without detailed expressions and by focusing the main subject, it also entertains and creates a sense of curiosity.

#### *2.2.2.2. Paragraph, sentence structure and suitability of word*

When the pages of "Keşfedin Sanat" were reviewed, it is seen that more visuals were included as 3-4 paragraphs text structure has been usually found. These paragraphs that don't exceed 4 sentences have a density and a sentence structure, which doesn't make target age group bother with a crowded expression and confuse them. When sentence structures are reviewed, simple and short sentences free from unnecessary words in which one judgment, one verb and one subject for each sentence were mostly adopted were used, like recommendation of Kibris (2011), Yalçın & Aytaş (2011) and Demirel (2010). In addition to these, combined sentences were also included in accordance with 9-15 age group on the condition that not to exaggerate. In a sentence, adjectives, prepositions and conjunctions, which children have difficulty to use are not also included. Absence of old Turkish words difficult to pronounce still increases the clarity of the book. It is also seen that metaphorical or slang sayings that are difficult to understand were not included. When the words in this book were reviewed, it should be taken into consideration that most of these words are used in daily life by children in target age group or included among the words learnt via the education at school, besides some words, phrases, like dramatic, transience of life can be strange for the child. In addition to these, since words are used far out of their real meanings in the descriptions, like "smooth transitions" on the 5th page, although this creates difficulty in understanding at first, it is considered that these description can be understood and they can enrich children's artistic expression language by being jointed in time as the expression is supported by visuals.

#### *2.2.2.3. Technical and foreign words, translation*

Since informative books have the purpose of informing on a specific subject, they must use the specific terms particular to that field if needed. From this point of view, the criteria "the necessity of avoidance from the use of term" valid for other types of children's literature is not possible for this kind of books. Child's art books must include art terms suitable for the level of target age group and when it is needed. In fact, this situation carries a positive meaning for the development of child's vocabulary and expression language related to art as well. But, the important point that should be noted here is the existence of explanations of terms or comprehension of the meaning of term by simple explanations. In this sense, the terms, installation, collage, contrast colors, pointillism, triple, naturemorte (still-life), vanitas were used and they were also defined. Terms were tried to be explained without using identical terms, by relating to visuals and depending on the narration in the text. In narration, terms were often tried to be explained without using identical terms, by relating to visuals and depending on the narration in the text. For instance, on page 5, the effects of warm and cool colors were mentioned without using warm color, cool color terms: "This picture is full of blue and bluish gray. Closed colors were used in a

consistent manner. These smooth transitions create a quiet, peaceful effect... Blues and grays are usually used to describe coolness, water and shadow... Orange and yellow remind of sunlight and hotness” (Dickins, 2010:5).

As descriptions are not made in this manner within the book, terms that can be difficult to understand for the child, like 3-dimensional relief, shape and mass composition, pigment, neon lamps, infrared cameras, x-rays are also available. Additionally, Turkish equivalents of defined foreign words, like installation, pointillism, still-life, were given next to them. However, it is seen that full Turkish meanings are not preferred instead of foreign originated words, like contrast, style and effect. Moreover, it is seen that absence of foreign words belong to a different languages, which are not translated into Turkish, except artist names, in the book is a positive feature. But, it is seen that although writing Turkish way of reading of artist names can be beneficial to children to provide easiness on pronunciation, it is not done.

#### 2.2.2.4. Compliance with grammar rules:

It is seen that in the book grammar and spelling rules were obeyed.

#### 2.2.3. Compliance with the child's development characteristics:

The most important feature of each child's book is to be "according to the child" whatever the purpose, subject, kind it has. "Growth and development period, psychology, word and concept knowledge, perception level of the child should be understood when "according to the child" is said” (Şirin, 2007: 44, 45). In this sense, to be able to be appropriate for the cognitive, personal, social and moral development of children, the themes, information text and visuals included in the book, shortly content of the book must have some criteria. In this study, the content of the children's art book named "Keşfedin Sanat" was done under 3 main topics in the context of the compliance with the child's development characteristics. These are; compliance with the child's personal development, compliance with the child's social development, compliance with the child's cognitive development.

Ahead of the review, criteria questions related to 3 main titles were developed in accordance with the art field and children's art books considering the criteria and recommendations in Demircan (2006), Demirel (2010), Güleç & Geçgel (2006), Kıbrıs (2010), Nas (2004), Oğuzkan (2001), Özer (2007), Seven (2010), Sever (2012), Tosunoğlu & Kayadibi (2007), Yalçın & Aytas (2011), Zengin & Zengin (2009). These criteria questions are included in Figure 13, Figure 15 and Figure 16.

##### 2.2.3.1. Compliance with the child's personal development

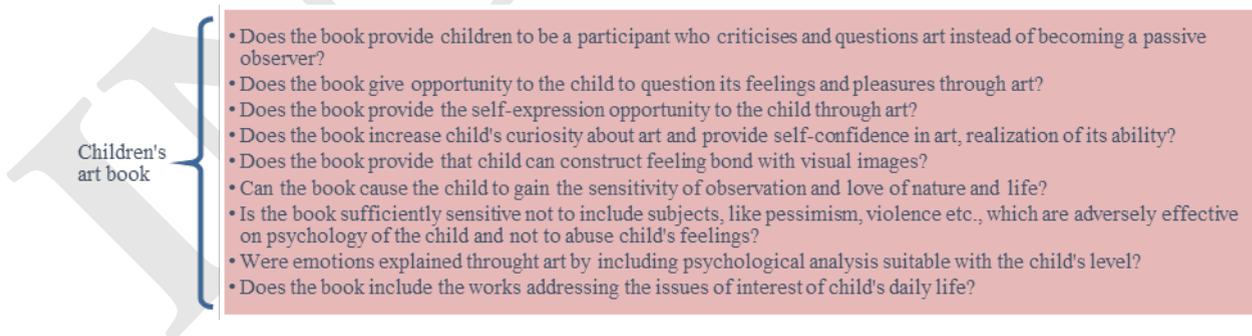

Figure 13. Criteria questions of children's art book related to Compliance with the child's personal development (Bolat Aydoğan, 2013)

On the first page of the book, with the words “Artwork can be in many different styles and size- on eye-pleasing paintings, on sculptures made of garbage. Things that everyone likes and dislikes are different.” (Dickins, 2011:1), in fact, the idea that children are free on their interpretations related to art is given. Additionally, with openable windows, movable pieces included in book design, it is provided to make the children seize by feeling of an exploration of art instead of directly reading the information; their participation is carried out not only by reading or watching, but also in an interactive manner. They are also encouraged to look at carefully with the questions asked about details on the pictures and make interpretations (Figure 14). In this way, it is provided that the curiosity of child about art increases and child would be more active. But, one of the most important points felt inadequate in this book is the absence of the activity, which provides the child to externalize its emotions through art, to realize its abilities of art and to have self-confidence. As it is based on the compliance with topics about art, the concern about the relation with the child's life is appeared to be a subordinate in the selection of work.

Anyway, while narrations related to only art included in the explanations of works, the subjects and feelings in the works were not referred, so an opportunity, which provides to establish feeling bond, question feelings and pleasures of child about these has not been created.

Special opportunities were not also provided about the love and observation of nature, life of child through art. Additionally, it is seen that works, which can cause the child to feel negative and can abuse its feelings were not selected, insomuch as they provide bright colorful artworks and a humorous, entertaining content with illustration including metaphor. In the same way, any narrations including negativity, like pessimism or feeling abuse were also not found in the content of text.

Figure 14. A detail from the 9th page of the book 'Keşfedin Sanat'

### 2.2.3.2. Compliance with the child's social development

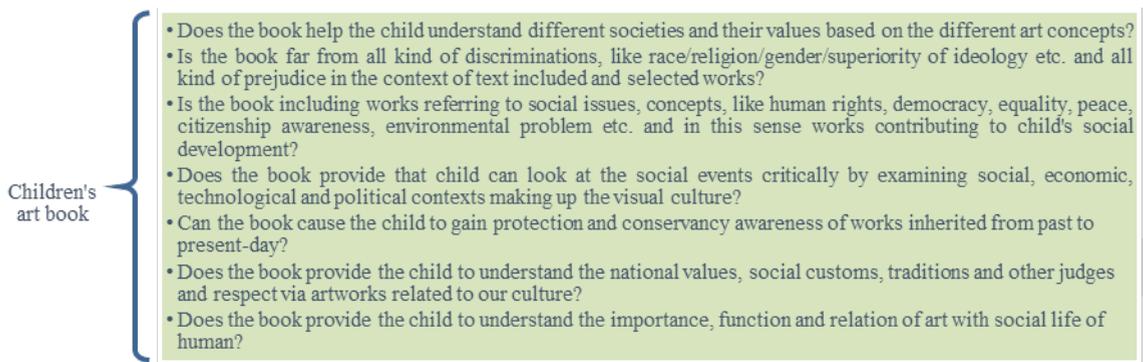

Figure 15. Criteria questions of children's art book related to Compliance with the child's social development (Bolat Aydoğan, 2013)

In the book “Keşfedini Sanat”, as stated previously, the vast majority of these artworks are among the Western Art and including 28 artworks of 24 different artists. In this sense, a full actualization of a gain to recognize the different societies and their values with only these examples of Western culture and a narration focused on artistic knowledge transfer seems impossible. Besides, despite being indirect, small hints related to religious belief in the Flemish culture in 16th century, life style of French society in 17th century, Indian culture and Social values in America are presented via symbols included in artworks under the title of “Secret Meanings”. In this way, again, despite being indirect, relation between social life and art, function of art in social life are taken attention. But, artworks addressed or referred social issues, like environmental problems, peace, equality, democracy, human rights etc., except “Statue of Liberty” on page 11, were not met in the book. Additionally, artworks and narration constituting the visual culture; examining the social, economic, technological, political contexts which will provide the child to evaluate the social issues critically are not faced clearly. But, explanations about how prepared paint tubes affect the artists' work (page 2) and easiness of printing technique (page 3) emphasize slightly that art is affected from economic and technological structure.

One of the contributions of children's art books to social development should be to provide the child to respect cultural and artistic values. There is no direct expression about this in the book “Keşfedini Sanat”, with the expression on page 2, the importance of artworks are implicated.

*“Art is not an easy thing. It requires both ability and a lot of work. Many paintings and sculptures are done with difficult techniques requiring proficiency. It can sometimes take months or years to finish an artwork.”* (Dickins, 2011: 2).

Although existence of all the criteria in an informative child's book is not expected, some criteria must be met. Being away from discriminations such as “each kind of prejudice, superiority of race/religion/gender/ideology” is also one of the criteria about the social development of the child. In the book "Keşfedini Sanat", taking part of mostly male artists, selecting Western Art centered narration is connected that the author is more expert of Western Art subject and mostly artworks of men are dense in the history of art. In this sense, it is believed that there is no discrimination in the book content in particular. Moreover, not to be met any explanation about this kind of discrimination in verbal narration confirms this.

### 2.2.3.3. Compliance with the child's cognitive development

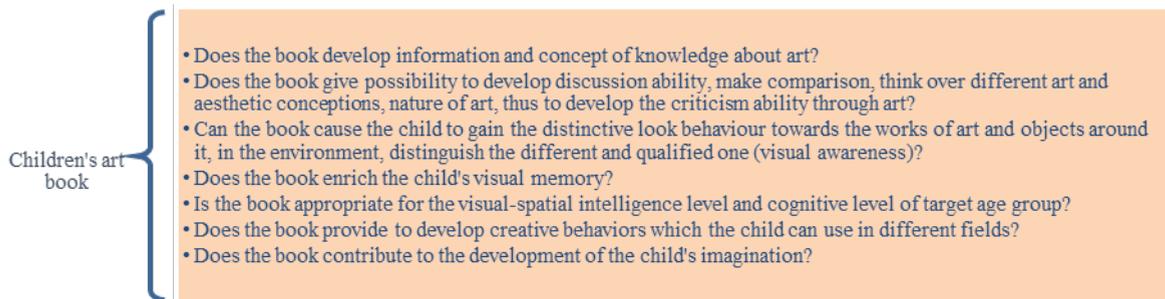

Figure 16. Criteria questions of children's art book related to Compliance with the child's cognitive development (Bolat Aydođan, 2013)

The book named "Keşfedin Sanat" is qualified for contributing to the development of concept knowledge positively by providing the child to meet with a lot of information and concept about art since it is included among the classification of the informative child's books specific to a certain field. Moreover, since many examples from very different artworks were given under a specific title, an opportunity is provided the child to compare different art concepts, and so to make criticism through art. Drawing attention about the details in artworks via narration and supportive visuals benefits on behalf of developing the visual awareness of the child. The book having a dense visualization supports enrichment of the visual memory of the child and also containing of visual about a large number of artworks despite few page numbers.

Target group of the book is in a wide range, like 9-15 age, and it covers reality period (9-12 age) and logic period (12-14 age) in terms of artistic development. According to Grtuna (2007), in the reality period, the child has not fully learnt the perspective, light-shadow rules yet and has not had three dimensional creation ability. So, more deep information about these subjects may break children's courage. From the inside part of the book, it is seen that these subjects are not mentioned, only plain examples about the use of art in artworks are given. In addition, there are also compositions, which are not too complex, in the selected artworks. In this sense, it is seen that the content of the book is appropriate for cognitive, visual-spatial intelligence of the child on the basis of the bottom level of age. It is also thought that the book provides positive contributions for the development of imagination of child and increase in creativity considering richness of the visual design of the book, having many different creative artworks.

### 3. Conclusion

When a general evaluation about the review of the book named "Keşfedin Sanat" is done, it can be mentioned that it is a child's book, which informs about the art with attractive, short narrations, a plain language, at the same time entertains and creates sense of curiosity without confusing details. "Art" is presented as a field, which includes interesting details needed to be discovered in accordance with the word "keşfedin (discovery)" of the book's name "Keşfedin Sanat". In this sense, as well as the name of the book, the book itself also makes sensation.

One of the other features which makes the book "Keşfedin Sanat" interesting is its visual design. Movable designs about windows and artworks containing information at its back provide an interactive learning environment while they make the book appealing for children. Illustrations of the book both make the book

attractive and entertaining and strengthen the narration by supporting the texts with visuals and humor included. In short, the visual design of the book increases the gains to be obtained from the book in terms of reinforcing the child's interest in art.

One of the highlights of this book can cause to gain the understanding that art is not only limited to specific forms and styles by presenting examples from different periods about different art techniques and types, traditional and alternative concepts of art regarding to artistic achievements. These gains are limited at an extent since the most of the artworks in the book are from Western Art and it doesn't provide the opportunity to recognize the art of more different cultures. One of the issues that should be addressed in the limitations of the book is exclusion of artistic activities. Although there is no an absolute rule in the form that there should be activity in each children's art book, the existence of directive to artistic studies, creative and entertaining activities in the book is beneficial in terms of both artistic achievement and development of child. It should not also be forgotten that the purpose of the children's art books is not only limited to artistic achievements, it should also support the development of the child.

In this sense, it is quite important to support the child's development not to limit the text with artistic expressions, to prefer the examples, which refers to social issues in the selection of artworks, gives opportunity to express their feelings, provides the child to recognize the life itself. It is thought that a children's art book, which meets most of the criteria is sufficient in its quality as it is not expected to include all the criteria based on this review. In this sense, it is concluded that "Keşfedin Sanat" is a qualified children's art book and can be recommended for families and art educators.

## Abstract

Paper talks about the history of the oldest technical university in Slovakia, its development and current state of the education provided. The paper describes forms of cooperation of the Faculty of Mechanical Engineering (FME) with industries. In addition to the history and current state of provision in the field of engineering education, the core of the contribution is dedicated to new forms of the cooperation technical training and common applied research.

Keywords: applied Research, new education methods, Post Graduate Research Centre

---

## 1. INTRODUCTION

Global changes during the past two decades have changed views on the role of education, skills development and training in economic and social development. Education, training and preparing of young researchers can be considered as a public good and an investment, having being as important as any physical investment. Training system reforms are being implemented in many countries. I can present the best achievements in the field preparing our students, graduates and postgraduates for practice. In order to improve the employability of its graduates, the Faculty of Mechanical Engineering of the Slovak University of Technology in Bratislava (FME STU) is trying to develop a new teaching paradigm for its project/internship course units in various fields.

This paper is devoted to the description of the development and implementation of methods of advanced interdisciplinary vocational education and applied research of students, graduates and postgraduates of different areas of industry and requalification's courses for employers. This project aims to support FME STU graduates in this field through establishing the creation the Post Graduate Research Centre.

## **2. FACULTY OF THE MECHANICAL ENGINEERING THE SLOVAK UNIVERSITY OF TECHNOLOGY IN BRATISLAVA (FME STU)**

### **2.1. History of FME STU**

The history of the higher technical education in Slovakia has started in the year 1762 by the foundation of the Academy of Mining and Forestry in Banská Štiavnica. The establishment of the Academy was important moment in the history of higher technical education, as it was the first educational institution in Slovakia providing technical education at the university level. The Academy of Mining and Forestry has maintained its high level of standard for more than 150 years of its existence and has founded the tradition of excellence of higher technical education in Slovakia.

More than two decades of struggles preceded the establishment and enactment of the first University in Slovakia. The Technical University of M. R. Štefánik was founded in Košice and authorised by the Act No. 170/1937 Coll. of the Czechoslovak National Council, on June 25, 1937.

Autonomous mechanical engineering studies at the Slovak Technical University date back to 1940. On the basis of a decree promulgated by the Government, in that year a new division of Mechanical Engineering was opened within the Department of Mechanical and Electrical Engineering.

By the Higher Education Act was in 1950 the Department of Mechanical and Electrical Engineering renamed the Faculty of Mechanical and Electrical Engineering. In 1951 this Faculty was split into two independent faculties: Faculty of Mechanical Engineering and Faculty of Electrical Engineering.

In 1940 the division of Mechanical and Electrical Engineering had a section of Mechanical Engineering, a section of Electrical Engineering and a section of Aviation Engineering. In 1948 the foundation stone of a new building was laid in today's Námestie slobody 17, Fig.1. The building was completed in 1963. The majority of today's Faculty of Mechanical Engineering moved there. Later the Faculty acquired other premises in Pionierska Street and Vazovova Street.

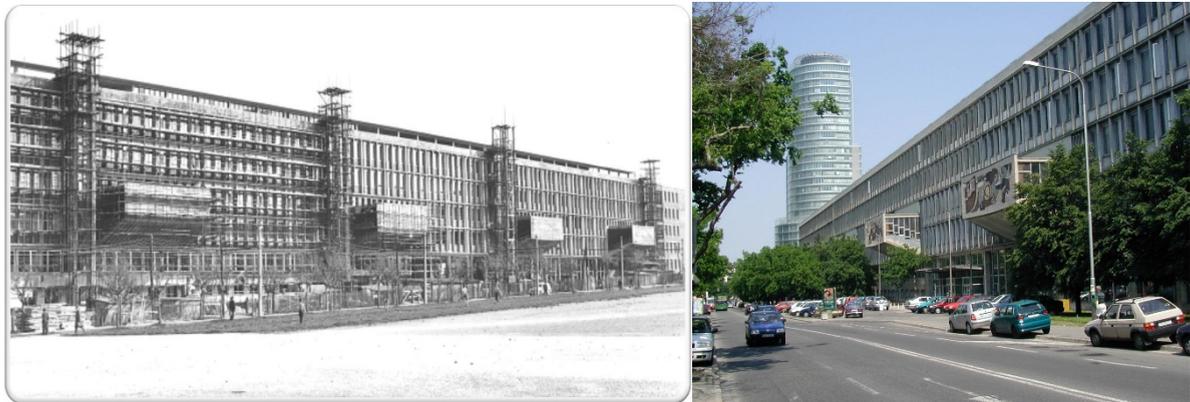

The first lectures in mechanical engineering for about 100 students begun in the academic year 1940/41 in provisional premises in Mýtna Street. The thousandth graduate obtained his diploma in 1957, the five thousandth graduated in 1973 and in 1983 the ten thousandth mechanical engineer completed his studies.

The Faculty of Mechanical Engineering had in 1951 eight departments and three study branches (mechanization and transport, power engineering and technology). In 1985 the number of departments increased to seventeen and within three streams (production engineering, economics and engineering design) to eleven study branches.

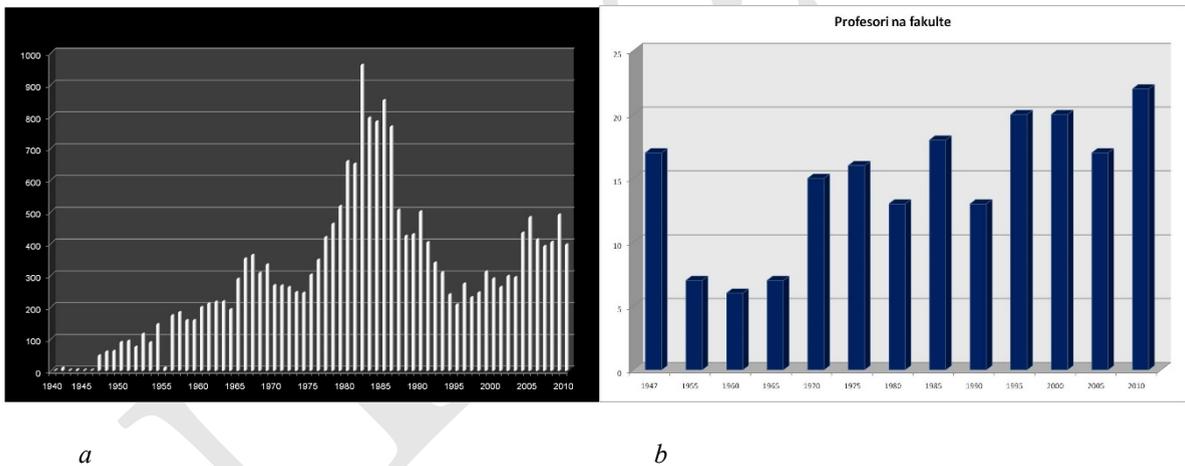

### **2.2 Contemporary FME STU**

#### **Study programs**

FME STU just has approximately 2500 students which study for three study degrees. Today the Faculty of Mechanical Engineering is accredited to provide study in six 3-year bachelor programs, thirteen 2-year full time and 3-year part time master graduate programs, and eleven 3-year full time or 5-year part time doctoral studies covered with the pedagogical staff of more than 148 lecturers from eight different institutes, inclusive 23 professors and 46 associate professors, Fig.2.

*Fig. 1 Main Building of the FME the Slovak University of Technology in Bratislava*  
*a) under the construction* *b) currently*

*Fig. 2 Development of the number of students (a) and professors (b) at the FME STU*

The studies are provided by eight Institutes and by two Faculties Centres.

- Institute of Automation, Measurement and Applied Informatics
- Institute of Applied Mechanics and Mechatronics
- Institute of Technologies and Materials
- Institute of Transport Technology and Engineering Design
- Institute of Process and Fluid Engineering
- Institute of Manufacturing Systems, Environmental Technology and Quality Management
- Institute of Thermal Power Engineering

- Institute of Mathematic and Physics
- and
- Centre of Innovations
  - Centre of Languages and Sports

The total number of graduates of all degrees has reached by the end of 2012 the number of nearly 23 000. Out of the number, there are approximately 10 % of international students. The medium of instruction is generally the Slovak language, the selected Bachelor programs are offered also in English language.

The Bachelor studies finish with a final state examination consisting of defending of the final project and oral examination in two selected subjects.

Holders of FME STU bachelor degree or persons having finished equivalent study programs recognized by the Faculty authority within another institution of higher education may apply for one of MSc study programs.

The MSc studies finish with final state examination consisting of defending the diploma project and oral examination in three selected subjects corresponding to the study program and the diploma project.

Students possessing the second degree can have access to the doctoral study (PhD), obtainable upon completion of a dissertation based on original research work.

### ***2.3 Research activity of FME STU***

The research carried out at the Faculty of Mechanical Engineering is oriented on nowadays energy and environmental challenges.

- biomass engineering treatment by briquetting and pelleting process,
- quality management and metrology,
- safety, reliability and residual durability of pressure equipments like nuclear reactors, chemical reactors transit gas line, storage reservoirs of hydrocarbon gas and oil,
- Finite Element Analysis, elasticity and strength of material, thermal stress
- multicriterial dynamic analysis and optimization of mechanical and mechatronical systems using computer simulations in the area of automotive, aircraft, rail, and production industry
- optimization of the robots and manipulators
- prediction of durability of mechanical systems

### ***2.4 International project***

Science is involved in a series of national, European and global projects. For all point out the transatlantic project Atlantis. Advanced Studies in Mechanics of Micro- and Nano-systems

Within this four-year project (2009 through 2013) was developed a mutually complementary international educational program in the area of engineering analysis of micro- and nano-mechanical systems. The primary objective of the project was to develop an exciting interdisciplinary training program in an area rich in opportunities for innovation that will inspire students to work collaboratively on technological innovation using the resources available in the EU and the USA. The proposed program will engage undergraduate students and first-level graduate students (Bc.) in a cohort-based international training and research experience where each student will spend at least one semester in a host institution taking courses and participating in sponsored research activities at the host institution. The specific objectives of the project are to provide:

- (1) Joint theoretical and experimental training in the area of non-linear mechanics of micro- and nano-systems
- (2) Development of a model for international collaboration based on joint research projects leveraging off the respective strengths of the participating organizations.
- (3) Increased awareness of the global aspects of the engineering profession through enrichment of the social capital of the participants.

- (4) Engagement of students from ethnically diverse regions of the United States (Arizona and New Mexico) and the European Union (Slovakia and Hungary) in a unique international collaborative program leading to their improved social and economic integration and opportunities for technological innovation.

### 3 COLLABORATION WITH INDUSTRY

The complex and rapidly changing business environment requires a new approach to this new reality, and demands methods of complex and interdisciplinary education and training. This education and training should include knowledge of both engineering and information technology (hard skills) enterprise planning, management, psychology and communication and control (soft skills) together with the ability to select appropriate technologies and technical's solutions. Knowledge and skills are becoming outdated much quicker and must be replaced continuously. The existence of internet and intranet infrastructures within organisations provides an unprecedented opportunity to enhance on-going training activities by incorporating multiple forms of media in their delivery.

Our Faculty has very good collaboration with industries. It is especially automotive industries, energy and the environment. In Slovakia act 3 big cars manufacturers (Volkswagen, PSA Peugeot Citroen, KIA). We have two major nuclear power plants. In 2012, we have produced 929,500 vehicles and with number of 177 cars produced per capita we reached the leading position in the world. Slovakia is also an agrarian country with an area of forest and fields of more than 90% of the total area. At the same time the country keeps hold of largest reservoir of drinking water in Europe.

Our graduates are very successful in average starting salary amount and percentage of unemployment rate after graduation. The average starting salary of € 1,169 ranks FME STU at the 4<sup>th</sup> place among 146 of Slovak faculties and the unemployment rate of 1,88% at the 3<sup>rd</sup> place at the same time. Best that our faculty were only 3 faculties of Informatics and the highest starting salary for graduates is in Slovakia € 1,420. At the first five places in the ranking are three faculties of STU. With the unemployment rate is 1,88 our faculty even 3 place.

The cooperation with practice can be broadly divided into two basic areas of:

- 1 - Applied technical education - specified according to customer's requirements,
- 2 - applied research - conducted according to the requirements of practice.

#### ***3.1 Present education project collaboration with industry***

##### *Centre of Quality*

Faculty of Mechanical Engineering and AUDI Ingolstadt has collaborated on a project of establishment of the Measurement Centre for Automotive Parts and Centre of Quality. Production of off-road AUDI vehicles was starting in VW plant, Bratislava in Sept. 2005.

*Fig. 3 View of the Centre of Quality*

#### Centre of Education for PSA Citroën

Faculty of Mechanical Engineering and company PSA Peugeot-Citroën have in 2004 created a project of professional education centre, within which the FME STU became the sole university body responsible for technical education in PSA Trnava (investment of PSA into Faculty app. 2.5 million €). The equipment belongs to our Faculty and is at disposal for education of our students.

*Fig. 4 Centre of Education for PSA Citroën*

#### Consultation Centre for Engineering Industry - SKC

SKC is Joint Workplace of Faculty of Mechanical Engineering STU Bratislava and SOVA Digital, Inc. Bratislava. SKC has mission to meet the broadest range of customer needs in the area of CAE including modelling, analysis and optimization of mechanical and mechatronics systems, industrial production processes and product lifecycle management.

Fig. 5. Consultation Centre for Engineering Industry - SKC

#### Authorized Training Centre for MSC.ADAMS - ATC

ATC is chartered to provide students and customers with training, consultations and collaboration in research and development of products using the MSC.ADAMS tools. ATC has mission to meet the broadest range of customer needs in the area of Mechanical System Simulation technology (MSS) including modelling, analysis, optimization and robustness of mechanical and mechatronic systems.

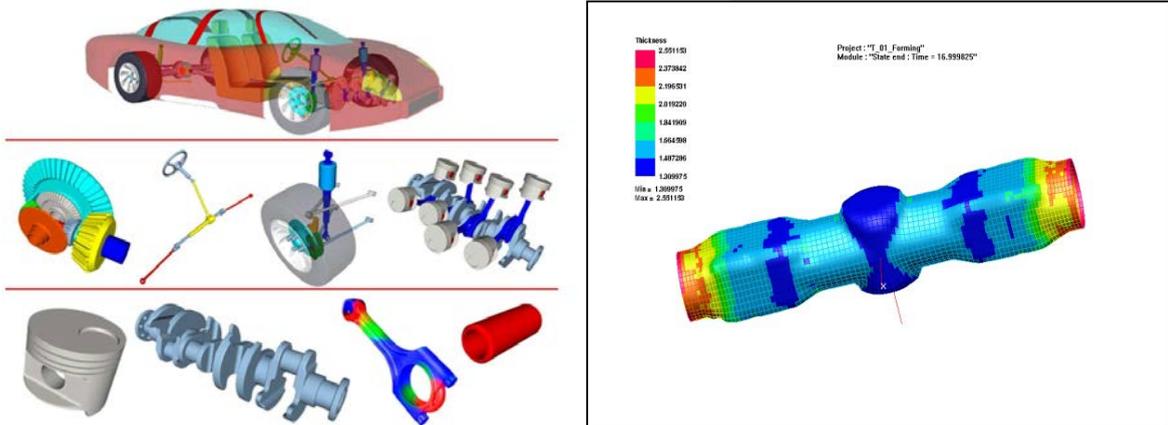

Fig. 6. Authorized Training Centre for MSC ADAMS

### 3.2 Postgradual research centre- PRC

Engineering education has been changing during decades for several reasons. Science and technology is developing and changing so fast that it becomes important to learn and learn again. It has become more difficult to motivate students. Today, engineers usually work in interdisciplinary teams, so they need good communication skills. All big companies are operating internationally, so engineers also need to get international competences.

In order to improve the employability of our graduates, postgraduates and employers, FME STU has introduced a new collaboration paradigm for its project/internship course units in various fields.

Slovakia still feels a lack of technically educated people. Enterprises necessarily need lots of well technology skilled professionals. The optimal solution for businesses is to get young graduates of technical schools who are ready to periods of theoretical but also with 2-3 years experience to be immediately applicable members of the investigator teams in enterprises. The young professionals of this profile are short on job market.

Therefore, we prepared a project of Postgraduate Research center (PRC), see Fig 7. The basic objective of the project is to focus the attention of clever young students and to motivate them for scientific work. Students and graduates will be headed by experienced supervisors and addressed to specific projects commissioned by particular companies. Supervision is a very important part of PRC. Supervisors should not only be technical supervisors, they should also help to develop the skills for team work and problem solution.

Benefits provided by the project are:

- Graduate can obtain a job in a company, which he had already cooperated with,
- Graduate obtains capability to solve the problem of a project,
- Graduate gets an expertise required by a specific company.

In a survey within this project, 150 companies were addressed to answer a questionnaire composed by FME STU. We have received 54 responses. Companies in these questionnaires have shown interest in 385 young technicians, technologists, and engineers. It has justified our effort to start the project at the beginning of September this year.

## CONCLUSION

It is not only my personal conviction that the students should be instructed through a project teamwork. Students, researchers and graduates are different personalities and they need an individual approach and different skills. Professors, supervisors are different too, with different methods of teaching and different research styles. Companies need people with different skills got by different project problem solution. Teaching and learning is food for the brain and is like other food. You cannot say that e.g. vegetables is the best thing for your health and only eat vegetables. Nutrition should be a good mixture of good ingredients. In the same way, learning and applied research should be a good mixture of good ingredients. We can not instruct our students on a totally traditional and voluntary base, we have to mix the best educational ingredients in favour of the needs of corresponding industries.

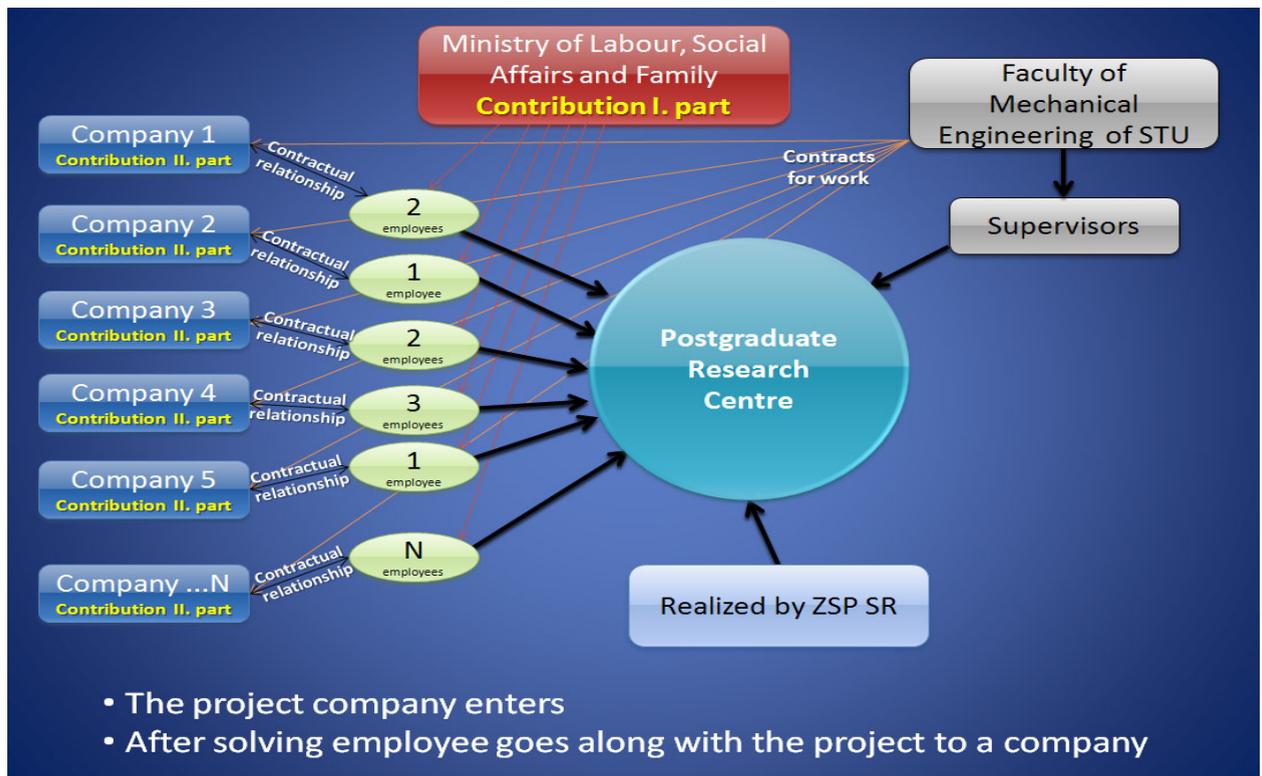

Fig. 7 Postgradual research centre- PRC

## Abstract

Each university tries to assess the work of the university teachers equitably. Through obtaining information about the teachers, the employer can desirably direct professional growth of the teachers and properly use their working and creative potential. The assessment of the working performance of the University of Zilina teachers is realized through scored assessment of their performance in the pedagogical and scientific-research activities. The assessment of the working performance is done by the head of department for the period of one year. Survey of the activities and outputs of each teacher given in the form, adjusted almost each year and approved by the rector, serves as a base for the performance assessment. In the last time this approach to performance assessment meets with teachers' dissatisfaction. The aim of this paper is to describe the current situation in assessment of the working performance of the University of Zilina teachers, based on a research to analyse limitations of the actual approach and defined criterions of the performance assessment and to propose new approach to the teachers' assessment. We propose the new approach to the performance assessment on the basis of the 360 Degree Feedback System application that can also serve as an impulse for innovation of the actual teachers' performance assessment. Applying the 360 Degree Feedback System can provide more objective assessment and strengthen the feeling of more equitable assessment that have great impact on teachers' motivation and quality of education at all universities.

*Keywords:* quality, education, assessment, working performance, university

## 1. Introduction

In modern organizations as well as in universities, the job performance assessment is considered to be an important aspect of enhancing their activities. Based on the assessment of the real working potential the university has at disposal and required working potential in term of accepted aims, the knowledge, skills, attitudes, value orientation, creativity, motivation, cooperation and other characteristics of each teacher can be developed. Except teachers' development, their assessment can have positive impact on the whole personal management system what should be reflected in the increasing effectiveness of the university (Kachaňáková, Nachtmannová & Joniaková, 2011).

At present ensuring the quality of university education is repeatedly occurring topic of professional and laic community not only in Slovakia but in the whole world. In the USA the quality of universities is evaluated according to the achieved results, e.g. the Top American Research Universities (TARU) evaluation model use indicators that gauge areas such as the quality of research, faculties and undergraduates, esteem of a university as reflected by the amount of research funding and donations received (Hall, 2010).

The European countries accept the European Association for Quality Assurance in Higher Education (ENQA), that in cooperation with the European University Association (EUA), the National Union of Students in Europe (ESIB), the European Association of Institutions in Higher Education has elaborated the file of standards and regulations for ensuring the quality in the European High Education Area. These standards and regulations are elaborated in so way to be usable for all the European universities and agencies regardless of their structure, function, size and national system.

According to ENQA ensuring the quality of pedagogical employees belongs to the group of the seven important factors participating in internal quality ensuring of the universities. Part 1.4 of these Standards that is dealing with quality assurance of teaching staff defines that universities should introduce ways to satisfy themselves that teachers involved with the teaching of students are qualified and competent to do so. They should be available to external reviewers and commented upon in reports (ENQA, 2009).

The work of the university teacher has a great impact on development of knowledge and cognition in each society. It is very demanding work that requires professional competences and continual enhancing professional knowledge, social competencies and also ability to develop them, ability in scientific research what is connected also with ability to transfer the science results to students in such a way to understand them and were inspiring for their future development (Kravčáková, Lukáčová & Búgelová, 2011).

## 2. The current state of the teachers' job performance assessment at the University of Zilina in Zilina

The University of Zilina in Zilina (UNIZA) is the only university located in the northwest region of the Slovak Republic. In terms of professional profile, the UNIZA is unique in Slovakia as it has this year a sixty years tradition of providing education in the fields of transport and communications. Furthermore, during the last period of development the UNIZA became an educational institution with a broad profile in many areas of science, technology, economics, management, and recently, educational and natural sciences. The UNIZA provides education at all three levels of higher education both in full-time and part-time forms (Bachelor's degree, Engineer/Master's degree and Doctoral degree). Teachers and research workers of the UNIZA actively participate in international educational and research projects.

The permanent precondition of successful UNIZA activities is sustaining and enhancing quality in all its academic and supporting activities. For quality assurance the UNIZA uses the internal quality assessment systems and external quality assessment carried out especially by independent (certified/accredited) organizations. One of the most important tools of the internal quality assessment is the regular complex job performance assessment of the university teachers realized yearly (see Table 1). The assessment is elaborated by direct superior following observation of the employee during the assessment period and survey of activities and

outputs in education, scientific – research and publication activities (see Table 2). The evaluator has an evaluating talk with each evaluated employee that should be realized in a form of discussion in collegial atmosphere. The aim of this assessment is to acquire information about achieved job performance for the purpose of creating the conditions of higher motivation and more effective work of the university teachers in the future. On the basis of this assessment the employee obtains information about his performance from the view of his direct superior. This information should be a base for his further working orientation, improving his work, elimination of the arisen faults and avoiding future faults (Blašková, 2003).

Concerning the quality of any subject and teacher, the students have also opportunity to express their opinion through the inquiry that is a part of the academic information and educational system of the UNIZA. They can express their opinion also at the end of each finished course within respective semester. The results are evaluated by the teacher giving the lessons and head of departments and faculties. Then they are submitted to the Scientific Boards of the faculties within the annual assessment of the achieved faculty level in educational activities and within analysis of the study results of the students.

Table 1. Form of the university teacher job performance assessment (UNIZA, 2003)

Assessment criteria	Assessment
1. The extent of using knowledge and experience in practice	1 2 3 4
2. Concern for own professional growth and personable development	1 2 3 4
3. Performance of the tasks in education and in the field of science and research	1 2 3 4
4. Production of study materials and their professional level	1 2 3 4
5. Ability of quick adaptation to changed conditions	1 2 3 4
6. Independence and initiative in performance of the work tasks	1 2 3 4
7. The level of scientific – research and publication activity	1 2 3 4
8. Applying new forms and methods in education	1 2 3 4
9. Active participation in international events and participation in their preparing	1 2 3 4
10. Personable elements in relation to work and performance of the tasks (Reliability, consequentiality, work in team, efficiency, work discipline and, etc.)	1 2 3 4
<b>Sum</b>	

The complex university teachers' job performance assessment applies this scaled score of assessment (UNIZA, 2003):

- 1 - Deeply below standard level of evaluated activity.
- 2 - Employee is doing his work only in a routine way, he is not interested in change and only accept the directions passively, his activity is poor.
- 3 - Active employee, he is looking for new forms and methods of working innovatively. The evaluator is fully satisfied with his work.
- 4 - Excellent high above standard work. The excellent results are supposition for further functional growth of the employee.

The background for the complex assessment of the university teachers' job performance assessment is the survey of activities and outputs of the pedagogical employees of the UNIZA that is yearly updated and approved by the rector, see Table 2.

The result of the complex teacher job performance assessment, see table 1, is categorization of the teachers into assessment levels according to their achieved score. The teacher's evaluator should propose the tasks and aims for the future development of the teacher.

The University of Zilina has been proving its intention of continual education quality improvement by many activities. One of them is implementation of the project entitled „Development of Quality Culture at the University of Zilina on the Base of the European Standards for Higher Education“. The specific objectives of the project include development of the permanent quality improvement strategy at the UNIZA covering the system of work with information within and also outside the University and verification of the functionality and effectiveness of the internal education quality assurance system. This project implemented within the Operational Programme Education in years 2011-2013 is supported by financing from the European Social Fund and state budget

Table 2. Shorten survey of activities and outputs in education, scientific-research and publication activity.

Description of activity		Coefficient	Scaled Score
<b>Scientific-research and publication activity</b>	Home projects		<b>50-100</b>
	Foreign projects		<b>50-200</b>
	Publishing at home conferences (AED, AEF, AFB, AFD, BED...)		<b>10-25</b>
	Publishing at conferences in abroad (AEC, AEE, AFA, AFC, BEC...)		<b>30-200</b>
	Publishing in home magazines (ADC, ADD, ADE, ADF...)		<b>10-50</b>
	Publishing in foreign magazines (ADC, ADD, ADE, ADF...)		<b>200-300</b>
	Foreign book publications (AAA, ABA, ABC...)		<b>80/AP</b>
	Home book publications (AAB, ABB, ABD...)		<b>50/AP</b>
	Artistic work		<b>40-150</b>
	Citations		<b>1-10</b>
Inventions, patents, awarded prizes		<b>50-200</b>	
<b>Education</b>	Textbooks - number of author pages (AP)		<b>35-50/AP</b>
	Scripts - number of author pages (AP)		<b>20-30/AP</b>
	Final works		<b>30-50</b>
	Education		<b>26/1h</b>
<b>Other activities</b>	Organizational and professional activity at faculty and department, editorial board of magazines ....		<b>10-250</b>

### 3. Dissatisfaction of the teachers with job performance assessment at the University of Zilina

In the last time this approach to job performance assessment at the University of Zilina meets with dissatisfaction of the teachers. Following the discussions with the teachers of the University of Zilina the weaknesses of the current complex job performance assessment can be described as follows:

- current approach to assessment is very subjective according to the teachers,
- specified criterions are very general, immeasurable, unclear,
- exact specification of criterions and assigning the weights are missing,
- the effects of results on evaluated teachers are doubted,
- exact specification of the subject competent to evaluate the job performance is missing,
- the form cannot be used as a base for comparison of individual performances,
- the regular course of the assessment process is not ensured in some cases,
- the assessment form of the complex job performance assessment is not in exact connection with the survey of the teacher's activities and outputs that results in higher subjectivity,
- imprecise conclusions from interpretation of the achieved score,
- defining work standard that would not be changed in respective year but would reflect scope of employment resulting from the labour contract is missing.

Based on the discussions with the University of Zilina teachers, the weaknesses of the current survey of activities and outputs in education, scientific-research and publication activity were also indicated as follows:

- defined survey of activities and outputs is very complicated, blind and unfairly evaluated,
- criterions are in large extent adjusted in favour of head employees,
- assessment justness in useful and especially effective form is doubted,
- precise and clear criterions for filling the survey are missing,
- assessment according to functional levels or working positions is missing, i.e.. PhD., assoc. prof., prof.,
- the levels of teachers acceptable performance are not defined,
- some teachers understand the specified survey of activities and outputs as misleading that demotivates employees and gives rise to bad relations among employees,
- changes in assessment form in each year without informing the employees about these changes in advance,
- in some departments the filled in forms are not checked,
- dissatisfaction with some specific criterions, e.g. small score for book publications, for elaboration of home and foreign project proposals, for guidance of students in elaboration of their bachelor and diploma works, too highlighted person of responsible investigator.

### 4. Proposal of job performance assessment at the University of Zilina

As a new approach to job performance assessment at the University of Zilina we propose to apply the method of 360 Degree (360 Degree Feedback System), that will be an impulse for innovation of current job performance assessment of the teachers.

The assessment of teachers according to the 360 Degree Feedback System can provide teachers with more objective assessment and reinforce the awareness of more fair assessment that has great impact on their motivation and quality of education at the universities.

The 360 Degree Feedback System is a method of job performance assessment that is oriented on description of working behaviour (Šuler, 2009). It is relatively objective method that is able to recognize the level of abilities and skills of evaluated person and reinforce the awareness of more fair assessment. It enables more effective

personal development of employee in relation to organization needs. It provides opportunity to obtain job performance assessment from people around, i.e. chief, colleagues, subordinates or external customers. The 360 Degree Feedback System supports providing transparent feedback; individual development plans and encourages self-confidence as development base. (Vefas, 2011)

Principles of work with 360 Degree Feedback System are as follows (Vedralová, 2013):

- method is based on job performance assessment through defined the most important criterions of job performance,
- multi-degree scales enable to differentiate evaluator statement,
- elaboration is made by independent source,
- all information are confidential and also the evaluators are anonymous,
- interpretation of obtained results is possible also through external couch,
- evaluated person prepares plan of personal development.

360 Degree Feedback System is suitable also for application of university teacher's assessment for comparison of his own performance with opinions of other colleagues and chief. Their opinions enable to identify his strengths and improve his weaknesses.

#### **Application of 360 Degree Feedback System on teacher's job performance assessment:**

##### **a) Selection of evaluators**

In the first step it is important to select proper evaluators who have the best knowledge about job performance of evaluated teacher.

Management of the faculty should specify the number of evaluators. Direct superior should be responsible for the assessment process. Team of evaluators can involve, e.g.:

- evaluated university teacher,
- direct superior,
- e.g. four colleagues (fellow workers),
- students (indirectly).

The evaluated teacher can select colleagues as team of co-operators who are able to express their opinion to his job performance. Application of this method enables also to use teacher's assessment elaborated by students but only indirectly, i.e. in the form of questionnaire at the end of finished semester. Form of evaluating questionnaire, filled in by students, is based on criterions that exclusively concern the educational process between teacher and student. If the teacher's assessment process involves also students, we say about 360 Degree Feedback (see Figure 1). If the students are not involved in assessment it is application only 270 Degree Feedback.

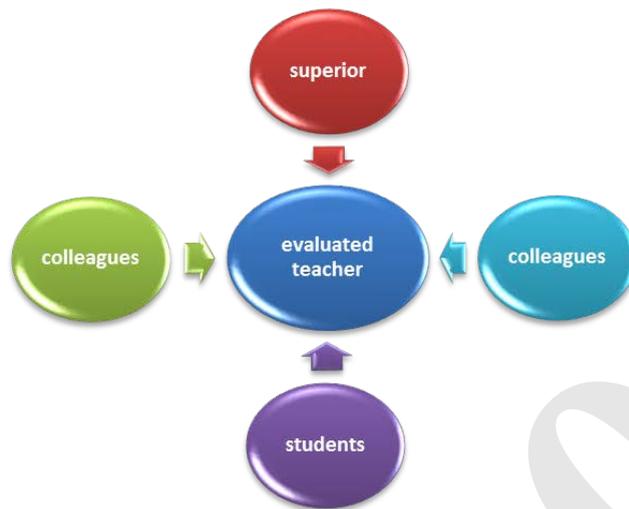

Fig. 1. Structure of teacher job performance assessment (elaborated by authors)

#### b) Assessment of teacher's job performance

All evaluators including teacher fill in the same job performance assessment form anonymously where the level of teacher's job performance from the view of key criterions of scientific-pedagogical activities is evaluated.

The job performance criterions in the assessment form are formulated in so way to define really measurable criterions of scientific-pedagogical activities, see Table 3. Each criterion has its measure. We propose five categories of scale, from unsatisfactory results to excellent assessment, see table 4. We propose to use double number of points for these assessment criterions:

- Quality of passing on knowledge to students.
- Development of students' skills and competences.
- Quality and contribution of scientific-research activity for development of department and faculty.
- Quality and contribution of publication activity for development of department and faculty.
- Involvement and initialization of new activities.

The advantage of the 360 Degree Feedback System is that the evaluators are willing to respond truly if they know that their responses are anonymous, will be used for further development and only very small number of people (usually evaluated teacher and his direct superior) will work with obtained information.

Table 3. Proposal of the university teacher assessment criterions (elaborated according to Blašková et al. 2013)

Assessment Card for 360 Degree Feedback System - Job Performance Assessment Form						
Department						
Name of employee						
Work position						
Category of employee						
Evaluated period						
No	Criterion	Assessment				
		1	2	3	4	5
1.	Quality of passing on knowledge to students	1	2	3	4	5
2.	Concern for own professional growth and personable development	1	2	3	4	5
3.	Development of students skills and competences	1	2	3	4	5
4.	Development of study materials and their professional level	1	2	3	4	5
5.	Applying new forms and methods in education	1	2	3	4	5
6.	Quality and contribution of scientific-research work for development of department and faculty	1	2	3	4	5
7.	Quality and contribution of publication activity for development of department and faculty	1	2	3	4	5
8.	Independence in performance of tasks and defined aims	1	2	3	4	5
9.	Involvement and initialization of new activities.	1	2	3	4	5
10.	Reliability and consequentiality in work	1	2	3	4	5
11.	Creativity, invention and flexibility in work	1	2	3	4	5

12.	Cooperation with colleagues from other departments	1	2	3	4	5
13.	Observance of work discipline	1	2	3	4	5
14.	Motivating effect on students and colleagues	1	2	3	4	5
15.	Responsibility and work effort	1	2	3	4	5
Sum						

Table 4. Assessment scale – form of qualitative job performance assessment of employees

Poi nts	Level characterization
1	<b>Unsatisfactory assessment.</b> Unsatisfactory level. It is possible to indicate essential disagreement with all items of key criterions given in job performance form. It is possible to formulate development from basis and immediately.
2	<b>Satisfactory assessment.</b> Substandard limiting level. It is possible to indicate essential disagreement with some of items of key criterions given in job performance form. Systematic development aimed to eliminate weaknesses should be formulated for given criterion.
3	<b>Good assessment.</b> Satisfactory minimal level. It corresponds with formulated criterion with certain stipulation. Key improvements can be formulated. Development can be oriented on enforcement of strengths and weaknesses weakening.
4	<b>Very good assessment.</b> Optimal level. It exactly corresponds with formulated assessment criterion. No stipulation only partial improvements can be formulated for given criterion. „Qualitative jump „cannot be formulated. Development can be oriented on enforcement of strengths.
5	<b>Excellent assessment.</b> Excellent level, ideal state. Defined criterions are at exemplary level and no improvements can be defined.

### c) Elaboration of the evaluator output report

After data collection their assessment including output report will be made. All results will be evaluated anonymously and always in connection with assessment conclusions of other evaluators, i.e. teacher's job performance assessment is compared with his assessment and assessment of his direct superior, his colleagues and also students' assessment. Based on this comparison, the level of evaluated teacher is assigned. Scale of the job performance assessment can remain the same as it is at present.

Table 5. Scale of job performance assessment (elaborated according to Šimák, 2012)

Achieved score %	Verbal assessment	Assessment
90% and more	Excellent level of job performance.	Excellent highly above-standard performance without a need of further improvement for respective conditions and circumstances. Excellent results are precondition of further progress in job position.
75% - 89%	Job performance is above standard level.	Active employee who well knows the work. He innovatively looks for new forms and methods of work. He has many good ideas. His activities and properties are above standard level. Evaluator is fully satisfied with his work.
50% - 74%	Job performance is on standard level.	Employee works standardly, he is not concerned to change and only accept the tasks passively, his activities are on low level.
49% and less	Job performance is under standard level.  (unsatisfactory)	Deeply under-standard level of evaluated activity, realized work, behaviour or required property. Employee has great limitations that have negative effect on results of his work.

#### d) Informing about outputs and plan of personal development

Elaborated results from application of the 360 Degree Feedback System should be presented individually between evaluated person and his direct superior and elaborated in output report. The output report should include teacher's performance, his strengths and development needs in the form of tasks for further period, i.e. the individual plan of teacher's development should be made. This plan of personal development should contribute to improvement of performance in that fields that were within assessment identified as problems.

Evaluated teacher has so at disposal his detailed and objective job performance assessment with specific weaknesses and strengths. It is important the teacher was able to accept these results and use them for his motivation and increasing the quality of education at the universities.

#### e) Regular assessment and monitoring

Application of the 360 Degree Feedback System should be realized once a year. Monitoring of evaluated teacher can be realized by his direct superior during a whole year and by students at the end of each semester. After repeated annual teacher's assessment by 360 Degree Feedback System it is needed to assess the effectiveness of the teacher's personal development plan and set new development aims for further period.

### 5. Conclusion

One of the basic requirements of the job performance assessment is achieving the highest correctness and objectivity as possible. Assessment conclusions should be always absolutely sustainable and reliable, i.e. un-

deformed by prejudice and other evaluating mistakes. It is important to say that many mistakes, occurring in assessment, are unintentional and the evaluators are not aware of them (similarly to barriers of effective communication). Some mistakes arise from slouch or lack of concentration of the evaluators, the others are carried out purposely with clear intention to disserve evaluated person. But it is necessary to fight against them and not to allow them to devastate the assessment system (Blašková, 2003).

Contributions of the 360 Degree Feedback System application for the teacher's job performance assessment are as follows:

- More objective and complete judgement of work performance and potential of teachers,
- Setting individual plan of personal development for each teacher, i.e. it enables more effective personal development of employee in relation to university needs.
- Improving credibility of performance assessment.
- Increasing motivation and effectiveness of teacher's job performance.
- Feedback from colleagues contributes to strengthening personal development.
- Strengthening relations between teachers and possibility of improving team work.
- Improving social culture at the university owing to teachers' participation in evaluating process of their colleagues,
- Enhancing education quality at the university.

We believe that if the management of the University of Zilina decides to apply the 360 Degree Feedback System for the teachers' assessment it will certainly bring more satisfaction among the teachers, from the view of more fair assessment that will reflect in increasing motivation and quality of the education at the university. Satisfied teachers with quality job performance are the most important aspect of the university progress.

# Art in the eyes of six-year-old children. Children's semantic hypallages regarding paintings of great masters

Małgorzata Karczmarzyk, Anna Wasilewska\*

*Uniwersytet Gdański, Instytut Pedagogiki, ul. Bażyńskiego 1a, 80-952 Gdańsk, Poland*

## Abstract

The present article will present six-year-olds' statements about paintings by Salvador Dali, Marc Chagall, Pablo Picasso and Zdzisław Beksiński. The statements will constitute a foundation for the analysis embedded in semiotic perspective. Communication through image is an original dialogue ground between a child and an adult researcher. Semantic hypallages of meanings given by six-year-olds in the reception process of a painting show worlds full of meanings. The statement about a painting becomes a child's self-communication about its perception of the world, colloquial theories about reality and ideas inspired by a particular painting.

Keywords: children's voice, semiotic methodology of the meaning of art, art as communication, polysemy of art, colloquial theories of children

## 1. Introduction to the subject

The study of meanings given to art of great masters by early learners rarely appears in Polish research studies. Authors usually ignore this issue, probably because art in early education is treated marginally. Various cultural messages addressed to children rarely belong to high art. If there are already some examples of paintings, they are usually realistic and refer to the nearest environment (e.g. landscapes by Wyspiański or Leon Wyczółkowski in the manual "Słońce na stole"). If a child has any contact with abstract or surreal art, it happens only at home. Although a young recipient's contact with this important cultural artifact is significant in educating and training young learners, it is too often forgotten. Education through art, so far described by many psychologists and educators (Herbert Read, Irena Wojnar, Wiesława Limont, Kamilla Nielek-Zawadzka, Hanna Krauze-Sikorska and others), is still among theoretical postulates in the modern world so much saturated with various visual

\* Corresponding author. Tel.: +48 609971400; fax: -  
E-mail address: wnsmk@univ.gda.pl

messages. Certainly one of the reasons for unsatisfactory state of art education is the current notion that art is too difficult to be received by small children.

The present article is an attempt to call this view into question. It will present six-year-olds' statements about paintings by Salvador Dali, Marc Chagall, Pablo Picasso and Zdzisław Beksiński. The statements will constitute a foundation for the analysis embedded in semiotic perspective. Communication through image is an original dialogue ground between a child and an adult researcher. Semantic hypallages of meanings given by six-year-olds in the reception process of a painting show worlds full of meanings. The statement about a painting becomes a child's self-communication (Lotman, 2008) about its perception of the world, colloquial theories about reality and ideas inspired by a particular painting.

## 2. Research methodology

The use of children's language in the presented language study invites to adopting a semiotic perspective. It should be noted though that this prospect is not homogeneous since within it there are various conceptions concerning relations between different types of signs. The confrontation of word and image applied here shows a number of problems. Sign analysis leads to questions about systems to which the signs can be attributed. Ambiguous semiotic status of plastic arts that do not use spoken or written language, makes it difficult to treat speech as a direct reflection of reading a work of art. S. Wyśłouch, reflecting on kinship of arts, asks questions referring to the plastic arts code system: "Are those primary languages, which is commonly believed, or perhaps secondary languages, built on some "original language" or innate genetic code?" (Wyśłouch, 1994). The "original language" trail leads to baby (primary) impressions in the reception of paintings. The language of image, as the one referring more to intuition than intellect, is perhaps closer to a child's perception than an adult's perception. The problem of mutual relations of iconic and language signs opens up a whole series of problems in the field of research methodology. What emerges then is the question about common structural elements of such different messages. Various codes of those texts may have common connotations since sense, motives and meanings are read regardless of the used code. Therefore in this type of research it is important to extract semantic fields and make their classification with special regard to the references to a range of children's knowledge about reality, including cultural reality.

The proposed research methodology uses intersemiotic translation which in the case of child as a recipient seems to be particularly justified. This justification can be seen in children's particular perception of reality (including cultural transfers) which is syncretic and holistic. It is also seen in child-specific communication situation. Child as the recipient of cultural texts moves in polyphonic space of codes. One should

pay attention to the fact that this polysensory of reception results not only from the existence of an agent, but also from the intersemiotic nature of messages addressed at children.

At this moment it is right to recall Götz Wienold's text processing theory covering all processes from reception, through consolidation, giving further for the use of other texts, ending with converting into new texts in other media (Wienold, 1986). According to Wienold, text processing, in terms of includes a number of various activities, from reception of specific text in the act of presenting, commenting, to stimulations relatively independent of the original text (Wienold, 1986). This type of procedure takes place in a child's daily contact with various cultural messages when for example it has listened to a fairy tale read by an adult, then drew a picture story showing the plot and some words or sentences, after which in a few days the child used the situations from the fairy tale in the play. This intersemiotic translation is particularly close to a child, and, most of all, helps the individual "order" next cultural experience in to building his/her own cognitive structures. Moreover, translation into other codes allows a child to avoid the realization difficulties that result from low language or art skills. Wienold points out that the "transition" from one system (or code) to the second allows a more powerful reception for individual participants. The text in a way obtains a greater semantic load during reception. Narrative statements about paintings, even if they are not intersemiotic translations, certainly show a specific interpretation of meanings. A child is not yet a passive recipient of cultural heritage but an active creator, constructing its own original theories that enable it to organize experience.

So is the innate genetic code shown in children's statements about paintings, or is other cultural experience and knowledge about reality dominant? Barbara Boniecka's thesis is also justifiable. It says "that it is impossible to prove to what a child-sender, a person who still develops and is constantly influenced by adults, represents only itself or presents somebody else's thoughts and opinions" (Boniecka, 2010). Therefore, research on children's statements about paintings concern not only the problem of painting reception, but also make it possible to understand the children's world - their perception of reality, constructing knowledge about reality and using that knowledge for building their own theories of the world.

### **3. Semantic hypallages of meanings assigned by children to paintings of great masters**

Material for the study, collected in 2011 and 2012 includes interviews with 6-year-old children about selected paintings by Marc Chagall, Salvador Dali, Pablo Picasso and Zdzisław Beksiński. The purpose of choosing the paintings was not to create a single narrative story, hence the choice is random. What was important here was to make a child interested in the painting. Therefore the images chosen for analysis were colorful, expressive and encouraging a child to use its imagination. This type of message is more complex than verbal language and it encourages a child to look for various semantic references. Therefore, both the images and

children's statements form a kind of network of interwoven meanings that one can try to decipher in order to find out how children perceive and construct knowledge about the world.

Below are the paintings of great masters and early learners' verbal comments.

### **Salvador Dali, Three Sphinxes**

Oil painting on canvas shows three shapes resembling human skulls. In the foreground we can clearly distinguish the back of the head, however next portraits are the compositional references to a dominant theme. The next head is composed of two green shapes resembling two green trees growing on a yellow desert. In the distance there is a third head that emerges from white rocks.

Here's what six-year-old Piotrek says about the painting:

“er: .. I see two connected trees in the shape of a balloon with ...

a cord cut in half, and the second tree reminds me e ..

a tree trunk falling from the clouds

As if there was a storm here that broke the tree

and lifted it up to heaven, and so it fell down ... and so it fell down”

At first the boy draws attention to two interconnected trees. So he is trying to refer picture elements to real objects and phenomena that he already knows. He clearly describes the clouds, the tree trunk, and the phenomenon of the storm which could be the reason of the shape of the trees in the form presented in the painting. The child perceives that form as a balloon. The boy does not see the outline of the skull, but rather a ball which he associates with inflated balloon so the image is interpreted according to Piotrek's knowledge about the world. On the other hand one can see that the image evokes in him the desire to be creative and it stimulates him to try to explain the reasons for the present state of affairs. What he says about the tree that: “fell down ... and it fell down, it” may also result from watching catastrophic or science fiction movies. Remembering a different image on the basis of a given visual communication is a kind of intersemiotic message which is close to the child and helps it to "order" its visual experience.

In the child's statements there were also diminutives such as “string and balloon”, which may indicate an attempt to "tame" a difficult message, for example a painting by Salvador Dali. Translating visual language into verbalization brings the child closer to the image and encourages it to search for hidden meanings in it. In this way the child explores difficult and confusing elements by using diminutives and well-known linguistic

simplifications. In this way the child also explains a difficult, not yet acquired message to itself. The reason for that is that it has occasional contact with high art, both at home and school. Therefore the painting by Salvador Dali on one hand stimulates imagination, but on the other hand it forces to make intellectual effort in order to be able to replace one visual example with another, recalled by the child's own memory and experience.

### **Marc Chagall, Self-portrait with seven fingers**

The oil painting is in rich colors and refers to cubist solutions from the beginning of the twentieth century. It shows an artist painting a genre scene, probably in his studio. In one hand he holds a colorful palette, and in the other a brush that he puts to the painting which is placed on the easel. In the background of the studio there is a window with a view on the Eiffel Tower under which stand miniature size human figures. Here's what six-year-old Paweł says about the image:

“That one man ... is painting, and this man is all dyed ... probably in Paris, because I can see the Eiffel Tower here. And he is painting a picture of a horse and a man ... Brunhild ....

that he has a little wrung hand, it's a bit of a different position here. And that he has (one.. two .. three ...) he has seven fingers. Seven! No one has so many! Maybe it's a monster .... and here, look at his face, he looks as if he wanted to attack us right from the image .... and blow it up into pieces”

The boy is very excited about the interpretation of the image. At the beginning he notices a painter who got paint all over himself because “he' s all dyed”. Such an analysis once again suggests the problem of relating the child's visual message to a real situation[2]. In the past Paweł could have seen the man wearing a painted apron so he recalls that image from his memory.

Another interesting meaning is a small detail that he notices in the background of the image. This is the view from the window of the studio in the Eiffel Tower. The boy immediately recognized Paris in the painted scene, which means that he knows the city from his own experience (e.g. a trip abroad with parents), or from popular science books and movies. The six-year-old's knowledge about the characteristic monument of Paris can also be the result of global access to information which is transmitted not only by adults but also advertisements and the Internet.

Identification of the painted figure with a monster is also interesting:

“And that he has (one.. two .. three ...) it has seven fingers. Seven! No one has so many! Maybe it's a monster .... and here, look at his face, he looks as if he wanted to attack us right from the image .... and blow it up into pieces”

This statement can be attributed to the hypallage of cartoon or computer games fiction, in which evil is always depicted as an ugly, strange character, a monster (Łaciak, 2005). Someone who has seven fingers is different from "normal", thus identified with socially excluded, worse, deprived of rights that the "normal" have. As a result, the "different" is shown differently by multiple media through a visual code that belongs to popular culture. It is not too aesthetic and created by adults (Ejsmont and Kosmalska, 2005) who, when creating a valid model of the world, air prejudice and stereotypes, not necessarily consciously.

It is noticeable that the boy sees some features in the "other" such as negative facial expressions, anger and aggression:

“as if he wanted to attack us right from the image .... and blow it up into pieces”

The boy tries to describe the "different" in order to understand it better, and recall his experience. However, what is worrying is that it is not a positive image. The child builds a narrative story based on the world of computer games and television films. Many researchers, both in Poland and in the West have spoken their mind about deviant influence of television, especially scenes of horror, cruelty and violence (Rulko, 2004) It is a problem that (according to what Jolanta and George Rulko have written) children treat “aggression code as "natural" in the interpretation of reality” (Rulko, 2004). As a result it causes anti-social behaviors, adaptation problems, impaired relationships and communication with others, and lack of the sense of security (Rulko, 2004). In the reception of the painting the child refers to the semantic field concerning aggression, thus it perceives unclear presentations as threats.

### **Pablo Picasso, Child with a Dove**

An oil painting shows the figure of a child holding a dove. In the foreground, on the left side of the image there is also a colorful ball. It is difficult to determine the figure's sex but the dress it is wearing suggests that it is a little girl. Further off a recipient can see an outline of a simple division of space with a green lawn and blue, a little dirty sky.

Six-year-old Alicja, who describes the picture, focuses mainly on the bird which is held by the figure. Here's what she says:

“The girl is holding a bird and farther there is a colourful ball ...

hmmm and maybe it' s a pet dog Galfi”

Interesting in what she says is that she sees the whole picture but eventually goes back to the theme that seems the most important to her. After some time she sees in the bird another animal, the dog Galfi. It is difficult to say whether Galfi is the real dog or a name borrowed from Alicja' s favourite fairytale or computer game. Nevertheless it is sure that the girl enters the world of fantasy in order to tame elements of the image that seem strange or unclear to her .It is an interesting kind of co-creating the image by a small viewer. It helps to understand a difficult visual message and awakens the child' s creativity.

### **Zdzislaw Beksiński, Untitled**

The painting depicts a woman sitting on a horse. However, this is not a woman alive, but rather a symbol of death. The foreground depicts a decaying horse that stands on the edge of the forest. The figure on the horse has her hair in the wind and it is impossible to see her face. Everything is kept in dark tone and rather murky mood.

Here's what six-year-old Patrycja says about the image:

“poor horse ... er.. it died, didn' t it? A lion probably ate it, lions eat zebras and horses ... but why is it in the field? It is so dark there ... or maybe it' s been dug out of the ground like mammoths and dinosaurs , and now it' s going to look for his family”

The girl turns out to be very mature for her age, for at the first moment she notices that the horse painted by the artist is not alive. However, she does not describe the horse, but rather tries to find out the reason why it' s dead. She answers her own questions as follows: “lion probably ate it, lions eat zebras and horses”. It seems that the child has the basic knowledge about nature. However, it is not a school established knowledge but the reality image constructed from the meanings transmitted by the network of messages such as media, conversations with parents or playing with peers. As Dorota Klus-Stańska writes: “A child continually attempts to understand reality (...) The originally given meanings influence understanding of the previously unknown objects and situations, constituting a kind of interpretive filter. At first they are hypothetical and open to modification but the more confirmed they become the more solidified they are, and start to constitute a specific, personal "theoretical" model of the world” (Klus-Stańska, 2004).

The next sentence which the girl says is another attempt to conduct a monologue with herself:

“or maybe it' s been dug out of the ground like mammoths and dinosaurs, and now it' s going to look for his family”

All the time Patrycja is trying to understand a difficult message. She does not know why the painted horse is dead, she cannot refer its presence in the image to reality, so she enters the world of imagination. By inventing the story she develops her creativity. It is a specific intersemiotic translation in which an image is explained by another one, for example the one derived from popular culture: the media, illustrations in children's books, cartoons, etc., is trying to enter the image's emotional load is another interesting image reception. The girl asks a rhetorical question " ... but why is it in the field? It is so dark there".

This time the child cannot find any answer. However, it is enough to reflect on the mood prevailing in the image to see that it becomes an intriguing beginning of constructing further narration. She begins to imagine a story in which the main character is the horse looking for its family. Entering the world of imagination allows the girl to transfer the meanings from reality to fiction. The change of moodiness is also interesting here. Through fiction the girl can change the stylistics from sadness and somber mood to the one full of hope. Finding its family, the horse is somehow "saved" and thus brought back to life.

Another worth remarking issue which becomes evident in the semantic fields of meanings given to the painting by Patrycja is that she draws her attention not to the human figure but to the animal. It becomes a focal point of the image to which she tries to adjust other meanings constructed by herself. This tendency may result from a simple reason - love for horses or other animals, which is very characteristic of children at this stage of development.

#### **4. Summary of analysis**

The above analysis which is a preliminary pilotage for a larger range research, shows that six-year-olds show remarkable creativity when reading meanings in the works of great masters of painting. Although messages are difficult, a child reads single painting signs, giving them specific meanings that refer to hypallages to certain knowledge about the real and fictional world. Children's meanings refer to real situations and to images that they know from media or literature. It is noticeable that children's contact with a work of art stimulates their creativity, develops vocabulary and helps a child to construct knowledge. Children smoothly pass from reality to the world of imagination which facilitates explanation of unclear phenomena and symbols. In this way they recognize and interpret the world of adults, its meanings, symbols and rules of the game which are often difficult to understand.

The six-year-olds who took part in the research surprise with cognitive maturity and perception which are much more diverse than the ones learned in the course of education, based on schemes and stereotypes. The youngest age (here from 5 to 9 years of age) has in fact still quite short roots in the culture of adults. Therefore the metaphor of a child can be used as a culturally unpredictable entity - it reads the world taming some meanings and symbols from the "world of adults."

Although there is no division into "adult world" and "children's world", childhood is the time that precedes social presence (Jacyno and Szulżycka, 1999). A child's position is in fact dependent on adults who construct common world to which not everyone has the same access. It is difficult for a child to get to visual messages of contemporary art which make it possible to understand difficult but important problems such as death, suffer and passing. This specific reluctance to introduce a small observer to the "truth" is certainly caused by "a child's good". However, limiting children's formal education we forget that a child learns not only from us - adults. All contents, both good and bad get to the child through various messages from outside world (e.g. media). Those are messages not always addressed to the child. Computer games, movies full of violence and vulgarisms reach small viewers often without our knowledge. On the other hand, a child's access to high culture (such as paintings of the great masters of painting) is limited. Nevertheless, the ascertainment concerning contemporary children's cultural world can only be a starting point for educators in order to understand how certain messages influence a child's building knowledge about reality. The reception and influence of a variety of cultural messages, not only those coming from electronic messages or mass media, but also those belonging to high culture is worth researching in order to uncover the field of meanings constructed by a child recipient. Such studies open the way to projecting educational strategies, the purpose of which may be introducing a child to the world of art and indirectly, also to difficult issues which are important for understanding a human and the world.

Univerzitná 8215/1, 010 26 Žilina, Slovak Republic*

## Abstract

The rapid and steady changes in a field of information and communication technologies have increased demand for high qualified specialists not only in a field of cybernetics and applied informatics, but also in related fields such as economy and management. This burning request of this specific area of the labour market has increased a need for a graduate who possesses interdisciplinary knowledge. This phenomenon considers the universities, as the providers of high qualitative education, as the key factor in this relation. This paper raises the question of a role of education in this process and discusses the approaches to the methodology of teaching economics for IT students outgoing from theoretical and also practical knowledge and experience.

Keywords: education of economy, informatics, teaching methods, university education

## 1. Introduction

A usage of information and communication technologies (ICT) in the consumer and industrial sectors have been significantly increased from the 20<sup>th</sup> century and still continually offers to society the promise of further benefits. Computers and mobiles became an essential element of our everyday professional and personal life and made it simpler in many ways. Despite of global recessions, economic activities resulted by new inventions and innovations are sharing ahead and the trade with information services (IS) generating positive results. It's trend has a rising potential requiring qualified staff, which makes Informatics one of the most enticing and exciting fields of study today. Education on study programs related to Informatics allows acquisition and the subsequent opportunity of carrying out interesting and well paid profession, which is very desirable among young people.

The growing importance to increase the ability to match education alternatives with career options generates necessity to provide even students of Informatics with opportunities to use economics to solve meaningful problems. Why they should be economically literate? Not to mention to all there are four basic reasons why graduated students of study programmes Informatics or even similar technical study programmes should study economics:

- On job position IT developer as an author or IT tester of numerous economic software they have to clearly understand the requirements of customers and to use economic terminology correctly in communication with them.
- On job position Senior Project Manager or Senior IT Specialist as a team leader are strongly required not only knowledge of computer science, but also basic economic and managerial skills to identify sources and

\* Dipl.Ing. Emese Tokarčíková, PhD. tel.: +00-421-41-513 44 22; fax: +00-421-41-513 40 55  
E-mail address: Emese.Tokarcikova@fri.uniza.sk

plan effectively, also to manage, evaluate and control the economic and managerial side of single projects or orders.

- In case of running their own business they have to have various economic and business skills from how to put together a business plan and initial marketing plan through how to manage company and own trade activities and certainly how to optimise processes, costs, how to make price strategy to maximize your profit. Knowledge of „relations among costs, prices, level of sales and profit are very helpful in managing” (Ďurišová, 2011) and further business activities.
- No matter of professional orientation, economic education helps to equip everybody with useful tools for making decisions and to be ready to face more complex choices in further professional and also personal life.

My objective in this article is to analyse different expectations and requirements of students of study program Informatics and their further employers and how universities through teaching economic subjects can be useful in this relation. In order to reach this objective is necessary to realize literature review about teaching methods in Economics, to make a survey with touchable actors and to design new ways of solution.

## 2. Related work

Economical way of thinking about national and international issues includes problem-solving skills that emphasize analytical reasoning using techniques and methods of economics. Successful managers understand that a reasonably activity in processing economical information not only accelerate their use, but primarily improves the quality of decision-making. (Chodasová, 2012). Teaching economics therefore have to focus to increase understanding of economic behaviour and improve a student's ability to predict the consequences of changes in economic forces.

Unfortunately, surveys show that most of the graduates having learned little economics, even if they have taken an economics course (Walstad and Allgood, 1999; Gardner, 1991; Allgood, 2001). Education economists, such as Becker and Watts (2001), argue that one problem with teaching of economics is that they are still dominated by the simple lecture format. This “chalk and talk” education method with “math issues and graphs” make teaching and learning process difficult. According to the survey (Taylor 2002, Sloman, 1998; Forsythe, 2002; Volpe, 2002) were found that lecturers and seminars usually follow a content-driven lecture-tutorial approach, complemented by the use of textbooks and tutorial question sheets or by use of artificial model problems discussed by working examples. Usually results and answers are in essay form, each of them three or four pages in length. (Miller, 2002)

Another problem why students tend not to be attracted to course of economics that economics is a social science discipline that heavily utilizes statistical and mathematical models to analyse real-life problems (Hansen, 2001; Cohn, Cohn, Hult, Balch & Bradley, 1998) so requires very good knowledge of mathematics also statistics and forecasting.

On the other hand many education specialists think that the key to understanding economics is to understand human action, but the current curriculums of economic subject are so rigid and uniform (Lawson, 1989; Walstad and Saunders, 1998; Siegfried, 1998; Frank, 1998; Boskin, 1998; McConnell, 1998; Davis and Erekson, 1998).

Standard curriculum usually doesn't include new economical approaches and paradigms diverting from neo-classical approach, even though many economics agree that understanding the main issues as defined by neo-classical economics is necessary for students for their further economics education.

The education economists suggest that teachers should consider new and innovative teaching strategies. We can find some non-traditional and more interactive methods of teaching economics (e.g. Sloman and Mitchell,

2002; Taylor, 2002; Welsh and Saunders, 1998). Several of these new teaching innovations reflect current developments in economics as a (Sutcliffe, 2002; Holt and McDaniel, 1998; Williams and Walker, 1993; DeYoung, 1993; Volpe, 2002; Buckles, 1998; Noussair and Walker, 1998; Oxoby, 2001). Also exploitation of information -communication technology (ICT) in process of teaching and learning economics is notable (e.g. Hobbs and Judge, 1995; Brooksbank et al., 1998; Sosin, 1998; Chalmers and McCausland, 2002; O'Leary and Ramsden, 2002; Elliott, 2003).

After all, surveys were also found that the predominant mode of instruction in economics, as opposed to more progressive teaching techniques in other disciplines that more actively involve students (Merriam & Caffarella, 1999; Becker & Watts, 2001; Quddus & Bussing - Burks, 1997).

### 3. Method, data and partial findings

The insights reported in this paper are exclusively based on semi-structured interviews that focused on capturing students' and employer's perceptions of the teaching-learning environments of economic subjects. The questionnaires and further interviews had been taken between first-year students of Faculty of Informatics and Management whose had been attending courses Principles of Economic Theories and Principles of Microeconomics.

The sample of 320 students was selected in period 2008-2012 (average 80 students yearly) with average 95 % response rate (90% male, 10% female). It was an anonym paper survey which was further supplemented with face to face talking in groups or individually. Tab.1 shows basic findings from questionnaires.

Table 1. Basic findings from students' questionnaires

Number of students	320	%
Response rates		99
Admitted some basic economic knowledge from secondary school		72
General understanding of the meaning :		
- GDP		32
- Unemployment		49
- Inflation		82
Expectation about further job's condition:		
- High salary		100
- Benefits		96
Assumption about further job's requirements related with knowledge of economics (KoE):		
- IT developer or own business without KoE		72
- IT developer or own business with basic KoE		13
- Senior project manager with good KoE		6
- Own business with excellent KoE		9

### 3.1. Findings from student's questionnaires and further interviews

From the realized questionnaires was identified the interest of the students for high-paid job position and also that they have little economics, even if they have taken an economics course. Further interviews underscored, that they think that for their further professional activity it is enough to have only good software knowledge (the „encoding“ is usually their main interest sometimes even main relish). Only a few of them realized the necessity of good economic skills for better organization of their working activities and for finding the best problem's solution and communication with their clients. Most of them find out, that economics is a complicated subject, because for describing the reality of theoretical premises:

- uses many definitions and students have to memorize them
- uses to many quantitative methods and mathematics
- is completely different than information science

Some of them therefore expect such modern way of teaching and learning economics also due to the fact that various students from Informatics also want to be later an Erasmus student in abroad. By this way they want to have a possibility to move more rapidly, to adapt in this environment (on-line study, discussion during the evenings with other participants of the courses, etc.).

### 3.2. Findings about IT employer's expectations related with economic knowledge

Findings about employer's perceptions of the teaching-learning environments of economic subjects reflect the demand side of the labour market, where students of study –program Informatics would like to employ. According to the managerial view, the qualified human capital is a business resource or asset which forms part of the market value of the company (Kucharčíková, 2011). IT employer's expectations and requirements related to their employee's skills and knowledge usually is very high and complex.

Data about this item were collected by further ways:

- Analyses of IT job requirements on the web site [www.profesia.sk](http://www.profesia.sk), which is the leader in the Slovak internet job market
- Workshops made by representatives of potential IT employers
- Feedback to graduate students Faculty of Management and Informatics.

Table 2. Basic findings about IT employer's expectations

Expectations
General economic knowledge and understanding about
- Macroeconomic indicators
- Costs and Benefits
- Production possibilities
- Accounting and controlling
Economic knowledge for decision-making at managing project
- Team cooperation in major projects across entire company
- Team cooperation of fellows on projects
Customer focused knowledge in the context of projects
- Flexibility and willingness learn new skills
Presentation skills
- Strong oral and written communication skills
- Multimedia usage skills

Analysis of the data indicated a significant difference between student's and employer's view about qualification requirements. Firms require a considerable amount of conceptual economic thinking and their practice as it shows the present table 2. Economic literacy with "human potential, intellect, competence skills and experiences can achieve the increase in quality of appearances and the elements of IT firms. (Blašková, 2009)

#### 4. Findings

Findings of a survey confirm the requirement for transformation as well as teaching and learning methods as the graduates needed in the future may not be the same as what they have at present. By then, graduate with reasonable economic and entrepreneurship skills is essential and would become the key factor to the firm's productivity in the future. From the mentioned detections we can make partial conclusions and deduce that economic education for study program Informatics must demonstrate that their students attain the following outcomes:

- an ability to apply knowledge of economic thinking and economic terms knowledge of contemporary issues,
- an ability to design and conduct experiments, as well as to analyse and interpret economic data,
- an ability to identify, formulate, and solve problems,
- an ability to design a system, component, or process to meet desired the client needs,
- an ability to manage projects and multidisciplinary teams,
- an ability to identify, formulate, and solve problems,
- an ability to communicate effectively as well in working teams as with the client ,

- and understanding the broad education necessary to understand the impact of engineering solutions in a global, economic, environmental, and societal context,
- an ability to use the techniques, skills, and modern informatics and economic tools necessary for their practice.

## 5. Discussion

Economic literacy means, that students are able to apply basic concepts years later in situations relevant to their professional and personal life. Economical education at universities should improve students' performance even they aren't supporters of economic theories and practice. Focus that, it is important to know the principles of economics because it helps to understand that only those who can safely harness not only the potential of information knowledge but also economic knowledge will be at a substantial advantage for future employment. It is important to give them the opportunity, if they are so-inclined, to take courses that will help them to acquire and develop entrepreneurial skills that will allow them to be more professional and even make serious money. The discussion indicates that university economic course for students of Informatics have to:

- clearly states the objectives of the economic course for Informatics and its relation for their further career,
- teach the course by making use of various activities and make use of also computers when it's needed,
- do a quality lesson presentation by giving practical examples that appropriate with the subject,
- explain complex and hard-to-understand economic concepts in a different way, use algorithm which is a frequently used way for student of Informatics how to understand logical interfaces,
- answer students' questions in the instructional process and bidding them to find problem solution either alone or to use teamwork,
- use new teaching methods and innovations in line with the objectives of the course.

### 5.1 Suggested teaching methods and innovations for university economic courses for students of Informatics

"Teaching innovations are defined as small changes in pedagogy that enable students to more quickly convert time to knowledge,, (Allgood, 2001). Some new teaching methods might increase the speed with which students begin to understand difficult economic concepts and also might have to effect of increasing student interest and motivation. Between suggested methods and techniques how to teach economy for students of Informatics we can involve:

- *Interactive lecturing* – a lecture format accompanied by visual aids, using of slide shows, demonstrations and role-playing , using techniques with effective response to questions. Interactive lectures are classes in which the teacher breaks the lecture at least once per class to have students participate in an activity that lets them work directly with the course material. It is important to develop a student's expectation that speaking in class is required.
- *Usage of algorithm blocks and schemas* - because they are a frequently used element in teaching informatics which means, that their usage in teaching economics might easier improve student understanding of economics course material and develop critical thinking skills. An emerging viewpoint in higher education emphasizes that a thorough understanding of today's real life problems requires interdisciplinary reflection. Interdisciplinary instruction entails the use and integration of methods and analytical frameworks from more than one academic discipline to examine a theme, issue, question or topic.

- Problem solution *by simulation and games or real life scenario*– allow to have some experience which is dealing with economic shifts and trends before student get out the university and can prepare a student how economic and issues can create in the frame of their real professional life.
- Small group *discussion* – this method not only engages students with economics content but can help to improve their oral communication skills. During the discussion participants are responsible for the quality of responses to posed questions. The most suggested forms of course discussion is a structured discussion described in detail by Salemi and Hansen (2005). This teaching method also gives for a teacher a very prompt and supportive feedback from students.
- Daily life *case studies* with using real statistic economic data and even media to enhance teaching and learning – easily accessed statistical data demonstrates the connection between course theory and real data. Use of media to teach economics in an innovative way might engage students, aid student retention of knowledge and can be a powerful learning experience.
- Creating a *course website* or *using a social network* - provide opportunities for easy and accurate communication outside of the course participants. Using computers and mobile technology to help teach economics is nowadays a basic tool in the economics instructor's toolkit. With new technology we use new tools to satisfy ancient needs and learn to use them with our limited cognitive capabilities. (Tokarčíková, 2011). Putting the syllabus, daily announcements and assignments online might improve active learning. References and links to related online courses and quizzes in different universities or links to games and economic simulations can make more productive the teaching process.

Certainly the discussion of this items must be concluded by opinion of students of related study –program.

## 6. Conclusion

The primary reason many student's entire university is to get a job with a desired set of characteristics. Even though they are students of study program Informatics, the understanding economics prepare them to be sounder and more active participation in the labour market and even in economy. This article defines the aspects why and how to teach subjects of Economics for students of study program Informatics. The possession of interdisciplinary knowledge is perceived differently by students and their further employers.

This phenomenon considers the universities, as the providers of high qualitative education, as the key factor in this relation. By analysing of student's and IT employer's expectations in present the existing problems might be solved with reform of teaching methods and techniques used in frame of university economics courses. Teaching innovation can increase the rate at which student converts time spent on the course into knowledge. The teaching innovations can make students more efficient learners. Practice ensures the link between theoretical knowledge and practical activities that provide students the opportunity to grow through experience and became more professional and educated. However, businesses need not only educated, but also creative, innovative, proactive and flexible employees. If employees do not meet these criteria, are in an era of globalization and high competition for business rather risk factor. (Klučka, 2011) No matter of professional orientation, economic education helps to equip everybody with useful tools for making decisions and to be ready to face more complex choices in further professional and also personal life.

## Abstract

This research project focuses on the curricula developed in a day care centre and in a kindergarten attended by children under institutional care. The aim of this study has been to analyse the existing contextual dimensions, namely at the level of the educational offer, group climate, room for initiative, organisation and the adult style (in three dimensions: stimulation, autonomy and sensitivity), keeping in mind the perspective of the children involved in the study. Based on the assessment of their competences, needs and interests, several initiatives and courses of action were planned and implemented in order to meet the identified needs and the established objectives. The data indicate the need for investment in the dimensions of the adult style, namely, at the level of sensitivity, stimulation and promotion of the children's autonomy, especially in what concerns the day care context.

*Keywords:* children's emotional needs; institutional care; experiential approach; early childhood education.

---

## 1. Introduction

Nowadays, there is a growing concern around the assessment and development of curricula in early childhood education settings. This research aims to acknowledge the role played by contextual dimensions existing in a day care centre and a in kindergarten, at the level of promotion of the emotional well being (EWB) and involvement (I) of children who attend these settings and live under institutional care (they've been separated from their families, because of neglect or abuse). Through direct observation and engagement, the skills, interests and needs of the children involved were assessed, thus establishing a foundation for the development of a set of initiatives intended to meet the needs that were identified.

In order to enable the development of practices that meet the needs and interests of children by focusing on their respective experiences, the analysis of contextual dimensions was based on the Self-Evaluation Instrument for Care Settings (SICS) (Laevers *et al*, 2005) and the Children Monitoring System (CMS) (Portugal & Laevers, 2010).

## 2. SICS and CMS in the analysis of the emotional well being (EWB) and involvement (I) of the child

The maximisation of resources to promote quality in day care centre and in kindergarten entails the systematic assessment of the educational context in its different dimensions. With this in mind, one can identify the strengths and weaknesses of the context and outline intervention strategies that offer the children support that is aligned with their needs. Therefore, the use of SICS and CMS is highlighted as a resource for improving quality in early childhood education.

SICS provides a supporting framework for the introduction of fundamental changes in educational practices at the level of day care centre, and organises the action of the educator into three phases: (1) observation and evaluation of EWB and I of the children attending the setting, (2) reflective analysis of contextual dimensions that enhance the quality of the context - educational offer, group climate, room for initiative/promoting autonomy, organisation and adult style, and (3) improvement of the educational action, via the design of an intervention plan, with the respective assessment. The educator is encouraged to assess his/her own action from the perspective of the child, thus establishing the conditions for the respective social-emotional and cognitive development (Laevers *et al*, 2005).

The CMS assesses and monitors the quality of the kindergarten setting and structures the development of the educator's action through three phases: (1) observation, either global and individualised assessment of the group of children (Forms 1g and 1i), keeping in mind the global level of EWB, I and overall development, on a 5-level scale, (2) individualised group and context analysis and reflection (Forms 2g and 2i), (3) definition of objectives and initiatives - for the group/educational setting - as well as individualised initiatives (Forms 3g and 3i, respectively). CMS allows the educator to identify the children who are under emotional distress, using a continuous cycle of observation, assessment, reflection and action on EWB and I, in addition to using indicators pertaining to children's learning and development (Portugal & Laevers, 2010).

The results of the assessment of children's EWB and I levels supply the educator with *materials* that allow for the assessment of their own actions. EWB, perceived as a foundational dimension for development and learning - i.e., the EWB underlying emotional release processes is essential to enable the child to become involved in tasks that result in learning at a deep level (ibidem) - has to do with *a particular state of being*, feeling good or bad, happy or sad, being happy or sad (ibidem). A child who experiences it radiates vitality, tranquillity, relaxation, self-confidence and is prone to learn at a deep level. EWB can be assessed in a five levels ranging, from 1, the lowest level, where the signs that the child is at risk of developing emotional distress or is already under emotional distress are clear, to level 5, the highest, where it is clear that the child is released, at ease with herself and the surrounding world.

Involvement, taken into account as the result of the quality of the educator's action (ibidem), is also an essential dimension for the child's development and learning process, as it provides the adult with information concerning the effectiveness of their efforts in creating a stimulating and interesting environment, "showing the child the means to do better" (p.27). Involvement refers to the child's strong motivation to carry out an activity, her intense mental activity, interest, persistence, precision, high level of concentration, openness to stimuli, the intense flow of energy and full satisfaction, complexity and creativity, fascination and natural involvement in activities (ibidem). If the child is engaged in a task, he/she is focused, keeping his/her attention on the activity, showing signs of being mentally active, mobilising skills towards the completion of the activity; therefore, one witnesses learning, construction of knowledge and knowing. Involvement is shown through a continuum that can be structured into five levels, from level 1 - very low - corresponding to the absence of activity (no involvement); until level 5 - very high - according into intense and continued activity (high involvement).

### 3. The contextual dimensions in early childhood education

Throughout the analysis of EWB and I, the educator will be able to assess his/her practice, seeking an explanation for low scores (and also high scores) within five curricular components that, according to Portugal and Laevers (2010), are essential to achieve educational quality:

#### 3.1. Educational offer

To what extent is the educational context rich and appealing, providing a diversity of materials? To what extent is the offer important and relevant for the learning and development processes of the child who is experiencing it? The educator must try to enrich the surrounding environment/space in order to make it more appealing, rich and with the possibility to allow for exploration and experiencing various learning opportunities (through the construction of materials, the diversity of games, food preparation...). Therefore, it is important for the children to be able to find in the classroom situations where he/she can actively participate, involving materials and dynamics that meet their needs, namely intense stimuli and activities that entail the several developmental domains (ibidem). It is essential that the interior space is ample, airy, well lit, warm and calm in addition to allowing for the movement of both children and adults. The areas must be enriched with soft and comfortable materials, which can be used during the day so as to enable their independent use by children, without interference occurring throughout the several possibilities of the experience. It is also essential that the exterior space is organised in order to allow for the development of activities that do not interfere with one another, enabling the children to have access to a variety of surfaces and experiences.

#### 3.2. Group climate

The reflection on the group climate gives the adult the opportunity to focus on the relational dimensions existing in the context and on the way they approach the child and offer her/him positive stimuli. Is it relevant to help the children to interact with the group (to talk about conflicts, understanding both their feelings and the feelings of others), to provide them with opportunities for feeling at ease in the group and in the context? Is there a positive interaction occurring within the children? Does the relationship of the adults with the children entail pleasant interactions? It is important to understand the quality of the relationships taking place in the context (between the children and with the adults); to cooperate and collaborate with each other, aiming to build a sense of belonging to the group. In addition to what was mentioned above, it is important to assess if the adult establishes adequate physical contact, if they show respect and empathy towards the children; it is important to observe if the adults reflect on the quality of the relationships they create with the children, if they develop the ability to assess the interactions they are involved in, if they improve the quality of their interventions, in other words, if they carry out the subsequent analysis of the quality of the interpersonal relationships they are involved in and of their experiential dialogue competencies (ibidem).

#### 3.3. Room for initiative/autonomy

How much initiative and autonomy is the child allowed and encouraged to have in the context? The child is the author of her own development; she will know better than anyone else how to find situations that are at the threshold of their *proximal development*. With this in mind it is essential to make room for the child to decide what he/she wants to do, how he/she wants to do it and whom he/she wants to do it with; to listen to his/her opinion with regards to the range of activities offered and to the lessons planning process. It is also essential to observe the degree in which the children take on responsibilities, the way problems are solved and rules are explained. Free initiative provides the child with room to create his/her own developmental path, leading to

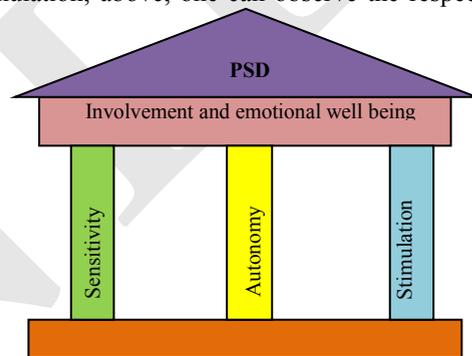

exploration and autonomy while enabling higher levels of involvement (ibidem). Initiative can be offered to the child in the act of freely playing/developing an activity. While playing, children engage and explore their potentialities (solve problems, make new discoveries, express themselves, use information and knowledge...), experiment, experience diverse learning situations and may also experiment freely, without fearing to make mistakes. Autonomy can be worked out by providing individual and shared experiences, opportunities in the discussion and resolution of conflicts, opportunities for individual expression (involving the child in debate, in storytelling activities, group conflicts...), making decisions and taking responsibility. The adults provide tools that are adapted to the age of the child in order to maximise his/her autonomy and give him/her a sense of responsibility in the performance of daily tasks (washing themselves, getting dressed, going to the bathroom...).

### 3.4. Organisation

Is the daily routine organised to meet the children's needs? Do adults communicate with each other, divide tasks and encourage the children to talk about events of the day or things that interest them? Are lesson plans and daily routines outside - eating, sleeping, playing - taken into account? Similarly, it is important to analyse the daily plan and routines and decide if these are sufficiently structured and yet still flexible, if variations to the program are introduced thus promoting autonomy and respecting the needs and interests of the children, with smooth transitions between events. Therefore, it is important to observe if one part of the day has free play and the other part of the day has a variety of indoor and outdoor activities that are monitored by the adult and initiated by the children (ibidem).

### 3.5. The adult style

Is the adult empathetic in their interaction with the children? Does he/she provide stimulating interactions? Does he/she promote and offer autonomy? Does he/she understand the needs and interests of the child and introduce elements in the activities to enhance involvement? Is the adult sensitive towards the children? Does the adult understand the children's feelings, ensures that their needs are met (for attention, affection, assertion...) and understand their emotions? The adult should sustain their practice upon three branches of experiential attitude: sensitivity, autonomy and stimulation; above, one can observe the respective organisation in the *scheme of the temple*.

EXPERIENTIAL ATTITUDE

Figure1. The Scheme of the Temple (Portugal & Laevers, 2010)

At the basis, the educator's experiential attitude is operationalized into: (1) *Sensitivity or experiential dialogue*, meaning the true and profound relationship the educator establishes with the children, meeting their emotional needs, for safety, for affection; in this sense, the educator must make sure the child feels understood, listened to and accepted; (2) *Autonomy*, corresponding to the way the educators stimulate the child's autonomy, how they allow the child's decision making process, with regards to choosing an activity, the process of monitoring the activity, the participation in setting the rules, boundaries and agreements; (3) *Stimulation*, concerning the way the educator stimulates the child by enriching the environment with new and diversified materials, activities and opportunities, taking into account the children's real interests and needs; in other words, the way the educator is (or is not) "a fertilizer of the educational ground" (ibidem). In the *crossbeam* of the temple, we have the processes of emotional release, operationalized by the EWB, and the developmental processes, translated into Involvement. Lastly, in the *pediment*, the purpose of the educational action, the personal and social development (PSD) or the child's emancipation (ibidem).

The line of thought of the experiential approach stresses the need for the educator to active listen the child, and aims to maintain an attentive attitude to the child's experiences, to the expression of their inner experience.

#### **4. Action plans for improving quality: day care centre and kindergarten**

In both contexts, we could register that the lessons plans and activities are designed based on the recognition of what the children already master, offering them *meaningful activities* (Dewey, 1971; Freinet, 1973) that constitute a real challenge to their abilities (Vigostky, 1991, 2007). At the day care, sometimes the educator showed a tendency to anticipate the child. Based on these assertions, some *action points* were formulated to be used in both settings (day care and kindergarten). These are summarised in Tables 1 and 2.

Action points. We want to...	Concrete actions to be developed
Improving game playing in the play room so that the context is more inviting and stimulating for the child	<ul style="list-style-type: none"> <li>- Creating the emotions corner (with images);</li> <li>- Introducing diversified materials: sound materials; sand box; a box full of feelings (Depondt, Kog &amp; Moons, 2004); games, puzzles, building blocks...</li> </ul>
Allowing the child more freedom/initiative and opportunities to choose	<ul style="list-style-type: none"> <li>- Diversifying and display the materials in a way that allows the children to choose, touch and explore them, i.e. books, games and building games;</li> <li>- Exhibiting the children's works on the walls.</li> </ul>
Improving the group environment so that the child can <i>feel at home</i>	<ul style="list-style-type: none"> <li>- Exhibiting the children's works;</li> <li>- Working with materials that showcase cultural diversity, for example through the use of coloured-skin dolls, images of various cultures and which show different kinds of families;</li> <li>- Working with activities and materials that allow for the exploration of emotions and feelings;</li> <li>- Using and work the emotions box.</li> </ul>
Organising the day in a more efficient way	<ul style="list-style-type: none"> <li>- Creating a board to register the children's opinion with regards to different activities and in which they can express their opinion through sad and happy smiley faces.</li> </ul>
Improving the style of the adult (sensitivity, stimulation and autonomy), with more stimulating interventions (enriching the children's game playing and creating opportunities to develop the game), a greater sense of sensitivity (more individualised and empathic attention) and promotion of autonomy (the children can choose activities and spaces that appeal to them, and their choice is respected).	<ul style="list-style-type: none"> <li>- Spending time with the child individually, telling him/her stories about emotions and exploring them;</li> <li>- Enriching the children's game playing, providing them with different sorts of materials so that they can have a greater opportunity to choose and to show initiative, for example books, puppets and images (showcasing emotions and feelings);</li> <li>- Spending time with the child in small groups, letting him/her draw in the researcher's notebook (the child evidenced to like very much to do this), enriching it with images;</li> <li>- The adult intervenes in the child's activities more closely and with increased dialogue, namely when playing is taking place, aiming to extend the children's activity;</li> <li>- The assistants play more with the children, offering them more love, affection and attention;</li> <li>- Letting the children choose activities and spaces that are appealing to them and respecting their choice.</li> </ul>

Table 1. Declaration of intent for quality improvement (Action Plan for day care)

In order to meet the needs of children in day care centre, some interventions to promote the children's self-awareness and self-esteem were designed, namely the work around emotions as "many children do not have opportunities to explore and express their emotions, not knowing what is going on with them" (Portugal & Laevers, 2010, p.122). Thus, various activities have been developed, such as the use of the *box full of feelings* (Depondt, Kog & Moons, 2004), listening/telling stories, drawing and painting. The researcher provided the children with various materials (images, masks, puppets, stories...), activities in which they found that the children were involved and stimulated, increasing their levels of EWB and I. Sometimes, they themselves took the initiative to ask to play, for example, with the *box full of feelings*.

Unlike what had been planned in the beginning, it was not possible to create a new activity area in the classroom and some materials could not be introduced, as is the case of sound materials, sandbox, puzzles, and building blocks. The researcher gave the children the opportunity to choose from a wider range of books which they could use, play with and explore. The children explored them with clear satisfaction, often taking the initiative to look for them and ask to use them, if they weren't available at a given moment.

With regards to the children's drawings and paintings, these could not be displayed on the walls because it was said they could damage the walls; they continued to be put away in the children's folders and were not displayed. It is, indeed, urgent to create strategies for improvement at this level. In addition to what was mentioned previously, the *child's opinion board* was created to register his/her point of view, his/her opinion and perspective (Laevers, 2008) regarding the educational offer. In this sense, the children identified the activities, and expressed their opinion: C1, throughout the first observation moment says "I don't like to play in the toy house!" but immediately afterward, he said "I like the machine and the bag!"; C1 and C2 highlight the fact that there are no books in the classroom "I like books, but there aren't any in the classroom!"

The importance of the adult's affective and warm contact was also stressed. The educator left the room a couple of times during the time of free game playing. The researcher proposed the educator a greater closeness and dialog with the children throughout these moments. Thus, the educator and the researcher were present during the children's play and activities, providing them with more individualised, warm, welcoming and stimulating attention (throughout playing and monitored activities...). According to Benjamin (1984, cited by Zortéa, 2008), while playing, children recreate and rethink the events that gave rise to it (the free play), through imitation, stories, scenes...

The *researcher notebook* is an instrument in which field notes, critical incidents, relevant considerations, successes and failures of the intervention and research are registered (Zabalza, 1994). It was found that children showed a strong desire and interest in the researcher's notebook (enriched with images of emotions), often asking to make drawings, view pictures and explore. Thus, the researcher put it at children's disposal, so they could handle and explore it.

At the level of kindergarten, action points were also outlined. These are summarised in the following table.

Table 2. Action plan for the kindergarten – goals and initiatives for the group/context

Specific aspects of change	Initiatives or actions to be developed
<b>Educational offer</b>	
<ul style="list-style-type: none"> <li>- Creating the feelings/emotions area;</li> <li>- Renovating the space dedicated to games and the kitchen;</li> <li>- Developing a number of scientific activities;</li> <li>- Enriching the outdoor space, creating more opportunities for broader movements and the release of energy as well as the carrying out of activities.</li> </ul>	<ul style="list-style-type: none"> <li>- Providing masks that are allusive to the different ways of feeling, i.e. of different feelings (such as fearful, angry, sad and happy). Children may paint/decorate the masks and can also create stories, develop role-playing activities and look at themselves in the mirror with the masks;</li> <li>- Developing materials for the construction of emotions masks;</li> <li>- Adding a greater diversity of games. Improving the existing ones and reorganising the space, making it more functional;</li> <li>- Adding materials to the kitchen area;</li> <li>- Carrying out the preparation of food in the context: cakes...;</li> <li>- Bringing ropes, cloths, springs, tables, chairs and materials outside that can be used for building projects, in order to provide children with different activities.</li> </ul>
<b>Group climate</b>	
<ul style="list-style-type: none"> <li>- Ensuring a positive group environment where</li> </ul>	<ul style="list-style-type: none"> <li>- Providing materials and activities that enable children to work around</li> </ul>

<p>children feel safe and cherished;</p> <ul style="list-style-type: none"> <li>- Creating a cosy and safe space;</li> <li>- Strengthening, listening and promoting mutual support relationships among children;</li> <li>- Promoting the knowledge of the other, respect, and cooperation among children and between children and adults.</li> </ul>	<p>emotions;</p> <ul style="list-style-type: none"> <li>- Taking advantage of the children's personal and family experiences to work aspects such as feelings and emotions that are related to certain situations;</li> <li>- Exploring the emotions box, offering the child various experiences in order to boost her ability to listen to others, tolerance and provide opportunities for each child to be able to express their own feelings and emotions, talk about them, their concerns and situations which they have experienced or lived;</li> <li>- Developing activities where children can express feelings or attitudes through body/voice;</li> <li>- Talking to the children about the activities that were developed, and asking them whether they liked or disliked them. This way the children can express their opinions, feel that they are listened;</li> <li>- Observing and listening to the messages of the children, their opinions and also their tastes;</li> <li>- Registering small sentences uttered by the children on every feeling/emotion and talking about the registers that were done (sentences or drawings made by children);</li> <li>- Talking to the children about situations of aggressiveness that sometimes occur between them and other children;</li> <li>- Helping children solve minor conflicts with each other through various instruments and materials;</li> <li>- Organising workgroups where responsibilities are shared.</li> </ul>
<p><b>Room for initiative/autonomy</b></p>	
<ul style="list-style-type: none"> <li>- Encouraging the decision making process and the assumption of responsibility by children;</li> <li>- Increasing the children's levels of collaboration as well as interesting and engaged participation in different activities existing in the room;</li> <li>- Encouraging creative individual expression;</li> <li>- Encouraging the decision making process and the assumption of responsibility by children;</li> <li>- Promoting a sense of confidence and high self-esteem, based on activities where children feel capable and responsible.</li> </ul>	<ul style="list-style-type: none"> <li>- Gradually boosting the children's sense of initiative throughout various moments and activities;</li> <li>- Allowing the children to decide what they will do, how they will do it and decide when a task is finished;</li> <li>- Empowering the children for their choices and behaviours;</li> <li>- Allowing children to discuss, create and adjust the existing rules in the classroom;</li> <li>- Giving the child room and time to perform the activity her own way, with different types of materials chosen by them and promote individual expression, autonomy, and an increasingly greater know-how;</li> <li>- Promoting moments of discussion and sharing of ideas in small or large group, encouraging the children to express themselves and utter their opinion.</li> </ul>
<p><b>Organisation</b></p>	
<ul style="list-style-type: none"> <li>- Ensuring the flexibility of the rules;</li> <li>- Providing more time to play outdoors;</li> </ul>	<p>Developing or giving greater visibility to the existing classroom rules, regarding the storage of materials, the behaviour that is allowed and not allowed (agree on the rules with children);</p>

<ul style="list-style-type: none"> <li>- Ensuring flexibility in the rules, when necessary;</li> <li>- Discussing and establishing agreements with the children, listening to them (not seeking to enforce our point of view);</li> <li>- Integrating the community's educational potentialities in the group's curricular project.</li> </ul>	<ul style="list-style-type: none"> <li>- Creating an <i>opinion board</i> for the children about the educational offer and hear their views;</li> <li>- Whenever possible, taking the children for outdoor activities, allowing him/her to be in touch with nature.</li> </ul>
<b>Style of the adult</b>	
<ul style="list-style-type: none"> <li>- Exercising self-assessment of both the educator and the researcher, without fearing the weaknesses one can find;</li> <li>- Being aware of the children's positive behaviours and value them, strengthening those moments;</li> <li>- Moderating the tendency to quickly intervene and solve conflicts between children;</li> <li>- Trying to see reality through the eyes of the child;</li> <li>- Supporting children in their social contacts, acting as a role model.</li> </ul>	<ul style="list-style-type: none"> <li>- Providing support and positive attention whenever necessary;</li> <li>- Paying attention to the impact that children's interventions have in terms of involvement and emotional well being;</li> <li>- Thinking before acting;</li> <li>- Observing and listen to children throughout their game playing to better know and appreciate them;</li> <li>- Developing a more targeted and individualised work (providing further monitoring) with children who have more difficulties so that, little by little, they feel safer and more autonomous.</li> </ul>
<b>Other aspects</b>	
<ul style="list-style-type: none"> <li>- Putting the children in touch with some activities within the scope of literacy;</li> <li>- Telling stories about diversity and emotional education;</li> <li>- Developing exterior outings, providing the children with a greater knowledge of the world and knowledge of the surrounding environment.</li> </ul>	<ul style="list-style-type: none"> <li>- Telling stories about diversity and emotional education, using various materials;</li> <li>- Putting the children in touch with some activities in the scope of literacy, namely through: association of image to a word, interpreting poems, learning some letters of the alphabet, getting in touch with and exploring some tongue twisters, creating stories, riddles, building rhymes, playing with words and looking for/search for letters and familiar words in newspapers, magazines, flyers, among others;</li> <li>- Promoting situations of discovery of atmospheric features, related to the different seasons.</li> </ul>

At the level of the kindergarten, several actions and strategies were developed, keeping the children's internal experience and lived experiences in mind. In this sense, the researcher developed a set of strategies and activities that are mentioned below.

The *box full of feelings* was part of the everyday activities available in the contexts, allowing for several learning processes and experiences to take place so as to boost the sense of listening to others, tolerance, providing opportunities for each child to say the names that are given to feelings and emotions, talk about themselves, talk about their concerns and situations which they lived. The children showed high interest and a liking for the box full of feelings: used the images, put on the masks walking through the different areas of activity, playing with finger puppets.

The researcher (in collaboration with the educator and the assistants) provided the children with several materials and activities:

- Images and tables about *How I am feeling today* in the researcher's notebook, so that the child could say how she felt on a specific day or at a specific moment; The children asked to draw and see the notebook; they also looked for the tables to fill them out;
- Acknowledging the children were very interested in the box full of feelings, the educator was proposed to create an *emotions area* where the children were able to paint/decorate masks about feelings (fearful, angry, sad, happy); this area was enriched with the masks and a mirror, giving the children the opportunity *to give wings to their imagination* (they saw themselves in the mirror, did role-play, came up with new stories...); indeed, the creation of an emotions area was very important for the children, as they had the opportunity to explore and deal with their emotions by experiencing activities that they had the opportunity to choose;
- The children were provided with different stories on the theme of emotions, so that they could explore them; during free play, they frequently asked to play with the stories: "Exploring the stories allows for the expression of feelings and evokes the recognition of feelings that are common to many children" (Portugal & Laevers, 2010, p.122);
- An opinion board for the children on the theme of educational offer was created to hear and register their point of view; according to Laevers (2008), in the scope of experiential approach it is essential to try and see the *reality* of everyday practice from the children's point of view; on this board, the children could put smiley faces, according to Brooker (in Oliveira-Formosinho, 2008), seen as pivotal to let the child show that she like or dislike certain situations or activities, as is the case of the child C3, who showed her dislike for the activity "physical education class" – "I don't like balls when they go up and down!". C3 and C4, during an initial register, show their dislike for the storytelling activity – "I don't like to listen to stories";
- The children could express through drawings and their point of view what each emotion/feeling meant for them;
- The drawings and the children's opinions were displayed in the activity room;
- The researcher offered each child an *emotions cube* (to take home); the children sat on the floor playing with the cube and role-playing what they saw in the pictures (each side of the cube showed the expression of a feeling);
- The children's works were displayed in the classroom, allowing the child to feel valued and giving them the opportunity to show the result of their work; often the children called the researcher to see their work and asked - "is it nice, Sofia?";
- The children had the opportunity to prepare food. C3 and C4 showed their interest in doing this kind of activities – C3 says "I like to mix everything and put it in the oven"; C4 says "I like to bake and eat the cake!";

- The outdoor space is an extension of the indoor environment (Post & Hohmann, 2003); With this in mind, in this specific context, the outdoor space was enriched with materials; the educator gave the children the opportunity to carry out certain outdoor activities, taking the table, chairs, cloths, springs, ropes, ... placing them in a way that facilitated the creation of small groups and gave the children the opportunity to spend time in a different space; whenever possible, the adult allowed the children to perform outdoor activities and be in touch with nature (i.e. library, the dinosaur museum, ...);
- The researcher was always present throughout the children's activities, establishing a warm and affectionate contact which, according to Rygaard (2006), helps the child to establish an affective state of being. In addition to this, the adult observed and listened to the children, allowing them to express their opinion and to feel that they were listened.

## 5. Conclusion

The use of this analysis and assessment tools allows the educator, alongside with the assessment and monitoring of the quality of the educational intervention, to define the children who are under emotional distress and in need of a more differentiated educational intervention: a practice that is sustained by sensitivity, autonomy and stimulation. In an analysis focused on processes of creating shared learning experiences, where the voices of children and their look provide different courses of action and where the concerns of adults unite in order to meet their respective needs and interests. It is urgent to support educators in looking for and applying other kinds of knowledge and alternatives, in a participatory, democratic and transparent process.

### Abstract

This study is conducted to evaluate the nutritional status of 10-14 years old adolescents determined by Mediterranean Diet Quality Index (KIDMED). 229 male adolescents who go to football school participated in the study. Participants' nutritional status was determined through a 16-item KIDMED Index. The mean age was  $12.15 \pm 1.08$  year, weight was  $39.16 \pm 6.30$  kg, height was  $143.07 \pm 8.62$  cm. Results indicated that 10.5% of the participants had a low quality diet ( $\leq 3$  points), 64.2% had a mid-quality/needs-improvement diet (4-7 points) and 25.3% had an optimal quality diet ( $\geq 8$  points). KIDMED Index is a suitable index for assessing Mediterranean and Healthy Diet. Healthy diet is very important for adolescent who play sports. Adolescents diet quality should be increased with healthy nutrition education.

Keywords: Kidmed index, adolescent, nutritional status

## 1. INTRODUCTION

Individuals that do sports during their adolescence need a balanced diet in order to grow, develop and to optimize their sporting performance and to protect their health. An adequate and a balanced diet will enable them to implement healthy eating habits during their adulthood and reduce risk of many diseases when accompanied by physical activity (Meyer, O'Connor, and Shirreffs, 2000).

There are many methods available for the evaluation of individuals nutritional status. One of these is the Mediterranean Diet Quality Index (KIDMED) (Koksal, Tek, and Pekcan, 2008a). It is thought that the Mediterranean diet is one of the healthiest diet models (Mariscal-Arcas et al., 2009). Although there are regional variances, the Mediterranean diet consists in the main of vegetative nutrition (fruits, vegetables, cereals, beans, nuts and seeds), mid-level dairy products, mid-level fish and poultry, a small amount of red meat and olive oil forms the main source of oil in the diet (Schröder, Mendez, Ribas-Barba, Covas, and Serra-Majem, 2010; Costarelli, Koretsi, and Georgitsogianni, 2012).

This study was carried out in order to assess the nutritional status of 10-14 year old age group individuals that are attending football training schools by means of KIDMED which is a rapid, easy and applicable tool.

## 2. MATERIAL AND METHODS

### 2.1. Participant

The study was based on 229 boys in the 10-14 year old age group (age average =  $12,15 \pm 1,08$  years) that are attending football schools at Antalya Turkey between the dates of March-April 2013. Before starting the study, the required permission was obtained from the boys schools and their parents and only volunteers were employed in the study.

### 2.2. Instruments

Body weight was recorded to the nearest 100 g with the use of a digital scale (Tanita TBF 300) and with subjects standing without shoes in light clothing. The height was recorded with heels together, without shoes and body in an upright vertical position with a deep inspiration and was recorded in cms. Body mass index was calculated by dividing weight (kg) by standing height squared ( $m^2$ ). The thinness, obesity status was evaluated according to 5-19 age group WHO-2007 reference values by using the "WHO Anthroplus" program (WHO, 2007).

KIDMED was created to estimate adherence to the Mediterranean diet in children and young adults, based on the principles that sustain Mediterranean dietary patterns and those that undermine it (Serra-Majem, Ribas, Garcia, Perez-Rodrigo, and Aranceta, 2003; Serra-Majem et al., 2004). KIDMED index consists of 16 questions. Items denoting lower adherence were assigned a value of -1 (4 items), and those related to higher adherence +1 (12 items). Scores range from 0 to 12. Higher scores indicate higher adherence to the Mediterranean diet (Schröder, Mendez, Ribas-Barba, Covas, and Serra-Majem, 2010). The questionnaire is shown in Table 1 (Serra-Majem, Ribas, Garcia, Perez-Rodrigo, and Aranceta, 2003).

Table 1: KIDMED test to assess the Mediterranean Diet

<b>KIDMED test Scoring</b>	
Takes a fruit or fruit juice every day	+1
Has a second fruit every day	+1
Has fresh or cooked vegetables regularly once a day	+1
Has fresh or cooked vegetables more than once a day	+1
Consumes fish regularly (at least 2–3/week)	+1
Goes >1/ week to a fast food restaurant (hamburger)	- 1
Likes pulses and eats them >1/week	+1
Consumes pasta or rice almost every day (5 or more per week)	+1
Has cereals or grains (bread, etc.) for breakfast	+1
Consumes nuts regularly (at least 2–3/week)	+1
Uses olive oil at home	+1
Skips breakfast	-1
Has a dairy product for breakfast (yoghurt, milk, etc.)	+1
Has commercially baked goods or pastries for breakfast	-1
Takes two yoghurts and/or some cheese (40 g) daily	+1
Takes sweets and candy several times every day	-1

KIDMED Index: poor  $\leq 3$ ; medium 4–7; high  $\geq 8$ .

In addition to the KIDMED index the parents educational status, meal skipping habits and their reasons were queried.

### 2.3. Data Analysis

The questionnaire responses were analysed using SPSS version 18.0 (SPSS Chicago, IL, USA). Continuous variables are presented as mean  $\pm$  SD, whereas categorical variables are presented as absolute and relative frequencies. One way ANOVA Analysis were used to evaluate their KIDMED scores according to BMI and parents educational status.

### 3. RESULTS

The baseline characteristics of the boys are shown in table 2. 13.1% of the boys are underweight, 61.1% normal weight, 23,1% overweight and 2.6% were obese. 62.4% of the boys indicated they didnt skip meals. In the meal skipping class the most skipped meal is breakfast. Majority of the responses to meal skipping was “because I didn’t feel like it”. The meal skipping status and reasons are given in table 3.

Table 2: Age, anthropometric characteristics, KIDMED score and obesity classification

	Boys (n=229)
Age (years)	12,15±1,08
Weight (kg)	38,67 ±6,90
Height (m)	143,89 ±7,94
BMI (kg/m <sup>2</sup> )	18,56±2,04
KIDMED score	6,05±2,10
Obesity classification (%)	
Under weight	13,1
Normal weight	61,1
Overweight	23,1
Obese	2,6

Table 3: Nutrition habits of the boys

Meal skipping	n	%
Not skipped	143	62,4
Breakfast	38	16,6
Lunch	18	7,9
Breakfast-lunch	5	2,2
Dinner	-	-
Snack	25	10,9
Total	229	100,0

The reasons of skipping meal		
Not skipped	143	62,4
Weight loss	6	2,6
Lack of time	20	8,7
Not in the habit	20	8,7
Economic reasons	5	2,2
Because didn't feel like it	35	15,3
Total	229	100,0

While 64.2 % of the individuals had medium diet quality, 10.5 % had poor diet quality and 25.3 had high diet quality (table 4). Parents educational status and their KIDMED scores according to BMI was investigated and is given in table 5. There is no significant statistical difference between the parents educational status and their KIDMED scores and BMI ( $p>0,05$ ).

Table 4: Diet quality according to KIDMED index

	Boys (n=229)	
	n	%
Poor diet ( $\leq 3$ )	24	10,5
Medium diet (4-7 point-diet needs improvement)	147	64,2
High-optimal Mediterranean diet ( $\geq 8$ )	58	25,3
Total	229	100,0

Table 5: KIDMED score according to BMI and parents educational status

Mothers Educational Status	Mean $\pm$ SD	F	p
Illiterate	6,21 $\pm$ 1,8	1,66	0,15
Literate	5,63 $\pm$ 2,5		
Primary School	6,07 $\pm$ 1,8		
Jr High	5,40 $\pm$ 2,1		
High School	6,22 $\pm$ 2,0		
University Community College	6,63 $\pm$ 2,1		
Post Graduate	6,05 $\pm$ 2,1		
Fathers Educational Status			
Illiterate	6,00 $\pm$ 1,4		
Literate	5,36 $\pm$ 1,8

#### 4. DISCUSSION

In the study carried out with rapid, easy to use and applicable tool KIDMED, on the nutrition status of 10- 14 year age group boys in football schools in Antalya, Turkey, it was found 13.1% of the boys were underweight, 61.1 % normal weight, 23,1 % overweight and 2.6 % were obese. In the study carried out in a group of 785 adolescent boys from all over Turkey in the 11-14 age group that participated in the basketball selections, it was found 13.1 % were underweight, 37.6 % normal weight and 49.3 % were obese. But we were informed, it could be wrong to evaluate these adolescents who are active and have a high muscle mass, according to BMI as this could be misleading (4). In the study carried out at the province of Antalya central primary school during June 2008-December 2009 on, 6-15 age group of 5150 boys, it was found 16.8 % of the boys were slightly obese and 11.8 % were obese (Akdemir, Toktas, and Ozer, 2010).

When the KIDMED score was evaluated in accordance with the BMI, there was no statistically significant difference between them ( $p > 0, 05$ ). In another study on 1140 boys in the 9-13 age groups, it was found the correlation between adherences to the Mediterranean diet is inversely associated with obesity (Lazarou, Panagiotakos, and Matalas, 2010). In a similar study on 1125 children in the 10-12 age groups, it was also found inverse correlation between adherences to the Mediterranean diet existed (Antonogeorgos et al., 2012). In another on 84 primary school children in Turkey, it as the KIDMED diet quality index dropped the risk of obesity increased (Samur, Günebak Sahin, Donmez, and Besler, 2008). In contrast to the other studies, this study did not find a difference between the KIDMED points of underweight, normal, slightly obese and obese children. The fact that the subjects in this study were actively engaging sports may have influenced the results.

37.6 % of the adolescents skip a meal and the most frequently skipped meal is breakfast. The highest frequency response has been "I didn't feel like it". Many other studies in Turkey have come up with similar results (Akar Sahingöz and Sanlier, 2011; Akar Sahingöz, 2009; Unusan, Sanlier, and Danişık, 2006). During the adolescent period growth and development is continuing, and for adolescents engaged in sports nutrition has even more of an importance. This should be communicated to children and individuals.

While 64.2 % of the subject have medium diet quality, 10.5 % have poor diet quality and 25.3 % have high diet quality. In the study carried by Köksal et al, (2008) in Ankara province centre, on 624 volunteer and healthy children and adolescents between the ages of 7-18, (268 male, 356 female) it was found that in 15.1 % the KIDMED index was very low, in 59.3 % it was medium and in 25.6 % it was good. (Köksal, Tek and Pekcan, 2008a). In another carried by Köksal et al, (2008b) on 225 healthy volunteer adolescents in the 12-18 age group and it was found that the KIDMED index was very low n 21.3 %, in 61.8 % it required intervention and in 16.9 % the KIDMED index was optimal. In a study carried out in Ankara Turkey on 464 volunteer boys and 426 girls in the age group 10-14, totalling 890 children, it was found that 17.9 % had low, 59.2 % medium and 22.9 % good diet quality index (Akar Sahingöz and Sanlier, 2011). These results display a similarity to our study. In contrast to our study, in a study carried out in Turkey in 2008 by Samur et al. on 84, 5<sup>th</sup> grade primary school children in the 10-12 year age group (40 male, 44 female) it was found that 2.4 % had a very low diet quality, 21.4 % medium level and 76.2 % had an optimal diet quality. The sampling structure of this study differs from the other studies.

The KIDMED score was evaluated according to the educational level of the parents and a statistically significant difference was not found between the KIDMED score and educational level of the parents ( $p>0,05$ ). In a study on 1125 children in the 10-12 age group, it was found if one of the parents had a high level of education then the child's KIDMED score was higher (Antonogeorgos et al., 2012). In another study in Turkey it was found that a high level education of the mother resulted in a high KIDMED score for the child (Akar Sahingöz and Sanlier, 2011).

KIDMED index proves to be successful in Turkey. But when the nutritional status of adolescents who are actively engaged in sports is evaluated, the anthropometric and bio-chemical measurements must be made in parallel with the KIDMED index and the nutrition consumption must be recorded. Coaches and families must possess information on adequate and balanced nutrition of adolescents actively engaged in sports and the adolescents must be trained in the subject.

# Attention capture preferences in teachers and pupils: differences and similarities

Katarína Cabanová\*

---

*Comenius University in Bratislava, Faculty of Education, Račianska 59, 813 34 Bratislava, Slovak Republic*

---

## Abstract

Conceptualization of the term “attention” and understanding of underlying processes or states in psychological or lay terminology tends to be very diverse. This means that attention as a pre-condition for successful and effective learning could be differently perceived by teachers and differently by pupils. In the present paper we focus on differences in ways of capturing attention preferred by teachers and pupils.

*Keywords:* Attention; Pupil; Teacher; Learning, School; Teacher Competences

## 1. Introduction

When the well-known Russian psychologist Ushinsky (in Ukhtomsky, 1950, p. 58) defined attention as „the door to child's soul, and through this door everything that is in consciousness has to pass”, and warned that “not a word of instruction should miss this door because otherwise it does not reach the soul”, he had no idea how fitting these ideas would be in the 21<sup>st</sup> century (Cabanová, 2012).

The volume and quality of stimuli an individual must process has changed, and the natural adaptation ability of any person is exposed to increased pressures on daily basis. The “door to one's soul” is wide open and sometimes there is quite a draft. Individual psychoregulators - of different measure and strength in every individual – however allow us to cope with this pressure exerted by multiple stimuli. A specific position is occupied here by attention, a psychological quality that creates the foundation of many effective abilities of an individual. Attention on one hand reinforces (or thwarts, if insufficient) the natural adaptation ability. On the other hand, it is a prerequisite to effective and creative contribution to the surrounding world (Cabanová, 2010).

If we look at this problematic on the level of school, we discover that attention, its level, and identification of the level of attention by teachers is unfortunately not represented in literature. The importance of attention in the learning process is understood to be unarguable (Smetanová, D. 2012), however, in standard Slovak or Czech textbooks of pedagogy or didactics (see e.g. Kalhous, Z., Obst, O. et al., 2002, Průcha, J., 1997) we will not find a chapter or a separate part focused on the issue of pupil attention in school. There are no monographic texts focused specifically on this issue, with the exception of the publication by Lokšová and Lokša (2006) where attention is discussed in relation to motivation, relaxation and creativity of children in school.

## 2. On Attention

In the wide sense of the word attention concerns all mental activities, from noticing something all the way to concentrated observation of something. Objects, phenomena or activities on which we focus our attention have one thing in common: for a certain period of time they become center points of mental activity. This “central position” causes that objects, phenomena or activities on which attention is focused become more explicit or clear, and dominate over other currently ongoing mental, behavioral or real processes or events.

Attention could at least be understood in the twofold sense:

1. As a term that expresses and defines a certain current state of readiness of an organism toward a mental or behavioral act,
2. As a current level of “vigilance” or arousal of psychological or somatic activity.

The current level of attention acts as a selective factor that defines which present stimuli make their way into consciousness and trigger adequate reaction (Cabanová, 2010). This has been aptly formulated by Plháčková (2003, p. 77) who wrote that “attention is a mental process with the function of introducing into consciousness a limited amount of information and thus protect it against being overloaded by a great amount of stimuli that currently and realistically act upon a person.”

However, attention does not only mean focusing of psychological activity on the acting stimulus but it also expresses the current state of consciousness. This state of consciousness is characterized by a certain level of clarity and explicitness of the perceived object in consciousness. Attention could thus be understood also as a general property of consciousness that demonstrates itself as conscious activation of mental functions with the objective of bringing these functions up to the highest level of performance. If we thus understand attention as a psychological state that demonstrates itself in directionality and focus of consciousness (Chalupa, 1981), we have to take into consideration the fact that human psychological activity may have different intensity over time, that it may oscillate, and it is a precondition for the current level of performance.

Different definitions of attention agree in three key terms: consciousness, concentration, and content. Concentration of consciousness is most frequently understood to be such level of psychological activity that could be defined as intensity of attention. The measure of intensity of attention is considered to be the level of awareness of current somatic or psychological activity – and by this we mean those activities that go on on the conscious level. The more concentrated is consciousness, the clearer we realize our experience or behavior. These processes obviously also go on the unconscious level which means that regulation or control of behavior also have some extra-conscious attributes. When it comes to attention we however mostly speak about what goes on on the conscious level – which does not mean that all ongoing mental or behavioral activities are constantly under control.

Let us come back to the school environment. The present practice requires teachers to be flexible, creative, to apply theoretical knowledge into practice, to master effective ways of instruction, to have thorough knowledge of subjects taught, and in addition to all that to communicate effectively and have the ability to create positive interpersonal relationships. It is also required from teachers to motivate children and adolescents in the area of education (Lemešová, 2013). A part of these attempts is also the need to improve abilities of teachers to acquire such techniques that help to excite attention in pupils and maintain it throughout the class – as confirmed by Šramová (2004).

Based on long-term experience with researching attention in pupils we can state that there is a difference between individual attention performance in pupils and in the way how this performance – i.e. the level of attention in pupils – is being perceived by teachers.

In this respect we are interested in the question which strategies are most often used by teachers to capture and maintain attention of pupils, and compare them with ways of capturing attention that are preferred by pupils themselves.

### 3. The Question

Which ways do teachers prefer (or use) to capture or maintain the attention of pupils?

To find some answers we approached 188 pupils in 5<sup>th</sup> to 9<sup>th</sup> grade of elementary school, and 68 of their teachers.

Answers could be grouped into the following categories:

1. Use of auditive stimuli (change of voice, tone). This category contains answers related to style of speech – but we also included answers related to capturing attention by means of audio tools;
2. Use of visual stimuli (visual aids, technology). This category contains answers related to the use of ICT aids, projectors and other tools used by teachers in the teaching process;
3. Switching from one activity to another, testing;
4. Answers related to teacher's personality – appearance, expressing emotions, expressing approval – answers related to positive evaluation of pupils by teachers, motivation toward better performance, expressing positive emotions;
5. Interesting presentation of teaching material;

6. Inadequate or no answers, no preference in any way.

Since we asked an open questions teachers and pupils could have provided multiple answers. Percentage of answers in individual categories is seen in Table 1.

Table 1 Frequency of responses by teachers and pupils, in %

Category	Teachers	Pupils
Category 1	10 %	5 %
Category 2	54 %	18 %
Category 3	21 %	11 %
Category 4	11 %	25 %
Category 5	4 %	22 %
Category 6	0 %	20 %

Unfortunately one fifth of pupils did not answer this question or do not prefer any way of capturing attention by pupils. What is however alarming is that while 54% of teachers prefer visual means of capturing attention only 18% of pupils find this way to be preferable. We presume that teachers overestimate the use of technology at the expense of other ways. The highest number of pupils – 24% - indicate that their attention in classes gets captured mostly by appearance of teachers and expression of positive emotions. A slightly lower number of 22% of pupils get attentive whenever the material is presented in an interesting way. What is striking is that only 4% of teachers capture attention of their pupils by interesting presentation of material.

As we know from relevant research and from school practice, attention of pupils in classes or throughout the school day oscillates. It is thus vital for a teacher to master ways how to capture attention and especially how to keep it up; and the question is whether these ways are accepted by pupils.

In our research 47% of pupils stated that with respect to capturing and maintaining attention they prefer what we could call “teaching mastery” – which means teacher's personality, his or her ability to present the material in an interesting and stimulating way. These are the capabilities that teachers do not consider to be vital; only 16% of teachers accepted this way of capturing attention in their answers. Use of visual stimuli and their preferences by teachers could also be caused by the societal pressure toward modernization and technologization, but also the idea that preparation of pupils for the needs of society is a priority and the needs of pupils are being overlooked. 20% of pupils who were not able to answer or gave inadequate answers could consist of either excellent pupils or pupils with no motivation for academic performance. From the point of view of psychological theory several ways preferred by teachers are not effective and only have short-term effect (auditive and visual stimuli).

# Attitudes and knowledge of students undergraduate a university in Mexico about distance education.

Juan Ignacio Barajas-Villarruel\*

*Universidad Autónoma de San Luis Potosí, Facultad de Contaduría y Administración. Madero No. 849, 78233, San Luis Potosí, México*

## Abstract

The objective of this research was to determine the attitudes and knowledge of Students Undergraduate at the Faculty of Accounting and Management in a public university in Central Mexico, about Distance Education (DE) supported by the Information and Communication Technologies (ICT). The research project was descriptive. The subjects used in the sample were taken from students in their second and eight semesters. The questionnaire used was adapted to the institutional context. The results rendered evidence that 74% of the students said they would be willing to study by distance, supported by Information and Communications Technologies. Based on the results of this study, it is fair to say that the design and implementation of the Distance Education Project at the Faculty of Accounting and Management has a good chance of success.

*Keywords:* Distance Education; Attitudes; Knowledge.

## 1. INTRODUCTION

In the year 2006, the Faculty of Accounting and Management (FAM) at a public university in Central Mexico took up the challenge to change. One of the first steps towards this change was to update the curriculum, which in turn, resulted in the implementation of the current educational model called: Curricular Model 2006 at the FAM (Faculty of Accounting and Management, 2006). In order to contribute to the development and implementation of this model, school authorities decided to take some actions to promote an educational model supported by Information and Communications Technologies (ICT) and in the near future, offer schooling through Distance Education (DE). In order to offer an educational model by distance, the Project for Distance Education for the Faculty of Accounting and Management was designed (in Spanish: Proyecto de Educación a Distancia de la Facultad de Contaduría y Administración, 2010).

The Project for Distance Education is based on the following studies: “Attitudes of Teachers at the faculty of Accounting and Management Towards Distance Education” (in Spanish: “Análisis de las Actitudes de Profesores de la FCA ante la EaD”) and “Evaluation of the Course Management System DOKEOS FCA” (in Spanish: “Evaluación del Uso del Sistema Administrador de Cursos DOKEOS FCA”) However, according to the National System of Distance Education (in Spanish: SINED) (2010) it is necessary to evaluate the attitudes and knowledge of undergraduate students towards DE and its implementation at the Faculty of Accounting and Management as well.

## 2. BACKGROUND

In the year, 2010 the National System of Distance Education established that DE increases the chances to provide education, and considering some provisions, a greater number of institutions for higher education will look for opportunities to implement this mode. According to Lupión y Rama (2010), DE has been established as a new, important reality for higher education in Latin America and the Caribbean. These authors affirm that the increase rates in DE are far superior to those of the traditional face-to-face mode.

In addition, in the higher education area of the Sectorial Education Program 2007-2012 for Mexico (SEP, 2007), it was established as the third objective:

“To promote the development and use of information and communication technology in the educational system in order to support learning, expand their competencies for life and to ease their integration into the knowledge society” (p. 11).

One of the strategies presented in the same program to achieve the previous goal was, “to promote open and distance education through permanent quality and innovation standards and criteria, with special emphasis on regions and groups who lack access to conventional in-school services” (SEP, 2007; p. 40).

## 3. RESEARCH PROBLEM

The FAM of a public university from Central Mexico offers three undergraduate programs, Accounting, Management and Public Management; there are 3457 registered students and 263 Professors (García, 2011).

The Academic Programs are organized into four subject sections: a) first cycle, from first to sixth semester; b) second cycle, from seventh to ninth semester; c) free elective courses, this means that students can choose three courses between the fourth and sixth semester; and d) depth elective courses, students can choose six courses out of ten professional emphasis (Facultad de Contaduría y Administración, 2006).

Within this context, the Faculty of Accounting and Management has developed the following strategies to become flexible, open, innovative and dynamic: a) to implement the Curricular Model 2006 for the FAM (Facultad de Contaduría y Administración, 2006) and b) the Distance Education Project for the FAM (Facultad de Contaduría y Administración, 2010).

## 4. PROBLEM-LITERATURE CORRELATION

The revision of literature demonstrated that most of the findings in the study related to the attitudes and knowledge towards DE indicate the need to prepare and train the teachers for the use and implementation of ICT within DE. Some of the authors following this line, highlight the need to provide teachers with at least a course in the use and application of ICT, and therefore lower the risk of academic failure (Ho Song, 2000). Consequently, the search for bibliography for this research project was directed towards three areas: a) Distance Education, b) Information and Communication Technology, and c) attitudes and knowledge. In terms of this research project, the concepts referred to are:

### 4.1. Distance Education (DE)

The concept considered was that of Simonson et al. (2009), who defined it as an institutional education, backed up by a traditional school or university, in which there is a separation in time, distance or intellect between the students and the teacher. These educational agents interact through telecommunications systems which allow sharing different media and resources to learn from experiences.

#### 4.2. *Information and Communication Technologies (ICT)*

These are the products of processes and products derived from hardware y software tools which offer support, in relation to storage, processing and digital transmission of information (González, Gisbert, Guillen, Lladó y Rallo, 1996).

#### 4.3. *Attitude*

Gagné (1985) defined it as the mood which reflects on a student's or teacher's behavior in relation to an object, or towards a specific situation. It is the result of personal and relational experiences, which influence people in terms of likes or dislikes.

#### 4.4. *Knowledge*

It is the information which transforms something or someone, in order to do something, or so that the individual or the institution have the capability to adopt a different or more efficient action (Drucker, 2003).

### 5. OBJECTIVE OF THE STUDY

To determine the attitudes and knowledge of undergraduate students at the Faculty of Accounting and Management in a public university in Central Mexico, towards distance education supported by Information and Communication Technologies.

### 6. HYPOTHESES

The favorable attitudes and knowledge shown by the students towards DE, will help the optimal implementation of this educational mode at the Faculty of Accounting and Management in a public university in Central Mexico.

### 7. METHODOLOGY

#### 7.1. *Research design*

The research design used in this study was descriptive, in order to provide information about the current conditions, in this case, the attitudes and knowledge towards DE among students in the second and eight semesters at the Faculty of Accounting and Management (Cohen & Malion, 1990).

#### 7.2. *Participants*

The student population was composed of 3457 students, male and female, ranging from 18 y 35 years of age, who study between the second and eight semesters of the undergraduate programs for Accounting, Management and Public Administration at the FAM. Due to the characteristics of this study, a representative stratification of students participating per semester was needed. Hence, an intentional sampling without replacement was done. From that population, a 5% was chosen at random to constitute a pilot sample of 173 students. From the remainder (3284 students) another 5% was chosen randomly (165 students), who were stratified per semester in order to conform the final sample.

### 7.3. Instruments

A valid questionnaire was designed by experts in Distance Education (DE). An Alfa Cronbach ( $\alpha = .7381$ ) analyses of internal consistency sample was also carried out. This instrument was organized into two sections: a) socioeconomic and b) Elements of Distance Education. The socioeconomic section showed the participant academic profile. The Distance Education elements section was structured into 19 items according to Distance Education knowledge factors, motivation, communication and Information and Communications Technologies (ICT). A five choice-response Likert scale was used. The response choices were determined as following: 1. Totally disagree, 2. Disagree, 3. Neither agree, nor disagree, 4. Agree and 5. Totally agree.

### 7.4. Data analysis

Data was presented descriptively; the average, frequency, standard deviation, median and mode were calculated for each one of the items (Hernández et al., 2010). We used The Statistical Package for the Social Sciences (SPSS®), version 20.0 to process the information.

## 8. RESULTS

The results showed that 92% of the participants in this study do not have experience in the Distance Education format. From this finding is observed that 8% of students reported having experience in DE is minimal. However, this group was the one that showed more willingness to study this modality. Consequently, from a qualitative perspective it is appreciated that the distance education modality can be considered as a possibility for training and education.

Another result was that 83% of students having an activity enunciated formal employment and 74% of them said are willing to study under a distance learning supported by ICT. Importantly, the sixth, seventh and eighth semesters are who make up a higher percentage this segment.

As for the motivation and communication factors, the results showed that these factors are positive for all students, particularly in participants who have: a) experience in distance education, b) willingness to study in this mode c) a formal job.

Finally, it was shown that 58% of students were undecided regarding lack of face to face relationship between teacher and student in the context of a distance education modality. However, the rest of the participants felt that the non-attendance dehumanizes the educational relationship.

## 9. CONCLUSIONS

According to the results, we can say that the design and implementation of the FAM Distance Education Project has success possibilities, despite the lack of experience with DE from students. This information can be asserted due to the fact that most students work already, and 74% would be willing to participate in a distance education mode.

In relation to the outcome of ICT can be concluded that the Distance Education Project of the FAM should consider the intensive use of these technological tools as a means of communication to support, facilitate and manage an ethical content required for the development of effective learning activities.

Another conclusion is that the motivation of students to participate in a distance education modality can be increased through information dissemination prior and timely. This information should emphasize how to communicate and interact with each other, which is clearly leaving his new role in DE.

With regard to the lack of face-to-face in a distance education mode is proposed to establish a propaedeutic course in order to induce students to their new role within the DE. It will also be necessary to implement in the Distance Education Project of the FAM a mentoring process as a fundamental support of DE.

Finally, it is important to note that this research is part of the basic diagnostics to design and implement the Distance Education Project of the FCA. This allows us to conclude that the development of this project represents a reference point for replication in other academic institutions of this university.

## 10. ACKNOWLEDGEMENTS

I appreciate the financing and support provided by the PROMEP for the development of this research. Also, my gratitude to researchers and fellows the Autonomous University of San Luis Potosi that have collaborated in the development of this study. Finally, I acknowledge the participation of all students surveyed, Faculty of Accounting and Administration.

# Attitude and approaches of faculty members regarding formal education and distance learning programs

Murad Karaduman<sup>a</sup>, Mustafa Sami Mencet<sup>b</sup> \*

<sup>a</sup> *Asst.Prof.Dr., Akdeniz University, Faculty of Communication, Antalya, 07070, Turkey*

<sup>b</sup> *Akdeniz University, Coordinator of Distance Learning Department, Antalya, 07070, Turkey*

## Abstract

Distance learning, which is a formal or institutional education activity that brings together students, instructors and education materials in different locations via communication technologies, is an education method that becomes commonplace in the whole world and whose components start to be used more day by day in formal education. In distance learning, knowledge and communication technologies as well as the ability of faculty members to use these have importance. However, because of distance learning applications not being able to be widespread enough and the prejudgments to this area; it is being observed that the adaptation of faculty members teaching in formal education to distance learning methods take time.

In this study, attitudes of faculty members, who are teaching the same courses both in formal education and distance learning in Turkey Akdeniz University, towards distance learning, their observations regarding the similarities and differences in the behaviors of students being educated in formal education and distance learning, and the attitudes of students towards education and their active participation to class will be identified via survey method. As a result, recommendations regarding distance learning programs will be developed based on faculty members' attitudes and approaches towards formal education and distance learning.

Key Words: Distance learning, formal education, educational technology

## 1. INTRODUCTION

We encounter distance learning practices in higher education based on communication and information technologies as an education method becoming more wide spread every day. As is the case in the rest of the world, new departments providing distance learning services are being commissioned in our country every year, tend of new distance learning programs are started at foundation degree, undergraduate, college graduation and post graduate levels attended by thousands of students. Since 1982 when distance learning works started - (Özer, 1989; 4-5) the number of distance education programs in Turkey has increased. It will be possible to understand this development when we merely look at the increase of the two year period. While the number of universities providing distance learning was nineteen in May 2010, this number has nowadays reached forty eight (Uzem Türkiye, 2013)

In line with the spread of distance learning, some findings of research conducted on the efficiency of distance learning by students educated by these programs and lecturers teaching in these programs have revealed that there is a linear relationship between increasing awareness in distance learning and the efficient use of the distance learning system as well as satisfaction by the said system (Yiğit et al., 2010; 27 - Okçu et al., 2008; 370 – Tezci, 2009; 1290). However this situation also sets forth that the positive opinions on distance learning are

\* Corresponding author. Tel.: + 90 2423106472; fax: +90 2422275987.

E-mail address: mkaraduman@gmail.com

restricted with the people utilizing the distance learning system. In fact, as may be understood from Yıldırım's (2010; 29-37) study conducted in Turkey between 2009-2010 and whereby the findings of distance learning research comprising lecturers and students have been amalgamated, it is observed that for groups of people who are uninformed about distance learning there are many differing attitudes such as the opinion that distance learning cannot be as efficient as formal education, indecisiveness concerning whether distance learning is a sufficient education system by itself, constitutes an alternative to formal education or that it shall remain merely as a supportive model of formal education and that therefore there is no clear standing against the structure of distance learning. For example Yıldırım (2010, 41-42) has determined in a study he has conducted on a private university's distance learning and formal education programs, that students learn faster and more efficiently with visual content and simulations, connect more regularly with lecturers and they view distance learning practices as more efficient, that distance learning however impedes social life, cannot set up a campus environment, that lecturers cannot efficiently use forums and that they have certain infrastructure problems. According to another study conducted among students attending both formal education and distance learning programs (Balcı and Tengilimoğlu, 2012), great majority of distance learning students are working and residing outside the town or region where the University is established. Therefore, we encounter distance learning as an education system addressing the actively working labor force and which in this sense fills a great vacuum. Therefore the efficiency of distance learning practices is of great importance.

As may be well known, the purpose of distance learning is to eliminate the time and venue factor in education. Therefore practices in distance learning are performed to substitute the elimination of the time and venue factors present in formal education. It is observed that distance learning is generally pursued by asynchronous, simultaneous and compound practices.

In asynchronous practices students can access class notes uploaded on the system anytime and anywhere they wish and study by downloading these on their computers. Simultaneous courses however are held on the date and hours at which they are announced. Lecturer can use smart boards, camera and microphones in classes. Students can watch classes live in an internet environment, ask their lecturers written or verbal questions and practice/implement applications. With educational television, teleconference and similar practices provided in the studio environments, it is possible to offer online courses over interactive interfaces (Alkan, Genç and Tekeder, 2003; 1-9) Apart from all the aforementioned, students may increase their knowledge by participating in the forum practices whereby they can share information on the course amongst themselves as well as with the lecturers and analyze additional sources.

All these procedures must be undertaken by certain standards to reach the quality target in education. These standards are classified as the quality of learning materials, the support of students by lecturers, system management, access facility, display and feedback mechanisms (Teknotürk, 2011). Apart from the abovementioned, web based distance learning and the web based distance learning systems must hold certain properties (Al and Madran, 2004; 4-7) Software used in distance learning ensures the recording and archiving of all kinds of activities, thereby facilitating the follow up on and measurement of the above stated standards. As is the case at Akdeniz University where the research is being conducted, there are Research and Implementation Centers in many universities providing distance learning, while there are content development units, data processing units and units such as photo film and web design in many higher education institutions. The activities held are performed by technical staff and lecturers employed in these units. For example, the weekly class notes in Akdeniz University where the research is conducted are prepared by the lecturer yet controlled by the content development unit and issued by adding visual materials supportive of education (flash, animation, changes in the visual order of class notes etc.). In formal education however these studies are generally conducted individually by the lecturer, while the measurement of the efficiency of the education is generally made either by informal means or methods such as surveys, interviews and grade points. Therefore, with the methods applied in distance learning, quality measurement in education and the control of education works can be applied more easily. It is

possible to compare the differences between methods applied in formal education and distance learning as follows:

Table 1. The differences between methods in formal learning and distance learning

Practice	<i>Formal learning</i>	<i>Distance learning</i>
Interactive course (Class environment)*	Available	Available
Out of class consultation	Regularly at the lecturer's office or over the internet if the lecturer has specified certain office hours for consultation. Accordingly, it depends on the lecturer.	Regular forum practices and kept under record
Regular forum practices and kept under record	Supplementary books, class note copies or having notes taken during class. Depends on the preference of the lecturer	Regular and enriched in content
Use of slide show / Visual description	Varies according to whether the lecturer uses slides regularly each week.	Regular class notes, video, animation etc.
Weekly study questions	Varies according to the content prepared by the lecturer	Regularly included in class notes.
Home-works	Once or twice per semester	Weekly short home works in much greater numbers over forum practices
Exams	At least twice a semester, being classical written exam and a test	Internet exams providing more frequent and faster examination yet with low security.

Although distance learning practices are theoretically accepted as a model assisting formal education, in depth research must be conducted on practices in both education systems and the effects of such practices on students and lecturers must be measured. In order to ensure contributions to the field in this sense, a response thereto shall be searched over the answers given by lecturers and distance learning practices the overall framework of which is set forth above by the Akdeniz University case and the correspondences thereof will be determined.

## 2. METHOD

The instructors lecturing in both formal and distance associate degree programs of the Mediterranean University were included in the study for measuring the attitude of the instructors towards the distance education and the difference between the distance education applications and formal education and the data were obtained by the survey method. In addition to the questionnaire, the instructors were requested to state in written whether they had observed a significant difference between the performances of the formal students and distance education students. Moreover, the distance education programs and its contents were researched; the applications of the instructors in the distance education during an academic term were observed and particularly the problems of the instructors lecturing in the distance education were determined.

Answers were searched for the following results in the research:

What's the degree of the differences between the applications of formal education and distance education?

Is there any significant difference between the active participation of the students to the courses in the formal education and distance education? What is the attitude of the instructors towards the distance education? What are the opinions and suggestions for the problems suffered in the distance education applications and/or improving the efficiency of the applications performed in the distance education?

### 3. FINDINGS

By considering the interview, questionnaire and observations with the instructors; the answers to the survey questions in the study are presented in tables.

#### 3.1. *The differences between the interaction level between the Distance Education and Formal Education*

When the instructors were asked whether there was a significant difference between the level of interaction with the student in the distance education and formal education, the findings in Table 2 were obtained. 60% of the instructors participated in the research stated that the courses were more highly interactive in the formal education, while 40% of them mentioned that there was no significant difference between the formal education and distance education in terms of interactivity. Of course, the contents of the course (for example; the interactivity of the course of sports culture in the formal education won't be the same with the distance education) or the way of lecturing of the instructor is considerably effective.

Table 2. Is there any significant difference between the active participation of the students to the courses in the formal education and distance education?

Answers	Number	Ratio (%)
The courses are highly interactive in the formal education.	12	60
There is no significant difference between the formal education and distance education in terms of interactivity.	8	40
The courses are more highly interactive in the distance education.	0	0
Total	20	100

#### 3.2. *Attitudes of instructors towards the distance education*

In order to determine the attitudes of the instructors towards the distance education, questions in likert scale were developed and searched under the following titles and the answers obtained were presented in tables.

Table 3. Level of sharing the statement of “When I don’t establish face-to-face communication with the students, the effectiveness of the course decreases”

Attitude	Number	Ratio (%)
I disagree	14	70
I agree	6	30
Total	20	100

Level of sharing the statement of “When I don’t establish face-to-face communication with the students, the effectiveness of the course decreases” was 30% and a positive result was obtained in favor of the distance education. Most of the instructors (70%) stated that the students were able to communicate adequately in the studio environment or by means of forum applications.

### 3.3. Attitudes of instructors regarding lecturing in the studio

It was investigated whether lecturing alone in the studio affected the motivations of the instructors negatively and the following findings were obtained.

Table 4. Level of sharing the statement of “Lecturing alone in the studio decreases my motivation”

Attitude	Number	Ratio (%)
I strongly disagree	6	30
I disagree	4	20
Neutral	6	30
I agree	2	10
I strongly agree	2	10
Total	20	100

Although a decided attitude couldn’t be observed, this statement was generally responded negatively and it appears that the instructors could lecture comfortably in the studio. It was observed that the instructors who had difficulty in their first lectures were adapted to the studio and presented a rather comfortable lecture, later.

### 3.4. Communication with the students in the distance education

The instructors were asked their opinions whether they could communicate adequately with their students in the distance education and the following findings were obtained. Being in consistent with the finding that the interaction level stated in Article 1 was at medium level, the level of sharing this statement was at medium level and it was responded positively with a difference of 10%.

Table 5. Level of sharing the statement of “I can communicate adequately with the students in the distance education”

Attitude	Number	Ratio (%)
I strongly disagree	2	10
I disagree	4	20
Neutral	6	30
I agree	8	40
I strongly agree	0	0
Total	20	100

### 3.5. Attitudes of instructors regarding forum applications

In forum application carried out for interview with students, sharing of information and references regarding the course, assignment (coursework) application, weekly study and etc., the attitudes of the instructors were investigated in terms of follow-up of assignment (coursework) and student’s studies and their levels of sharing the statement of “I can make the students do more assignments (course works) and applications by means of forum applications” were evaluated. The findings are presented in Table 6.

Table 6. Level of sharing the statement of “I can make the students do more assignments (course works) and applications by means of forum applications”

Attitude	Number	Ratio (%)
I strongly disagree	4	20
I disagree	0	0
Neutral	8	40
I agree	8	40
I strongly agree	0	0
Total	20	100

As is seen in the Table, a decided attitude regarding effectiveness of the forum applications became evident. It appears that since it became obligatory to perform forum application and opening new subject titles and carrying on communication with the students in the distance education, the instructors carried on such applications regularly each week.

### 3.6. Difference between using of course hours in the formal education and distance education

The level of sharing of the statement of “I can make use of the course hours more effectively in the distance education” was searched in order to investigate the opinions of the instructors regarding whether there was any difference between the use of course hours in the formal education and distance education and a decided positive result in favor of distance education was obtained. The findings are presented in Table 7.

Table 7. Level of sharing the statement of “I can make use of the course hours more effectively in the distance education”

Attitude	Number	Ratio (%)
I strongly disagree	0	0

### 3.7. Distance learning applications

The instructors were asked about their level of sharing the statement of “I frequently use audio and smart board applications in the distance education” and a positive result was obtained. The instructors stated that they frequently performed the smart board and audio applications. It was observed that the instructors used the podiums enabling direct applications on the student screen in addition to the smart board and microphone was particularly used in foreign language courses. However, it was observed it wasn't much preferred since audio transmission took long due to slow internet connectivity of the students and low quality microphones.

### 3.8. Offering solutions for the problems of students

It's observed that the problems of the distance education students like mid-terms, grades, registration are solved via e-mail; however, more frequent communication between the instructors and students affects the problems like affective components, success in course, motivation of the students and etc.

Table 9. Level of sharing the statement of “I can offer solutions for the problems of the students in the formal education more easily”

### 3.9. Student's success and tracking the interest level

Vast majority of the lecturers that have participated to the study declared that they fail to closely follow the student accomplishment and interest to the class. Findings are depicted in Table 10.

### 3.10. Application of distance learning programs in formal education

Vast majority of the lecturers agree that "It is possible to implement forum seasons that executed in distance learning, online exams, opportunity to enter to the classes that are missed etc. into the formal education". The findings are indicated in Table 11.

Table 11. Support rate of the notion that "It is possible to implement forum seasons that executed in distance learning, online exams, opportunity to enter to the classes that are missed etc into the formal education "

Absolutely I do not support	0	0
I do not support	2	10
I have no decision	0	0
I agree	0	0
I agree completely	18	80
Total	20	100

Lecturer's orientations referring to the adaptation of distance education programs into the formal education have been observed significantly satisfactory. Also as far as observations held during one season course notes that were composed for distance learning were distributed to formal education students as class notes and again at class environment diagnosed to have been applied as presentations. In that respect, the fact that potentiated distance learning to be so popular in cyclical environment is also observed to have been approved also in the environment where the study is conducted. Searching out to enhance formal education using the gains inherited by long distance learning shall also improve the quality of currently applied training.

### 3.11. What are the variations between applications in formal education and distance education?

Programs conducted during one season under the course content; examined under the headlines of course note preparation, negotiation hours with students, brief homework, applications via internet environment, data or source allocation, term homework, giving presentation assignments to the students, laboratory/workshop works and applications made in formal learning and distance learning were compared. Primarily most remarkable difference between distance learning and formal learning is found to be concentrated on weekly class notes. Most of the lecturers (%75) for their classes at formal education do not compose notes weekly but in distance learning they stated out that they compile notes weekly. Some of the lecturers while follow a precise book in formal education in distance learning over a standardized template they said that they make weekly course notes. As well as observations made over one term lecturers at the beginning are mostly forced from preparing written class notes for every course, but timely it is established over a certain system and most lecturers compose class notes before the class and loaded into the system setting.

Another parameter observed at the applications is negotiation hours with students. In formal education while lecturers arrange regular negotiation hours in distance learning naturally negotiations with students are carried out at Formal Management System and Forum applications. Entire lecturers that are participated to the works (%100) every week made weekly negotiations with student via forums or social networks and produced solutions for the problems of the students, in the contacts held with students they have no incompleteness according to formal education.

When the brief homework and internet based works are taken into concern in formal education brief homework given in one term etc., applications while on average per each class is **1.5** in distance learning principally at forums weekly average brief homework given corresponds to **2.6**. Track of the homework in forum environment being lower and easier and available for archive formation avail brief homework in distance learning to be applied in more abundantly.

In summary, in distance learning programs when allocating homework lecturers allocating the course different than formal education in distance learning composes weekly class notes and compare to formal education more number brief homework/weekly internet etc., applications are available. Lecturers support the application of distance learning programs (course class, online exams, unit assessment questions etc) into the formal education (%88.9) and state out that they use the materials that apply in distance learning also into the formal education.

### *3.12. Approaches, perceptions and recommendations of lecturers for distance learning*

To learn approaches, perceptions and recommendations of lecturers for distance learning, ideas for problems encountered in distance learning in depth negotiations were held with lecturers whom joined to the study and questions such as “*What Are The Main Problems In Distance Learning Programs In Your University?*”, “*What are the Required Interferences in Distance Learning to Improve Efficiency in Distance Learning?*” and answers below down were provided:

### *3.13. What Are The Differences Between Distance Learning And Formal Learning?*

- In fact distance learning must not constitute an alternative for formal learning. Information technologies must taken place in every segment of instruction programs and applications that are applied in distance learning must be dispersed over the entire segments of formal education.
- Distance learning has advantages for employees and especially for disabled individuals. Especially due to employment in formal learning it requires expansion for students whom are not able to attend to classes satisfactorily.

- In formal learning any student whom is not interested into the courses with as much number lecturers as he/she wants fails upon face to face communication. Also in distance learning enthusiastic and successful student even though via internet channel assimilates the information given and earns success at the classes. For example some of our students in distance learning are found to be more successful than widespread of students at formal programs. Also in formal education only the ones coming to the exams or although making participation to all classes there are some very unsuccessful students. Therefore, I do not very huge difference between formal education and distance learning in terms of quality, level, even applications. In distance learning, when student consultancy is made successfully and efficiently disadvantage emerged due to lack of same time and environmental unification shall be eradicated.
- In distance learning if students achieve high attendance to live form studio classes also viability in formal learning shall also be provided there. Only disadvantage of the distance learning since all students follow classes at any time they wish a disorganized structure shall be emerged. Also in formal education if low attendance is gained that shall negatively effect lecturers. Apart from that, I suppose there is no other difference between distance learning and formal education.

### 3.14. *“What Are The Fundamental Distance Learning Problems In Your University?”*

- Importance given to formal education from the lecturer’s point I suppose is underestimated in distance learning courses. For that reason, I suppose we as the lecturers offering classes must challenge much more.
- Principally during university exams period over our university’s official web page or from other platforms I suppose advertisement facilities have been ignored.
- For distance learning classes a class note template shall be compiled, this must also be adopted to formal education, whereas according to the course content interrelation level must be able to be intensified. In distance learning foreign language training is more harsh compare to formal education. New organizations are available in that matter.
- Distance learning likewise plenty of universities also in our university especially student affairs and remaining relevant personnel’s lack of knowledge in that matter I suppose led to student’s failure to gain desired gains from the system.
- Distance learning course fees paid for lecturers may be required to be risen. In that matter, from distance learning students additional material fee may be claimed. Because, they create much less costs than formal program students.

## 4. CONCLUSION

Both in formal and distance learning in the present which applied in association with lecturers emerged circumstance generally; lecturers generally is positively oriented to distance learning, they also anticipate to apply plenty of gains inherited by distance learning into formal education. Included in formal education but paying attention to motivate students into that system and incompleteness of definitions related to formal learning lecturers determined some adaptability problems owing to newly developing system and technical problems.

Another point appealing attention in the study in distance learning no interactive communication problem exist during courses, but in extra class works factors debilitating student’s motivation or such as failure to track student performance are present as the negative structures. For example, in formal education for students whom are at the

class but poorly interested at the class the lecturer may execute some involvements to appeal attention into the class, whereas, in distance learning contact between student whom did not make attendance with class and lecturers is nearly negligible considering as if entirely cancelled. If the student out of cyberspace class also not attended to forum applications lecturer even will not be aware of the student's attendance, thus that shall always shaken student and lecturer inter-relations. To eliminate negative outcomes of lecturers to track student's performances a lot of methods must be developed. Higher magnitude advertisement of distance learning and its expansion; principally employees, disabled and the parties whom are graduated from the other units and striving to sophisticate their knowledge accumulations its attractiveness must be dispersed over higher masses that has been proved in that present study. Eventually, approach of lecturers toward distance learning may be defined as if it is open to development and oriented to apply distance learning opportunities into the formal education. Negative sides of distance learning are referred to lack of monitoring the student performance, to fail to make rapid solutions for problems. In association with the sophistication of distance learning applied methods and technologies if adopted to formal education makes us to anticipate as if in the future more desired outcomes shall be derived from the both education types.

### Abstract

In recent times, the progresses of the human sciences and neurosciences have shown that the body experience has a deep relationship with the emotional and cognitive processes. So, think of the human being as a fusion of body, mind and emotions, it offers the opportunity to explore new ways of giving value to the body experience of the child. Therefore, the dance education is a discipline appropriate to the world of childhood, it helps the rapprochement between body and mind: the language of the body in dance merges with the language of the soul. In an enactive perspective, dance can be compared to the flow of languaging and emotioning; language is not placed in the brain structure and is not a physiological phenomenon of the nervous system but it is an autopoietic process. The emotioning flow is conditioned by languaging, as well as languaging is complementary to emotioning. Dance, as an ethical possibility for man, is an example of languaging and emotioning, because with the body language humans create and convey emotions subjectively interpreted by the beholder. Therefore, dance can be considered an educational activity, like the other disciplines contributing the formation of personality, ensuring physical, mental and intellectual wellbeing. The dance education in schools may be proposed through the didactic laboratory, it represents a time and a space where you want to harmonize the child's personality through the integration of thoughts, feelings, emotions, motor skills and physicality.

Keywords: *languaging, autopoiesis, emotions, dance, laboratory.*

## 1. Introduction

Nowadays the progress in humane sciences and of neurosciences has highlighted how the body experience is closely linked to the emotional dimension and to the cognitive processes, ending up in a holistic perspective of the subject of learning that is essentially meant as a subject-person. Thus thinking of the education of corporeity, in this context, means thinking of a sort of education based on recognition and acceptance of and giving worth to one's own body on the one side and, on the other side, it means thinking of new educational ways that can give worth to the child's corporeity in its holistic unity of body, mind and emotion.

Over the centuries, school has been conditioned by the deep body-soul dualism and has often produced educational systems based on giving privilege to rationality, that have fostered a dualistic view of the body and of the mind meant as separate fields of reference.

Dance, seen as a particular form of body expressiveness, seems to cancel the borders between body and thought: with dance, body language and soul language mix in the harmony of being; here it takes on specific and peculiar educational goals and contributes to shaping the global personality of the subject- person under the physical, psychic, intellectual, emotional and affective profiles.

## 2. Autopoiesis and Dance

Under an enactive viewpoint, it may be compared to the languaging and emotioning flows, where it is not primarily to be found in the brain structure and is not a structural physiological phenomenon of the nervous system and, in a relationships environment, it exists and springs from the structural coupling of organisms and is strictly linked with the emotions of living together. In this matter, Maturana and Varela coin a new word, languaging, which indicates giving shape to my experiences and my emotions (conversing); in this context, emotion is the stimulus, the motivating element that leads to action.

The emotioning flow is conditioned by the languaging flow, just like the languaging flow is complementary to the emotioning flow. The interaction between the languaging and the emotioning foster the mutual consent domains that, in their turn, are the precondition for the language development and lineage formation (Pastena 2011).

Living in a conversational flow implies a set of self-referential-recursive coordinations of languaging and emotioning. The way we any time participate in the flow of languaging is the outcome of our interactions related to the particular conformation that our structure presents at exactly that moment (Maturana H., 1988).

Maturana and Dávila state that the whole socio-cultural set up stands on the pleasure of living together and on the capability of loving; it is emotion that supports and makes man a social being capable of generating /self-producing his knowing how to be a man in accepting others (Maturana&Davila, 2006).

Under this profile, dance seen as man's ethical chance, is a languaging and emotioning example, because with body language one can create and arouse in others emotions that can be subjectively interpreted by anyone who looks at them. In the act of dancing emotion defines the action; in this perspective, emotion and love are the foundation of man and the foundation of society. Here dance becomes a means of accepting the other man because it is able of giving emotions to those who observe and admire the dancer. In the choreography of dance, the dancer and the observer (who acts and who benefits) are part of an unusual perception: the existence of man and the situation of the world are recreated in the imagination. The imagination transcends the real and gives life to the choreography (Zagatti F., 2006). Dance, in the philosophical perspective, is considered the art of anti-dualism, where the dancer is able to contain, in the physical world, other worlds. Dance can be defined as the art of using movement to communicate, create worlds and build their own identity.

Dance teaching in schools takes on the value of dance education; it complies with the child's natural inclination to movement and favors an eloquent communicative language. Learning is not provided by an order of

prearranged codes, but springs from a spontaneous, natural and free movement that leads to a process of self-productive regeneration and of autopoietic determination of one's being.

All human beings live in on-off mutual consent emotional flows, which they learn from the coexistence of other human beings. In a socio-cultural environment of living together, when human interacting is outside the domain of the emotioning and languaging flows, one enters a behavioral mechanism that increasingly reduces the chances of using mutual consent acts. This leads to a restriction in recognizing the other as the other legitimate one; it also leads to a loss of the wish of living together, to discord in cohabitation and finally, to the general disruption of society (the structural pairing-off no longer occurs as a spontaneous and lasting life style) and, consequently, it brings about the end of the socio-cultural order of reference .

On this subject, Maturana states that "We human beings are living systems that exist in language. This means that although we exist as human beings in language and although our cognitive domains (domains of adequate actions) as such take place in the domain of languaging, our languaging takes place through our operation as living systems. Accordingly, in what follows I shall consider what takes place in language[,] as language arises as a biological phenomenon from the operation of living systems in recurrent interactions with conservation of organization and adaptation through their co-ontogenic structural drift, and thus show language as a consequence of the same mechanism that explains the phenomena of cognition" (Maturana H., 1988).

Under this view point, dance can be considered as a particular form of languaging and can be used as a means of acceptance of the other, because it can arouse emotions in those who are together in a dancing/languaging domain and in those who co-participate in the dance time, which generates/self-produces the harmony of living.

Thus, the experience of the educational dance becomes an opportunity to re-discover the body (that becomes art expression) as a means to bring about meaningful and personal messages. One discovers the language of emotion and understands that the qualities of the movement vary according to the emotions and the sensations experienced. With dance, everybody improves their awareness and body perception in a structural coupling dominion where one learns to listen to and to know one's own body), interpersonal relationships are strengthened and everybody is valued in their being different: the contact with the mates, thanks to the activities carried out, is the first step in creating cohesion in a group that can work together. With dance one works in the field of wellbeing and to build one's own identity in a harmonious and creative dimension; the educational dance includes the expertise of doing (by expanding the basic movement language), that of creating (by boosting imagination and fancy), that of observing (by acquiring observation rules and movement analysis). Elicited by instinct, a child is put in a position to create and invent movements and gestures coming from his innermost feelings. A dancing pupil becomes a creator of worlds in an autopoietic process where he discovers himself and his inner capability of being.

### **3. Educational dancing and the teaching laboratory**

Dance laboratory, which is structured in the Italian Primary School with interdisciplinary and transdisciplinary methodologies, can be programmed using the "project theme", which allows to intersect dance and school planning, using topics such as intercultural education, education for visual and plastic arts.

Educational dancing in Italy is suggested in schools with a teaching laboratory that is planned and made available by the dance teacher. The laboratory is meant to harmonize the child's personality by integrating thought, sensitivity, affectivity, and motor skills. The laboratory represents space and time and its use is divided in various stages, starting from admittance, warming up, exploration right to composition and execution of the planned training. In the time-space of the laboratory, the child is thought to recognize, experience and familiarize with the main principles of dancing, such as action, space, time, dynamics and relationship.

The dance workshop is characterized by the ritual of its phases; repetition allows us to capture the improvements in pupils' behavior, the assimilation of the rules and autonomy of action. The scheme that is used

in a dance laboratory provides some didactic phases: welcoming, heating, individual and collective exploration, individual and collective composition, the final stage with the vision and reflection.

There is a set of activities that can be carried out and can be divided as follows:

Activities carried out during the acceptance stage.

Silent Good morning: that is when they learn how to say "Hello" to their mates just with a gesture or a movement, without using the voice. The teacher may ask to use either slow or fast, either small or ample gestures, or also a gesture showing their mood of the day, etc..

Activities during the warming up stage.

Painting with the body: the body will be used as a painting brush by painting circles with the head, points with the elbows, straight lines with the feet etc..

Activities carried out during the exploration phase.

Being invisible: the students are asked to play with their bodies imagining that they are alternatively visible and invisible. In this, the learners must be able to control the parts of their bodies.

Being wind: one child will have to imagine that he is the wind, the other one imagines he is the object blown by the wind. The one representing the wind will show where the wind comes from and how strong it is without ever touching his mate's body; the one representing the object, must move accordingly.

Being the humor of the body parts: image a sad arm (and move it as though it was sad), then move it as though it was happy, angry etc..

Activities carried out during the composition stage.

The magic wand: the magic wand will show the transformation of contrasting elements: summer/winter, night/day, good ones and bad ones etc.

Adjectives: One chooses an adjective and tries to shape it up with his body; then he tries to show the various grades of the adjective, : the comparative and the superlative.

Poems: recite poems accompanying them with gestures and movements (solo, in pairs or in groups)

The learners get in touch with a new person, that of a specialized, professional dance teacher, with pedagogic, educational and artistic expertise. The aim of his work is to arouse the child's body perception and emotions by stimulating his expressiveness and making him wish to improve in inventing and observing. It is important that the dance teacher creates a positive rapport with the learners, getting them to abide the rules so as to establish the ideal conditions where the lived experience may become educational experience. The dance teacher must be able to get all the information in his teaching environment; in the laboratory he can link up with the other disciplines in a cross-curricular viewpoint by taking decisions on the music and the theme to deal with, starting from the interesting points of the world of motions and from everyone's imaginary world. The stimulus can be an object, an emotion, a natural element, a trade, or any event that can lead to the world of dance.

The educational dance can give new shape to the experience of growing, it fosters the physical and mental development as well as the child's emotional enrichment by contributing to building his own identity and helping to shape a sensitive, harmonious body; it makes the child careful in listening and relating with the others, as well as the keen observer of other people's movements.

#### 4. Conclusion

In recent years, the Human Sciences were very interested in the significance of corporeality in education. In fact, think of man as inseparability of body, mind and emotion offers the chance to experience new ways of educational. In Italy, physical education and dance are today in the national school curriculum, but do not have a central role. The child, in the process of personality formation and construction of an identity, before the mental awareness of having a body, is a body that knows and feels emotion (Gamelli, 2011). The dancer and choreographer Martha Graham said that the dance is a hidden language of the soul; a soul that dance tells much more of a soul that speaks. Dance expresses us in an authentic way manifesting the deep part of our being.

Another dancer Doju Dinajara Freire says, instead, that dance is something that belongs by nature to anyone. In conclusion, bringing the thought of Rudolf Laban, dance intensifies every day life; it is like a poetic movement that unfolds in a time and a space (Laban, 1999).

## Abstract

Ablution is a ritual washing performed by Muslim and it is part of compulsory activities to ensure cleanliness before the Muslim perform prayer it has been recorded in the Holy Book's of Quran. In general, ablution followed by washing on particular body, based on *Quran*, *Sunnah* and the Scholars consensus, the ablution ritual which they have a few rules and manner when performing the ritual. However, base on research the Malaysian Muslim knowledge on ablution is very basic and not detailed. In this work we reported about the Muslim understanding towards their knowledge on ablution and propose a tool to control the behaviour of Malay society on ablution ritual to minimize usage of water. In all probability, a survey has been done to capture the ablution ritual among Muslim society in Malaysia. The groups investigated were in between of 20 to 40 years old. Most of Muslims show their understanding of performing ablution procedure. Most of them, practicing more than one time while sweep water on compulsory body as required. However, with most of male agreed and the rest female disagreed with the excessive consumption can be categorized abluitions as a waster while performed the ablution, but while the consuming water in ablution ritual refer to the Quran all of them agreed. In order to overcome this problem respondent mostly agreed with the suggestion of introducing new design for ablution tub design system. As conclusion, ablution ritual in Malaysia was reflected by the human behaviour and only the ablution performing system will able to control their habit in order to reduce of water usage while practicing the ablution.

Keywords: Ablution performance, human behaviour, water.

---

## 1. INTRODUCTION

In Islam ablution is a ritual washing performed by Muslim and it is part of compulsory activities to ensure cleanliness before they performing prayer (Besari A. R. A, Zamri R, Yusaeri A, Palil M. D, Prabuwono A. S, 2009). As claimed by Abu Hurairah, Prophet Muhammad Peace Be upon Him (PBUH) mentions that "He will only accept the prayer of a person that has done ablution ritual" (Rahman Z. A, 2012). In general, ablution followed by washing on particular body. The washing ritual it involve s washing at four compulsory area followed by washing of face, both of hand, forehead to crown of head and both feet. It also recorded in the Holy Book's of Quran (Johari N. H, Anwar R, Hassan O. H, 2012), "O you who believe! When you rise up to prayer, was your face and your hands as far as the elbows, and wipe your heads and your feet to ankle (Kamal A. M, 2008). Based on Quran, *Sunnah* and the Scholars consensus, the ablution rituals have a few rules and manner when performing the ritual.

Within the teachings of Islam, it recognizes have four *mazhab* of Sunni Islam, which is a *mazhab* Imam Hambali, *mazhab* Imam Syafi'i, *mazhab* Imam Hanafi and *mazhab* Imam Maliki (Fox J. J, 2004). The majority of Malaysian Muslim it follow a Sunni Muslim of Imam Syafi'i. As stated by Walker E. W, (2001), the standard argument is that Sunni Islam ultimately prevailed over Shia Islam in the region because it was better able to accommodate local practices and traditions, including eventually Sufism, a mystical and popularized form of Islamic worship. Moreover, in this work we reported about the Muslim understanding towards their knowledge

on ablution and propose a tool to control the behavior of Malay society on ablution ritual to minimize usage of water.

## 2. RESEARCH METHOD

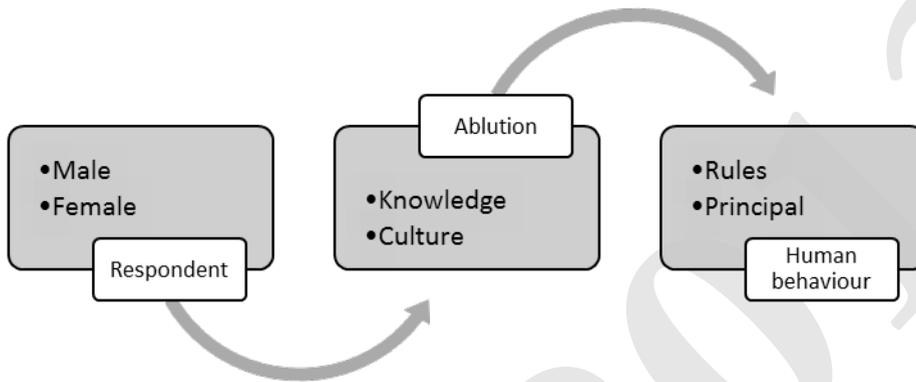

Figure 1. Research process

The figure 1 shows the flow chart of research process in this work. Thru survey at Masjid Sultan Salahuddin Abdul Aziz Shah (MSSAAS) Shah Alam, a survey has been done to capture the ablution ritual among Muslim in MSSAAS. The survey was systematically structured and divide into several sections and had been complied using factors identified in the background study. The respondents were pickled randomly base on different background (Kamaruzaman M. F, 2012).

The question covered several regarding human behaviour while performing ablution ritual and understanding respondent about ablution ritual in different gender. The groups investigated were in between of 20 to 40 years old because to identify how this age area think about the ablution behaviour. Following the compulsory pillar required while perform the ablution among of them can identify the following compulsory pillar but some of them lack of knowledge the ablution ritual.

Majority of Malaysian Muslim practiced more than one time while sweep water on compulsory body as required. However ablution repetition for one times it can be done, it show that the Malaysian Muslim does not have ablution's knowledge in detail, so it can recognize how deep the Malaysian Muslim knowledge of ablution.

When it is refer to questionnaire, we declare the excessive consumption can be categorized ablutions as a waster it shown the differences responds between men and women. It because to classify knowledge between men and woman among Malaysia Muslim society about rules repetition when performed ablution and principal during perform ablution ritual as stated in general knowledge. The result come out with 50 respondents from men answer yes and respond from women not consistent, when 24 respondents answer yes and 26 respondents answer no, as shown in figure 2.

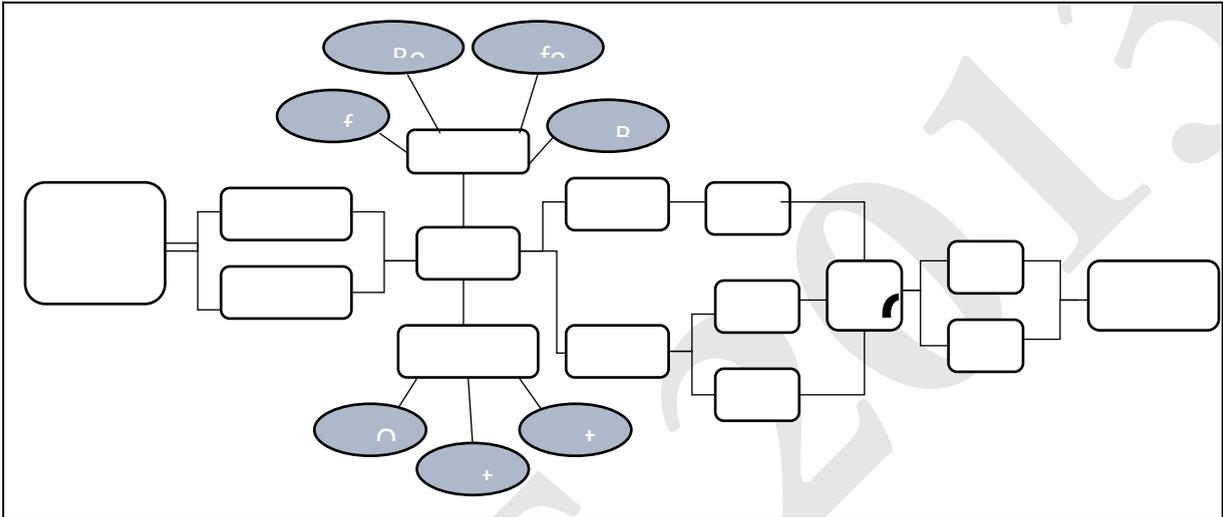

Figure 2. Level of knowledge among the Malaysian Society.

The figure 2 shows how deep level of knowledge among the Malaysian Muslim society it can identify when we declare the wastage in terms of Islam is highly forbidden practices as mentioned in the Quran, the result shown with totally different. When all of respondent from women consist answer yes. It because to classify between men and woman thinking about rules and principal during perform ablution ritual when refer to the Quran. It related with the importance of consuming water while performing the ablution should be controlled among with women and men because ablution ritual was reflected by the human behaviour. For the reason that to identify the human behaviour should be control or other wise.

### 3. RESULT AND DISCUSSION

Most of Malaysian Muslims show their understanding of performing ablution procedure but they knowledge on ablution is very basic. Majority of them practiced more than one time while sweep water on compulsory body as required because the proper way of ablution ritual is washing the particular body for three times as done by the Prophet Muhammad PBUH (Al-Bukhari M, 1986). With the intention of the average of ablution process required of about 6 to 9 litter of water volume, however as Prophet Muhammad PBUH has done is a *sunnah*.

Amount of water about half to 2 litters it enough to apply on the body (A. R. A Besari and et all, 2009), because certain *hadis* mention the Prophet Muhammad PBUH used to perform ablution with one *mudd* of water (equal to

¾ liters) (Faruqui N. I, Biswas A. K, Bino M. J, 2001), (Faruqui N. I, 2003). On the other hand, when we declare the excessive consumption can be categorized ablutions as a waster, the respondent from men answer yes, but respondent from women not consist when 26 respondent answer no and 24 respondents answer yes. However when we declare the wastage in terms of Islam is highly forbidden practices as mentioned in the Quran, they answer yes, particularly respondent from women. When declare about wastage in general they are agreed with the statement but when the wastage refer in the Quran the change their thinking. It shows that women need a system or tool to control their behaviour before their performed the ablution ritual because human behaviour it something that come naturally. However it is possible to be control using a tool or mechanism (Tomasello M, 1991), (Henrich J, Gil-White F. J, 2000).

#### 4. CONCLUSION

As conclusion, ablution ritual in Malaysia was reflected by the human behaviour and only the ablution performing system will able to control their habit because human behaviour it natural to have a tool to control it. In order wise, it to reduce of water usage while practicing the ablution. In order to overcome this problem respondent mostly agreed with the suggestion of introducing new design for ablution tub design system

#### Acknowledgments

Authors would like to acknowledge the generous participation of the interaction designers in the research. This study was conducted in Form Giving Design Research Lab established by Research Management Institute, Universiti Teknologi MARA (UiTM). This issue has finalized in collaboration with the contributing authors, and with support from Malaysia Minister of Higher Education for *Tenaga Pengajar Muda* Scholarship and research fund of RAGS project. Including UiTM for the financial support under Research Excellent Fund Scheme. In addition, two anonymous reviewers provided insightful and of an earlier abstract of this paper.

# A calculation scheme for measuring the efficiency of knowledge texts for vocational education

Tereza Rauchová<sup>a\*</sup>, Milan Houška<sup>a</sup>*<sup>a</sup>Czech University of Life Sciences Prague, Department of Systems Engineering, Kamýcká 129, 165 21, Prague 6, Czech Republic*

---

## Abstract

Innovative tools developed in education should be in line with the economic reality. The innovations of disadvantageous cost-to-benefits ratio could be interesting, but not sustainable in use for a long time. The paper provides a calculation scheme to measuring the efficiency of investments into such an innovation in education - knowledge texts. As other authors focus on the learning outcomes reached through the texts or time savings in a learning process, we are dealing with knowledge texts from the viewpoint of economic efficiency. General calculation scheme as well as the case study on its application is provided in the paper.

*Keywords: Knowledge text, knowledge unit, calculation formulas, economic efficiency, vocational training.*

---

## 1. Introduction

Increasing number of innovations in business processes, ICT or technologies as well as a number and speed of changes in legal environment requires permanent enhancement of knowledge of all employees, managers and company owners through vocational education. It is essential to ensure, so that the learning tools used for such an education are not only useful, but also time-saving and cost-efficient. The educational tools for educated people should provide the addition to data and information, also knowledge, which can then be applied in practice and solving specific problems within and outside the company. The article presents knowledge texts as a possible tool for vocational education and also examines the economic efficiency of investments in these teaching tools from the perspective of corporate costs and benefits.

Truneček (2004) emphasizes the importance of developing people skills knowledge, sharing knowledge, their optimum, efficient and economic use of innovation and work with knowledge. On the other hand Kislingerová et al. (2008) describes the importance of innovation for the development and prosperity of the company. Tomek and Vávrová (2009) regard the innovation as one of the important parameters not only for external relations, but also for internal relations firms and organizations. Innovation is the impetus for the development of business concepts. Tidd and Bessant (2009) show that management innovation in the enterprise is often very difficult, innovation in an organization requires vocational training, a number of textual support in the form of directives, guidelines, methodologies, regulations, etc.

Enhancing the quality of formal education as well as corporate vocational training is one of the most important topics. It can be documented by the amount of public financial resources allocated to the training; for instance, in the current call (one of many) for projects on the training (ESF, HREOP, call No. 94), there is allocated 700 mil. CZK. It is crucial to spend the resources efficiently so that it becomes an investment, not consumption.

Schollevá (2008) states, that the economic efficiency of investments is considered the relationship between economic and social effects. It is expressed by comparing the economic income investments with a value of costs incurred to achieve them. That the investment was considered economically effective, it must be the overall effect resulting from its use be higher than the costs of the investment. Economic efficiency indicators, that are used to evaluate, taking into account individual criteria to investment decisions.

Basl and Blažíček (2008) describe the effects the introduction of new information and knowledge support. Effects can be both a financial nature and non-financial nature (process effects, learning and growth). Innovations in information and knowledge-based systems require a significant investment, so organizations are monitoring for "business effects", ie. the emphasis is on saving and return on invested funds.

Many authors also deal with the evaluation of efficiency of education and different pedagogical models (Tudor, 2012, Singer and Moscovici, 2008). Starý and Chvál (2009) describe the models of quality and efficiency on a pedagogical level. Efficiency of individual learning methods is one of the most common aspects of evaluating the efficiency in education (Maňák and Janík, 2009). Special attention is given to working with textbooks. Experiments dealing with textbook analysis clarify the impact of individual characteristics and parameters of the textbooks on learning outcomes (Mikk, 2007). More authors, e.g. Duric and Song (2012), Asaishi (2011) or Tannenbergová (2009), aim at the analysis of educational texts. Typically, they evaluate and measure characteristics such as the didactic facility of textbooks, the difficulty of the text, terms analysis, rate of information density, etc.

Interdisciplinary cooperation among related areas dealing with knowledge acquisition and sharing allows using methods and approaches developed in Knowledge Engineering in pedagogical and didactic disciplines. Knowledge Engineering provides formalized models for representing explicit knowledge, which is the object of transfer and sharing in education or consultancy with experts. Some authors, e.g. Glava and Glava (2011) or Brožová, Houška et al. (2011), emphasise the importance of the General Systems Theory and systems approaches for this purpose. The systems approach was also used for the development of a new representation of knowledge, the knowledge unit (Dömeová et al., 2008). The knowledge unit is a very appropriate form of knowledge representation for human users, because it allows expressing the formal model of knowledge in a natural language as well as creating texts including knowledge in explicit form (knowledge texts). Also the systems approach is suitable for developing metrics for the evaluation of learning outcomes, which are understood as one of the indicators of the knowledge transfer quality (Rosales et al., 2012).

Rottensteiner (2010) mentions, that the comprehensibility rate of a text is the key variable for This is in line with our purpose. This paper stems from the necessity to suggest the methodology for measuring the efficiency of knowledge transfer realized by the knowledge texts. Also we are dealing in case study with the issue of vocational training for farmers by using knowledge texts.

In this area, educational support of farmers as well as sharing knowledge among them is limited or does not exist at all; this is reflected in the priorities of the CAP for the programming period 2014-2020 (RSZF, 2012).

Therefore, it is important that knowledge and expert systems that help in solving problems, as well as didactic tools, have started to develop. Many authors, e.g. Kawtrakul (2012), Song et al. (2012), Léger and Naud (2009), Saunders et al. (2005) have started deal with knowledge and expert systems used in agriculture in some chosen problem domains, but outside the Czech Republic environment. In our previous works we suggested several innovations leading to the improvement of educational texts. As specified in Materials and Methods, we worked with a new representation of elementary piece of knowledge – knowledge unit – and developed a procedure to creating educational texts based on the knowledge units. The objective of this paper is to present a methodology for measuring the economic efficiency of the procedure leading to the development of knowledge-based educational texts. The methodology is also applied in a particular case study on vocational education in agriculture sector.

INTE 2013

## 2. Materials and Methods

### 2.1. Knowledge units

In further text we understand “knowledge text” as a specific form of the text, which expresses explicit knowledge directly. Based on our previous research (Dömeová, Houška and Houšková Beránková, 2008) we see production rules and their advanced version, knowledge unit, respectively, as the most suitable form to representing explicit knowledge in the text.

Formally, we suggested to define knowledge unit as (Dömeová, Houška and Houšková Beránková, 2008)

$$KU = \{X, Y, Z, Q\}, \quad (1)$$

where

- $X$  stands for a problem situation,
- $Y$  stands for the elementary problem being solved in the  $X$  problem situation,
- $Z$  stands for the objective of solving the elementary problem,
- $Q$  stands for a successful solution of the elementary problem (result).

Next we should explain the adjective "elementary". The rate of elementarity is determined by the user and his/her ability to understand and apply the rules included in elementary knowledge. If any part of the knowledge unit is too difficult, so the user is not able to work with the knowledge unit efficiently, it is necessary to divide such a complex problem into more sub-problems understandable for the user. This is in accordance with previous intuitive views of knowledge units and their definitions (Zack, 1999).

Even if there is no unique way to create sentences based on the production rules (Kendal and Creen, 2007), we may always express the knowledge unit in the following textual form (Dömeová, Houška and Houšková Beránková, 2008):

If we want to solve an elementary problem  $Y$  in the problem situation  $X$  to reach the objective  $Z$ , then we should apply the solution  $Q$ .

### 2.2. Knowledge text

We also specified how to distinguish between a standard text and knowledge text, and how to create the knowledge text. For this purpose, we developed the following procedure (Houška, Rauchová, 2013).

Step 1: Select a standard text for transformation

We can either choose a standard text that will be transformed, or we can use the codification of knowledge, based on knowledge acquisition from the experts. A procedure of knowledge elicitation from the expert is described in the paper by Cowan (2001). The aim of this activity is to get the procedural knowledge that can be represented by the methods used in knowledge engineering. The time-consumption of the interview depends on the extension of problem domain.

Text selection is the crucial part of the process. This is not the issue of efficiency, but effectiveness. Formally we are able to transform any text into the knowledge form, but it is sometimes useless. Two typical cases follow.

- The purpose of the text is to provide information. This is a meaningful purpose of the text only to inform the reader about some facts, events or other realities. We can often meet informative texts in fact-based disciplines such as history or geography.
- The text in an original form is already well-structured. We usually meet highly-structured texts in much formalized disciplines such as mathematics, physics, operational research, etc. The texts naturally describe procedures and algorithms and so the knowledge has been already expressed in its pure form.

### Step 2: Analyze the text to identify knowledge units in analytical form

In a standard text, knowledge is usually hidden. To reveal it, we have to analyze individual sentences, paragraphs and sections. On the level of individual sentences, we should aim at complex sentences and find three-dimensional constructions (Havlíček, Brožová and Šubrt, 2006): the relationship between two objects supplemented by the objective of a related problem solved. The text is sometimes written in simple sentences or compound sentences. In this case we should analyze whole paragraphs to identify the subject of the knowledge first.

After the identification has been done, we can formalize the knowledge extracted from the text and represent it through a knowledge unit. In particular, we identify all components of the knowledge unit (X, Y, Z and Q) and assign the text statements to them. Let us note that this is still analysis, not synthesis; that is why the individual statements reach the quality of information only.

### Step 3: Convert the analytical form of knowledge unit into a natural language

This phase covers the synthesis, which allows us to merge information included in separated parts of the knowledge units and express it in the natural language. Obviously, the knowledge unit is being expressed as a complex sentence. On one hand, it sometimes makes the sentence longer than the original one; on the other hand, there is no doubt on the existence of the knowledge in the text. The sentence could be corrected stylistically, but its sense cannot be changed.

### Step 4: Add auxiliary information and data supporting knowledge into the text

No text can be based on complex sentences representing individual knowledge units, because it would be extremely difficult to read. Thus the auxiliary information is returned back to the text support knowledge, explain its segments, provide necessary data, etc. This approach is in concordance with a common understanding of the knowledge chain Data - Information - Knowledge (Aven, 2013).

## 2.3. *Effects leading to savings*

To determine the effect of using the knowledge of the text leading to increased productive time in the organization was based on an experiment by Rauchová and Houska (2013). Rauchová (2012) designed a formula. Increase productive time has eventually leads to savings. The effect of using the knowledge of the text is based on the percentage difference in the accuracy of solutions of identical examples using KT and ST, the effect is reduced by more time-consuming KT necessary for the preparation of the text, further reducing the effect of each case incorrect solve the problem, since it must read the average time required for examination and time spent on the repair of solving the problem (about half the average time at work to KT) and the subsequent time to have a second inspection (approximately half of the time allocated to the first check). Rauchová (2012) has said, that the usage of knowledge-based texts leads to an increase in productive time of 4.2%. Verification of the coefficient on a representative sample of students is the subject of further research.

According to Schoellová (2008) investment is one of the essential conditions of long-term prosperity of the company. It is characterized by a larger one-time or short-term spending early and the expected return of the funds and their evaluation. The main criterion for selection is the ability to evaluate investments. When deciding on possible investments should take into account the vastness and non-recovery of investment, as well as risk and time factor. It is necessary to note that the adoption of inappropriate investments may change the company's prosperity. That the investment was considered economically effective, it must be the overall effect resulting from its use be higher than the costs of the investment. Dynamic indicator (Net Present Value) based on discounted cash flow analysis is often used for measuring the efficiency of investment. Net Present Value (*NPI*) can be count as follows:

$$NPV(i, N) = \sum [R_t / (1 + i)^t], \quad (2)$$

where

- $R_t$  stands for cash inflow minus cash outflow,
- $i$  stands for the discount rate,
- $t$  stands for the time of the cash flow.

### 3. Results

#### 3.1. Calculation formulas

Calculation formulas were designed for costs and benefits analysis. The usage these formulas in the same steps corresponds to methodology for measuring economic efficiency of an investment into the knowledge texts used for vocational training.

Costs Analysis

Following formulas describe costs for investments into knowledge texts.

$$C_{tot} = C_{cod} + C_{ku} + C_{cr} + C_s + C_{up}, \quad (3)$$

where

$C_{tot}$  stands for the total costs of the codification of knowledge, creation of educational texts and actualization of its content (currency units),

$C_{cod}$  stands for the costs of codification of knowledge altogether (currency units),

$C_{ku}$  stands for the costs of services: a one-day course learning to knowledge representation and use of knowledge units (currency units),

$C_{cr}$  stands for the costs of creating educational texts (currency units),

$C_s$  stands for the costs of services: proofreading and didactic control (currency units),

$C_{up}$  stands for the costs for updating of educational texts depending on problem domain and branch (currency units).

$$C_{cod} = \left( \frac{p}{t_{cod}} \right) \cdot (w_{ki} + w_{ex}), \quad (4)$$

where

$p$  stands for a number of pages that need to be done (pages),

$t_{cod}$  stands for time-consuming codification (pages / hour),

$w_{ex}$  stands for the wage rate of the expert (currency units/ hour),

$w_{ki}$  stands for the wage rate of the knowledge engineer (currency units / hour).

$$C_{ku} = n_{per} \cdot p_{rku}, \quad (5)$$

where

$n_{per}$  stands for a number of people participating in the transfer of knowledge representation and use of knowledge units (number of person),

$p_{rku}$  stands for the price of the course on knowledge representation and use of knowledge units for one person (selected currency / person).

$$C_{cr} = p \cdot t_{cr} \cdot w_{ed}, \quad (6)$$

where

$t_{cr}$  stands for the time required to produce one standard page (hour / standard page),  
 $w_{ed}$  stands for the recalculated hourly salary rate of educator (selected currency / hour).

$$C_s = p \cdot pr_{did}, \quad (7)$$

where

$pr_{did}$  stands for the price of didactic revision and proofreading (selected currency/standard page).

$$C_{up} = ACH_{ku} \cdot p \cdot \frac{(C_{cod} + C_{cr} + C_s)}{p \cdot KU_{pp}}, \quad (8)$$

$$ACH_{ku} = \frac{(2/3 * ch_{dt} + 2/9 / ch_{it} + 1/9 ch_{kt})}{5}, \quad (9)$$

where

$ACH_{ku}$  stands for average change of knowledge units during 5 years per 1 page (knowledge units/page),

$KU_{pp}$  stands for average estimated number of knowledge units per 1 page (knowledge units/page),

$ch_{dt}$  stands for a number of changed knowledge units per 1 page influenced by changes on data levels in time  $t$  ( $t=1, 2, \dots, 5$ ) (knowledge units)

$ch_{it}$  stands for a number of changed knowledge units per 1 page influenced by changes on information levels in time  $t$  ( $t=1, 2, \dots, 5$ ) (knowledge units)

$ch_{kt}$  stands for a number of changed knowledge units per 1 page influenced by changes on knowledge levels in time  $t$  ( $t=1, 2, \dots, 5$ ) (knowledge units)

#### Benefit Analysis

Following formulas describe benefits from investments into knowledge texts.

$$S = AS_{pp} \cdot n_{stud}, \quad (10)$$

where

$S$  stands for savings resulting from the use of knowledge-based texts (currency units),

$AS_{pp}$  stands for average savings resulting from the use of knowledge-based texts per person (currency units/person)

$n_{stud}$  stands for the number of educated people (number of person).

$$AS_{pp} = \left( \frac{e_{kt}}{100} \right) \cdot E \cdot n_{wh} \cdot w_{stud}, \quad (11)$$

where

- $E$  stands for the number of credit points expressing intensity of the training course according to the European Credit System ECTS (ECTS credit points),
- $n_{wh}$  stands for the number of working hours per one ECTS credit point (hour/1 ECTS point),
- $w_{stud}$  stands for the wage rate of educated people (currency units/hour),
- $e_{kt}$  stands for the effect of using knowledge text (%).

### 3.2. Case Study

This case study is based on the calculated efficiency of investment in knowledge texts used in vocational training for Czech farmers. The knowledge will be transferred from the expert direction to end users, farmers, by using knowledge texts. We assume that the using of knowledge texts facilitate farmers training and problem solving than when they use standard educational texts. It is necessary to determine whether this investment in knowledge texts is profitable or not. Therefore, it is necessary to analyse the costs and benefits accruing from this investment and to evaluate the economic efficiency.

#### Costs Analysis

The total costs ( $C_{tot}$ ) of preparation, creation and implementation of knowledge texts in teaching are influenced by four aspects: costs incurred in the codification of expert knowledge ( $C_{cod}$ ), the costs associated with the service "course of using the methods of knowledge representation and knowledge units" ( $C_{ku}$ ), costs associated with the actual production of texts ( $C_{cr}$ ), the costs associated with didactic and linguistic proofs in the form of external services ( $C_s$ ), and the costs influenced by actualisation of knowledge texts.

We need to create 100 pages of textual support for teaching ( $p$ ), i.e. 100 pages of text containing knowledge from the expert. Based on experiments by Rauchová et al. (2013), we assume that the average time required for the codification of knowledge using methods commonly used in knowledge engineering is 1 hour per standard page ( $t_{cod}$ ). To determine the costs of this action is necessary to know the salary costs of an expert, i.e. 335 CZK / hour ( $w_{ex}$ ) and salary costs of a knowledge engineer, i.e. 308 CZK /hour ( $w_{ki}$ ). Salary costs have already included the social security and health insurance paid by the employer:  $C_{cod} = (100/1) \cdot (308 + 335) = 64,300$  (CZK), according the formula (4).

The "course of using the methods of knowledge representation and knowledge units" is attended by 1 educator ( $n_{per}$ ) who will participate in the revision of texts using the concept of knowledge units. Price of the course is comparable to the cost of the soft-skills course, which is in the Czech Republic around 7,260 CZK ( $pr_{ku}$ ), the price of service has already included the value added tax:  $C_{ku} = 1 \cdot 7,260 = 7,260$  (CZK), according the formula (5). It is also necessary to take into account the time at which the override codified knowledge into one standard page using knowledge units, according to Rauchová (2013), experts estimate this period to 1.3 hours/standard ( $t_{cr}$ ). The adjusted wage rate of teachers, creating 100 ( $p$ ) knowledge texts, in the Czech Republic is 178 CZK/hour ( $w_{ed}$ ). Salary costs have already included the social security and health insurance paid by the employer:  $C_{cr} = 100 \cdot 1.3 \cdot 178 = 23,169$  (CZK), according the formula (6).

Costs are also affected by the external services: the didactic control and texts proofreading. The rate per standard page is 182 CZK ( $pr_{did}$ ), the price has already included the value added tax:  $C_s = 100 \cdot 182 = 18,200$  (CZK), according the formula (7).

Costs are also affected by the updating depending on branch, i.e. different effects of legislation, economics or technology, which is reflected in changes in the knowledge texts. Changes in the knowledge units are caused by changes on three levels - data ( $ch_{dt}$ ), information ( $ch_{it}$ ) and knowledge level ( $ch_{kt}$ ). In the agricultural branch, we can estimate knowledge changes of knowledge units per page caused on three levels during 5 years ( $t = 1,2,\dots,5$ ).

See Table. 1

Table 1. Numbers of changes of knowledge units per one page depending on 3 levels (data-information-knowledge)

KU/page year	Data $ch_{dt}$	Information $ch_{it}$	Knowledge $ch_{kt}$
1	1	0	0
2	1	1	1
3	2	1	2
4	1	2	1
5	1	1	0

From the numbers on the Table 1, we can count, according the formula (9)  $ACH_{ku}$ , which is an average annual number of changed knowledge units per 1 page, i.e. 1.1knowledge units. An average estimated number of the KU per page is 6 ( $KU_{pp}$ ), therefore the costs for updating are:  $C_{up} = 1.1 \cdot 100 \cdot [(105,639) / 100 \cdot 6] = 19,367$  (CZK), according the formula (á).

The total costs ( $C_{tot}$ ) are:  $C_{tot} = C_{cod} + C_{ku} + C_{cr} + C_s + C_{up} = 132,266$  (CZK), according the formula (3).

#### Benefit Analysis

The return on investment is expected to increase the current productive time using the of the knowledge units in educational texts. According to Rauchová (2013) the value of the effect of using the knowledge texts leading to an increase in productive time, is 4.2% ( $e_{kt}$ ), mentioned in Materials and Methods.

Assuming an increase in productive time of the percentages is necessary to calculate the average savings resulting from a change in the type of text per person. This saving is the expected return on the investment. It should be based on costs for farmers who work with knowledge texts. These costs are derived from their labor costs. Farmer are participants of education and their wage rate is 141 CZK/hour ( $w_{stud}$ ), and time-consuming training course is rated 6 ECTS credits ( $E$ ), according to European Commission (2013) credits are units expressing the importance of the subject for the study branch and load rate of students in the subject. 1 credit corresponds from 25 to 30 working hours. The number of working hours depends on the country, e.g. 1 ECTS credit in the Czech Republic corresponds to 25 ( $n_{wh}$ ) working hours.

Cost-efficiency depends on the ratio of productive time to total working hours. With an increase in productive time of 4.2% ( $e_{kt}$ ) per year i.e. 888 CZK represents annual savings to participants:  $AS_{pp} = (4.2/100) \cdot 6 \cdot 25 \cdot 141 = 888$  (CZK), according the formula (11).

If the annual average corporate savings per employee is 888 CZK, then to determine the total annual income this amount must be multiplied by the number of all the participants who work with knowledge texts and solves problems according to them, i.e. 300 farmers ( $n_{stud}$ ).

The expected annual return on investment ( $S$ ) is:  $S = 888 \cdot 300 = 266,490$  (CZK), according the formula (10).

#### The efficiency of the investment

The efficiency of this investment to knowledge texts (*ceteris paribus*) is compared with investment in standard educational texts ( $C_{tot} = C_{cod} + C_{cr} + C_s + C_{up}$ ,  $t_{cr} = 1$ ,  $e_{st} = 4$  instead of  $e_{kt}$ , *ceteris paribus*) for indicators of Net Present Value ( $NPV$ ). Theoretically, the most accurate method of investment decision based on discounting is  $NPV$ .  $NPV$  expressed in absolute terms, the difference between the PV of cash income from investments and PV capital costs of the investment. We assume that the lifetime of the investment in the texts will be four years before being updated their content.

Table 2. Net Present Value: Comparison of inflow/outflow of the investment (CZK)

Time of the cash flow	Knowledge texts	Standard texts
0	-132,266	-119,659
1	+266,490	+253,800

If we are deciding between two projects, where the distribution of a cash flow is different but otherwise identical conditions (rate of discount is 10%, and time is 4 years), the first project calculate the higher net present value, we select the first project, i.e. investment in knowledge texts.

#### 4. Conclusion

In this work we suggest a calculation scheme to estimate the efficiency of knowledge text to support the decision-making process on whether it worth creating educational texts based on the principles of knowledge engineering, or not. We distinguish individual cost items subject to their nature (fixed, variable; on creation, utilization, sustainability) and compare them with measurable benefits arisen from the utilization of knowledge text in vocational education. In the case study we show how significant economic effect can be reached in a real organization.

In further work we will enhance the descriptions and principles of the sustainability phase in projects on creating the knowledge-based educational texts. In particular, we will use process analysis techniques to describe its life cycle and the Activity-based costing method (ABC) to calculate the process costs. We will also incorporate the break-even point analysis to our calculation scheme to provide more specific resolution of the original problem.

# A case study on primary science teacher candidates' perceptions towards alienating from nature

Mustafa Kahyaoğlu<sup>a\*</sup>

<sup>a</sup>*Siirt University, Faculty of Education 56100, "Siirt", Turkey*

---

## Abstract

One of the aims of environmental education is to make students take responsibility for protecting the environment and to lead them have nature friendly behaviors. The purpose of this study was to present primary science teacher candidates' perceptions of nature and ideas about alienating from nature. The data was conducted with 44 students who have been studying in Siirt University Faculty of Education Primary Science Teaching Department in Turkey. The data was analyzed using qualitative descriptive analysis and content analysis. The results of the study showed that most of the teacher candidates perceived nature as a living space and they stated that the reasons of alienating from nature were busy school, lesson and work schedule, depletion of natural resources and lands, and excessive urbanization.

Keywords: nature, nature education, teacher candidate

---

## 1. INTRODUCTION

Human is a living creature that being in the nature, forming their life in nature with the conditions in there and can have a compulsory relationship with the nature. The background of this relationship is actually human being's dependence to the nature. Our relationship with nature is formed the way of the perception of human being's role in nature and the nature itself. The individuals' nature perception is related to their ideas, beliefs and the way that perceive the nature and how they identify human-nature relationship. Human being's nature perception is formed by the variances of family, culture, socializing, education level and personal characteristics (Arcury & Christianson, 1990; Kattman, 1994; Disinger & Tomsen, 1995; Van Den Born, Lenders, De Groot & Huijsman, 2001; Bang, Medin & Atran, 2007; cited in Kutru & Soran, 2012). Bacon said that human commands nature. According to Goethe, nature is the mother. In the strict sense, nature is all the phenomena that do not the reason of human actions and all the non-human events. In the general meaning, nature can be defined as an infinite system of various types of living and non-living substances, affects and to be affected, can change and can be a changer, has features of self-renewing and creating, is formed without the influence of human, exists by itself, has its own code and mechanisms and covers so many notions related to phenomenon, existence, relations, interactions and processes (Atasoy, 2005). Furthermore, for individuals alienated from nature is a hard task to perceive the principles of nature as the integrity of the natural systems, the finiteness and adequateness of nature, nothing disappears in nature, there is no benefit without a return, nature knows the best, mutual dependence and cooperation, minimum harm and content, tolerance and humbleness principles. Louv (2009) stated that there was 25% of declining of natural park visits in USA between 1987 and 2003, and the most important reason of this decline is the disconnectedness between the youth and the nature. It is impossible to perceive the nature problems

\* Mustafa KAHYAOĞLU. Tel.: +90 507 776 87 80.  
E-mail address: mustafa.kahyaoglu56@gmail.com

and create objective solutions to them for the individuals who does not spend time in nature and does not even know what the nature is. In literature, environment education covering land works enables students to transform knowledge into behaviors and helps the students to build positive attitudes and values towards the environment. It also provides the students' behaviors to become more permanent and sensitive about the environmental problems (Keleş, Uzun, Uzun, 2010). Environment and nature education has mainly provided in primary schools with Social and Science and Technology lessons. There is no lesson plan on the curriculum of these lessons titled as nature and environment education. The acquisitions towards nature and environment education are provided in the various units of these lessons. Teachers and teacher candidates should teach the students that natural sources have an ending; such as water, forests, soil and mineral sources can be contaminated and they are dying out; all the creatures and human being depend on the nature and people have respect and responsibilities to the nature. While the studies conducted about the nature perception of the teacher candidates are highly important in order to light the environmental education, it is also significant to understand how the teacher candidates perceive the nature. There are few studies on nature perception and nature education in our country while there is no study on the reasons of their perceptions towards alienating from nature. Therefore, the purpose of the study is to present the ideas about alienating from nature and the perceptions of nature of primary science teacher candidates. The following questions were sought to be answered:

1. How are the nature perceptions of primary science teacher candidates?
2. According to their point of view, what are the reasons of alienating from nature?

## **2. METHOD**

### *2.1. Participants*

The study is a descriptive study. The study was conducted with 44 primary science teacher candidates who are student at Education Faculty of Siirt University during the academic year of 2012-2013.

### *2.2. Data Collection and Analysis*

The interview form was used in this study as a data collection tool that was formed by the researcher in order to determine the primary science teacher candidates' nature perception and their ideas about alienating from the nature. In the interview form there were two open ended questions. An expert was consulted about the questions, conducted data and coding process in order to confirm the validity of data. Direct speeches of the teacher candidates were used in the study. The expert's confirmation has taken for the validity of data considering the consistency of raw data, the results of this data and the statements related to the questions. The data was analyzed using descriptive analysis and content analysis. There were more than one answer and statements that can be regarded as more than one theme. Therefore, there was more frequency numbers in themes obtained in analysis than the number of the participants. In the study, each participant was numbered. These codes were symbolized as (TC1, TC2, TC3...) and these codes were used when providing teacher candidates' statements.

## **RESULT**

### *Nature Perception of Primary Science Teacher Candidates*

Nature perception of teacher candidates were analyzed and accordingly it was found that there were four themes as "nature as a living space, nature as a regression, nature as a whole and balanced, nature as a source" regarding their definitions. Themes, conceptual coding under these themes and frequency of the usage of themes were shown below. Examining their definitions about nature, 56,8 % of teacher candidates have been perceiving

the nature as a living space. Examples of statements of teacher candidates who perceive the nature as a living space are shown below:

*TC1: The living space where living creatures are born, live and die.*

*TC3: The living space where living and non-living creatures live in it interactively.*

*TC8: The land where birds, trees and people live in it*

*TC14: The green land is the nature where locates out of residential areas.*

*TC17: The nature is the land where we live in it.*

*TC22: It is the land where people and other living creatures live in.*

*TC26: It is the place that has been used by living creatures from the beginning of their life time until now.*

20,5 % of primary science teacher candidates define the nature as a place used with the purpose of regression. Their statements are:

*TC2: It is the place where people rest their souls, think healthy and sometimes be comfortable and have fun like a kid.*

*TC4: It is the place where people rest, where picnic areas are full of trees. Areas where good time is passed with the peace to be nested with green.*

*TC6: It is the place where humans rest their soul and body purified from technological devices. A place where people shelter together from crowd of the city even if it is for a short time.*

*TC9: A wonderful place of heaven for people and other living things.*

*TC12: It is an amazing place that hosts every kind of beauty inside.*

*TC27: A place to rest where people find peace.*

*TC32: They are natural areas where people relax and get fresh air.*

13,6% of primary science teacher candidates define the nature as a whole and balanced. The statements of the teacher candidates' who define nature as nature as a whole and balanced are as follows:

*TC5: Nature is a sum of events, living and non-living. Sum of communities consisted from plants, forests and animals.*

*TC31: It is the area where the living lives and interacts with their environment.*

*TC36: Where living and non-living environment is nested within in a balance.*

13,6% of primary science teacher candidates define the nature as a source. The statements of the teacher candidates' who define nature as a source are as follows:

*TC11: Nature is a life source for all the living.*

*TC20: Nature is the resource that helps individual to comprehend their existence.*

***Primary science teacher candidates' perception towards alienating from nature***

When primary science teacher candidates' perception towards alienating from nature is investigated, 40,2% indicate alienating from nature as busy work schedule, the intensity of the lessons and exams. According to this information, some of the teachers' statements are as follows.

*TC6: The pace of everyday life and work intensity*

*TC8: Spending too much time at school*

*TC11: The intensity of lessons*

*TC17: The intensity of exams*

*TC19: Our social duties (i.e. school, work, domestic affairs)*

*TC23: Not to be able to find a common time to spend with friends due to the intense pace of work*

25,7% of teacher candidates define the reason of alienation from the nature as the decrease in natural areas. Accordingly, some of the teachers' statements are as follows.

*TC2: Decrease and long distance of nature areas*

*TC7: Destruction of forests*

*TC11: Decrease in forest areas*

*TC15: Destruction of nature areas*

*TC27: Nature not to be beautiful as it used to be and destruction of nature*

17,9% of teacher candidates define the reason of alienation from the nature as technology addiction. Some of the teachers' statements are as follows.

*TC2: computer, internet*

*TC28: television*

*TC30: technology addiction*

10,4% of teacher candidates define the reason of alienation from the nature as concretion and urbanization. According to this information, some of the teachers' statements are as follows.

*TC2: unguided urbanization*

*TC7: concretion*

5,9% of teacher candidates define the reason of alienation from the nature as harmful animals in nature. Some of the teachers' statements are as follows.

*TC24: animals in nature*

*TC26: wild animals in the nature (e.g. Crimean-Congo disease)*

## **Discussion and Conclusion**

In our study, it has been found that primary science teacher candidates perceive nature as a living space and regression for the nature. It is followed by perceiving nature as a whole and balanced and nature as a resource. In

similar studies, Kökşer (2012) stated that most of the primary school students perceive the nature as "*botanical element*" while most of the teacher candidates perceive the nature as a life-space. In the study of Kahyaoğlu (2013) it is indicated that a majority of primary teachers perceive nature as regression purpose while others perceive as living space, forest and greenery. In Kutru and Soran's study (2012) university students' associate nature with green. Yardımcı and Kılıç (2010) indicate that primary students perceive environment as a place of plants and animals. Wenzel and Gerhardt (1998) stated that students identify nature with forest and greenery concepts (cited in Kutru & Soran 2013). In the study of Vining, Merrick and Prica (2008) participants define nature as untouched by human, not man-made, beautiful and peaceful place.

In this study, it is identified that teacher candidates places human very few in their nature perception. This condition may be caused by the perception of nature not being man-made according to teacher candidates. It has a vital importance to perceive the integrity, function, importance and multi dimensionality of nature to continue our existence on this planet. This can be achieved by being together with nature from an early age. It is very hard to expect to protect nature from a generation far away from it. Atasoy (2005) defines that social, economic, political and engineering errors that is caused by people from human – nature relationship is derived from cultural, ethical and misconceptions or lack of thinking. Along with this it is stated that drastic improvements in human – nature relationship should not be expected unless drastic changes are done in educational institutions that educate individuals on knowledge, culture and morals and gives environmental awareness, attitude and behaviors.

When primary school science teacher candidates' perception towards alienating from nature is investigated, 40,2% indicate alienating from nature as work schedule, the intensity of the lessons and exams. According to this, some of the teachers' statements are as follows. Louv (2009) stated that the cause of young people alienating from nature is the transition from real world experience to virtual nature. In Yardımcı and Kılıç's study (2010) it is identified that the education given to individuals is not sufficient to allow the integration with nature. In a study conducted by Verboom Vasiljev on middle school students, it was found that more than half of the students have very little or no exposure to parks, zoos, botanical gardens, or conservation areas (cited: Louv, 2009).

In conclusion, environment and preventing environmental problems, building better perception of the nature among people, preventing alienating from nature day by day via the effect of developing technology, enabling more nature experiences in order to form a sustainable relationship between human and nature and promoting nature education inside the nature are highly important issues.

### Abstract

This work proposes a teaching-learning activity encouraging students to think and discuss on social values: respect, solidarity, and a like. The main goal is the student becomes aware of economic and social extend of her own decisions. To this purpose, we design an activity combining experimental economics and structured debate discipline. This activity is developed in three phases. First, students participate in a laboratory economic experiment based on ultimatum game. Second, a structured debate on a controversial social topic is organized, affirmative team against negative team. And third, a discussion class to collect students' opinions and final evaluation.

**Keywords:** social responsibility, ultimatum game, experimental economics, structured debate.

### 1. INTRODUCTION

The present work offers a teaching-learning experience similar to Dickinson (2002), conducted to develop communication, analysis and critique skills from a social and economic point of view. With this purpose, the experiment joins two different methodologies: structured debate and economic experiment. On the one hand, the structured debate sets a framework for students to acquire and develop information and communication competencies. First, thesis and arguments require a previous searching and documentation work, and second the argument and rebuttal require a clear and precise communication style. On the other hand, the economic experiment allows the student to involve in the topic discussed beyond one person that watches, analyses and makes critiques, since her decisions have an economic interest to herself and her opponent.

Specially, this teaching-learning experience was carried on through two main phases. The first phase consisted of an economic experiment based on ultimatum game. Two weeks later took place the second phase: a structured debate. Students were distributed in teams of three or four students each, and then teams were paired. One team was assigned the role of affirmative group and the other the role of negative group. From students' proposals the issue to discuss was selected. Proposals should be on a social and controversial concern. It deserves to be mentioned the fact of students were enrolled in their first course of degree on Business and Administration (BA) (Economics Faculty of Valencia University in Spain).

\* Corresponding author. Amalia Rodrigo-González, Department of Corporate Finance, Faculty of Economics, Valencia University, Avda. Los naranjos s/n, 46022, Valencia (Spain). Tel.: +34-96-382-8369; fax: +34-96-382-8370.

*E-mail address:* Amalia.Rodrigo@uv.es

The main goal of this activity is to create interest and consciousness in students on social responsibility issues with economic value. Through this experience, the student takes decisions, reacts when her own interest is involved and faces up the others' opinions on the debated issue.

In opinion of students expressed in ad hoc questionnaires, this activity allowed them to make a deep reflection on social values by an amusing and interesting activity, game-debate, which awakes logic reasoning and consciousness on the consequences of actions and decisions for oneself and the others.

The structure of the paper is the following: in section 2, the theoretic model is explained together a brief review of related literature. The section 3 is devoted to the design of the classroom experiment (game and debate). In section 4, a statistical analysis of experimental data is showed. Students' opinions on learning experiment are reported in the section 5. The section 6 concludes the paper.

## 2. Theoretical Model: Ultimatum Game

The ultimatum game (Güth et al., 1982) is a two-player sequential game. The players face a resource distribution problem under unequal bargaining conditions. The final distribution of resources between players depends on their individual decisions. The first player (proposer) proposes how to divide the resource between the two players, and the second player (responder) can either accept or reject this proposal. If the second player rejects, neither player receives anything. If the second player accepts, the resource is split according to the proposal.

The Fig 1 (a) shows the extensive form representation of an  $x$  proposal ultimatum game. The proposer offers the amount  $x$  of  $M$ . If the responder accepts, she receives  $x$  and the proposer  $M-x$ . If she rejects the offer, neither player receives any amount.

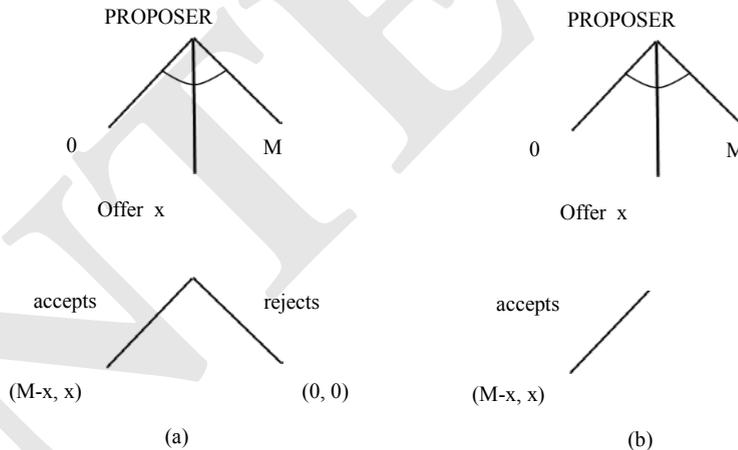

Figure1: Ultimatum game *versus* Dictator game

The game is solved by backward induction. Clearly, the responder's decision will be to accept all non-zero offers, since the payoff when she accepts is greater than when rejects the offer ( $x > 0$ ). The proposer knows it, and will offer the minimum possible amount to maximize her own payoff ( $M-x$ ).

According to the standard prediction of Economics Theory, on the one hand, the rational proposer will offer the minimum amount possible and keep the rest for himself, almost the whole. On the other hand, a rational responder will accept any small amount, because anything is better than nothing. However, this prediction is not corroborated by experimental economics studies. The experimental evidence is that responders punish excessively selfish proposers by rejecting their offers. Sometimes, proposers make 50%-50% offers due to a moral sense, or the fear of rejection and to loss everything.

A variant of ultimatum game is known as dictator game (Forsythe et al., 1994). The responder does not have any decision power (Fig 1(b)), therefore, the offer is never rejected. The distribution of resource only depends on the proposer's willingness to share.

The results of earlier experiments (Hoffman et al., 1994) on individuals' altruism behavior based on dictator game with anonymity of subjects show that the 46% of dictator players share the 30% of resources at least. The authors interpret anonymity as fairness indicator as a pure preferences phenomenon, and discuss that the apparent altruism behavior could be due to the social importance that the proposer gives to what the others think of him. Some alternative explanation of anonymity effect are: (1) can eliminate the motivation to make donations because the beneficiary is not identified, and (2) proposer's decision depends on personal valuation but not the social valuation (Eckel & Grossman, 1996).

The fairness hypothesis has been tested by comparing the distributions of offers made by proposers in the ultimatum game versus the dictator game (Forsythe et al., 1994): if non-trivial offers are only by fairness, the both distributions will be equal. This presumption is not experimentally corroborated, since there are significant differences: i) the 22% of proposers in the dictator game play altruistically (at-least-50% offers), the number rises up to 65% in the ultimatum game. ii) The 0% of proposers in the ultimatum game offers the subgame perfect nash equilibrium amount, this percentage is 36% in the dictator game. Similar experiments support the previous results (Eckel and Grossman, 1996), the 62.5% (30 out of 48) of dictator players do not share anything, and the 8.3% of them does at least the 50%. However when the beneficiary player is a charity institution, dictators behave differently: the 27.1% (13 de 48) does not make donation and the 31.25% donates less than the 50%.

It is important to remark that the proposer assumes an opportunity cost related to the reject risk. This risk is only present in the ultimatum game, where the responder has decision power. The reject risk depends on the responder's reservation value that the proposer does not know. Therefore, the proposer will reduce the reject risk by increasing the amount offered.

### **3. Design of Classroom Experiment: Game-Debate**

The experiment was run with students enrolled in the first course on BA Degree of the Faculty of Economics (Valencia University, Spain): 79 students distributed in two groups of 54 (23 males and 31 females), and 25 students (12 males and 13 females), respectively.

The first part of the classroom experiment, ultimatum game, took place for 90 minutes of a practice class of the subject "incorporation to university" at the middle of quarter. The second part was developed in the two next classes linked to the underlying topic: social responsibility. The week before the ultimatum game experiment, students were informed about the activity, no information on content was given. The attendance was compulsory and the score summed up to the student's final score of subject. They were said that the minimum score possible was 0.25 and the maximum 1 point. A linear rule was used to compute the student's score. This rule was a

function of the student's payoff, and the minimum and maximum payoffs of assigned group, responders or proposers. Two separated rooms were needed to run the experimental game and also the help of two mentor students. The proposer players were allocated in one room, and the responders in the other. In this way anonymity was guaranteed. The students were cry-out called one by one, given an identification number, and the set of instructions. The game was played 10 rounds, in each round each proposer was randomly paired to a responder. The pairs were always different, thus reciprocity between the two players was not possible. The phases completing the game-debate activity are described below:

- **Game phase:** The teacher reads instructions aloud (15 minutes), and 10 rounds were played. Each round was organized as follows: (1) Students were said the amount of resource (pie) available. Each proposer took her sharing decision and wrote down her offer in a piece of paper that handed to the teacher (2 minutes). (2) Once responders received offers from proposers, they had 2 minutes to accept or reject them and fill up their decision sheet. (3) Next, the piece of paper was back to proposer, who took note of the responder's decision and the gain obtained in the round (2 minutes). After finishing the experimental game, students were asked to fill up a questionnaire: (1) What do you think is the underlying topic? (2) Find an example of the real life. (3) Do you think you would have played in the same way if your pair had been a friend of yours? (4) How do you consider yourself: selfish, altruistic, equalitarian? (5) How do you think you would have played the opposite role? (6) Which social values are important to you? (7) What of the activity do like or dislike you the most? (10 minutes)
- **Debate phase:** Through a debate activity the underlying topic (social responsibility) was developed from another point of view. Critical reasoning and synthesis skills were emphasized rather than verbal or non-verbal communication skills. One 90-minute class was dedicated to explain the structure of debate and students made a written practice on how to postulate arguments for and against, and another 90-minute class to the very debate. Students proposed some general concern questions to debate, they showed particularly interested into the followings: "Public vs Private Health Care Systems", and "Public vs Private University Studies". Students were distributed in teams of three or four students, the teams were paired, and assigned to the negative or affirmative side to debate. They were given a week's time to research and argue for and against. The class debate lasted 50 minutes, 25 minutes per pair. The formal debate was structured as follows: (1) The affirmative team opens the debate and presents their case for 3 minutes. (2) The negative team presents their case for 3 minutes. (3) The affirmative team presents their first rebuttal for 4 minutes. (4) The negative team presents their first rebuttal for 4 minutes. (5) The affirmative team presents their second rebuttal for 4 minutes. (6) The negative team presents their second rebuttal for 4 minutes. (7) The negative team presents their summary for 3 minutes. (8) The affirmative team presents their summary for 3 minutes and closes the debate. (9) The audience decided the most convincing argument and the winner team was determined.
- **Discussion phase.** In order to connect the game phase to the debate phase, students were encouraged to find out similarities and differences between both experiences. In doing so, they were able to bring together social and economic aspects existing in bargaining process between agents, individuals or institutions.

#### 4. Quantitative Analysis of Experimental Data

This section is devoted to the quantitative analysis of experimental game played by students. Two sessions were run, the first one is the baseline case, and the second the treatment. In order to contrast the behavior of proposers, which is represented by the offer, from one session to another, the message "She/He is in your hands"

was added in second session instructions for proposers, only. We conduct a basic statistical analysis to study the raw data of the experiment.

#### 4.1. Basic statistical analysis

In order to gain a first intuition on players' playing, we begin with the graph analysis of results of two experimental sessions. The box and whiskers diagram (Fig 2) elaborated on the percentage offered of pie in the ultimatum game is useful to detect the existence of homogeneity in mean or/and variance between the two groups of proposers and as well as the existence of extreme values. At first sight we find that interquartile range ( $IQR = Q_3 - Q_1$ ) of the session 1 is greater than that of session 2 (0.05 vs 0.025). Therefore proposers of session 1 show a more opinion variability. There exist extreme values, although more compensated in the session 1 than in the session 2. In the session 1, extreme values produce a slight positive asymmetry of 0.29, whereas in session 2 very low extreme values produce a negative asymmetry of -3.78. There is a negligible difference between the mean values of both sessions (47%-48%). However by comparing empirical distribution functions of percentage offered by proposers of each session (Fig 2) significant differences are found. According to the two-sample Kolmogorov-Smirnov test, it rejects the null hypothesis  $H_0$ : data come from the same distribution function ( $D = 0.3231$ ,  $p\text{-value} < 0.0001$ ). This evidence provides our first result: the two groups of proposers are not homogeneous, that is to say, they behave differently in relation to sharing decision.

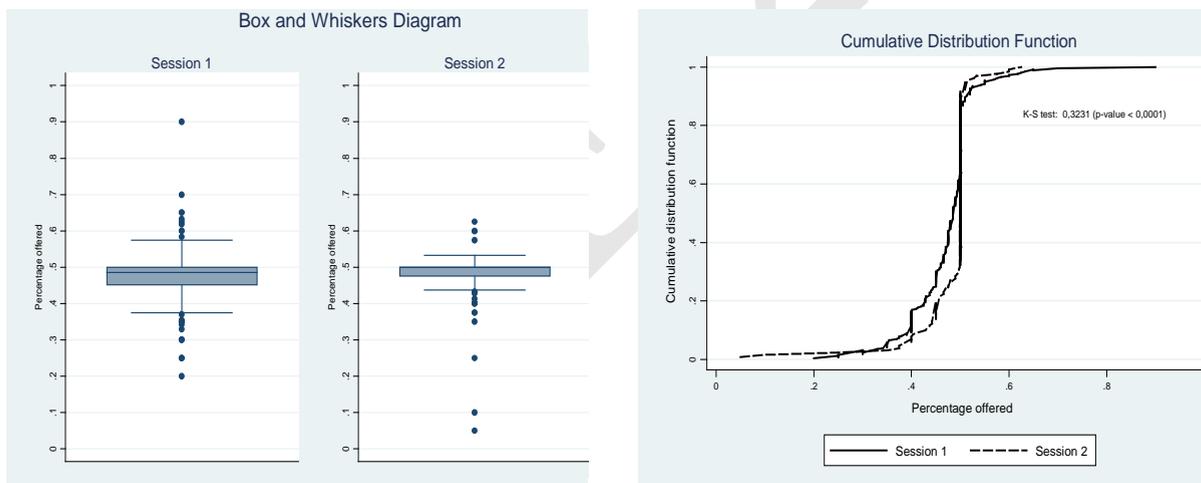

Figure 2: Box and Whiskers Diagram and Cumulative Distribution Function of experimental results of ultimatum game.

Recall that in each session students played 10 rounds, they were randomly and anonymous paired, and the pie size changed each. The pie available in each round was determined by random selection without replacement from the set  $\{1, 2, 8, 10, 20, 35, 50, 75, 100, 200\}$ . Fig 3 shows percentage offered per round by proposers of the sessions 1 and 2 in the ultimatum game. The blue line represents the average percentage, slightly below 50% in both sessions. The red (green) line represents the maximum (minimum) percentage. The width of bounds (max-

min) session 1 is larger than those of session 2, what indicates that the first group of proposers shows more variability than the second.

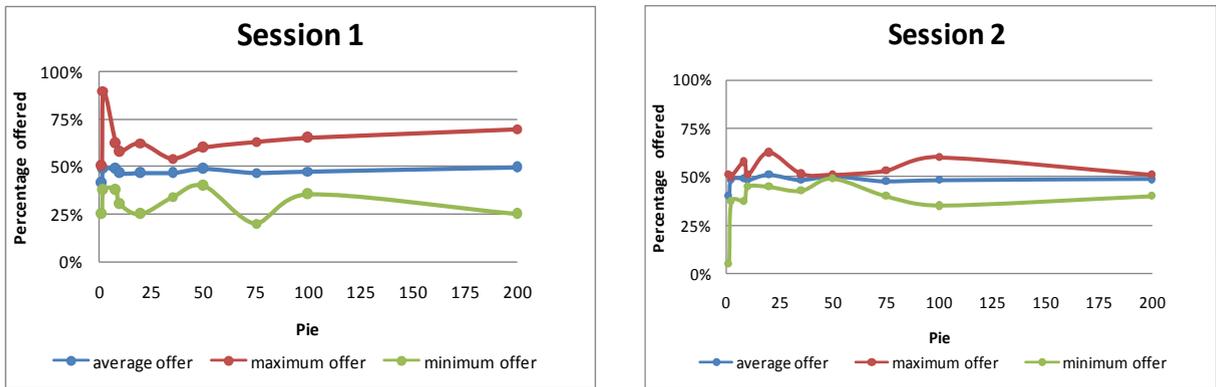

Figure 3: Average, maximum, and minimum percentage offered in ultimatum game.

Students were asked for additional information without effect in their gains: *How much would you offer if there was no reject risk (dictator game)? How much is the minimum offer acceptable to you?* The findings from proposers' answers are the followings: (1) The average percentage offered decreases in both sessions: between 16% and 24% in session 1, and between 1% and 8% in session 2. (2) The discrepancy of opinions increases between sessions. Proposers of session 1 show more solidarity than those that of session 2. The relative frequency histogram of percentage offered in each game (ultimatum *versus* dictator) and session let us detect the differences of behavior of the two groups of proposers.

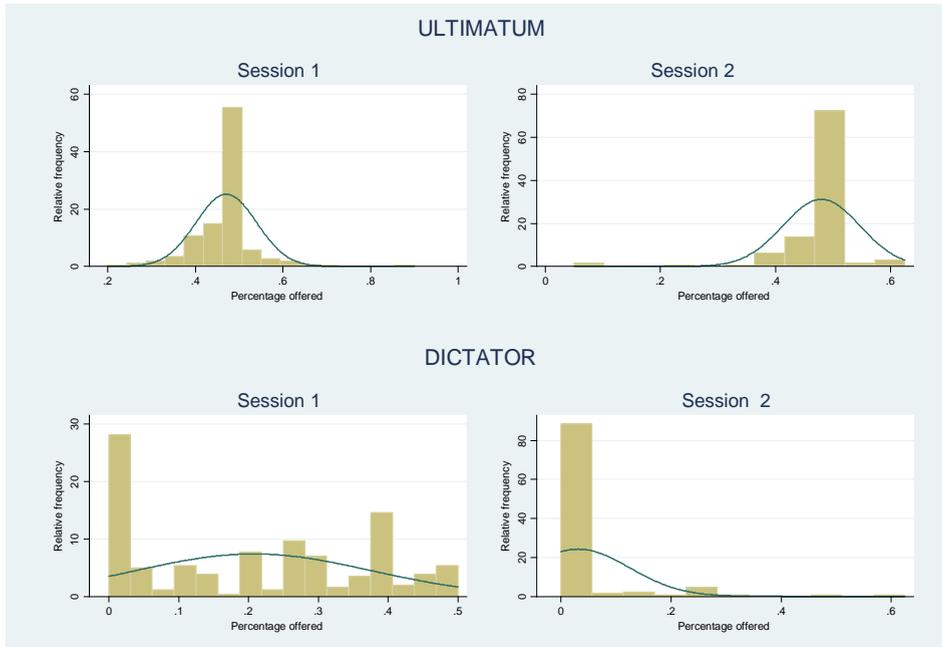

Figure 4. Histograms of relative frequencies

In relation to the question made to responders about the minimum acceptable offer we compute the envy coefficient by Fehr and Schmidt (1999). The responder will accept the offer  $x$  if she obtains a higher utility than rejecting:  $U(1-x, x) > U(0,0)$ . Then, responder's utility will equal the offer  $x$  minus the dissatisfaction by receiving an amount less than that of proposer ( $x < 1-x$ ). The responder's utility can formulate as  $U(1-x, x) = x - \alpha(1-2x)$ . Let  $x^*$  be the minimum amount that the responder would accept, the envy coefficient  $\alpha$  is computed from the equation  $U(1-x^*, x^*) = x^* - \alpha(1-2x^*) = 0$ , as  $\alpha = x^*/(1-2x^*)$ . Table 1 shows the approximation to responders' envy degree, computed for the average minimum percentage required for accepting the offer. The Wilcoxon sum rank test, applied to the two independent samples, does not let reject the equal median null hypothesis,  $H_0$ : responders of session 1 and session 2 have the same median envy coefficient ( $p$ -value = 0.1619). Now, we provide our second result: both groups of responders exhibit the same median envy degree.

In relation to the percentage of offers accepted: responders of session 1 accept between 50% y 89% of offers received (mean = 75%, median = 77%). The numbers for session 2 are 62% y 92% (mean = 83%, median = 85%). According to the Wilcoxon sum rank test the null hypothesis of equal median values is accepted ( $p$ -value = 0.1187).

We finish this section with two questions on gender. The first one: *Who reject more men or women?* Aggregated results (Fig 5) show that 27% (20%) male (female) responders reject the offer received. Therefore, men reject more than women. In session 1, this difference grows up to 10 points, whereas in session 2 the difference of 1 point is in favor of women.

The second question is related to proposers: *Who offer more men or women, and under which conditions?* Figs 6 and 7 represent the distribution of proposers by gender, level of offer, and session under ultimatum and dictator conditions, respectively. Under reject risk condition (Fig 6), the modal level of offer is between 25% and

50% of resource. The percentage of men and women offering this level are 87% and 84% in session 1, and 85% and 94% in session 2. In addition, in session 1 the 16% of women offer more than 50%, only 10% of men offer this percentage. Therefore, we can say that women are somewhat more generous than men in session 1. The opposite happens in session 2, 13% of men and 2% of women offer more than 50%. When there is no reject risk (Fig 7), the gender result holds for session 1: 47% of women offer more than 25%, whereas 72% of men offer less than 25%. However in session 2 the higher percentages of men and women are for zero offer (88% vs 68%). Therefore, when responder is under absolutely indefence conditions, it seems that women have more propensity to sharing than men. We conclude the third result: on average, women accept lower offer and make higher offer than men.

Table 1. Responder's envy degree,  $\square = x^* / (1-2x^*)$

Pie	Round	Session 1	Session 2
1	2	4.60	11.50
2	5	4.26	12.83
8	4	9.11	4.61
10	6	6.18	4.95
20	1	7.22	7.00
35	9	8.99	3.62
50	8	9.50	5.05
75	7	5.10	3.59
100	3	8.17	4.12
200	10	15.96	5.21
average		7.909	6.248
median		7.695	5

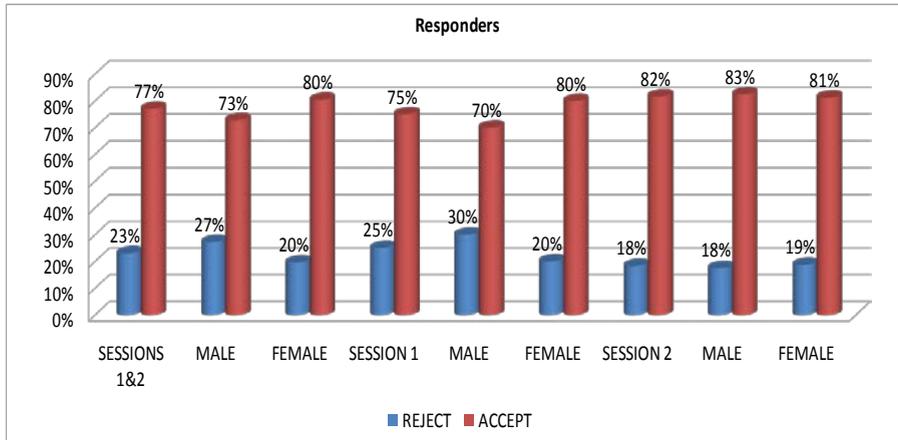

Figure 5. Distribution of responder's answer (by session, and gender).

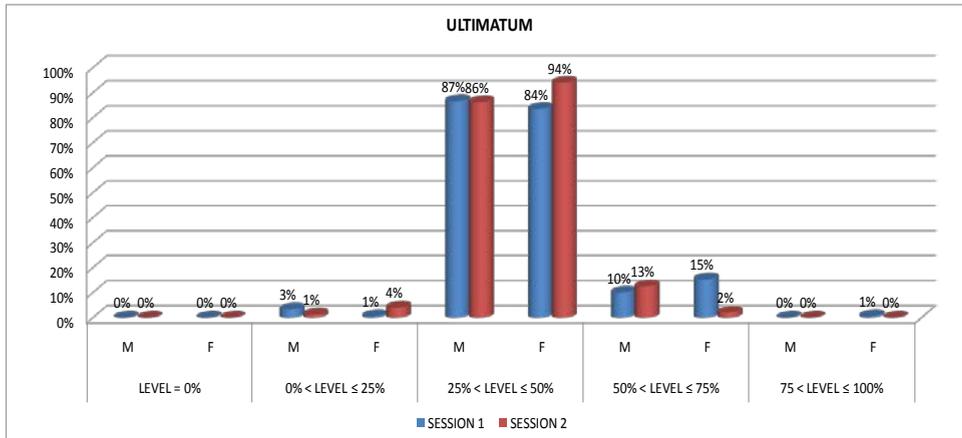

Figure 6. Distribution of ultimatum proposer's offers (by session, and gender).

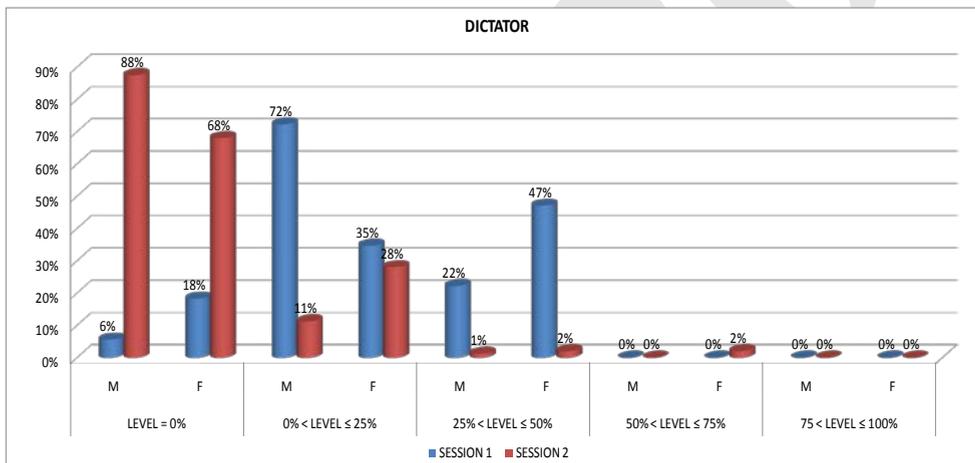

Figure 7. Distribution of dictator proposer's offers (by session, and gender).

### 5. Qualitative Analysis: Students' Opinions and Evaluations

Just finished the first phase of the experiment, ultimatum game, students were asked to fill up a questionnaire of some questions on the experience. We get usefull and interesting information from answers.

First, students made an interpretation of game and the underlying topic. The results can be summarised as follows: (1) Most students thought of game a recreation of economic agents interaction, such as consumers-companys, institutions-users, and so on. (2) Some of them declared that the target was to maximise profits, exercise strategic skills and competitive spirit. (3) They found similarities between the ultimatum game and the supply and demand. Students associated the fact of accepting offers to the reservation price or maximum price

that they would pay to buy a product. As a first conclusion, we can say that few students thought of underlying topic related to empathy or generosity towards the others. They understood the game as a competition one.

Second, we asked students to find real life examples organized under similar rules to ultimatum game. They gave some interesting examples: (1) Prices of products and consumer's decision to buy or not. (2) Studies on willingness to buy before launching a new product. (3) Labor market, the worker accepts or rejects offers depending on wages. (4) At home, sometimes one needs to bargain rooms or wages. (6) Auctions and bets.

In spite of main target was to encourage reflection on social fairness, some interpretations of students have been studied by literature, for instance, Gächter and Ferhr (2002) on labor market.

Third, according to Cabrales and Ponti (2011), the proposer's behavior could change if the responder was a relative or friend. The results of answers given by students are the followings: In session 1, the 40% of students would not change their offers, the rest declared that they had been more sensitive and equalitarian. In session 2, the 65% of students found some reasons to change their behavior. Some students claimed that one offers an equalitarian agreement to a friend. However, other students thought of getting advantage of friendship, because a friend accepts anything.

We think that the fact of a higher percentage of student proposers in session 2 changed their mind could be due to relax the idea of absolute power reinforced by the message "She/He is in your hands". This sentence could have induced a selfish behavior maximizing profit without taking into account others.

Fourth, students were asked to declare the self-perception on altruistic, selfish, and equalitarian character. In session 1, the 62% of students said to consider themselves as equalitarian, the 32% as selfish, and the 6% as altruistic. In session 2, the respective percentages are: 80%, 14%, and 6%.

This classification is in line with experimental results. On average, the percentage offered was around 47%. Therefore, except some outlier cases, most proposers offered an amount close to 50% of the whole.

Fifth, in order to contrast the behavior exhibited in ultimatum game, students were asked to express the minimum offer under no reject risk conditions (dictator game). The offers were not equalitarian at all. In session 1, students offered a percentage between 16% and 21%. In session 2, the average percentage fell up to 0%.

Finally, students were asked for social values considered important to them. The oftenest ones were: respect, equality, honesty, sincerity and friendship.

Two weeks later of the game experiment and after the debate class, a discussion class was developed to highlight differences and similarities between the ultimatum game experiment and debate on social topics. This class was structured in the following steps: (1) *Brainstorming*. We asked students to share ideas on the relationship between the game and the debate. In the blackboard, the teacher wrote words such as economic agents, public resources, private resources, human capital, taxes, distribution of wealth, bargaining power, social inequality, solidarity. As result, the topic of game experiment emerged in a natural way: *distribution of resources under unequal bargaining power*. (2) Make a comment of the following sentence by Ferh and Schmidt (1999): "Almost all economic models assume that all people are exclusively pursuing their material self-interest and do not care about "social" goals per se"(pag.817). More than 50% of students agreed. Students argued for a few minutes, some of them thought of being selfish is similar to nasty and inconsiderate to others. We clarified the term selfish as "one is in charge of her/his own responsibility" and this is maturity. (3) Explanation of the

ultimatum game and dictator game in extensive form representation (Fig 1). Students concluded the results of the subgame perfect Nash equilibrium. (4) We showed the experimental evidence: proposers offer between 30% and 40% of pie, and responders reject offers less than 30% of pie. (5) Which factors could explain proposers' and responders' behavior? Students answered that proposer's behavior could be due to reject risk. And they related responder's behavior to emotions. We concluded with Ferh and Schmidt (1999) model. (6) Finally, students' results obtaining in the game experiment were showed and commented. Higher grades were obtained by responder students accepting all offers received.

## 6. Conclusions

We found that the full activity proposed in this paper was a useful and interesting activity to involve students in an interactive exercise which increased sensitivity in the social responsibility and justice issue. In addition, analysis of students' answers and choices offer us some interesting conclusions.

Firstly, we can observe as within the ultimatum game, students tend to offer a piece of pie near 50%. We calculate students profits as a function of the student's payoff, and the minimum and maximum payoffs of assigned group, therefore the most rational behavior seems to be offer 50% of the pie.

However, within the dictator game, when there is no risk of rejection, strong differences in the proposers' behavior were found. Proposers try to obtain the maximum benefit offering a very little part of the pie, in some cases near to 0%. Under this situation, students didn't show any feeling of solidarity with the responders.

These results strongly contradict the opinion that students have about their selves. Specifically, in group 1, the average offers are about 20% and 62% of students consider themselves as an egalitarian, while in group 2, the average offer was around 0% and the 80% of the students defined themselves as egalitarian.

Secondly, results showed some behavioral difference between genders. On one hand, we found that men reject more than women. On the other hand, in group 1 women are somewhat more generous than men, while opposite happens in session 2. However, under no rejection risk it seems that in both groups women have more propensity to sharing than men.

Finally, the full activity proposed in this paper put students in a situation in which they have to take decision and chose a specific orientation for their decisions and opinions. When students realizes about the differences between their self-perception and their choices, they can reflect about the link between core values and everyday actions and decisions. They can also realize that discourses about values are not abstract theories but are part of life and daily decisions.

Therefore, the main goal of this activity was achieved. This experience creates interest and consciousness in students on social responsibility issues with economic value. They could take decisions, reacts when their own interest is involved and faces up to others' opinions on the debated issue.

We firmly believe that any university graduate, perhaps especially BA graduates, should acquire particular sensitivity in social responsibility and justice issues, in order to apply it in their work and daily lives. Therefore, subjects which encourage reflection and sensitivity in this field should be integrated into academic programs. Meanwhile, activities as the proposed in this work can be a useful tool, which allows students to gain maturity in thinking and feeling in decisions related to social responsibility and justice issues.

## Acknowledgements

We really appreciate all comments received from participants of V Workshop on Teaching on Economics celebrated in Toledo, Spain, June 2013. Also we thank the Service of Innovation in Education of Valencia University the financial support.

## Abstract

This study has been conducted with the aim of analyzing the relationship between Self-confidence and Personal Growth Initiative Scale levels of employees and managers. All the employees and managers are selected from big companies and schools which is in Istanbul and the rest of the employees participants are also selected by the using random selection method from small shops or companies. Such descriptive statistics as mean, standard deviation as well as reliability analysis, independent T test and correlation analysis have been made use of within the scope of the research. The results suggest that there are relationships between the self-confidence and Personal Growth Initiative levels of employees and managers. Although the data acquired is rather recent, it would not be wrong to claim that they are striking. This is the first time self-confidence and Personal Growth Initiative are investigated with level of employees and managers in a thesis therefore the research is important. As can be seen, between level of employees and managers, Self-Confidence and Personal Growth Initiative are positive according to gender. Some of the data acquired by means of the investigation seems to support hypotheses. That is, there are meaningful differences in terms of age as far as self-confidence and personal growth initiative of the employees and the manager are concerned.

*Keywords:* employee, Manager, Self-confidence, Personal growth initiative

## 1. Introduction

Self- confidence is considering from subjective perspective and thinking about themselves abilities or failures. Moreover self- confidence encloses to comment on you and after these commenting, results of this comment and reflections of feelings about it (Kasatura, 2000). Personal Growth initiative usually means to be understood like increasing inherent energy. But when we search the concept about this thesis, it changes. It isn't only about inherent energy, if it's considered closely, (that's important) it effects a situation's conduct, continuity and results (Brenegar, 2005).

A person, who has self- confidence, proves oneself with his/her abilities and achieves. Person can see his/her positive ways and when he/she achieves something, they would know that these achieves are results of conscious and to assume responsibility (MEB, 2008). They don't only see the positive ways; they see and accept their negative ways. As part of Almanac Higher Education efforts; concept of self- confidence germinates at a young age. So infancy, childhood and adolescence are the most important periods. If a child has a positive

\* Corresponding author. Tel.: +90 216 444 0 413/2217

E-mail address: rabaci@gmail.com

individualism, then they can be more curious, successful and social than the others. As we see, self- confidence carries with different concepts (The NEA Almanac of Higher Education, 1995).

About researchers, people who have self- confidence love themselves. They accept negative and positive ways about themselves. According to them, all the people can be powerful and powerless. Sometimes, in some articles, self- confidence and leadership are together. If managers and employees treat a question under several heads, most of the managers are working better when the employees are comfortable and glad full at global companies (Tutar, H., Altınöz, M., & Çakıroğlu, D., 2009)

If there are complication and chaos, employees can need a leader who has a talent about solving problems and keeping calm. Leaders are the people who can catch the new chances after big exchanges. In spite of having certainty and danger, they appraise these and create new forms (Zel, 2006).

The concept of individualism which is mixed in self- confidence is formed of social interaction and people identify the social environment with perception of individualism. People accept the experiences which are suitable in concept of individual; they regret which are not suitable or they change the concept which can connect with the perception of individuality. Sometimes people want to have some specialties which they have not. Correspondingly, people can't be glad full the specialties that they have. At this point, if people want to have something different, that means "Ideal Individuality" (Rogers, 1959).

According to Super (1963, 1970), career choice is a declaration of person's designs about oneself and individuality. So, there are lots of common point between specialties of people and career choice. This study is important because of minor workings about personal growth initiative. From a national perspective, there are rarely studies about comparison of self- confidence and personal growth initiative. So this study will supplement to the future studies.

## 2. Purpose

The purpose of this research was to explore the relationship between self confidence levels and personal growth initiative skills between managers and employees. In this study we hypothesized that there will be a positive relationship between confidence levels and personal growth initiative skills. In addition, in this study, the subquestions below will be answered. These questions are;

Are there any expressive affairs between self- confidence ranks and personal growth initiative of managers and employees?

Are there any expressive affairs of self- confidence ranks between managers and employees?

According to gender, are there any expressive affairs about the self- confidence ranks of managers?

According to gender, are there any expressive affairs about self- confidence ranks of employees?

According to gender, are there any expressive affairs about personal growth initiative ranks of managers?

According to gender, are there any expressive affairs about personal growth initiative ranks of employees?

## 3. Method

### 3.1. Research Methodology

This study is arranged at comparative relational scanning model. This model is defined about changing degrees together between two or more variables. In that model starts from the most possible solution with the comparison way, the reasons are decreased to “one” reason.

### 3.2. Participants

Study participants are composed by managers and employees. Sample group is between 25-40 and in all, there are 165 (%52.4) women and 150 (%47.6) men. Present study is limited with the answer of 315 people who is called as managers and employees. Therefore it's impossible to be analyzed the entire sample, the study is limited.

### 3.3. Data Collection

#### *Personal Information Form*

The purpose to prepare this form is to gather information about participants and their socio- demographic occasion. In this form there are 4 questions about age, gender, to know about manager or employee and their sector.

#### *Self- Confidence Scale*

Self- confidence measure is used to realize self-confidence scale .Self- confidence measure's points are between 1 and 5. After the inquiries, if we look the substances, under two factors; the substance which is in first factor is related more internal than the other factors and it's called “internal self- confidence”. These symbolize about love and to know one self thinking about positive ways, to know powerful and powerless. Second factor is related self- confidence with social environment, so it's called “external self- confidence”. These are about communicating easily, to speech/ criticize about one self clearly, to control the feelings and to get risks.

#### *Personal Growth Initiative Scale*

Personal growth initiative measure is used to realize personal growth initiative skills. It's developed by Claes, Beheydt and Lemmens (2005). The scale is adapted to Turkish at 2011 by Akin and Anlı (2011). The points of personal growth initiative measure are between 1 and 6. 1 means: “I certainly don't agree” and 6 means: “I certainly agree”. The original form of the measures: 1 means: I certainly don't agree, 2 means: I generally don't agree, 3 means: I rather don't agree, 4 means: I rather agree, 5 means: I generally agree and 6 means: I certainly agree. The highest point of the measure is 54 and the minimal point is 6.

The data which get are loaded to the computer. To compare the ranks; correlation is used. Moreover the differences are compared by “t” test.

## 4. Findings

Correlation is used to determine to answer of this question: “Is there a significance relation of self- confidence and personal growth initiative skills between employees and managers or not?” The findings which are acquired are Table 1.

Table 1. Descriptive Statistics and Inter-correlations of the Variables

Variables	1	2	3
1. Internal self- confidence	1.00		
2. External self- confidence	.66**	1.00	
3. Personal Growth Initiative	.56**	.47**	1.00
Mean	72,25	63,04	40,93
Sd	7,52	6,80	5,96

\*\* p< .01.

When the table is analyzed a significance relation can be seen. There is a positive relation between internal self- confidence and external self-confidence with personal growth initiative. There's positive relation between internal and external self-confidence too. In conclusion personal growth initiative is mostly interactional with internal self-confidence; there's positive relation. Internal self-confidence is the only strong variable.

Table 2. Manager's Self-Confidence Levels in Terms of Gender

Variable	Gender	N	X	Ss	t	Sd	P
Internal self- confidence	Female	65	71,72	7,68	1,734	157	.08
	Male	94	69,45	8,44			
External self- confidence	Female	65	62,34	6,92	1,862	157	.06
	Male	94	60,23	7,06			

The t test is a significance test which is used to compare the differences between two averages. In table 2, according to gender variable, self-confidence points average and standard deviation is seen. According to the form, there isn't any significance difference about internal self- confidence and external self-confidence:

Table 3. Employer's Self-Confidence Levels in Terms of Gender

Variable	Gender	N	X	Ss	t	Sd	P
Internal self-confidence	Femal	100	73,9	6,4	0,695	154	.48
	Male	56	74,63	5,97			
External self-confidence	Femal	100	65,14	6,09	0,321	154	.74
	Male	56	64,82	5,67			

In table 3, according to gender variable, self-confidence points average and standard deviation is seen. As we see, there isn't any significance relation about internal self-confidence and external self-confidence.

Table 4. Manager's Personal Growth Initiative Skills in Terms of Gender

Variable	Gender	N	X	Ss	t	Sd	p
Personal Growth Initiative	Femal	65	39,6	5,89	0,164	157	.87
	Male	94	39,77	6,5			

In table 4 according to gender variable; personal growth initiative points averages and standard deviation is seen. According the form, there isn't any significance relation about personal growth initiative.

Table 5. Employer's Personal Growth Initiative Skills in Terms of Gender

Variable	Gender	N	X	Ss	t	Sd	p
Personal Growth Initiative	Femal	100	42,49	5,06	0,92	154	.35
	Male	56	41,66	5,96			

In table 5, according to gender variable, personal growth initiative point's average and standard deviation is seen. According to the form, there isn't any significance difference personal growth initiative of employees.

## 5. Discussion

The diagnosis which had acquisition will be discussed according to inquiries (hypothesis) and will be annotated in hypothetical perspective (outlines). The aim of this study is analyzing and comparing the relation of self- confidence and personal growth initiative skills between employees and managers. According to this purpose, all the surveys are strained to employees and managers in big companies and schools in Istanbul and the rest ones are strained to the specific sectors (transportation, education and health). The surveys have the information of demographic characteristics, self- confidence ranks and personal growth initiative skills. They're implemented face to face technique.

All the questions which is in the surveys are multiple- choice questions. The data which acquisitioned are analyzed with SPSS 11.5 programme. Item analysis and construct validity are implemented and according to the purpose, correlation analysis, parametric, non- parametric tests, reliability analysis and descriptive statistics are used. According to the measure of self- confidence, sample 796 high school students groups are selected from Istanbul, Kocaeli and Sakarya. 135 students are from Istanbul, 213 students are from Kocaeli and the rest (448) ones are from Sakarya. Girls are 386 (%48) and the boys are 410 (%52). 285 of them are at the first class (%35.8), 243 of them are at the second class (%30.6), and the 268 of them (%33) are from third class students. The factor analyze is the determining factor which discovered by Tabachnick and Fidell(1996) to create the number of the work group. According to these criterion, 300 people as "good", 500 people as "very good" and 1000 people as "perfect".

This analyze doesn't include 27 students who choose always the same answers or who doesn't choose only of the answers. As it's told before, t test is used to realize the significance differences about gender variable. Gender variable is examined in detail in this study.

Starting point of this study , it's assumed to get significance differences about self- confidence measure between employees and managers. According to the diagnosis, the dimensions of self- confidence (internal and external) haven't got differentiations between women and men. It's both valid for managers and employees. If it's looked out sectorial perspective "the parallelism is appearance": managers and employees from companies to petty dealer. The t test is used to betray the power of independent and/or parallel groups. The results show the parallelism in self- confidence between genders. That means there's no significance difference between genders.

The results of some meta- analysis show the interaction between personality, social environment, work life and personal growth initiative. In this parallelism, there's a big interaction with self- confidence, too. It is seen that, there's a positive and significance relation between self- confidence and personal growth initiative. (Öğüt, Akgemci ve Demirsel, 2004). The Turkish form of personal growth initiative measure is done to 2 groups. Moreover the validity and reliability analysis are examined, too. First group occurs from 336 high school students; testing and repeating the test, 111 students had done the measure again 4 weeks apart. 68 English teachers worked for the linguistic equivalence of the measure.

Personal growth initiative is associated with self- confidence rank. At the end of the study, there isn't any significance relation about personal growth initiative skills between employees and managers. Both of the genders and two perspectives (managers and employees), there is a positive relation between personal growth initiative and self- confidence.

In this study, it's assumed to get significance differences about self- confidence and personal growth initiative measures between employees and managers. The diagnoses are proved.

## Abstract

Today, the importance and necessity of technology use is an undisputable matter. Thanks to this, it has become possible to advance in education. Educational/instructional technologies (computer-aided teaching, material development etc.) and music technologies (sound recording, tonmeister etc.) are separate disciplines. The aim of this study is not to investigate only one of the above fields and then make inferences. However, what comes to the mind first when it comes to music, education and technology are the ones above. Therefore, these concepts will be explained in order to prevent a potential incomprehensibility and to lay the scientific foundations of the study. Advanced technologies are used effectively in music and music education, as they are in all other fields. If a music educator is unaware of useful technological facilities, it is necessary to look for such facilities in the environment in which s/he is active and especially in the educational environment. An educator can use something in her teaching activities to the extent she knows and comprehends it. For this reason, in terms of the relationship between music, education and technology; an education on using technology should be provided on the issues of educational environments (schools, courses etc.) and education systems (curricula etc.). Thus, the main purpose of this study is not to define the extent to which music educators use technology, but to determine the extent to which music education programs include this education and to underline the necessity of using them effectively. To this end, the universe of the study consists of conservatories and departments of music education in Turkey. These programs will be compared, courses in these programs aimed at teaching technology use in music education will be examined, and findings will be interpreted.

**Keywords:** Conservatories, Departments of Music Education, Music Education and Technology Use.

## 1. Introduction

The advance of technology has rendered necessary its effective and functional utilization in arts, in general, and in the field of music, in particular. It is possible to train undergraduate students in technology and thus to enable them to effectively use it. Today, there exist vast technological opportunities that can be used in music education.

In the process of preparation of the Master's thesis entitled "Analysis of Technology Use by Music Educators in Music Education", which I supervised in 2009, music educators' knowledge levels in music technologies were examined (Beşer, 2010). It was observed that teachers and academics, including professors of conservatories, did not have sufficient knowledge of using technology in music education.

If a music educator is unaware of useful technological facilities, it is necessary to look for such facilities in the environment in which she is active and especially in the educational environment. An educator or an artist can use something in her teaching activities to the extent she knows and comprehends it. For this reason, the relationship between music, education and technology is addressed here with respect to curricula and teaching plans. With this approach, the main purpose of the study is not to define the extent to which music educators use technology, but to determine the extent to which music education programs include this education and to underline the necessity of using them effectively. **In this study that I am presenting, the importance of adequately using technology in music education will be emphasized and the extent to which curricula include relevant courses will be determined.**

According to Engler, technology is an integral component of education. When education is seen as a web of communication between teachers, students and the environment; it then becomes clear that instructional technologies play a significant role in defining these relationships (Engler, 1972:62, <http://uretim.meb.gov.tr/egitekhaber/s92/yazarlar.htm>, 18 Haziran 2013, saat: 14.00).

Contemporary education is aimed at training individuals in the most appropriate and advanced manner as a balanced unity by considering their physical, mental and intellectual aspects. More importantly, it is aimed at a total improvement. The main function of contemporary education is forming modern societies that consist of modern individuals, as required by the contemporary life. For this reason, an education system that will reach all segments of the society and contemporary methods are needed. Due to changing programs and approaches, it is observed that the expected/desired level of success cannot be achieved. Components of a desired education are endearing music to the individual and endowing her with a perspective to differentiate between good music and bad music. In order to achieve them, it is necessary to utilize advanced methods and technology.

A total development will be accomplished in music education when problems pertaining to planning, programs and methods are overcome.

Benjamin Bloom, in his book that has been translated to dozens of languages, underlines the importance of planned education: A society, which needs a high number of individuals with diverse skills, cannot stick to methods of obtaining these skills only through selection. Such a society has to develop these skills early on and to take the necessary steps to provide a planned education aimed at these skills for long times. For these

reasons, societies, which desire to have members who are capable of solving complex problems, keeping up with rapidly changing conditions, verbally communicating at advanced levels, and rapidly learning complex and new ideas; have to implement a planned and programmed education in order to be able to facilitate the development of these skills from early childhood and to improve them in school years (Bloom, 1998:251-252)

Since the opening of Music Teachers' School (Mûsiki Muallim Mektebi) in 1924, music-teaching curriculum has undergone numerous changes. The Ministry of National Education's view of music curricula along with potential changes has influenced the model of training music teachers. Main issues in music education can be juxtaposed as follows:

Professional qualifications of the music teacher,

- Inadequacy of music class hours,
- Regulation of the music curricula,
- Insufficiency in music instruments and materials,
- Insufficiency of reference books and repertoires,
- Inability to effectively utilize contemporary methods and technology.

In my opinion, the most important one among these issues is the one that pertains to the utilization of contemporary methods and technology in music education. Technological materials and highly-developed devices fill classrooms, but there exists a lack of skilled educators and experts who are capable of using them.

## **2. Technology Use in Music Education**

### **a. Technology, Educational Technology, Instructional Technology**

Technology is humans' control over nature by means of science.

Technology is the control of a group, which is technically effective both in concrete and experimental terms, over the rest of the unity (people, events, machines etc.) by means of an organizational hierarchy (Mc. Dermott, 1981:142, <http://uretim.meb.gov.tr/egitekhaber/s92/yazarlar.htm> , 18 Haziran 2013, saat: 14.10)

## Educational Technology

Education is the process of developing behaviors and talents, and acquiring knowledge, skills and attitudes. Technology, in very general, can be defined as forming functional structures required to have control over nature by using acquired skills (Alkan, 1998:16).

Given these meanings of these sub-concepts; educational technology then could be defined as the functional structuring of learning or teaching processes by using relevant knowledge and skills with the purpose of holding control over education in general, and the learning situation in particular. In other words, it is the act of designing, executing, evaluating and improving learning-teaching processes. (Alkan, 1998:17)

## Instructional Technology

Instructional technology is a technological concept, which is based on the idea that teaching is a sub-dimension of education and on the consideration of unique aspects of certain teaching disciplines. This term refers to a systematic approach that comprises all of designing, executing, assessing and developing teaching-learning processes in line with certain special objectives, by simultaneously using human and non-human resources, with the purpose of forming effective learning arrangements pertaining to relevant disciplines. (Alkan: 19)

Instructional technology is the branch of science, which examines the analyzing, designing, developing, execution and evaluation of processes and instruments that could be used in organizational, designed and curriculed environments for the purpose of enhancing “desired learning”( <http://tr.wikipedia.org>, 19.06.2013, 17:58)

### b. Musical Technology and Technology Use in Music Education

The term “musical technology” generally refers to all technological issues dealing with the art of music. More specifically, it refers to the act of executing activities such as playing, recording, composing, storing and performing by means of electronic instruments and computer software. (<http://tr.wikipedia.org>, 19.06.2013, 18:04)

Technology use in music education, on the other hand, refers to the execution of the above-mentioned activities for educational purposes. It is receiving the support of technological devices in the process of acquiring concepts and behaviors related to the science of music.

In today's conditions, in fact, all educators are expected to have a certain idea about all these fields. They are supposed to be useful to themselves and to their environments by using educational, instructional and musical technologies to certain extents. Ample opportunities in the form of materials, hardware and software that serve the above purpose are available today.

What might be the Technological Devices that can be used in Music Education? (Beşer, 2010:31-59)

Reflection Devices (Overhead Projector, Slide Projector, Opaque Projector, Film Strip Projector, Video Projector [Barcoveision], Datash ow [Lcd Panel], Conference Projector),

Devices used to Record and Play Video and Audio (Record Player, Cassette Player, Music Player, External Speaker, Television, Radio, Video Player, VCD Player, DVD Player, Video Camera, Voice Recorder),

Devices used in Music Education (Metronome, Tuner, Smart/Interactive Music Board, Computer, Midi Keyboard, Electronic Keyboard, Digital Piano, Synthesizer, Sampler),

Computer Software (Operating System, Web Browser, Office Applications, Programming Software, Web Design, Programming and Database Software, Picture and Graphic Software, Video Playing and Slide Software, Music Education Software, Note Writing Software, Voice Recording and Processing Software, Music Production Software) and other technological data (experimental instruments, mobile devices and software [iPhone, educational devices and toys, walkable piano, portable music instruments, foldable drum etc.]. Examples are the following: Foldable Piano, iPhone, walkable piano and other samples (Beşer, 2010: 58-59)

How these instruments/materials should/could be used in music education is a subject of another and more extensive study. For this reason, this issue will addressed briefly in the "suggestions" section.

What this study actually desires to emphasize is a planned inclusion of these materials in programs with the aim of endowing candidates with knowledge and experience.

### 3. How should Today's Music Education be?

Music (*lat.* Musica, *gr.* Musike, *fr.* Musique, *ita.* Musica, *tur.* Muzik, *ger.* Musik, *ar.* Musîkî) is the art of expressing ideas and imaginations in mono- or poly-phony (Sözer, 1996: 490)

Music is a universal language, a means of communication, and an important step of education that has been strengthening the unity of societies since the beginning of humanity (Ergöz, 2007: 7).

Music is among the essential sources of life for human beings. A person, who is nourished with adequate and correct music, is likely to have a healthier and more quality structure of thinking and feeling. In general, people who live with music emerge more prominent in societies in terms of a higher quality worldview and skills such as problem-solving. In this respect, individuals with higher music awareness, and societies composed of such individuals, are unlikely to fail in other segments of life (Beşer, 2010:5).

We need to train individuals who know about and effectively utilize technology in order to popularize music across the society and to provide a better education.

Education is the process of deliberately forming desired behaviors in an individual's life. (Ertürk, 1982:12)

Music education, on the other hand, is the process of endowing the individual with musical concepts and behaviors, and rendering her more competent in a planned manner.

Here, what is referred to is a planned education that serves for a certain purpose. We should reflect our objectives and targets in our programs. It might become possible to obtain better results if programs are revised in this manner.

A contemporary music educator should be someone, who is knowledgeable about all subjects related to music, is capable of playing an instrument competently, has technical and historical knowledge of Turkish and world music, is capable of analyzing, and is capable of combining all her knowledge with the latest teaching techniques and technological facilities.

The common point of programs in schools that aim to train music educators is putting more emphasis on area instruments. Candidates are trained in these programs to enable them to play an instrument competently.

However, what is more important for a music educator is learning the extent to which she should use contemporary methods and technology while teaching music than learning how to play an instrument.

It is observed that all teaching programs, including the latest one that was presented with the name of restructuration as if it was going to bring positive changes, are based on area instruments. It could be seen that the only area course that is given throughout the entire duration of education is on area instruments in all teaching programs. This shows that the main aim of all programs is to endow the pre-service teacher with the ability to play an instrument. We would be more realistic if we used the time spent for teaching how to play an instrument, a skill which teachers rarely use in their professional lives, for training music teachers who have a lot to talk about issues pertaining to music. Do music teachers cover all dimensions of music in their classes? If the answer to this question was “yes”, then we would now be able to state that we have attained a good level in general music education (Sevgi, 2003:67).

The title “music educator” does not only refer to the person who supervises in-school music courses and various music activities anymore. A music educator is now perceived as a professional who can be employed in numerous professional fields; such as instrument/sound teacher of individuals at all ages in or out of school; music expert of mass communication media (radio, TV, movie, recording studio etc.); music manager or counselor of institutions of musical therapy, large companies, tourism firms or big hotels; music expert of culture-tourism bureaucracy (gallery, museum, festival etc.); and so forth. She cannot, naturally, be expected to have acquired all skills that render her competent in all of these fields. What is meant here is that music education has long exceeded the boundaries of schools or music classes, and that music education is needed in all these fields. For the formation of the individual’s cultural/artistic sense is possible only if the act of including music in her life is performed with an educational care, which can only be shown by people who amalgamated musical skills with a pedagogical approach. (Okay, 2007)

For all these reasons, music educators should be individuals who are versatile, and capable of keeping up with contemporary methods and technological devices, so that she can be a guide to new generations.

In the final declaration of 9<sup>th</sup> National Music Education Symposium held in Marmara University, the emphasis was on the inclusion of musical technologies and programs and on departments of musical engineering. “In Turkey, the number of Faculties of Fine Arts has increased and the programs they offer have diversified. These schools should train only intermediary professionals who are experts on musical technologies. If conservatories will keep training instrument teachers, these teachers should be trained in teaching methods and instrument pedagogy. Finally, music education must be widened, it should be divided into branches, and Music Faculties or Music Universities should be established by bringing together departments on teaching, performing, musicology, musical engineering, conducting, composing etc.” (Filiz Kamacıoğlu, www.muzed.org.tr, 20.06.2013, 15:45)

#### 4. Findings and Interpretation

In this section, departments' curricula will be examined, differences will be addressed, and evaluations will be provided. It will be tried to determine the numbers of classes on technology use in music education offered in the existing programs.

##### Scope

**Universe:** Departments of Music Education and State Conservatories in Turkey.

**Sample:** A curriculum and a teaching plan from each of the following schools: Gazi University Faculty of Education Department of Music Education, Istanbul Technical University (ITU) Turkish Music State Conservatory (TMSC), Gaziantep University TMSC, and Sakarya University State Conservatory.

##### Data Collection Method and Instruments

Since 1998, faculties of education have been offering education according to a common plan, as required by the Council of Higher Education in Turkey (YÖK). In the study, eight-year teaching plans of Gazi University Faculty of Education Department of Music Education and State Conservatories constituted the sample. While some of these teaching plans were accessed online, some others were obtained directly from school managements, and then they were subjected to analysis.

##### a. Examination of Eight-Semester Curricula of Faculties of Education

Music departments of faculties of education are educational institutions that train music teachers. The candidate receives a quality training in the field of teaching. There exist 22 music departments of faculties of education in Turkey. Each year, these programs admit 30-60 students.

With the Decision (04.11.1997 - 97.39.2761) of the Council of Higher Education (YÖK), the process of restructuring faculties of education has started, and within this framework, the revised teacher training programs were put into effect in the 1998-1999 Academic year. In the restructuring efforts, programs of faculties of education that train teachers for elementary schools were restructured in a way that will meet the requirements of the eight-year continuous education (<http://www.meb.gov.tr>, 18.06.2013, 13:48).

This year, on the other hand, YÖK decided to cancel admitting candidates to faculties of education due to the high number of unemployed teachers.

The following findings were obtained after an analysis on the 8-Semester Curriculum of Gazi University Department of Music Teaching. ([www.guzelsanatlar.gazi.edu.tr](http://www.guzelsanatlar.gazi.edu.tr), 18.06.2013, 14:14)

#### Assessment:

In the curriculum, the obligatory course “Computer Use in Music” is given in the 1<sup>st</sup> and 2<sup>nd</sup> semesters with a total of 4 credits, and the obligatory courses “Computer I” and “Computer II” are given in the 3<sup>rd</sup> and 4<sup>th</sup> semesters with a total of 6 credits. Moreover, the elective course “Electronic Keyboard Training” is offered with 1 credit. While the total number of credits is 240, the number of credits of courses related to technology use is 11.

#### b. Examination of Eight-Semester Curricula of State Conservatories

State Conservatories are institutions that mostly train artists and musical scientists, mainly focusing on the artistic aspects of music. For this reason, more emphasis is placed in their programs on instrument training, sound training or theoretical training. In Turkey, there exist nearly 30 state conservatories (<http://tr.wikipedia.org>, 18.06.2013, 16:53) in different cities. While some of them focus on Turkish music, some other focus on Western music. Every year, 20-50 students enroll each of in these programs.

The Department of Music Technologies, on the other hand, was established for the first time in ITU TMSC, and today several conservatories in Turkey have this department. However, the lack of professors is an obstacle in front of opening such departments and admitting students.

#### 4.2.1. Curriculum of Sakarya University State Conservatory

Sakarya University (SAU) State Conservatory (SC) has four different departments: Basic Sciences, Turkish Music, Turkish Folk Dances and Music Technologies. While the former three are currently operating, the Department of Music Technologies does not admit students at the moment due to the lack of professors.

The 8-Year Curriculum of SAU SC Department of Basic Sciences ([www.dk.sakarya.edu.tr](http://www.dk.sakarya.edu.tr), 19 Haziran 2013, saat 16:00) was examined, and the following findings were obtained.

#### Assessment:

In the program, the course “Music Technologies” is given in the first semester with 3 credits. While the total number of credits is 240, the number of credits of the course related to technology use is 3.

INTE 2013

#### 4.2.2. Semester Curriculum of ITU TMSC Department of Basic Sciences Division of Music Theory

Under ITU TMSC; a total of eight departments operate: Basic Sciences, Music Theory, Vocal Training, Musical Technologies, Composition, Musicology, Musicology (English), Instruments, and Turkish Folk Dances. In this study, the curriculum of the Department of Music Theory, which was revised in 2010-2011, is addressed.

It was noted above that the first Department of Music Technologies was opened in this school.

The 8-Year Curriculum of ITU TMSC Department of Basic Sciences Division of Music Theory ([http://www.tmdk.itu.edu.tr/epTeb\\_tur.pdf](http://www.tmdk.itu.edu.tr/epTeb_tur.pdf) , 18.06.203, 14:21) was examined, and the following findings were obtained.

Assessment:

In the program, the obligatory course “Computer” is given in the first semester with one credit. Total number of credits in the program is 151; however, there is no obligatory course related to technology use in music.

#### 4.2.3. Curriculum of Gaziantep University TMSC Department of Basic Sciences Division of Turkish Classical Music

Gaziantep University TMSC have the Departments of Basic Sciences, Vocal Training, Turkish Folk Dances and Musicology.

The 8-Year Curriculum of Gaziantep University TMSC Department of Basic Sciences Division of Turkish Classical Music ([www.gantep.edu.tr](http://www.gantep.edu.tr), 19 Haziran 2013 saat 16:10) was examined, and the following findings were obtained.

Assessment:

In the program, the obligatory course “Computerized Note Writing” is given in the 7<sup>th</sup> and 8<sup>th</sup> semesters with a total of 4 credits. While the number of total credits in the program is 168, the number of credits of courses related to technology use in music is 4.

### 4.3. Comparison of the Programs

**Table 1. Comparison of the Programs**

<b>Courses</b>	<b>Faculty of Education</b>	<b>ITU TMSC Music Theory</b>	<b>SAU SC</b>	<b>GAU TMSC</b>
<b>“Technology Use in Music” Course</b>	<b>10(4.1%)</b>	<b>1 (0.6%)</b>	<b>3 (1.25%)</b>	<b>4 (2.3%)</b>
<b>Total Credits</b>	<b>240</b>	<b>151</b>	<b>240</b>	<b>168</b>

#### Assessment:

The percentages of courses related to technology use in music in curricula are the following: 4.1% in the Faculty of Education Department of Music, 0.6% in ITU TMSC Department of Music Theory, 1.25% in SAU SC Department of Basic Sciences, 2.3% in GAU TMSC Department of Basic Sciences. While all these percentages are low, it is seen that the percentage in the Faculty of Education is higher than in the other departments. Since not all departments included elective courses, they were not included in the analysis.

It was also observed in general reviews conducted on the internet that the number of courses on technology use in music is inadequate, and even some schools do not offer any such course at all.

The conservatories addressed here have similar programs, which is why they were selected.

## 5. Conclusion

The comparison of the programs suggest that these programs differ with respect to the coverage of technology use in music in courses offered. It is noteworthy that the number of such courses is low in all of these departments. The finding that the faculty of education has slightly higher percentage of such courses might have stemmed from the fact that the number of such practices has increased in the past ten years.

#### Suggestions

1. The necessity and benefits of music education at all age levels is clear today. Contemporary methods and technological devices could be used in order to popularize this education and render it more effective. In this respect, curricula may include courses on the use of technological devices in music education.

2. Elective courses should be included in curricula so that attentions of interested students can be attracted.

3. We still have departments of music technologies, which have been shut down or cannot admit students due to lack of professors. Training professors for these departments may be possible this way.

4. A lack of methods and reference books in music education is widely acknowledged. It is possible by benefiting from the facilities provided by technology to produce note books, solfeggio methods and playing methods. Mentioning here only the famous Finale software will give an idea on this matter. This note writing software is updated every year. It is possible to provide a faster and better education by including such software in our educational methods.

5. It is possible today to support printed publications visually by CDs and DVDs. For this purpose, voice recording studios and computer software might be used.

Benefiting from contemporary technologies and including these subjects in curricula both in music education and resource production will be a contemporary approach.

# A comparison of the education systems in Turkey and Singapore and 1999-2011 timss tests results

Lect. Dr. Senem Seda Şahenk Erkan \*

*Marmara University, School of Foreign Languages, Istanbul, Turkey*

---

## Abstract

This study is limited to TIMSS tests. The problem statement can be expressed as: “How the education systems of Turkey and Singapore are differed?” “What are the results of Turkey and Singapore in TIMSS 1999-2007-2011?” This study is used literature method. Thank you to BAPKO for supporting my study.

Key words: Turkey, Singapore, education systems, TIMSS

---

## 1. INTRODUCTION

A Trend International Mathematics and Science Study (TIMSS) is a research study which examines students' achievement according to some variables in participant countries in every 4-year-period. This research was commissioned by International Association for the Evaluation of Educational Achievement (IEA). The first round of TIMSS took place in 1995 and the second round in 1999. It was the third round that made TIMSS famous worldwide. It collects data on educational achievement from students at the 4<sup>th</sup> and 8<sup>th</sup> grades. It also collects extensive information from students, teachers and school principals about the teaching and learning of mathematics and science.

In 1999-2007, Turkey participated in TIMSS research at 8<sup>th</sup> grade level. Also, Turkey participated in TIMSS 2011 with 4<sup>th</sup> and 8<sup>th</sup> grade students.

The fact that some Asian countries topped the achievement list in TIMSS amazed many people and drew the attention of the industrial countries. Consequently it induced the study on these high-performing Asian countries, namely, China, Korea, Japan, and Singapore (Yee, de Lange and Schmidt, 2006: 1663).

When the Mathematics section of this survey is examined, the contents can be determined with these items: fraction and number sense, measurement, data representation, analysis and probability, proportionality, geometry and algebra. Otherwise, when the Science part of this study is examined, the subjects of science can be separated in these items: life science, physical science, earth science, biology, chemistry, physics, earth science.

Turkey is participated in TIMSS 1999, 2007 and 2011. But Singapore is participated in every TIMSS exams (1995, 1999, 2003, 2007 and 2011). Due to non-participation of Turkey in TIMSS 1995 and 2003 exams, these two applications were excluded from the scope of this study.

Each study of TIMSS involves approximately 50 countries and thousands of students in each participating country. 38 countries are participated in TIMSS 1999. After that, 59 countries are participated in TIMSS 2007. Finally, 57 countries with 4<sup>th</sup> grade students and 56 countries with 8<sup>th</sup> grade students are participated in TIMSS 2011.

### 1.1. Problem

The problem statement can be expressed as: “How the education systems of Turkey and Singapore are differed?” “What are the results of Turkey and Singapore in TIMSS 1999-2007-2011?”

### 1.2. Sub-problems

The sub-problems of this study can be arranged as:

- “1) How the compulsory education, primary and secondary education of Turkey and Singapore are differed?
- 2) What are the results of Turkey in TIMSS 1999-2007-2011?

---

\* Corresponding author. Tel.: +90 533 251 97 41; fax: +90 216 302 21 81  
E-mail address: senemseda78@gmail.com

- 3) What are the results of Turkey and Singapore in TIMSS 1999-2007-2011?  
 4) How the results of Singapore and Turkey in TIMSS 1999-2007-2011 can be compared?"

### 1.3. Aim

The aim of this study is to demonstrate the differences between TIMSS results (1999, 2007 and 2011) in Turkey and in Singapore.

## 2. METHOD

This study is used literature method. The definition of this method can be given as below: "All books, master and doctorate thesis, articles are examined and summarized in this type of study (Karasar, 2008)."

### 3. Comparisons of Education System and of TIMSS Surveys in Turkey and in Singapore

#### 3.1. Comparison of Compulsory Education System in Turkey and in Singapore

In the table below, it can be showed comparatively the concept of compulsory education system in Turkey and in Singapore.

**Table 1 : Turkey-Singapore Compulsory Education**

Compulsory Education	
Turkey	Singapore
6-18 ages: 4+4+4 (4 year in primary, 4 year in middle school and 4 year in high school)	6-15 ages: 1-6 years in primary, 7-9 years in secondary (minimum 6 primary classes)

(12-year applications related to compulsory education Circular 2012/20, 09/05/2012, Compulsory education act, chapter 51, 2003)

As shown in the table 1, in 2012-2013 academic year, the duration of compulsory education Turkey upgrade from 8 years to 12 years (4+4+4: 4 years in primary, 4 years in college and 4 years in high school). In other words, 6-18 years are included in the compulsory education system. But, in Singapore, the compulsory education is covered students who have from 6 to 15 years old.

#### 3.2. Comparisons of Primary Education System in Turkey and in Singapore

In the table below, it can be demonstrated comparatively the primary education system in Turkey and in Singapore.

**Table 2: Turkey-Singapore Primary Education System**

Turkey-Singapore Primary Education System	
Turkey	Singapore
6-10 ages: 1-4 classes: 4 year primary	6-12 ages: 1-6 classes: 6 year primary

(Hodge, 2012, <http://multilingualphilippines.com/?p=6344>)

As shown in table 2, within the scope of 12-years compulsory education, in Turkey, the primary level involves 1<sup>st</sup>-4<sup>th</sup> grade. But in Singapore, the primary level takes 1<sup>st</sup>-6<sup>th</sup> grades (6-12 years).

#### 3.3. Comparisons of Secondary Education System in Turkey and in Singapore

In the table below, it can be given comparatively the secondary education system in Turkey and in Singapore.

**Table 3: Turkey-Singapore Secondary Education System**

Turkey-Singapore Secondary Education System	
Turkey	Singapore
11-14 ages: 5-8 classes: 4 year in secondary	13-18 ages: 7-12 classes: 5 year in secondary

(Hodge, 2012, <http://multilingualphilippines.com/?p=6344>)

As shown in the table 3, in Turkey, within the scope of 12-year compulsory education system, the college covers 5<sup>th</sup>-8<sup>th</sup> grades (11-14 years). But in Singapore, the secondary level involves 7<sup>th</sup>-12<sup>th</sup> grades (13-18 years).

### 3.4. Comparisons of Mathematics Lessons

In the table below, it can be showed comparatively the mathematics lessons in Turkey and in Singapore.

**Table 4: Comparisons of Singapore-Turkey Mathematics Lesson Hours**

Comparisons of Singapore-Turkey Mathematics Lesson Hours			
	Weekly Lesson Hours	Percentage of Mathematics Lessons in Weekly Curriculum	Annual Mathematics Lesson Hours
Singapore	29	13	124
Turkey	27	11	95

(Şişman, Acat, Aypay and Karadağ, 2007)

As shown in table 4, the weekly lesson hours are 29 in Singapore. But, the weekly lesson hours are 27 in Turkey. The percentage of mathematics lesson in weekly curriculum is 13 % in Singapore. But, the percentage of mathematics lessons in weekly curriculum is 11 % in Turkey. The annual mathematics lesson hours are 124 in Singapore. But, the annual mathematics lesson hours are 95 in Turkey.

### 3.4.2. Comparisons of Science Lessons

In the table below, it can be demonstrated comparatively the mathematics lessons in Turkey and in Singapore.

**Table 5: Comparisons of Singapore-Turkey Science Lesson Hours**

Comparisons of Singapore-Turkey Science Lesson Hours			
	Weekly Lesson Hours	Percentage of Science Lessons in Weekly Curriculum	Annual Science Lesson Hours
Singapore	23	15	14
Turkey	20	10	8

(Şişman, Acat, Aypay and Karadağ, 2007)

As shown in table 5, the weekly lesson hours are 23 in Singapore. But, the weekly lesson hours are 20 in Turkey. The percentage of science lesson in weekly curriculum is 15 % in Singapore. But, the percentage of science lessons in weekly curriculum is 10 % 20 in Turkey. The annual science lesson hours are 14 in Singapore. But, the annual science lesson hours are 8 in Turkey.

### 3.5. Comparisons of TIMSS Tests Results in Turkey and in Singapore

#### 3.5.1. Comparisons of TIMSS 1999 Tests Results in Turkey and in Singapore

Turkey is participated in TIMSS 1999 with 2204 schools and 7841 students. But Singapore participated in TIMSS 1999 with 5000 in 8<sup>th</sup> grade students (International Study Center, 2000, Martin, Gregory and Stemler, 2000).

In the table below, it can be given comparatively TIMSS 1999 international average of mathematics and science achievement and mathematics and science scores in Singapore, in Turkey.

**Table 6 Comparisons of Singapore-International Average-Turkey in TIMSS 1999 Mathematics Achievement**

	TIMSS 1999 Mathematics Achievement	TIMSS 1999 Science Achievement
<b>Singapore</b>	604	568
<b>International Average</b>	487	488
<b>Turkey</b>	429	433

(International Study Center, 2000)

As shown in table 6, when the mathematics scores of TIMSS 1999 are compared, it is seen that Singapore is ranked 1<sup>st</sup> with 604 scores. The international average of 487 was obtained by averaging across the mean scores for each of the 38 participating countries. Turkey is ranked 31<sup>rd</sup> among 38 countries with 429 scores. Also when the science scores of TIMSS 1999 are compared, Singapore is ranked 2<sup>nd</sup> country with 568 scores. The international average of this exam is 488. Turkey is ranked 33<sup>rd</sup> among 38 countries with 433 scores.

#### 3.5.2. Comparisons of TIMSS 2007 Tests Results in Turkey and in Singapore

Turkey participated in TIMSS 2007 with 16.112 schools and 1.163.830 in 8<sup>th</sup> grade students. But Singapore participated in TIMSS 2007 with 177 schools and 49.363 in 4<sup>th</sup> grade students and 164 and 50.904 in 8<sup>th</sup> grade students (Olson, Martin and Mullis, 2009).

In the table below, it can be demonstrated comparatively TIMSS 2007 international average of mathematics and science achievement and mathematics and science scores in Singapore, in Turkey.

**Table 7: Comparisons of Singapore-International Average-Turkey in TIMSS 2007 Mathematics Achievement**

	TIMSS 2007 Mathematics Achievement		TIMSS 2007 Science Achievement	
	4 <sup>th</sup>	8 <sup>th</sup>	4 <sup>th</sup>	8 <sup>th</sup>
<b>Singapore</b>	599	593	<b>Singapore</b>	587
<b>International Average</b>	500	500	<b>International Average</b>	500
<b>Turkey</b>		432	<b>Turkey</b>	454

(Mullis, Martin and Foy, 2009, Şişman, Acat, Aypay and Karadağ, 2007, Martin, Mullis and Foy, 2009)

As shown in table 7, Singapore is ranked 2<sup>nd</sup> country with 599 scores among 4<sup>th</sup> grade students. But this country is ranked 3<sup>rd</sup> country with 593 scores. The international average of this exam is 500. Turkey is participated this survey only in 8<sup>th</sup> grade students. Turkey is ranked is ranked 30<sup>th</sup> with 432 scores. Also when the science scores of TIMSS 2007 are compared, Singapore is ranked 1<sup>st</sup> country with 587 scores among 4<sup>th</sup> grade students. But this country is ranked 1<sup>st</sup> country with 567 scores. The international average of this exam is 488. Turkey is ranked 31<sup>th</sup> among 38 countries with 454 scores.

### 3.5.3. Comparisons of TIMSS 2011 Tests Results in Turkey and in Singapore

In Turkey, this exam is realized in April 2011 with 257 schools and 7.479 students in 4<sup>th</sup> grade and 239 schools and 6928 students in 8<sup>th</sup> grade.

TIMSS was administrated at grade 4 in 57 countries and at grade 8, in 56 countries (Katsberg, Ferrarro, Lemanski, Roey and Jenkins, 2013).

In the table below, it can be showed comparatively TIMSS 2011 international average of mathematics and science achievement and mathematics and science scores in Singapore, in Turkey.

**Table 8: Comparisons of Singapore-International Average-Turkey TIMSS 2011 Mathematics Achievement**

	TIMSS 2011 Mathematics Achievement		TIMSS 2011 Science Achievement		
	4 <sup>th</sup> grade	8 <sup>th</sup> grade	4 <sup>th</sup> grade	8 <sup>th</sup> grade	
<b>Singapore</b>	606	611	<b>Singapore</b>	583	590
<b>International Average</b>	500	500	<b>International Average</b>	500	500
<b>Turkey</b>	469	452	<b>Turkey</b>	463	483

(Yücel, Karadağ and Turan, 2013, Martin, Mullis, Foy and Stanco, 2012)

As shown in table 8, Singapore is ranked 1<sup>st</sup> country with 606 scores among 4<sup>th</sup> grade students. But this country is ranked 2<sup>nd</sup> country with 611 scores. The international average of this exam is 500. Turkey is participated this survey in 4<sup>th</sup> and 8<sup>th</sup> grade students. Turkey is ranked 35<sup>th</sup> with 469 scores among 4<sup>th</sup> students. And it is ranked 24<sup>th</sup> with 452 scores among 8<sup>th</sup> students. Also when the science scores of TIMSS 2011 are compared, Singapore is ranked 2<sup>nd</sup> country with 583 scores among 4<sup>th</sup> grade students. But this country is ranked 1<sup>st</sup> with 567 scores among 8<sup>th</sup> grade students. The international average of this exam is 488. Turkey is ranked 36<sup>th</sup> with 463 scores among 4<sup>th</sup> grade students. But it is ranked 21<sup>th</sup> with 483 scores among 8<sup>th</sup> grade students.

## 4. DISCUSSIONS

Salehi-Isfahani, Hassine and Assaad (2011) prepared an article with this title “Equality of Opportunity in Education in the Middle East and North Africa.” The inequality of opportunities explains a significant part of the inequality in educational achievements in most Middle East and North Africa (MENA) countries, but in a few cases, notably Algeria, its role is small. Family background variables are the most important determinants of inequality in achievement, followed by community characteristics. Inequality of education opportunities are high in several MENA countries, and have either stayed the same or worsened in recent years. The results show that, despite great efforts in past decades to invest in free public education, in most MENA countries there is plenty of room left in further levelling the playing field in education.

Öztürk and Uçar (2010) wrote an article with this title “determination and comparison of factors, which effect the achievement in science of 8<sup>th</sup> grade students, using the results of TIMSS exams in Taiwan and Turkey. These countries have some differences in socio-economic situations, the budget of education, the education conditions of parents, the instruction of teachers and the programs. That’s why, in Taiwan, the students are succeeded in two domains of TIMSS exams.

Bouhlila (2012) wrote an article with this title “The quality of secondary education in the Middle East and North Africa: what can we learn from TIMSS’ results?” The research questions addressed here are why is achievement low? And why is the gap between the top-performing countries and MENA countries large? In order to answer these questions, the paper focuses on several aspects: the first is the inefficiency of acquiring the language, the second is the inefficiency of time devoted to homework, the third is the meagre intended curriculum which is translated into a weaker implemented curriculum, the fourth aspect deals with the inefficiency of public resources devoted to the education sector. Finally, the paper highlights two other factors believed to affect students’ achievement: family background and students’ attitudes towards mathematics and science.

Ghagar, Othman and Mohammadpour (2011) prepared an article with this title “Multilevel analysis of achievement in mathematics of Malaysian and Singaporean students.” The results indicated that 57,28 % of the total variance in mathematics achievement in Malaysia accounted for school-level differences. Meanwhile, the results showed that classroom-level differences contributed to 74,6 % of the total variance in achievement of Singaporean students. Only 5,9 % of the variance in achievement in Singapore accounted for school-level differences. At the student level, mathematics self-concept was the most influential factor on achievement of students from both countries. At the school level, school climate as perceived by the school principals was the most influential factor on achievement of students from both countries.

Uzun, Bütüner and Yiğit (2010) prepared an article with this title “A Comparison of the Results of TIMSS 1999-2007: The Most Successful Five Countries-Turkey Sample.” According to results of TIMSS 1999 & 2007, students from East Asian countries were the top performers in science and mathematics. The findings obtained by TIMSS 1999 & 2007 showed that Turkish students’ low achievement cannot be explained by the variables that are attitude, time spent on homework or the education level of parents.

Aslan and Kaptan (2007) prepared an article with this title “A comparison with the relationship between the changes in the program of teaching science and the program of instruction teacher: an example of Turkey and Singapore.” In two countries, the programs of teaching science have a large content. But in Singapore, the science teachers have more cultural knowledge than Turkish science teachers. Also, Turkish science teachers receive a little instruction in service. Otherwise, they can be supported a little about references and the techniques of learning science. That’s why, in Singapore, the students took part in first or second range in science in TIMSS-R exams.

## 5. CONCLUSION

### 5.1. Results

The results of this study are given below:

- 1) According to compulsory education act, in Singapore, the children must be educated in school from 6 to 15 ages.
- 2) According to curricular 12-year compulsory education, in Turkey, the children must go to school from 5/6 to 17/18 ages.
- 3) According to compulsory education act chapter 51, in Singapore, the primary level takes 6 years (6-12 ages).
- 4) According to curricular 12-year compulsory education, in Turkey, the primary level takes 4 years (5/6-9/10 ages).
- 5) The secondary level takes 6 years (12-18 ages) in Singapore.
- 6) The secondary level takes separately 4 years in middle school (9/10-13/14 ages) and 4 years (13/14-17/18 ages) in high school in Turkey.
- 7) The weekly lesson hours are 29 in Singapore. But, the weekly lesson hours are 27 in Turkey. The percentage of mathematics lesson in weekly curriculum is 13 % in Singapore. But, the percentage of mathematics lessons in weekly curriculum is 11 % in Turkey. The annual mathematics lesson hours are 124 in Singapore. But, the annual mathematics lesson hours are 95 in Turkey.
- 8) The weekly lesson hours are 23 in Singapore. But, the weekly lesson hours are 20 in Turkey. The percentage of science lesson in weekly curriculum is 15 % in Singapore. But, the percentage of science lessons in weekly curriculum is 10 % 20 in Turkey. The annual science lesson hours are 14 in Singapore. But, the annual science lesson hours are 8 in Turkey.

9) In TIMSS 1999, Singapore is ranked 1<sup>st</sup> with 604 scores. The international average of 487 was obtained by averaging across the mean scores for each of the 38 participating countries. Turkey is ranked 31<sup>rd</sup> among 38 countries with 429 scores. Also when the science scores of TIMSS 1999 are compared, Singapore is ranked 2<sup>nd</sup>

country with 568 scores. The international average of this exam is 488. Turkey is ranked 33<sup>st</sup> among 38 countries with 433 scores.

10) In TIMSS 2007, Singapore is ranked 2<sup>nd</sup> country with 599 scores among 4<sup>th</sup> grade students. But this country is ranked 3<sup>rd</sup> country with 593 scores. The international average of this exam is 500. Turkey is participated this survey only in 8<sup>th</sup> grade students. Turkey is ranked is ranked 30<sup>th</sup> with 432 scores. Also when the science scores of TIMSS 2007 are compared, Singapore is ranked 1<sup>st</sup> country with 587 scores among 4<sup>th</sup> grade students. But this country is ranked 1<sup>st</sup> country with 567 scores. The international average of this exam is 488. Turkey is ranked 31<sup>th</sup> among 38 countries with 454 scores.

11) In TIMSS 2011, Singapore is ranked 1<sup>st</sup> country with 606 scores among 4<sup>th</sup> grade students. But this country is ranked 2<sup>nd</sup> country with 611 scores. The international average of this exam is 500. Turkey is participated this survey in 4<sup>th</sup> and 8<sup>th</sup> grade students. Turkey is ranked 35<sup>th</sup> with 469 scores among 4<sup>th</sup> students. And it is ranked 24<sup>th</sup> with 452 scores among 8<sup>th</sup> students Also when the science scores of TIMSS 2011 are compared, Singapore is ranked 2<sup>nd</sup> country with 583 scores among 4<sup>th</sup> grade students. But this country is ranked 1<sup>st</sup> with 567 scores among 8<sup>th</sup> grade students. The international average of this exam is 488. Turkey is ranked 36<sup>th</sup> with 463 scores among 4<sup>th</sup> grade students. But it is ranked 21<sup>th</sup> with 483 scores among 8<sup>th</sup> grade students.

## 5.2. Suggestions

The suggestions for other researchers are demonstrated below:

- 1) From 1999 to 2011, the mathematics section TIMSS test results can be compared in Turkey and in Singapore.
- 2) From 1999 to 2011, the science part TIMSS test results can be compared in Turkey and in Singapore.
- 3) From 1999 to 2011, the mathematics section TIMSS test results can be compared in Turkey and in other ME countries.

The suggestions for Turkey are explained below:

- 1) The teachers can be informed about TIMSS surveys in-service education programs.
- 2) The teachers can try to solve previous TIMSS surveys with their students.
- 3) The students can be informed about TIMSS exams in different seminars.

4<sup>th</sup> International Conference on New Horizons in Education

# A comprehensive quality academic project for a bachelor's degree with accredited program and certified laboratories. The case of the degree of civil engineering in the FES Aragón UNAM

Martín Ortiz\*

*Universidad Nacional Autónoma de México, Facultad de Estudios Superiores Aragón, Nezahualcóyotl, México*

---

## Abstract

In the Decade of the 1990s, a significant decrease occurred in the number of students entering institutions of higher education in Mexico, to study the degree of Civil Engineer. The decrease in enrollment at the school of higher studies Aragón of the UNAM was dramatic, insomuch the principal of the school according to the administrative chief considered, in 2002, the closure of one of the shifts.

One of the main reasons of this decrease was the economic crisis in Mexico in 1994, starting which a considerably decreased in the infrastructure investment, as well as the strike at the UNAM, in 1999, that kept the institution paralyzed for nearly a year.

This work mentions the actions that we carried out for the improvement of the curriculum, which led to accreditation and certification of its Labs. It also mentions the strategies followed by the academic and administrative staff which enabled substantial improvements and the achievement of favorable evaluations. It also talk about the main benefits for the students of the career, which impacted on the increased of enrollment.

Keywords: accreditation, certification, improvement

E-mail address: mortiz1963@yahoo.com.mx

## **Background**

The Faculty of higher studies Aragon (FES Aragón) is a multidisciplinary entity belonging to the Universidad Nacional Autónoma de México (UNAM), which is located in the northeast area of the capital of Mexico. This educational unit was created to generate an alternate campus of UNAM that would accommodate 12 degree programs, in which the infrastructure was not enough for the quantity of students.

The first generation was composed of 260 students divided into four 65 student groups two of them in the morning the rest in the evening.

33 generations of civil engineers, has been prepared in the classrooms of the faculty.

## **Problem**

During the 37 years of academic work of the faculty, Civil Engineer career has offered and with no interruption, however the career has been subject of various internal and external problems which reduced the enrolment and put in risk one of the shifts.

From 1976 up to 1990 there were a continuous increase in the enrolment; they recorded a maximum of 1189 students. From 1990 to 1993 there was decrease of students and we reached the number of 643 students. This setback was motivated, among other factors, because a good number of students were hired with engineering companies, without having completed her studies, considering that there was an important offer of jobs for projects, construction and supervision of infrastructure, due to a considerable investment in these products promoted by the federal Government. The workload was such, that companies accept young people without being entitled, even those who had barely passed only half of the credits of the career.

In 1994, in the month of December, there was a change in the administration of the country; there was a severe economic crisis. The huge investment in infrastructure over the previous years was made from requested loans from abroad offering guarantees that the country was not able to meet.

Unable to pay their obligations, the federal Government carried out budgetary restrictions, mainly with regard to the construction of infrastructure. The labor market of the construction industry shrank dramatically, causing layoffs in companies.

In the career of Civil Engineering of the FES Aragón there was a small increase in enrollment since 1995 and up to the year 1997 (768 students). The increase of 140 students with respect to 1993, largely responds to a good number of students who had left his truncated career returned to conclude it, due to there were no job offers.

The scant infrastructure investment lasted from 1994 until the end of the Decade, by which Civil Engineer career was not one of the attractive options for high school graduates.

In 1999, UNAM was paralyzed by a strike, which lasted for almost a year, which generates defections of students of the institution as well as a lack of potential candidates to enter, who looked for other educational options.

After the strike, in the years 2001, 2002 and 2003, enrollment drops dramatically from 545, 534 and 502 students respectively.

During those years, the career offered 240 places new students and received, on average, only 45% of them.

Due to such problems, the administration of the Faculty assessed the possibility of closing one of the shifts of the career, in order to take better advantage of the spaces and save resources in the recruitment of academics.

The panoram was not in any way encouraging, especially considering that the total number of civil engineers graduated from institutions of higher education in the country, accounted for only 20% of professionals in the field needed to meet the demands in terms of building infrastructure.

Considering the severe contraction of the registration, as well as the challenge of providing graduates with profile appropriate to the needs of the labor market, it was required an in-depth analysis of the necessary actions so that the academic program respond effectively under such circumstances.

There were meetings of the administrative responsible of the program with representatives of different areas of knowledge, to analyze the problem.

As a result of these meetings of analysis, it was identified the necessity to elaborate a diagnosis of the situation of the program.

### **Diagnosis of the academic program**

In this evaluation exercise it was consulted to Bachelor's degree graduates, teachers of the academic program and employers, through surveys.

The most important findings of the consultation were as follows:

- The training of students of the career should continue to be the generalist.
- It was necessary to increase the number of computer tools in the subjects of Applied Engineering
- It was necessary to improve the service in the laboratories of the career because some practices were not carried out for any problem and they were not rescheduled the equipment for the practices were insufficient.

There were no relationship between theoretical and practical classes; there were no coincidence with the study program, since the theory and practices were taught by different teachers.

- Insufficient and partially updated bibliographic material
- There were no formal mentoring activities in the career
- It was required to expand the range of options to get the degree.

From the diagnostic information, it was established a strategy considering the most urgent matters, establishing two lines of action:

- 1. Improvement in the process of teaching in the laboratories of the career, beginning with a good system of quality management.**
- 2. Works for the improvement of the academic program**

### **Quality Committee**

To drive improvement in services in laboratories and work improvement of the academic program, the creation of a working group which was called quality Committee considered suitable. The Committee was formed in 2003.

Within the structure academic administration of the faculty, the academic program of Civil Engineering belongs to the Division of physical and mathematical sciences and engineering. Computer Engineering and Mechanical and Electrical Engineering also belong to this division.

The responsible for administrative and academic staff of three careers in engineering and the quality Committee worked together. With this new Committee works started with the main objective of improving the service of laboratories careers in parallel.

The Committee was formed by the Chief of the Division of engineering taking the role of President and representative of the principal of the Faculty; the academic Division Secretary, taking the role of the internal quality Committee; three heads of the three careers, four technical secretaries and three chief of laboratory.

Before starting to work, the Committee members received training, which was given by staff of the coordination of research of the University (UNAM). The topics studied were as follows:

- Theoretical principles of the quality management systems
- Knowledge of Norma ISO 9001: 2000 (ISO 9001:2008 later)

### **1. The improvement of the teaching process in the laboratories of the career, beginning with a good system of quality management.**

Realization of practices in the engineering laboratory is an essential part in the formation of the students. They help student to identify different parameters that subsequently will be decisive in the design.

In civil engineering academic program, a significant number of subjects requires studying and pass the laboratory.

Deficiencies in service of the laboratories were detected; those deficiencies were associated with inadequate infrastructure, lack of equipment, absence of the technicians in charge of areas and poor planning of laboratory practices, among other things, impacting on an inadequate preparation of the students.

#### **Need for the implementation of a quality management system.**

The establishment of verification mechanisms of the quality of service in teaching laboratories, as well as the determination of actions that not only allowed correction of detected problems, but the improvement of positive aspects, these are factors that favor the establishment of a process of continuous improvement in the service. On the other hand, continuous improvement of laboratories activities includes a review and permanent updating of the manuals of practices, as well as the supervision of the activities in the laboratories.

With the establishment of a system of quality management, the following objectives are pursued:

- Provide the necessary conditions for the realization of practices for practical-theoretical subjects, so that satisfy the expectations of students and contribute in obtaining a consistent profile to the needs of the labor market.
- Establish a dynamic of continuous improvement of the service in the laboratory, which even exceeds the expectations of students.

#### **Awareness-raising and training of the staff of the laboratories**

The commitment of all those involved in the quality management system is essential for the activities y the laboratory. Therefore, it is necessary a wide work of diffusion and training of all members.

Prior to the formal implementation of the quality management system, briefings were carried out with the technical academic and teachers of practices of the laboratories; such activities were scheduled in both shifts (morning and evening), in order to facilitate the attendance of all members.

In these meetings it was informed to participants about the objectives of the implementation of the quality management system, the role that each of the members of the laboratories would play, the mechanisms of evaluation and monitoring that would be subjected and the benefits that in short, medium and long terms accrue its implementation.

### **Determination of the processes subject to control**

The quality management system can include one or more of the processes carried out. The laboratory of civil engineering was considered the following mission:

*Support and complement the teaching-learning process of theoretical and practical subjects in Bachelor of civil engineering curriculum map, belonging to the FES Aragón UNAM, as well as give complementary courses of updating and professional training.*

All the laboratories of the academic program were considered in the scope of the management system.

### **Generation of the quality management system documents**

In order to guide and give certainty to the system of management of quality, documents that will govern the activities in the laboratory must be generated.

The documents generated for the quality management system are:

- Quality manual

It is the document that establishes the scope of the quality management system, the mission, vision and goals of the Organization, specifying the responsibilities of each of the members of the system as well as measurement and control mechanisms.

- Document Control procedure

It establishes the guidelines of the quality management system for the control and preservation of internal and external documents related to the same.

- Control records Procedure

It establishes the elements of identification and control that must contain a document of the quality management system, as well as the mechanisms to ensure its identification, storage, protection, retrieval, retention and disposition.

### **Testing of the documentary processes and records control**

Before to the implementation of the quality management system, it began the documentary control of the laboratories, using new formats during a school semester. The use of new documents purpose was to detect faults existing in them, in order to make the necessary changes.

### **Implementation of the quality management system**

Once it was considered that there were solid foundations for the formal start of the work of the quality management system, it was launched under the new conditions laid down in the documents that were properly generated.

### **Evaluation system of the laboratory (SEL)**

To evaluate the service three questionnaires were generated, they were directed to the customer (student), teachers and instructors. Each instrument consists on average of twenty closed questions.

The questionnaires were applied at least twice during the semester; the first one at the middle of the semester and the second at the end of it.

The analysis to determine the causes of the non-conforming service is done through cause and effect (Ishikawa)<sup>2</sup> diagram.

Once we conclude the analysis of causes of non-conformities, the corrective actions are determined.

### **Internal audits**

From the implementation of the quality management system, at least once a year the internal audit is conducted to know the status and to take the necessary actions to correct the causes of nonconformities. These information is also valuable for the preparation of audits of certification, surveillance or recertification, carried out by an evaluation Agency.

### **External audits (for certification)**

Taking into account the improvement in the service to the client, thanks to the establishment of the system of management of quality, it was considered convenient that this was evaluated by an external instance by means of an audit for certification.

The system was evaluated by the Mexican Institute of standardization and certification, in November 2004, granting the certificate of quality.

## **2. Works for the improvement of the academic program**

Evaluation of academic programs by external peers is a virtuous process, in the institutions of higher education are taking ever greater force and in which the administrations of the same will be increasingly involved, since it is a public recognition of the academic work carried out.

Based on the positive results obtained in laboratories, the central administration of the Autonomous National University of Mexico, devoted extraordinary resources to equip laboratories and expand service coverage. Taking advantage of the support received, there were also improvements in the classroom.

In order to continue with efforts to improve the academic program, actions with the intention of subjecting it to the assessment for accreditation were carried out.

A strategy was developed in order to face the process, it is described below, it is "a way" to prepare an evaluation process for accreditation, based on the idea that the generation of a strategy will strengthen the efforts to assist the process, as outlined in document *"The seven knowledge necessary for the education of the future"*, of the United Nations Organization for education, science and culture<sup>1</sup>.

The strategy raised the following activities:

### Before the evaluation visit

- Evaluation of the appropriateness of submitting to the process (CIPP method and analysis tow).

It was considered convenient, that there would be an evaluation of the State keeping the academic program prior to submitting it to the accreditation process. We used the CIPP method<sup>2</sup> (context, input, process and product), recommended by the Joint Committee on Standards for Educational Evaluation of the United States.

To complement the evaluation, applied analysis tow<sup>2</sup> (DAFO), from whose results, positive and negative aspects of the academic program is determined and general strategies for work were established.

- Adequacy of spaces and places for teachers and technical management.

It was evaluated the necessity of hiring full time teachers as well as technical academic, and it was requested to the administration before the evaluation for accreditation of the program.

An analysis of the State that kept the facilities of the academic program was made, and it was requested to the Superintendence department to carry out the necessary maintenance work.

- Selection and training of the staff (stakeholders).

An element fundamental, prior to the accreditation process, was the formation of a compact team of specialists in each of the areas of the academic program.

- Self-diagnostic of the program (Delphi technique).

Before the evaluation visit, as a requirement of the accrediting body, responsible for the program sent a self-assessment document, previously provided by that instance. In order to have valuable elements that serve as support for a collegiate assessment, and whose evaluation parameters allow objectively qualify the status of the academic program, applied the Delphi technique<sup>2</sup>.

- Preparation of the logistics for the assessment visit.

During the evaluation visit, there are different needs to be covered. It is necessary to anticipate them.

### During the evaluation visit

- Participation of the entire team.

Everybody was involved in the process, so it was obvious that all of them worked which on a common goal.

- Assuming a positive attitude of open-minded

It was Emphasized the advisability of staying with an open mind and assuming an positive attitude, considering the comments of reviewers as valuable contributions to generate improvements in the academic program.

- We sought to satisfy those aspects that would not have been clear to the evaluators, considering that, while the visit is not concluded, evidences to clarify could be used.
- We asked the evaluators for their pinion at the end of each day and at the end of the visit (such information, even if it is unofficial, allowed us to anticipate a reaction plan).

#### **After the visit**

- Human and material resources were handled.
- The Accreditation Council members were contacted to clarify doubts with respect to the requirements set out in the certificate of evaluation.
- In the plan of reaction we established actions that benefit human and material resources and that could be shared with other programs of the faculty.
- A reaction plan was developed and submitted, unofficially, to the revision of the accrediting body.

#### **Main dividends of the continuous improvement process**

The continuous improvement process initiated in 2004, with the creation of the quality Committee, allowed to establish orderly work dynamics, with clearly defined goals and indicators of efficiency.

From the improvement works carried out in the laboratories, it was requested a review of the quality management system by an external instance. At the end of the process, it was obtained the certificate of quality.

From the improvement of laboratories, we reviewed other aspects of the academic program, as the infrastructure, study programs, evaluation mechanisms and forms to get the degree.

From the analysis, the form to get the degree grow from 1 to 9 options, study programs were reviewed, and updated as well as the bibliography of the subjects of the program.

The quality of the classrooms was improved, preparing them for the use of projection equipment.

Once the program was considered strong enough to undergo an evaluation by external peers, it was requested the evaluation for accreditation to the Council for the Accreditation of Engineering Education, obtaining the certificate in August 2007.

### **Perspectives of the academic program of Civil Engineering of the FES Aragon**

From the creation of the internal Committee of quality, the improvements carried out in the academic program without a doubt have been factor in the gradual increase of the number of students, as well as the favorable opinion from graduates and employers.

In recent years, from 2008 to 2012, the program has been rated among the top ten of the country (surveys of newspapers of national circulation "El Universal" and "Reforma").

As shown in the following table, enrollment has increased consistently over the last years.

Table 1. School population in the career of Civil Engineering

<b>YEARS</b>					
2007	2008	2009	2010	2011	2012
551	640	751	861	981	1139

\* Source: Unit of planning from the school of higher studies Aragon of the UNAM

## Conclusions

The generation of a quality system for teaching in laboratories is a process that involves the commitment of all members of the Organization: Division Chief, heads and Secretaries of the careers, technical, academic and laboratory teachers.

The quality of the profile of the students will be more in keeping with the needs of the labor market.

The members of the quality management system are also part of the academic programs in engineering. That is why the dynamics of continuous improvement will also benefit other programs.

The activities of planning prior to the evaluation process for the accreditation are decisive to anticipate the Evaluation Committee's observations, allowing establishing the plan of reaction based on the resources available to the academic program. The strategies planned with such resources allow us to face the mid-term review of the accreditation body (2.5 years), without compromising the Faculty and with the certainty of accomplishing the established commitments.

The dynamics of the work of the members of the academic program, generated from the activities of planning, contributes to the efficient use of human and material resources, for the benefit of students and academic institutions.

Continuous improvement of academic programs allows you to maintain high standards of quality of educational services and offer graduates according to the profile required by the labor market.

## Abstract

The purpose of the present study is review all the articles published in 6 international from Social Sciences Citation Index (SSCI) in 2011 through content analysis method. According to the results, the most frequently used research method was found to be quantitative methodology. Among data collection tools, the most frequently used one is questionnaire and the most preferred sampling method in all the journals is convenience sampling method. It is believed that this study will provide a direction for the future studies and fill the gaps in literature.

Keywords: instructional technology, educational technology, content analysis

## 1. INTRODUCTION

The connection between education and technology has improved especially in recent years as a result of advancements observed in Information and Communications Technologies. As a result of these developments, changes in Education Technology discipline have also occurred and new research areas under the discipline of education technologies have emerged.

As the scope of Education Technology discipline is quite broad, there are many different perceptions of Educational Technology. According to experts in the field of Educational Technology, though all dimensions of education are of the interest of Educational Technology, educational processes and environment are considered to be the real specialty of this discipline (Simsek, 2002). Being a dynamic and comprehensive area, Educational Technology has passed through various stages throughout its history and its orientation has changed, which is quite normal.

Educational technology has passed through four age. First one is "The Age of Instructional Design" which focuses on the content, the second one is "The Age of Message Design" which focuses on format, the third one is "The Age of Simulation" which focuses on the interaction between teaching materials and students, and the last one is "New Age" which we are currently experiencing and in which research is increasingly focusing on learning environments and construction of them (Winn, 2002).

\* Corresponding author. Tel.: +90 312 202 83 19

E-mail address: ekilic@gazi.edu.tr; ebrukilic@gmail.com

When the related literature is reviewed, it is seen that research aiming to determine the trends in education technologies both in the world and in Turkey generally focuses on topic, method, data collection instruments, data analysis methods, selection of sampling and the number of citations.. Some studies from the literature are presented in Table 1.

Table 1. Studies conducted in the field of educational technologies

Author(s)	Aims/Objectives of study	Results and conclusions
Göktaş et. al. (2012)	460 articles from Turkey published in the field of educational technologies in 2000-2009 were analyzed.	<p><b>The most commonly preferred ones</b></p> <p><i>Topic:</i> Educational media and technology</p> <p><i>Data collection instrument:</i> Questionnaire</p> <p><i>Sampling selection method:</i> Purposive sampling</p> <p><i>Level of sampling:</i> Undergraduate (Education faculty)</p> <p><i>Data analysis method:</i> Descriptive analysis</p>
Lu, Wu & Chiu (2009)	413 articles published in 4 journals in SSCI in 2005-2007 in the field e-learning were analyzed.	<p><b>The most commonly preferred ones</b></p> <p><i>Topic:</i> New Roles of the Instructor &amp; Learner</p> <p><i>Method:</i> Experimental I</p> <p><i>Level of the sampling:</i> College/University</p> <p><i>Academic discipline:</i> Physical sciences and Social sciences</p>
Alper & Gülbahar (2009)	The articles published in The Turkish Online Journal of Educational Technology in 2003-2007 were analyzed to determine the tendencies in the field of educational technologies.	<p><b>The most commonly preferred ones</b></p> <p><i>Topic:</i> Computer and multimedia-based instruction</p> <p><i>Method:</i> Literature review</p> <p><i>Data collection instrument:</i> Scales</p> <p><i>Sampling selection method:</i> Easily available</p> <p><i>Level of the sampling:</i> University</p>
Kurt, Şahin & Karakoyun (2009)	Theses written in the field of Computer and Instruction Technologies were analyzed to reveal the tendencies in the field.	<p><b>The most commonly preferred ones</b></p> <p><i>Topic:</i> On-line learning</p> <p><i>Method:</i> Quantitative</p> <p><i>Level of the sampling:</i> University</p> <p><i>Data analysis method:</i> Means and standard deviations</p>

Şimşek et.al.(2009)	259 master's theses completed in the field of educational technologies at Middle East Technical University, Anadolu University, Karadeniz Technical University, Gazi University, Ankara University, Çukurova University, Hacettepe University, Marmara University and Sakarya University in Turkey in 2000-2007 were analyzed in terms of their topics, methods and results.	<p><b>The most commonly preferred ones</b></p> <p><i>Topic:</i> Computer-assisted instruction, alternative teaching-learning approaches, web-assisted learning, problems experienced in the use of educational technologies , internet-based learning and distance education</p> <p><i>Method:</i> Quantitative</p> <p><i>Data Collection Instrument:</i> Questionnaires, tests and scales</p> <p><i>Data analysis method:</i> Descriptive statistics, t-test and variance analysis</p>
Gülbahar & Alper (2009)	The journal of Ankara University Educational Sciences Faculty, the journal of Hacettepe University Education Faculty, the journal of Gazi University Education Faculty, The Turkish Online Journal of Educational Technology and The Turkish Online Journal of Distance Education were reviewed to carry out a content analysis of the studies conducted in the field of educational technologies in Turkey in 2005-2007.	<p><b>The most commonly preferred ones</b></p> <p><i>Topic:</i> E-learning and distance education</p> <p><i>Method:</i> Quantitative</p> <p><i>Data Collection Instrument:</i> Scale, test and questionnaire</p> <p><i>Sampling selection method:</i> Easily available</p> <p><i>Level of the sampling:</i> University</p>
Hew, Kale & Kim (2007)	Articles published in the journals of Educational Technology Research and Development, Instructional Science, and The Journal of Educational Computing Research in 2000 – 2004 were analyzed.	<p><b>The most commonly preferred ones</b></p> <p><i>Topic:</i> Learning environment, learning and teaching psychology</p> <p>Educational design approaches, research and evaluation approaches</p> <p><i>Method:</i> Descriptive</p> <p><i>Data collection instrument:</i> Questionnaire</p>
Ma (2000)	The theses completed in the field of educational technologies in the Department of Educational Technologies of Wisconsin University in 1977-1999 were analyzed through content analysis and citation analysis.	<p><b>The most commonly preferred ones</b></p> <p><i>Topic:</i> interactive video and the use of computers in education</p> <p><i>Method:</i> Experimental and case study</p> <p><i>Data collection tools:</i> Interview</p>

The present study rather than looking at the tendencies in the field based on the analysis of the articles published in one or few journals for a certain period of time as in many other studies, analyzed all the articles published in 6 journals of educational technologies within Social Sciences Citation Index (SSCI) through content analysis. All the articles published in these journals in 2011 were subject to the analysis. In this way, clear picture of the studies carried out in the field of educational technologies for a year was taken and most preferred topics,

methods and their distribution across the journals were determined. For this purpose, the research questions were constructed as follows:

1. What is the distribution of the studies in journals publishing educational technology research?
2. What is the distribution of (a) Research methods, (b) Data collection tools, (c) Data collection types, (d) Sampling methods, (e) Level of the sample, (f) Size of the sample, (g) Data analysis methods used in educational technology research across the journals?

## 2. METHOD

All the articles published in 6 international journals in SSCI in 2011 were analyzed through content analysis method. Content analysis can be defined as a systematic and renewable technique through which a text is summarized by reducing it to smaller content categories based on certain rules (Stemler, 2001).

### 2.1. Sample

The population of the study consists of all the education technology articles published in journals within SSCI list in 2011. However, given the limitations of the study, there is a need to make some selection among the journals based on certain criteria. In this regard, the journals listed in SSCI and having “Educational Technology” in its name were included in the study. In addition to this, among these journals, the ones having “Computer and Education” in their names and publishing articles in the field of educational technology were determined. As a result of this selection procedure, the sample of the study became 600 articles published in the 6 international journals (Australasian Journal of Educational Technology-AJET, British Journal of Educational Technology-BJET, Computers & Education-C&E, Educational Technology and Society-ET&S, Educational Technology Research and Development-ETR&D, Turkish Online Journal of Educational Technology-TOJET) in SSCI list in 2011 (see. Table2). Without doubt, there are many journals publishing important research in the field of educational technologies apart from the journals included in the present study. As it was not possible to analyze all these journals in a short time, such a limitation was used in the present study. Future research may look at other journals.

### 2.2. Data collection instruments

In the present study, Article Review Form (ARF) was used to analyze the articles. The ARF was developed by making some changes on “The Educational Technologies Publication Classification Form” developed by Göktaş et al. (2012) by means of a literature review (Hew et al., 2007; Masood, 2004; Reeves, 1995; Sözbilir & Kutu, 2008). Throughout the updating process, first the form was examined by the researchers and the new categories considered to be necessary were added. Then, the form was examined by two people specialized in the field of research methods.

In the first part of the form there is some descriptive information such as the name of the article, its author, and the journal where it is published. In the other parts, type of article, methodology of the article, its data collections tools, sampling and data analysis methods are included.

### 2.3. Data analysis

The articles in the journals selected for the present study were analyzed through ARF by the researchers. Before starting independent analyses, randomly selected 50 articles were analyzed by all the researchers and compatibility between independent observers was examined. As no incompatibility was observed between the codings of the researchers, the other articles were independently analyzed by the researchers; yet, after each

journal was completed, crosstabs were constructed (e.g. research methods with data collection instruments or research methods with analysis methods) and whether there was any problem in coding was investigated and necessary amendments were made. Moreover, throughout the period when the researchers carried out their analyses independently, the researchers came together when they met any problem while filling in the forms and following a group discussion, final form of data entry was determined. The collected data were analyzed through descriptive methods and percentages and frequencies are presented in tables.

### **3. FINDINGS**

The findings obtained from the analysis of the articles are presented below in an order parallel to that of the research questions.

The present study analyzed 600 articles published in the field of educational technologies in 6 international journals within the scope of SSCI index in 2011. When the table is examined, it is seen that the highest number of articles was published in C&E journal in 2011 and this is followed by TOJET, AJET, BJET, ET&S, and ETRD.

Table 2. The number of articles in the journals

Journals	The number of articles	
	n	%
AJET	80	13.3
BJET	74	12.3
C&E	203	33.8
ET&S	72	12.0
ETRD	41	6.8
TOJET	130	21.7
<b>Total</b>	<b>600</b>	<b>100.0</b>

The distribution of research methods in the articles analyzed in the field of education technologies across the journals is presented in Table 3. When the methods of the articles analyzed were examined, the most frequently used research method was found to be quantitative methodology (58.67%), and this is followed by mixed (21.33%), qualitative (10.50%), others (4.83%) and literature review (4.67%).

In quantitative studies, it is seen that non-experimental research (33.17%) is preferred more than experimental research (25.50%). In non-experimental studies, descriptive research method is more preferred (17.17%) than the other methods and in experimental studies, quasi-experimental method is more preferred (17.67%) than the others. Among the qualitative methods, case study (9.33%) is the most preferred research design. In studies in which mixed method is preferred the most frequently preferred design is explanatory (9.17%) and it is followed by triangulation (8.00%) and exploratory (4.17%) design. In literature review studies, most commonly seen one is the studies compiling the literature concerning the related topic (4.00%). Meta-analysis method is only seen in four articles (0.67%). Apart from all these methods, studies describing the developed technology etc. are classified under the title of others. That type of studies make up 4.83% of all the articles analyzed.

When the data presented in Table 3 are examined, it is seen that in all the articles analyzed, quantitative method is the most commonly used one and this is followed by mixed method. When compared the other journals, AJET and TOJET include more qualitative research. Literature review type of studies occupy very little place in the journals. Out of all the journals, ETRD accommodates the highest amount of literature review research. Three out of the four meta-analysis studies are published in C&E and one of them in ETRD. The studies classified under the title of the others are mostly published in TOJET (27.6%). While explanatory design is dominant in C&E, AJET and BJET, triangulation design is more popular in TOJET, C&E and AJET.

The distribution of the data collection instruments used in the analyzed educational technology studies is given in Table 4. When the data collection tools used in the articles analyzed are examined, it is seen that there are totally 970 data collection tools used. The most frequently used data collection tool was found to be questionnaire (31.44%), and this is followed by achievement tests (16.29%). The least frequently preferred one was found to be document analysis (2.16%). When the rates of data collection tools are examined according to the journals, it is seen that observation is most frequently used in C&E (30.00%). Interviews (27.43%), achievement tests (37.34%) and alternative tools (37.50%) are used more in C&E than the others. Attitude, perception, personality and skill tests (38.53%) and questionnaires (39.34%) are used more in articles published in C&E. Document analysis for data collection is most commonly used in AJET (28.57%). Moreover, general sum of the data collection tools used in C&E (34.85%) and TOJET (20.00%) is more than those of the other journals. The reason for this is the higher number of articles published in these journals.

<b>Total</b>	<b>80</b>	<b>13.33</b>	<b>74</b>	<b>12.33</b>	<b>203</b>	<b>33.83</b>	<b>72</b>	<b>12.00</b>	<b>41</b>	<b>6.83</b>	<b>130</b>	<b>21.67</b>	<b>600</b>	<b>100.00</b>

Table 5 presents data collection types used in education technology research. The tools used are divided into three groups as classic, online, and mixed. Apart from these types, the area which is coded as “unused” includes the studies which did not use any data collection tools. It is seen that in the analyzed studies, the most frequently employed data collection tools are classic data collection tools using pen and paper (59.83%). They are followed by online (21.83%) and mixed (online and paper-pen) (10.33%). When the preferred data collection tool types are analyzed according to the journals, it is seen that the highest number of classic data collection tools are used by C&E (31.20%). In articles published in C&E, online scales are preferred more than the others (41.98%). The studies using mixed method to collect data are mostly seen in C&E (41.94%).

The distribution of the sampling methods used in educational technology research according to the journals is given in Table 6.

Table 6. Sampling methods according to the journals

When the Table 6 is examined, it is seen that the most popular sampling method in all the journals is convenience sampling (67.20%). This is followed by purposive sampling (22.46%). The ratio of the research employing random sampling selection is 7.49%. The number of the studies in which whole of the population is accessible is one.

The distribution of the level of the sample used in education technology research is presented in Table 7.

Table 7. Level of the sample according to the journals

When Table 7 is examined, it is seen that in all the journals, the most frequently preferred level of sample is undergraduate students (46.20%). The studies are usually carried out with undergraduate students and they are

followed by elementary school students (21.95%). In the studies conducted in the field of educational technologies, directors (0.18%) and parents (1.24%) are less frequently preferred as sample. Moreover, the number of studies carried out with pre-school students (0.88%) is quite few. Studies carried out with graduate students are most commonly published in AJET (50.00%). The ratio of the studies carried out with elementary school students is higher in C&E than the other journals. There is no study carried out with graduate students in TOJET and BJET. The ratio of the studies conducted with directors is quite low and they are only seen in BJET.

The distribution of the sizes of sample in articles analyzed in the field of educational technologies according to the journals is presented in Table 8.

Table 8. The sizes of sample according to the journals

When Table 8 is examined, it is seen that the dominant number of participants in all the journals is between 31 and 100 (34.77%). The ratio of the studies having more than 1000 participants is 6.13%. The articles having more than 1000 participants are most commonly seen in C&E (55.88%). The number of participants in the studies published in TOJET is mostly in the range of 31-100.

The distribution of the data analysis methods used in the articles analyzed in the field of educational technologies is given in Table 9.

It is seen that descriptive analysis method (43.90%) and inferential analysis method (40.47%) are most commonly used methods in educational technology research. While percentages and frequencies are most popular ones among the descriptive analyses (21.24%), among the inferential analyses, the most frequently used ones are t-test (11.62%), and ANOVA (10.45%). When the distribution of analysis methods is investigated according to the journals, it is seen that all statistics are mostly used in C&E (44.76 % descriptive statistics, 41.11% inferential statistics, 28.34% qualitative statistics).

#### 4. RESULTS AND SUGGESTIONS

In the present study, the articles published in 6 international journals in SSCI index were analyzed in terms of, method, data collection tools, sampling and data analysis method. The present study analyzed totally 600 articles published in AJET, BJET, C&E, ETR&D, ET&S, TOJET.

When the number of the articles published in these journals is examined, it is seen that the highest number of articles was published in C&E and it is followed by TOJET. When the methods used in the articles are analyzed, the quantitative methods seem to be used more and it is followed by mixed, qualitative, and literature review research methods. Similar studies in the literature also report that mostly quantitative methods are employed (Alper & Gülbahar, 2009; Goktas et al., 2012; Hew et al., 2007; Kurt et al., 2009; Şimşek et al., 2009). The reasons behind the preference for quantitative methods may be that they can be displayed within more visible lines, they can lead the researcher to certain causes and effects and their results can be more generalizable. When the methods are examined across the journals, it is seen that TOJET and AJET accommodate more place for qualitative studies and ETRD accommodates more place for literature review studies than the other journals. In light of these findings, it can be suggested that in future research, qualitative methods should be used to elaborate the results of studies carried out according to a quantitative design. In addition, mixed methods could also be used. Moreover, by employing mixed methods in future research, the findings can be enhanced and the methods can consolidate each other so that more comprehensive solutions can be found to problems. Of course, two basic points to be considered in the selection of research method should be research problem and research questions.

The data collection tools used in the studies are classified as observations, interviews, achievement tests, attitude-perception-personality tests, questionnaires, documents and alternative tools and totally 970 data collection tools were found to be used in all the articles. Among these tools, the most frequently used one is questionnaire and it is followed by achievement tests. It is seen that the number of the studies carried out by using documents is quite limited. In their content analysis studies, Alper and Gülbahar (2009), Göktaş et al. (2012), Hew et al. (2007), Şimşek et al. (2009) also investigated data collection tools and found that questionnaires are used more than the others. The reason why questionnaire is preferred more can be that it can be administered to big groups in different regions rapidly and cost-effectively. Moreover, as the most frequently used methods are quantitative methods in the articles, quantitative data collection instruments such as questionnaire and achievement test are preferred more. It was also found that student logs are used as an alternative data collection tools. It is believed that the studies to be carried out by using different data collection tools can bring different perspectives to the literature.

The data collection methods used in the studies are classified into three as classic, online and mixed. Among these, the classic methods are the most popular in the studies analyzed here. When the journals are examined individually, it is seen that C&E includes more studies preferring classic and mixed methods. It is thought that online data collection method will be used more in future as it makes easy to reach a lot of people, eliminates the problem of data arrangement and reduces the problems stemming from individuals and allows fast data analysis.

In the present study, the sampling methods used in education technology research were investigated from a several aspects. When the sampling method is examined in general, it is seen that the most preferred one in all the journals is convenience sampling method and the other methods are used relatively less. Some other similar studies have also elicited a similar finding (Alper & Gülbahar, 2009; Göktaş et al., 2012). In order to improve the

external validity and generalizability of a study, it seems to be better to use random sampling method. In studies using convenience sampling and purposive sampling methods, the findings should be interpreted considering the limitations resulting from the sampling methods. When the articles are analyzed in terms of the level of the sample, it is seen that mostly undergraduate students are selected as the participants in all the journals analyzed and relatively fewer studies are carried out with elementary school students, directors and parents. Similar studies in the literature also show that undergraduate students are preferred more than the others (Alper & Gülbahar, 2009). Hew et al. (2007) also points out that undergraduate students are mostly preferred as the sampling. Focusing on undergraduate students may result in ignoring some important factors of education technologies, Hence, future research can select samples consisting of pre-school students, directors and parents so that problems primarily concerning these groups can be solved more easily. The reason why undergraduate students are preferred more in the articles can be related to the popularity of easily available sampling method. As most of the studies are carried by academicians and due to convenience they prefer to work with undergraduate students, this seems to be natural.

When the number of the participants in the studies is investigated, it is seen that it generally varies from 11 to 300. The studies carried out with 1000 or more participants are generally seen in C&E. If the size of the sampling is increased in future studies, this can improve the generalizability of the researches.

The articles were analyzed in terms of the data analysis methods used and it was found that totally 1196 analyses were carried out. The analyses are classified as descriptive, inferential and qualitative. The most frequently used one among these is the descriptive statistics and in this type of analyses, percentages and frequencies are used. This is because of the fact that the data of both qualitative and quantitative research methods can be analyzed through frequencies and percentages. Among the inferential statistics, t-test is preferred more and in qualitative analyses, descriptive analysis is used more. This finding concurs with the similar studies in literature (Göktaş et al., 2012; Hew et al., 2007; Klein, 1997) .

One limitation of the present study is the analysis of 6 journals. In future research, the number of journals to be analyzed can be increased. The credible journals whether within SSCI or not can be included in future research. Such research can be repeated each year and then brought together at certain intervals to see the tendencies in the field more clearly.

## Abstract

Mapping the learning process and its analysis are relatively complicated activities. This paper demonstrates the use of precedence for non-standard analysis. Precedential model and precedence analysis are based on a comparison of elements in the system and the search precedence in the linkages between these elements. Links are defined for the elements of the system and precedence is set for attributes of elements. Multiple precedence and consensus in precedence are examined and modeled using the identified precedence. This way we can find the critical points and critical activities in the educational process.

*Keywords:* precedence, incidence, model, learning process, schedule of teaching

## 1. INTRODUCTION

The learning process is essentially composed of a set of elements and the links between them. A good definition of these elements and links can be for modeling and analyzing to use of classical methods of systems theory, systems analysis, operational analysis and graph theory. Standard methods and optimization tasks provide a similar set of results, which is nowadays usually applied. To increase efficiency analysis and modeling is a need to find new, non-standard methods and procedures that extend the methods used previously. These new methods must fulfill several conditions:

- Universal application
- Simple applicability to existing structures
- Existing methodologies and mathematical apparatus

At the Silesian University in Opava, School of Business Administration in Karvina there are existed projects that are investigating the use of precedence for new types of modeling and analysis. Precedence analysis is based on the basic definition of the general system. The system is defined as a set of elements and links between them. Each element has assigned set of attributes. Precedence analysis compares the values of selected attributes of the elements that have defined common link. Comparison can be absolute values of the attributes or purpose defined changeover value: relative increases over, the absolute increases over time, relative increases in space, absolute increases in space, deviations from the average values, deviations from the maximum values, deviations from the minimum values, etc. By comparing these values we get between soever defined pairs of elements of the direction of flow values for a given attribute. On the basis of these flows we set precedence and a sequence of elements according to the values of the attributes in the system - and succession precedence. These precedence

E-mail address: botlik@opf.slu.cz

and succedence we process by existing mathematical apparatus described closer Borje (1981). These tools further developed as Diestel (2005), who described the application of chart theory and Bakshi (2008), which dealt with practical applications. In the Czech Republic followed the example Borje for example Unčovský (1991), who generalized the incidence analysis in graph theory. These theoretical foundations follows research carried out in the grant SGS 5/2013 at the Silesian University in Opava, where is examined from mainly analyzes Botlík, Botlíková (see reference for 2010-2013), currently the analyze involved Andřýsek (2013), Palová (2013), Václavíková (2012) and others.

## 2. MODEL FOR ANALYZES

The basic model is multi-level; the structure is evident from Fig. 1<sup>†</sup>. The first level consists of a set of incidence matrices. Incidence matrices are defined for different types of links. The basic set consists of matrices for transitions between years, matrices for links between sections, matrices for links between objects and other.

Incidence matrix is a square matrix that records the existence of the link. Matrix has a dimension of  $(m+i) \times (m+i)$  where  $m$  is the number of elements in the system and  $i$  is the number of the defined surrounding. For each element of the surrounding is defined by exactly one row and one column of the matrix. Matrix elements have the value "1" if the row element has linkage with columnar. It is a symmetric matrix according to the main diagonal. With the implementation of the matrices to model we change the structure of the model. Incidence matrix is easily modifiable and universal. The second level consists of the matrix of values of attributes. Matrix has a dimension of  $(m+i) \times n$ , where  $m$  is the number of elements of the system and  $i$  is the number of the surrounding of analyzed attributes. In the absence of the attribute values in the relevant surroundings attribute value is counted using a set of keys (min, max, average, etc.) from the attribute values of elements of the system. The values of one attribute are therefore described by the row vectors. Matrix of values of attribute is again easily modifiable and universal. The third level consists of a set of precedents matrix. Precedence matrix is generated for the attribute from vector of attribute values and the incidence matrix. At this level are compared values of the selected attribute between each pair of elements. Subsequently, based on the value of the element of incidence matrix it is determined whether there is between elements the appropriate type of linkage. In case of a linkage is determined by binding orientation direction from an element with a lower value to an element with a higher value of the attribute. In some cases, it is at this level performed correction of values. For example, due to ensuring of acyclic of chart are values of attributes corrected for insignificant value item which will benefit the selected elements according to some qualitative criteria (e.g. by averaging the scores of student publications by the teacher, etc.). Over the set of precedence matrices are performed basic system operations. Composition operations of the selection vector with matrix and unification of selected vectors is defined for the model. Based on these operations, we can determined a set precedents for the selected element, set precedents on the set of selected elements, existence of precedence multiple lengths between two elements, and frequency of precedence multiple length between the two elements. Turn the orientation of the links, which we will carry through the precedence matrix transposition, we get succession matrix (successor's matrix). The set of operations, then we can extend the searching set succession to set precedents and vice versa.

<sup>†</sup>  $A_1, A_2, \dots, A_k$ : incidence matrix,  $P_1, P_2, \dots, P_k$ : precedence matrix,  $k_1, k_2, k_l$ : selective vectors,  $P_j^2, P_j^3, \dots, P_j^b$ : matrix  $P_j$  raised to the b-th,  $a_1, a_2, \dots, a_m$ : system elements,  $o_1, o_2, \dots, o_i$ : around the system,  $v_1, v_2, \dots$ : element attributes

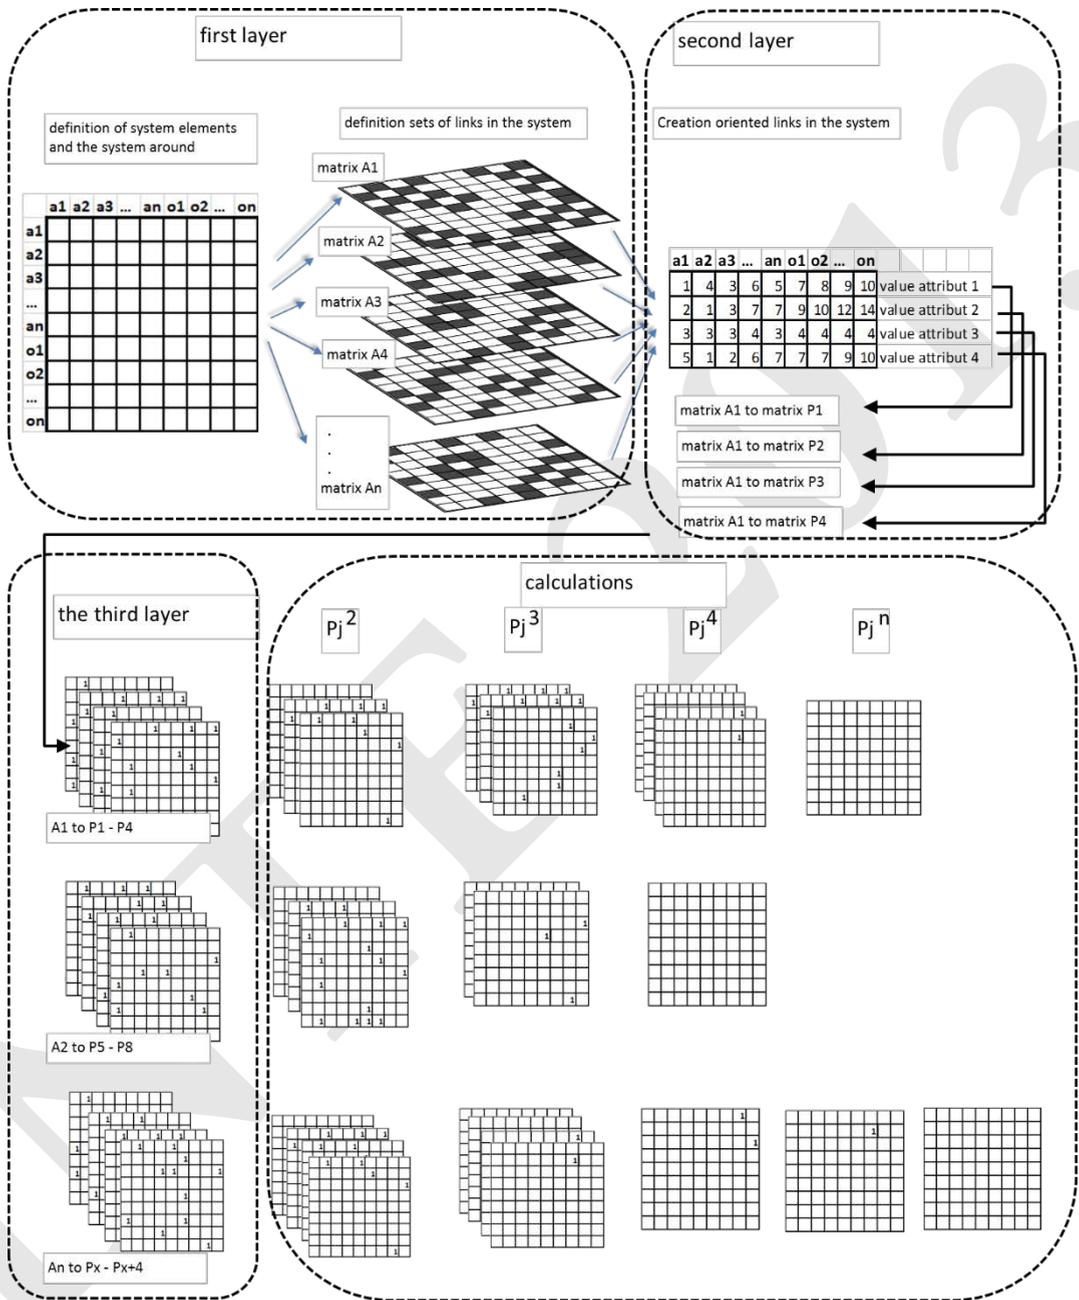

Figure 1 hierarchical model

Creating system structures is evident from Fig. 2, precedence formation is Fig. 3

### 3. ANALYSIS OF THE LEARNING PROCESS, EXAMPLES

#### 3.1. Preceding set of elements

In complicated structures is usually difficult to find the selected sets. In a learning process, we often encounter problems when we need to find a set of time-dependent objects. This is usually about the links between classes, following in the subjects in the following forms of study (Bachelor, Master, and Doctorate), following in the form of a ensure subject (the links between departments), follow the test process (credit, exam, comprehensive exam), etc. These links can be defined almost unlimited; the only criterion is the existence of quantifiable attribute. The situation shown in Fig. 4, we can imagine such as finding the set of objects which a student must complete in the selected semester (designate B) so that he can graduate immediately following semester (designate A). Apparently simple problem is in complex structures difficult to implement. In precedent model is a simple calculation of (1). The set of objects immediately follow-up of the semester we describe using a selective vector  $k$ .

$$Pk=k' \tag{1}$$

Selective vector has a dimension of the number of elements of the system. Selection we denote so that a corresponding element of vector will have a value of "1" when it is in the set of elements to choose. Operation (1), Borje (1981) indicates that matrix multiplication with the vector<sup>‡</sup>; operation consists of a selection of column vectors precedence matrix **P** that have the same indexes (corresponding to the same elements of the system) as elements of the selection vector and the subsequent unification of these vectors. The result is a vector of  $k'$ , which contains the value "1" in the elements that precede the set described by selective vector.

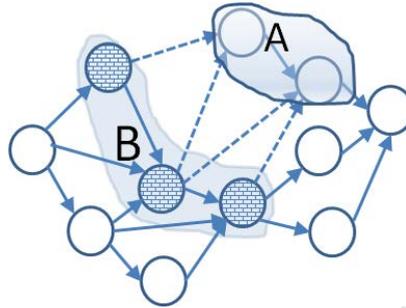

Figure 4 Previous precedences

### 3.2. Independent operations

Selective vector can be used for finding a set of independent operations. The basis of the algorithm is that the set of succedence to set of precedents of some set is another set (2). On Fig. 5 and 6 is an example where the schedule items dropped out educator. We need to find out which subjects may be taught independently of this specific educator and by which subjects we must ensure substitute teaching. The set of subjects taught a teacher is marked **A**, the set of courses that students have finished and that follow the teacher's subjects is marked **B**, set of independent activities is marked **C** and the set, which is independent but in the future will be dependent is marked as **D**. The set **B** we obtain by multiplying the selection vector  $k$  with precedence matrix **P**. The set **C** we obtain as the complement of the set **A** and set of succession of set **B**. The set **D** is obtained as the intersection of set **C** and set of succeson of set **A**.

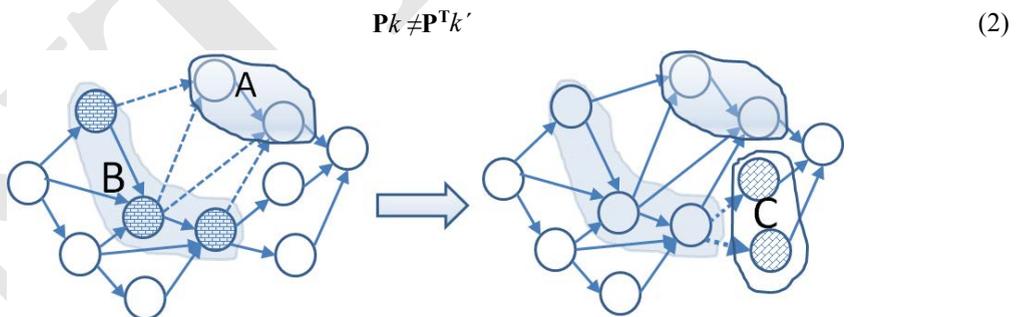

Figure 5 independent operations

<sup>‡</sup> Described in the references, Botlík, Botlíková (2010 – 2013)

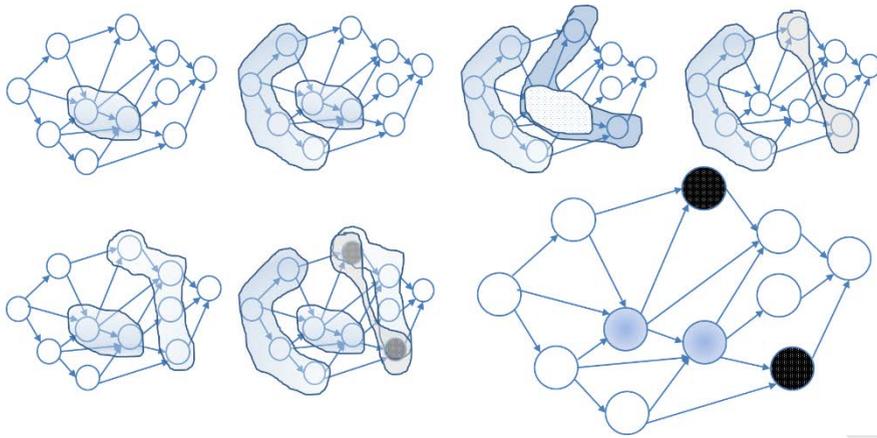

Figure 6 independent operations in future dependent, set D is shown in black

3.3. A set of multiple links, multiple precedence

A common problem is tracing existing dependencies. Dependencies can be direct, unmediated or dependence through other objects. In the case of finding of direct dependency is a finding of all precedence in the system. In the case of mediated linkages it is about finding multiple-precedence.

Fig. 7 is an example where we have described links between subjects in each semester (link shows that subjects consecutively in the next semester). Using multiple-precedence can identify groups of subjects, among which are different time intervals (2 semesters, 3 semesters, 4 semesters, etc.).

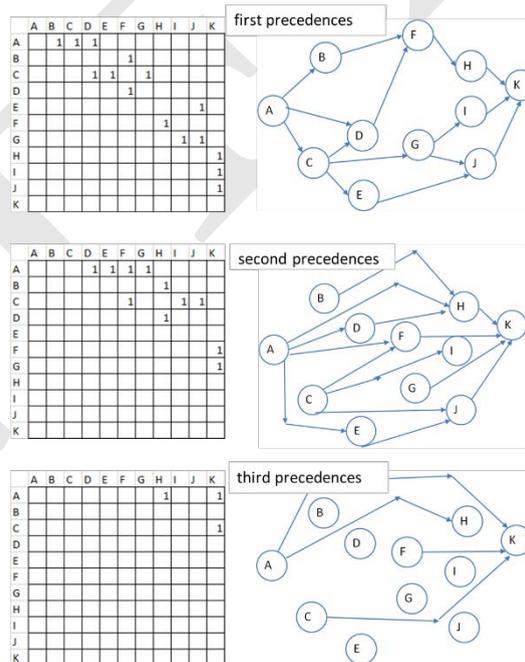

Figure 7 multiple-precedence

The solution is based on the principle of searching elements among which are multiple-precedence. As multiple-precedence is understood precedence to another existing precedence. According to Borje multiple-precedence can be calculated as the power of the precedence matrix. Appropriate level of power indicates how long (what multiples) precedence in the matrix is recorded. The highest power of nonzero matrix gives the longest precedence in the system. Borje defined determination of the existence of precedence between two elements as binary multiplication of binary matrix; in practice it is possible to use a classic multiplication of binary matrix to determine the frequency of precedence of appropriate length (see references Botlík, Botlíková).

### 3.4. Parallel operations

In some cases, we need to find in the learning process deuces in continuity for example between subjects. Continuity can again be direct or mediate. Fig. 7 shows the subjects that follow each other (for passing the subject it is necessary to have graduated another subject) and oriented edges are set directions of bonds (which item is necessary pass earlier). In some cases, it may lead to concurrence continuity, shown in Figure it is shown that the subject F can be taken subsequently after passing subjects B,C and D. Subject D can be taken subsequently after passing the subject C and C subsequently after passing the subject A. At the same time the by subject B it is stated that to complete the course it is required to pass the subject A. Finding such concurrence can be applied to task where we find such a power precedence matrices that have the same index of the non-zero elements (the value "1" occurs in the same rows and columns of the matrix with different power).

The task is easy to solve, for example with the counting the matrices, when in conformity of precedence different lengths will be in element of the resulting matrix values larger than 1.

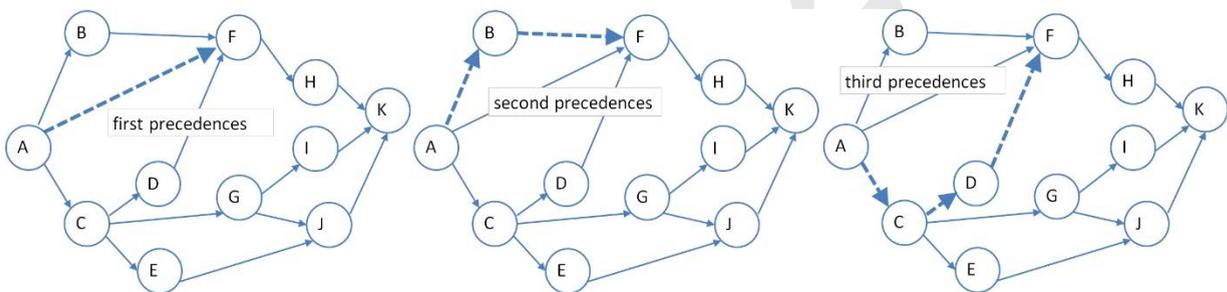

Figure 8 coexistence of the first, second and third precedence between nodes A and F

## 4. Conclusion

The paper demonstrates universal precedence model suitable for the analysis of the learning process. Forte of the model is universality when we define independently a set of elements, a set of attributes and a set of links. This independence allows creating many of independent structures and carrying out time-independent and space-independent analysis. Changing the structure is easily reached selecting the relevant incidence matrix, change the parameters of the system is realized by changing the vector of attribute values and calculating the appropriate precedence.

The model is applicable wherever where we work with disparate values (number of students, study programs, continuity on subjects etc.), furthermore, where we work simultaneously with the state variables (number of students, number on subjects etc.) and with flow values (increase the number of students, duration of study, etc.). The model allows analyzing even flow operation between the surroundings and the system, allows defining more

types surrounding (e.g. unsuccessful students after first year unsuccessful students after the second year, students who transfer to another school, students who come from another school, etc.).

The paper demonstrated on concrete examples a fraction of the model options that exceed the scope of this paper.

# A Mathematics Intervention: The case of 4 year-old Rylan and Hilda!

Marina PAPIC<sup>a\*</sup>

<sup>a</sup>Macquarie University, Institute of Early Childhood, 2109, Sydney, Australia

## Abstract

This paper provides an overview of a three-year study with 60 early childhood educators and approximately 240 children aged 4 to 5 years currently being conducted with 15 Australian Indigenous communities. International research provides strong evidence for investing early for improved health and wellbeing of young children (Barnett, 2011). The numeracy Intervention, *Patterns and Early Algebra Preschool (PEAP) Professional Development (PD) Program*, reported in this paper focuses on developing children's early algebraic and mathematical reasoning skills. A case study of two children in the study exemplifies how PEAP has the potential to advance young children's mathematical problem solving and thinking skills. The broader aim of the project is to work towards closing the gap in numeracy achievement for children from low socio-economic and disadvantaged backgrounds.

Keywords: Early numeracy, Patterning; Early algebra; Indigenous education

## 1. Introduction

Children's learning experiences in the early years play a critical role in setting foundations for lifelong learning (Clements & Sarama, 2007; 2011). Research shows that high quality developmentally appropriate early childhood programs produce both short and long-term effects on children's cognitive and social development (Barnett, Hustedt, Hawkinson, & Robin, 2007). In relation to mathematical development, research has demonstrated that the quality and quantity of early mathematical experiences are the main factors in determining future mathematical success. Van Tuill, Lesman and Rispens (2001), in their longitudinal study, found that the "long-lasting impact of an unfavourable start in formal education [is that] initial disadvantage seldom disappear, and there is evidence that gaps tend to widen" (p. 148, cited in Thomson, Rowe, Underwood, & Peck, 2005, p. 6). In addition, children from low socio-economic backgrounds, as well as disadvantaged backgrounds, have a lower level of achievement in mathematics than their peers when entering formal schooling (Tymms, Merrell, & Jones, 2004). "Without active intervention it seems likely that children with little mathematical knowledge at the beginning of formal schooling will remain low achievers throughout their primary years and probably beyond" (Aubrey, Dahl, & Godfrey, 2006, p. 44). This paper reports on a numeracy Intervention, *Patterns and Early Algebra Preschool (PEAP) Professional Development (PD) Program* with preschoolers (4-5 year olds) (Papic, in press), focused on developing children's problem solving and mathematical reasoning skills. PEAP PD advances young children's patterning, early algebraic and mathematical thinking skills, working towards the broader goal

of closing the gap in numeracy achievement for children from low socio-economic and disadvantaged backgrounds.

## 2. Background

### 2.1. *Early Childhood Mathematics Curriculum*

Early childhood curriculums and frameworks world-wide are beginning to recognise the potential for children prior to formal schooling to think mathematically, solve complex problems, make connections between various concepts, abstract and generalise mathematics ideas and represent these ideas. A recent national Early Years Learning Framework [EYLF] (Department of Education, Employment and Workforce Relations [DEEWR], 2009) in Australia outlines five broad learning outcomes with two of the outcomes providing opportunities for mathematical exploration, development and learning:

1. Children are confident and involved learners.
2. Children are effective communicators.

To be confident and involved learners and effective communicators, EYLF recognizes the importance of providing children with opportunities to investigate; solve problems; represent and communicate mathematical ideas and concepts; recognise patterns and relationships; and make generalisations.

The Australian EYLF “reflects a holistic approach to learning and development, embedded within play-based environments” (Perry & Dockett, 2011, p. 624) and acknowledges the important role early childhood educators have in supporting children’s learning. However, research shows that early childhood educators are not confident in their ability to plan for and capitalize on mathematical opportunities (Clements & Sarama, 2011). “Early childhood teachers often believe they are ‘doing mathematics’ when they provide puzzles, blocks, and songs. Even when they teach mathematics, that content is usually not the main focus ... evidence suggests that such an approach is ineffective, owing to a lack of explicit attention to mathematical concepts and procedures along with a lack of intentionality to engage in mathematical practices” (Clements & Sarama, 2011, p. 968).

To enhance mathematics learning for young children, particularly children from low socio-economic and disadvantaged backgrounds, research-based interventions are required. However, the development of interventions to promote numeracy must be aligned with initiatives to support professionals. “The ability of preschool practitioners to plan developmentally appropriate experiences that foster the advancement of mathematical concepts and processes of young children is dependent on a complex combination of both mathematical subject matter and pedagogical content knowledge” (Bobis, Papic, & Mulligan, 2010).

### 2.2. *Interventions in the Early Years*

There is strong body of research that attributes quality early childhood experiences to children’s successive achievement in schooling and later life. “Early childhood is a time of rapid growth and development, faster than at any other time of life, and establishes the foundations for a child’s future development, health, learning and social well-being. These early experiences set the stage for later success in school, adolescence and adulthood. Early intervention improves outcomes across a range of physical, emotional and social (including educational) indicators that have a positive effect throughout the life span” (Maari Ma Health Aboriginal Corporation, 2009, p. 3).

International research provides strong evidence for investing early for improved health and wellbeing of young children (Barnett, 2011). A cost/benefit analysis of one of the most famous early year's programmes, the High/Scope Perry Preschool Programme (Schweinhart, Montie Xiang, Barnett, Belfield, & Nores, 2005), showed significant savings to society over time in a range of outcomes. For every dollar spent per child on the Perry Preschool Program, at 40 year follow up, \$17 is returned to society.

Educational policy and practice is being increasingly directed towards improving early childhood education with interventions designed to promote mathematics learning e.g. *Building Blocks Project* (Clements & Sarama, 2007), *Curious Minds* (van Nes & de Lange, 2007) and the *Pattern and Structure Project* (Mulligan & Mitchelmore, 2009; Mulligan, Prescott, Paptic, & Mitchelmore, 2006).

### 2.3. Indigenous Australians

Australian national statistics highlight the unacceptable levels of disadvantage faced by Indigenous Australians in living standards, life-expectancy, education, health and employment (Australian Government, 2009). Australian Indigenous children aged 0-14 years make up 39% of the Australian Indigenous population. According to the National Report on Schooling in Australia (Ministerial Council on Education, Employment, Training and Youth Affairs, MCEETYA, 2008), literacy and numeracy results for Indigenous students are consistently below the national average, especially in remote areas; only forty-seven percent of Indigenous Australian children in year 7 are achieving results at the benchmark for numeracy (p. 29). In the early childhood years Indigenous children are less likely to participate in preschool programs than non-Indigenous children and they have higher rates of absenteeism in primary/elementary school (Frigo, Corrigan, Adams, Hughes, Stephens, & Woods, 2004). Poor educational outcomes of Indigenous children in later years of schooling are indicative of inadequate educational progress in the early years of schooling (Adams, 1998, p. 8). For the first time in Australia's history, the Government has set specific targets to address Indigenous disadvantage (Australian Government, 2009). Suitable educational opportunities not just in literacy and numeracy but also in developing skills and attitudes for lifelong learning play a critical role in achieving these targets, particularly in the early years.

### 3. Current Study

A three-year study with 60 early childhood educators and approximately 240 children aged 4 to 5 years is currently being conducted with 15 Australian Indigenous communities. The project consists of a design study integrating a quasi-experimental approach and adopts a social-constructivist approach to learning. The Patterns and Early Algebra Preschool (PEAP) Professional Development (PD) Program is being implemented in Early Childhood Services (prior to formal schooling) where approximately 80% of staff and children are Indigenous.

The PEAP PD Intervention is implemented in collaboration with early childhood educators working within the services. Through on-going professional development and support educators build pedagogical content knowledge and understanding of mathematical content. Following an Early Mathematical Patterning Assessment (Paptic, in press; Paptic, Mulligan, & Mitchelmore, 2011) the project implemented an early Patterning Framework that developed young children's mathematical thinking and problem-solving skills. Follow up interviews with kindergarten teachers, supported by data from standardised Kindergarten assessment *Best Start Numeracy* (NSW Department of Education & Training, 2009), provides evidence of the potential impact of this program on children's mathematics learning. Additional information will be gained from the children's Kindergarten teachers through semi-structured interviews to identify the teachers' perceptions of the children in terms of mathematical knowledge and confidence in the classroom to engage, question, communicate and justify their thinking during mathematical experiences.

The study builds on previous studies by Paptic (Paptic, in press; Paptic & Mulligan, 2007; Paptic, Mulligan, &

Mitchelmore, 2011) and aims to:

1. Advance pedagogical content knowledge and mathematical subject knowledge of early childhood educators.
2. Support teachers to implement an early numeracy program that explicitly aims to develop mathematical thinking and reasoning.

### 3.1. *Mathematical Patterning and Early Algebraic Thinking*

“Algebra can be viewed as a symbolical language that enables us to express relationships and generalizations, usually involving numbers, and use them in order to solve problems without the extensive numerical computations that might otherwise be necessary (e.g., when using trial and error)”, (Papic, Mulligan, Mitchelmore, 2011, p. 239). The central idea here is that of a generalization, that is, a relationship that holds over an entire class of values and not only in isolated instances (Dörfler, 1991). “From this perspective, finding and using generalizations may be considered as *algebraic thinking*” (Papic, Mulligan, Mitchelmore, 2011, p. 239).

A pattern is a type of generalisation, in that it involves a relationship that is “everywhere the same”. Some researchers have claimed that early algebraic thinking develops from the ability to see and represent patterns in early childhood (Mason, Graham, & Johnson-Wilder, 2005). Others have claimed that the integration of patterning in early mathematics learning is critical to the abstraction of mathematical ideas and relationships, and the development of mathematical thinking and reasoning in young children (Mulligan & Mitchelmore, 2009; Papic, Mulligan & Mitchelmore, 2011). “Patterning is an essential skill in early mathematics learning, particularly in the development of spatial awareness, sequencing and ordering, comparison and classification. This includes the ability to identify & describe attributes of objects and similarities and differences between them” (Papic, 2007, p.8). Recent research with young children has shown that the early development of pattern and structure positively influences, mathematical development and provides a stronger foundation for algebraic thinking (Papic, in press; Papic, Mulligan, & Mitchelmore, 2011).

### 3.2. *The Patterns and Early Algebra Preschool (PEAP) Professional Development (PD) Intervention*

The PEAP PD Intervention included individual or small group sessions with each child once a week for 10 weeks. Instruction frameworks based on patterning tasks guided the sessions (Papic, Mulligan, & Mitchelmore, 2011). Children explored, copied, created and drew various patterns, identified the unit of repeat (the pattern element e.g. ABC) and the number of repetitions, were encouraged to describe similarities and differences between patterns and explain their problem solving strategies and their thinking. Children were also encouraged to identify the unit of repeat in various repeating patterns and generalize this to create other patterns using various materials, still containing the same pattern structure (e.g. ABC, ABBA, ABCD). Teachers were also supported to “Patternise” their regular preschool program over a 12 week period. They were encouraged to incorporate rich patterning and numeracy experiences within their daily planning and implementation, building on children’s interests and incorporating culturally appropriate resources and experiences. This pedagogical strategy replicated, to some extent, the approach taken by Blanton and Kaput (2003) when they “algebrafied” school mathematics. Sharing patternising experiences in an online learning community extended and promoted opportunities for numeracy development across the 15 communities. A further component of the Intervention was to document children’s mathematical thinking and patterning in free play in order to plan appropriate follow up mathematical experiences.

A critical factor of the Intervention was developing early childhood educators’ pedagogical and content knowledge. This enabled them to incorporate patterns, problem solving and mathematical language and concepts

into their teaching. Teachers received three days initial training and one day weekly support visits over the 12 week Intervention.

An interview based assessment tool *Early Mathematical Patterning Assessment (EMPA)* (Papic, in press; Papic, Mulligan, & Mitchelmore, 2011) was used at the start of the Intervention to assess children's pattern recognition and problem solving strategies. EMPA was administered by the teachers to children on a one-to-one basis, taking approximately 15 minutes to administer per child. A variety of tasks assessed children's facility with repeating and spatial patterns and included copying, drawing and continuing patterns and identifying the number of dots or objects in various spatial arrangements. Instructional Frameworks incorporating pattern-eliciting tasks guided individual teaching over the 10 week period (Papic, in press). The Frameworks provided critical opportunities for developing early algebraic and mathematical thinking through sequential problem-solving patterning activities. Table 1 shows the five development levels on the Repeating Pattern Instructional Framework (Papic in press) and the associated tasks on each level.

This paper reports on a case study of two 4 year-old's (Rylan and Hilda) progression through the Repeating Pattern Instructional Framework. While this paper does not have the scope to report on the children's development through the Spatial Patterns Instructional Framework or their engagement in mathematical explorations through daily curriculum and in free play, it does provide evidence of the potential impact of an Intervention focused on mathematical patterns and early generalization on children's mathematical learning.

#### 4. Results: The Case of Rylan and Hilda

Rylan and Hilda, 4 years of age, were from the same centre in inner Sydney, Australia. Both children were assessed using the EMPA and their strategies to solve the various tasks placed Rylan at Level 3 on the Repeating Pattern Instructional Framework (See Table 1) and Hilda at Level 2. Both children progressed through the tasks on the Framework over the 12 week Intervention period: Rylan completed Tasks 10-32 and Hilda completed Tasks 5-32. The children could solve various patterning problems and justify their thinking and solution strategies. This included creating and drawing complex towers (e.g. ABCD x 3) from memory (see Figure 1a). Both Rylan and Hilda could describe their patterns showing an understanding of unit of repeat and the concept of multiplicative thinking:

*Teacher:*            *What pattern did you make?*

*Rylan:*              *Yellow, brown, red, orange pattern, 3 times ... That's 1, 2, 3, 4, ... 11, 12 blocks.*

**Level 5 - Advanced structural 2**

26. Designing own multi-variable repetitions
- 27-30. Recognising, continuing and creating repeating border patterns
27. Identify the various unit of repeat in border patterns
28. Continuing a given border pattern
29. Creating a border pattern around a picture
30. Identifying the missing item in the border pattern
31. Recognising, copying and drawing hopscotch patterns from different orientations
32. Creating hopscotch patterns
- 

Both children could break up their patterns to show the individual units of repeat and the number of times they were repeated (see Figure 1b).

*Teacher:* How many times have you made your pattern?

*Hilda:* Four.

*Teacher:* Can you show me?

*Hilda:* One times, two times, three times, four times.

Solving patterning problems also provided opportunities to explore the concepts of “adding”, “taking away”, “more” and “less”. In creating an AABBC tower Rylan made two units of repeat and then stated “That’s two, now I gotta make it one more time”. Rylan made the tower again with 6 repeats and the teacher asked him to compare the two towers and explain what was the same and different about them.

*Rylan:* They both have blue, blue, green, green, dark blue as the pattern. This one is three times and this one is six times.

*Teacher:* How many do you need to take away from this one (referring to the AABBC x 6 pattern) to make it the same as this one (referring to the AABBC x 3 pattern)?

*Rylan:* Three of the patterns. Rylan proceeds to demonstrate this to the teacher breaking off one unit of repeat at a time.

At Level 5 children worked with complex patterns using a variety of materials. Patterns were presented in different orientations such as cyclic patterns (see Figure 2a) and hopscotch patterns (see Figure 2b). The teddy represents the starting point of the hopscotch.

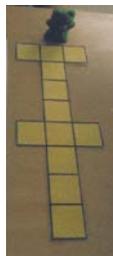

Fig. 2. (a) Cyclic pattern; (b) Hopscotch pattern

Rylan was given an 11 x 6 pattern of squares with an incomplete ABC pattern (see Figure 3a). He was asked if it could be completed. Since the border consisted of 34 squares, the task could not be completed without breaking the pattern. Rylan initially answered yes but when he explored it further he replied “No! We need blue at the end!”

Rylan used his understanding of border patterns to create his own complex pattern. Rylan was given the problem of creating a border around a picture ensuring the pattern is complete. Figure 3(b) shows Rylan’s border pattern. He successfully created a complex AABCCD border around his picture. The teacher challenged Rylan further asking him to close his eyes and she removed three random tiles. When he opened his eyes, Rylan was asked to identify the colors of the missing tiles. He could immediately identify the correct tiles using the unit of repeat as his justification e.g. “There should be a red after the two blues in the pattern”.

Fig. 3. (a) Incomplete ABB border pattern; (b) Rylan’s AABCCD border pattern

To extend Rylan’s skills further in solving problems and justifying his thinking the teacher gave Rylan another border pattern and asked him to identify the unit of repeat. She got Rylan to close his eyes and she swapped two of the picture tiles around. Rylan was asked to find what was wrong with the border pattern. Rylan identified that two of the pieces were in the incorrect place explaining that the pattern should be “turtle, hand, crab, octopus” (see Figure 4a).

Fig. 4. (a) Rylan, border pattern task; (b) Hilda, abstracting and generalizing the pattern to a border pattern

Children were encouraged to abstract the unit of repeat and generalize the pattern using other materials. Hilda created a pink, yellow, blue, red, purple tower with blocks (ABCDE x 7). She then identified an object to represent each of the colors in her pattern and recreated the same pattern structure (ABCDE x 7) as a border pattern (see Figure 4b).

Hilda went on to create an ABCDCE border pattern (rock, frog, shell, lizard, shell, bead). The teacher asked Hilda how she could draw her pattern. She said it was hard to draw a frog and a lizard. The teacher asked if she

could draw something to represent each of the objects. Together they came up with symbols to represent each of the items (see Figure 5a). Hilda went on to successfully use symbols to represent the complex border pattern (see Figure 5b).

Fig. 5. (a) Symbols to represent items in the pattern; (b) Hilda's symbolic representation of her border pattern

Hopscotch patterns (see Figure 2b) and associated problem solving tasks were included to explore patterns represented in different orientations and thus provide opportunities to enhance children's transformation skills. Children were asked to copy the various hopscotch patterns with tiles, create their own hopscotch pattern and draw the hopscotch pattern. Children were asked to do this from various perspectives. Figure 6 shows Rylan and Hilda reconstructing the given hopscotch from the perspective of the teddy (recreating the hopscotch at 180 degrees).

Fig. 6. (a) Reconstructed hopscotch at 180 degrees

## 5. Conclusions

The examples of Rylan and Hilda engaging in various patterning tasks provide empirical evidence that young children can develop sophisticated pattern concepts and skills and that children prior to formal schooling can abstract, generalize and explain patterns and pattern structures. They can view patterns from different orientations and use various materials to create complex patterns. The examples provided in this paper document episodes of young children solving problems, reasoning and generalizing their thinking. These skills are critical for long term mathematical growth and development (Papic, Mulligan & Mitchelmore, 2009; 2011). The impact of such a program on children's numeracy skills and mathematical confidence and competence will be explored when children's Kindergarten Best Start (NSW Department of Education and Communities, 2009) results are collected and analysed along with interview data collected from the Kindergarten teachers who are teaching the children the year after the PEAP Program implementation (2013). While the PEAP PD project has not been completed, the initial data shows that an Intervention with four year olds focused primarily on patterns has the potential to advance young children's mathematical problem solving and reasoning skills. This in turn has the potential to close the gap in numeracy achievement for children from low socio-economic and disadvantaged backgrounds.

## Acknowledgements

The current project is supported by an Australian Research Council (ARC) Linkages Grant LP110100553 (Papic, Mulligan, Highfield, McKay-Tempest, Garrett, Mandarakas, & Granite, 2011-2013). Any opinions, findings, and conclusions or recommendations expressed in this paper are those of the author and do not necessarily reflect the views of the ARC. I wish to acknowledge the excellent support provided by Gowrie NSW, project industry partner, and the dedicated teachers and children from the various early childhood centres involved in the study.

## Abstract

**Introduction:** Physical education may help to improve the physical activity level (PAL) and has an important role in the development of fundamental movement skills (FMS). Indeed, several studies showed that the acquisition of FMS correlate with PAL, health-related fitness and self-esteem (Stodden, Langendorfer, & Robertson, 2009; Stodden & Goodway, 2007). **Purpose of study:** In education the assessment of children's motor skills represents an interesting research issue. In this work we discuss about the results obtained during the assessment of one movement skill in 11/12-age children of an Italian school. **Methods:** Fundamental motor skill was evaluated using quantitative instruments, kinematic video-based analysis, and qualitative instruments as specific evaluation grid. The test used for the FMS assessment is "Catch" (Fundamental Motor Skills, 1996). **Discussion:** The comparison about the data show two interesting findings: 1) children don't reach the level of motor-gross abilities expected for their age; 2) evaluations of qualitative instruments sometimes don't match the ones obtained by quantitative devices.

*Keywords:* Physical Education; Fundamental Movement Skills; Video-Analysis; Physical Activity Level; Physical Activity Assessment

## 1. Introduction

The role of physical education is important for the development of fundamental motor skills and for the improvement of physical activity levels. Several researches believe that the low level of physical activity is one of the major causes of overweight and obesity in children and youth (Odgen et al., 2006). The dramatic increase in childhood obesity has been deemed one of the most serious public health issues facing nowadays society (Ebbeling, Pawlak & Ludwig, 2002; Odgen et al., 2006). Physical activity helps health and social life during our existence. The childhood represents a critical period when the practice of physical activity can improve our health level and it can help to prevent problems such as hypertension, respiratory problems and orthopaedic complications (Dietz, 1998). In Italy, the report "Osservasalute-2009" proposed by the National Health Observatory outlined that in several Italian regions the overweight phenomenon increased in last years and a third of Italian people are considered overweight.

Several guidelines produced by numerous countries promote physical activity importance in children and youth (Janssen, 2007). In the previously mentioned guidelines, with a few exceptions, authors suggest children and youth to participate at least 60 minutes of moderate-to-vigorous intensity of physical activity daily (Janssen & LeBlanc, 2010). Other researches, regrettably, proved that the indications provided by those guidelines are only partially attended by youth. Ribeiro and his colleagues, studying a sample of 210 youth of the city of

\* Corresponding author. Tel.: +39 0935536363  
E-mail address: francesco.sgro@unikore.it

Oporto, showed that the level of physical activity is compatible with the same proposed by the guidelines only in the weekends; moreover only the 15% of boys and the 7% of girls respect the guideline indications (2009).

Today school represents the ideal context to promote the physical activities for youth and children, especially in biggest cities where the opportunity to play with other friends is highly restricted. School, moreover, has to promote innovative learning methods for physical education, including the use of the new technologies, as the exergames, to engage students' participation and to improve the assessment method of physical activity levels (Sgrò et al., 2010).

Moving from this consideration, in this work we discuss about the results obtained using a mixed-method approach for the assessment of a motor test, "Catch" proposed as a fundamental motor skill in childhood and youth (Okely, Booth & Patterson, 2004; Cliff et al., 2009).

## 2. Physical Education

Physical education is an all-encompassing term, including fitness, skills, movement, dance, recreation, health, games and sport plus the appropriate values and knowledge of each.

Physical education (PE) in school curricula must help students to develop motor abilities. A good motor proficiency acquired during childhood is fundamental to a healthy lifestyle and a suitable level of physical activity. Unfortunately, PE is not relevant in the school system of many countries (Casolo, 2012) and it is often associated to a sport-practice time, while it would be managed as other learning subjects of school curricula, as suggested by Gardner in his studies on multiple intelligence (Gardner, 1987). Students often underestimate the importance of the concepts taught in physical education, such as BMI definition or sports rules. If PE had much relevance in the education, probably some health-problems related to the low level of physical activity could be avoided.

### 2.1. Fundamental Motor Skills in education

The fundamental motor skills (FMS) represent an important part of PE programs in pre-school and primary schools. FMS are common motor and physical activities with specific patterns. Fundamental motor skills are often divided in two domains:

- *Locomotor skills*: run, jump, hop.
- *Object-control skills*: catch, heap, throw, kick.

FMS are the building blocks for more complex motor skills and movement patterns and represent the underlying performance competency required for participation in many forms of physical activity (Payne&Isaacs, 2011). FMS proficiency influences students in many aspects of their life. For instance, sport performances are more efficient in children with good ability in FMS: several skills used in sports and physical activities represent a more complicated pattern of specific FMS.

The development of FMS proficiency is prominent in early childhood and primary school physical education curricula. The FMS competences play an important role in children's physical, cognitive and social development (Payne&Isaacs, 2011). Furthermore, several scientific researches showed the correlation of FMS with health outcome in youth; adolescents with high level of FMS have higher cardio-respiratory fitness (Okely, Booth & Patterson, 2001) and lower probabilities to be overweight (Okely & Booth, 2004) than their peers.

The assessment of FMS was carried out using the motor test. The evaluation criteria of the motor test can address performance outcomes and/or technical skills. Especially in the education environment, the FMS assessment has to examine first the moving pattern or technique, which can provide more useful information to FMS proficiency in young children (Cliff et al., 2007). Furthermore, we believe that the indication on moving pattern can be useful both to give a specific feedback to students and to upgrade, if necessary, teaching methods.

In this way physical education could share the same approaches and purposes with the notational analysis in sport, as proposed by Mango and his colleagues (Mango et al., 2010).

## 2.2. Assessment Methodologies in Physical Education

Physical activity requires multidisciplinary evaluation, but this is very difficult to realize in the educational environment. In Sport Science research field, the assessment of physical activity involves several aspects: sample size, assessment time, ethics and instruments. Assessment approaches can be divided in two domains: subjective and objective. Armstrong and Welsman stated that the assessment of young physical activity has to be contextual with the methodology used (2006). Moving from this consideration we can assume that the choice of instruments must be in according to the motor task analyzed and the objective of the assessment.

Subjective instruments used in physical education studies are: questionnaire (Sirad & Pate, 2001), self-report questionnaire (Pate et al., 2002) and examination grid (Ulrich, 2000). The last instrument requires an external observer. Subjective instruments are especially used for epidemiological studies.

The use of objective instruments to assess physical activity in young is recently growing. The reasons of this increase are: technologies development, easy-to-use interaction, feasibility, wearable characteristics and lower price. The most used devices in PE environment are: heart rate monitor (Welsman & Armstrong, 2000), step counter (Raustrup, Pangrazie & Stahle, 2004), accelerometer (Ekelund, 1999; Cliff et al., 2009), IMU - Inertial – Magnetic Unit (Marsci et al., 2012) and video-analysis technologies (Cliff et al., 2009).

As stated above, the best choice is directly linked to the aim of the assessment. The use of subjective methods is cheaper and less accurately than the objective one. In this work we use the subjective method proposed by Ulrich for the “Catch” FMS assessment, upgrading the assessment with an objective evaluation of some technique skill using video-analysis system.

## 3. Research Methods

Data were collected in a school of Sicily (Italy). Students were recruited among 11- to 13- year-olds. The following data were acquired from each student: age, height, weight and dominant limb. Trained assessors directly measured height and weight using specific devices; shoes and heavy clothing were removed before measurements. Data were collected from March to September 2012. Body Mass Index (BMI) was calculated from height and weight values, using the follow equation:  $BMI = \text{weight (kg)} / \text{height}^2 \text{ (m}^2\text{)}$ . Each student involved in the assessment sessions produced parent consent.

### 3.1. “Catch” Test

*Catch* represents one of the fundamental motor skills. The test assesses the student’s catch proficiency; each student must catch a basketball ball thrown from a distance of 8 meters. The ball trajectory must to be a parabolic. All tests were administered in the school gym during physical education hours. We decided to assess the skill performance process rather than the outcomes of performance using criteria proposed in the TGMD-2 (Ulrich, 2000). The validity and the reliability of the test in this age group had also established. In our work we assessed only *Catch* proficiency, so we used the same procedure suggested by Ulrich but using only *Catch* performance normative data.

Before testing *Catch* skill, a skilled operator produced a visual demonstration of the correct technique for all students. Participants were then called individually to produce their performance for five trials. The teacher encouraged the student during trials, but he/she didn’t give any specific feedback. Moreover, students didn’t know criteria used for their evaluation. All performances were video-recorded using Skill Capture software and

each video was labeled with the same code associated to students. In according to several researches (Cliff et al., 2009; Hardy et al., 2010), criteria used to assess the *Catch* proficiency were:

Table 1. Assessment *Catch* criteria

N. Criteria	Performance Criteria	Mastered Age (FMS,1997 - Revised)
1	Eyes are focused on the ball throughout the catch	5/6
2	Preparatory position with elbows bent and hands in front of body	6/8
3	Hands move to meet the ball	6/8
4	Hands and fingers positioned correctly to catch the ball	7/9
5	Catch and control the ball with hands only	7/9
6	Elbow bends to absorb force of the ball	8/10

The last column contains the age at which each criteria could be expected to be mastered (FMS Teacher Manual, 1997). If the student doesn't catch the ball is noted as an error.

### 3.2. Subjective Assessment Methodology

Four skilled operators were recruited for the subjective assessment of catch proficiency. Each operator was trained in the evaluation criteria used to assess FMS proficiency. Each operator analyzed the video of each student assessing three performances without errors. The operator compiled a specific record that contains a blank box for each performance criteria proposed in table 1. Every form row contained specific boxes for each student and trial. The operator inserted "1" if the child has mastered for the analyzed criteria; a "0" score indicated that the student was not skilled in assessed competence.

### 3.3. Objective Assessment Methodology

Specific methodologies and technologies often used in movement analysis are required for the objective assessment of *Catch* proficiency. In this work we propose the biomechanical approach to the movement analysis using video-analysis methodology. First of all, we identified which criteria proposed for the subjective analysis we can also assessed using objective approach. In detail we chose the criteria number 2, 3 and 6. In Fig 1a we show a snapshot of video-analysis assessment procedure. In order to assess the cited criteria, we must develop a specific biomechanical model of the upper arms. The model proposed is represented in Fig. 1b.

Specific landmarks were pointed to every student corresponding to the joint center of upper arms: shoulder, elbow and wrist. These visual references are used to build the triangle proposed in Fig. 1 and used to assess the shoulder flex-extension angle ( $\alpha$ ). We developed an algorithm to assess the amplitude of  $\alpha$  and the linear displacement of joint using the coordinates X and Y of landmarks. For the linear displacement we also used the coordinates of Hip landmarks. The coordinates of each joint were obtained using software for biomechanics analysis called SkillSpector. All the equations and conditions proposed for the objective assessment of performance were realized considering the frame of each trial started from 0.

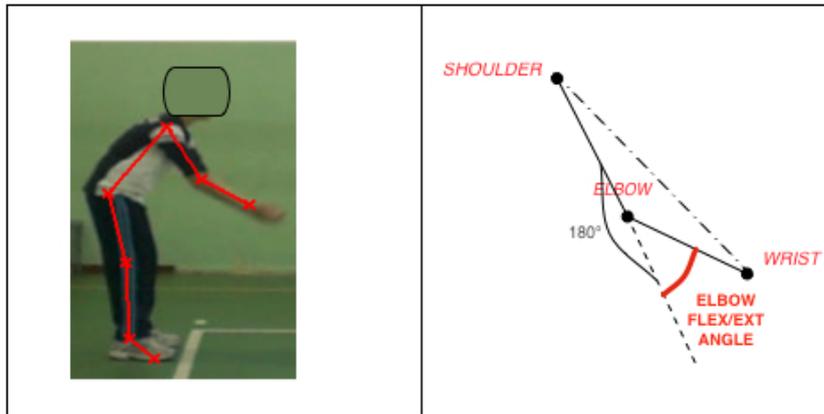

Fig 1. (a) Visual Frame realized using Skill Specter; (b) Biomechanics model of elbow

Using this approach we can propose an objective evaluation of the criteria 2, 3 and 6 described in table 2:

Table 2. Objective Assessment *Catch* criteria

N. Criteria	Objective Performance Variables	Performance Mastered Condition
2	1) Elbow Flex/Ext Angle ( $\alpha$ ) – 2) X-coordinates of Hip and Wrist	$90 < \alpha < 160$ and $X_{\text{hip}}(0) - X_{\text{wrist}}(0) < 0$
3	Displacement of Wrist from initial phase to the frame before the catch (Wrist_Displacement)	Wrist_Displacement > 50 cm
6	Elbow Flex/Ext Angle ( $\alpha$ )	$120 < \alpha < 150$

The algorithm returns “1” if the criteria expressed in the last columns of Table 3 were reached; otherwise it returned “0”. The range and the threshold used to define the mastered criteria were chose using an empirical approach.

The objective method is also proposed because a quantitative measures is less influence by the experience subjectivity and sensitivity, in according to Masci and her colleagues (2012)

### 3.4. Statistical Analysis

All analyses were conducted using SPSS version 20.0. First of all we verified the normality of the data using Kolmogorov-Smirnov test and inspecting asymmetry-kurtosis values. For normality data we calculated means and standard deviation, while for not normality data median and interquartile ranges were estimated. The gender difference was assessed using t-Test from normally distributed values, while Mann-Whitney U was used for not normally ones. A correlation analysis was also conducted between anthropometric data and total score of two types of assessment. Statistical significance was set at  $p < 0.05$  for all analyses.

## 4. Results

Initially twenty-six students composed the sample group. Unfortunately only sixteen students provided all information and documents required and completed correctly the assessment session. Three students had not

anthropometric data suitable with the parameters chose for this research. The data obtained using statistical approaches prosed in the section 3.4 are represented in the table 3.

Table 3. Demographic, anthropometric and fundamental movement skill data

Variable	Girls (n=8)	Boys (n=8)	t/z	p
<u>Demographic</u>				
Age (years), mean $\pm$ SD	11.38 $\pm$ 0.51	11.38 $\pm$ 0.51	0.00	1.00
<u>Anthropometry</u>				
Weight (Kg), mean $\pm$ SD	45.9 $\pm$ 11.09	45.76 $\pm$ 11.37	0.29	0.977
Height (m), median (IQ range)	1.54 (0.16)	1.5 (0,19)	-0.263	0.793
BMI (Kg/m <sup>2</sup> ), median (IQ range)	18.62 (1.97)	19.37 (4.02)	-0.053	0.958
<u>Catch Criteria Scores - Qualitative Assessment</u>				
Skill Criteria N. 1 (range: 0-12), mean $\pm$ SD	11.63 $\pm$ 0.5	11.88 $\pm$ 0.35	-1.128	0.278
Skill Criteria N. 2 (range: 0-12), median (IQ)	7.50 (4.00)	9.00 (2.00)	-0.917	0.359
Skill Criteria N. 3 (range: 0-12), mean $\pm$ SD	11.00 $\pm$ 1.06	10.88 $\pm$ 2.10	0.150	0.883
Skill Criteria N. 4 (range: 0-12), median (IQ)	8.00 (6.00)	3.50 (8.00)	-1.320	0.187
Skill Criteria N. 5 (range: 0-12), median (IQ)	7.00 (7.00)	2.50 (8.00)	-1.320	0.187
Skill Criteria N. 6 (range: 0-12), median (IQ)	9.00 (5.00)	11 (3.00)	-1.235	0.217
Catch total score (range: 0-72), mean $\pm$ SD	53.25 $\pm$ (9.05)	49.75 $\pm$ (9.72)	0.745	0.468
<u>Catch Criteria Scores - Quantitative Assessment</u>				
Skill Criteria N. 2 (range: 0-3), median (IQ)	2.00 (1.00)	3.00 (0.00)	-2.031	0.042
Skill Criteria N. 3 (range: 0-3), median (IQ)	3.00 (1.00)	3.00 (1.00)	-0.645	0.519
Skill Criteria N. 6 (range: 0-3), mean $\pm$ SD	1.88 $\pm$ (0.835)	1.38 $\pm$ (1.188)	0.974	0.346
Catch total score (range: 0-12), mean $\pm$ SD	6.50 $\pm$ (1.39)	7.00 $\pm$ (1.51)	-0.707	0.491

## 5. Discussion and Conclusion

In this work we discuss about results obtained in the assessment of *catch* proficiency in childhood students. In according to previous research, students involved in the research could to be mastered in each performance criteria used for their evaluation. The assessment procedures proposed are two: one is complete and following the methodological approach proposed by Ulrich, while the second addresses only the performance criteria that we try to study using objective procedure. A summary evaluation of results obtained outlines that the students aren't mastered in all the criteria assessed. In the Figure 2 we propose the comparison between a normalized scores obtained in the criteria 2, 3 and 6 using both procedure proposed in this work.

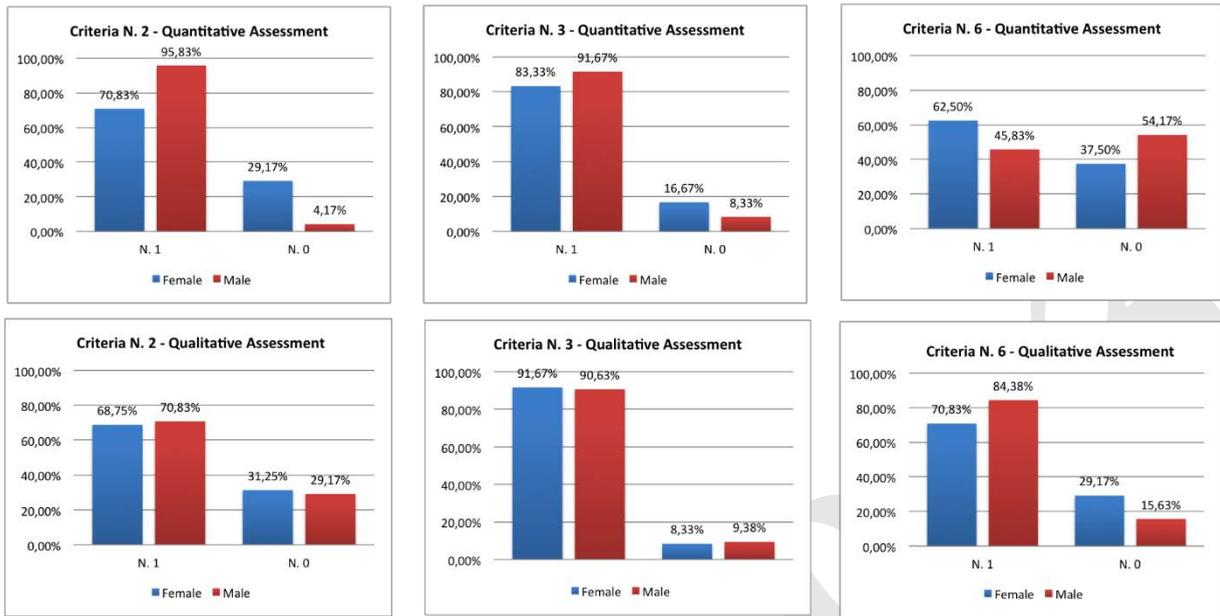

Fig. 2 – Proportion (%) of students scores obtained with objective and subjective assessment procedure

Participating boys and girls didn't differ in demographic, anthropometry and *Catch* criteria scores (all  $p > 0.005$  – Table 1). These findings were consistent with the conclusion proposed by Cliff and his colleagues (2009). No correlation was found among anthropometric data and mastered scores obtained with both procedures. Positive correlation was found between the BMI and the flex-ext angles in criteria number six. The trend of subjective and objective assessment methods was the same for the performance criteria 2 and 3. In the assessment of criteria number 6 the level of mastered and not mastered is more equal in objective assessment while in the subjective assessment boys resulted more skilled than girls.

In previous study about the *Catch* proficiency in pre-school children boys had better performance than girls. The same trend was not obtained using subjective procedure. Otherwise, boys seem to be better than girls using biomechanical approach. Teachers can acquire more interesting information about the FMS proficiency of his/her students through the objective evaluation of motor pattern than the subjective ones. The annotation of angles and linear displacement, moreover, can be useful to improve the evaluation of students' development cycle.

Limits of this study are the low number of students, especially due to the few time for the test, and the choice of threshold and range for objective assessment. We will try to define a normative data for range and threshold increasing the sample size of our students.

## Acknowledgements

We wish to thank the school, teachers, students and their parents; Carola Sambito and Matteo Barresi for data gathering; Valentina Sgrò for her assistance with manuscript preparation.

---

### Abstract

Recent pervasiveness of mobile computing becomes an attractive motivation for EFL learners. Korea provides an excellent environment for using mobile devices such as smartphones and tablet PCs, with easy access to wireless networks. This offers the learners a chance to practice writing on-the-move. This paper introduces a design of a mobile-based tool to assist the learners of beginning to intermediate levels in improving English writing skills. It provides two types of learning mode: 1) the learners select grammatical categories for which the tool provides a brief description and exercise questions, and 2) they choose one of the suggested Korean sentences and write a corresponding English sentence to be evaluated and provided with instructional feedback.

*Keywords:* mobile-based learning tool; writing skill improvement; EFL; instructional feedback

## 1. Introduction

Wireless communication technology is rapidly growing and has produced advanced computing devices which are still evolving. The devices present high capabilities from which human life greatly benefits. Korea provides an excellent environment for using mobile devices such as smartphones and tablet PCs since a variety of devices is easily accessible. Those hand-held devices along with easy and widespread access to wireless networks have changed the future of e-learning (Godwin-Jones, 2011). Mobile-based language learning in particular is recognized as a potential and convenient way as extension to currently existing methods because it is spontaneous and ubiquitous. Since mobile-based language learning also offers an opportunity for learners to practice language on-the-move, it can be an ideal solution to overcome time and place related barriers for language learning process.

Enthusiasm on learning English in Korea is beyond what is considered necessary throughout the nation. In particular, the students at grade school and high school pursue intense learning process to survive from excessive competition. They are sent to a cramming school or taking private tutoring after class. Moreover, learning through internet has become very popular among English learners because it allows them to access anytime and anywhere internet connection is available. This kind of convenience together with zeal for learning English has now moved onto mobile devices which can substitute PCs in many aspects. Moreover, those devices are accessible to majority of the learners including even grade school students who are adept in using them. Using mobile devices seems greatly effective in that the learners can utilize them for language learning when they are away from PCs even with a limited amount of spare time.

In this paper, we describe a mobile-based English learning tool that is designed to assist Korean EFL learners in improving their writing skills. They can utilize two types of learning modes the tool provides: grammar review and writing practice. Adopting automated assessment including short answer grading (Mohler et al, 2009), both learning modes evaluate learners' linguistic knowledge which does not require an instructor or tutor. With grammar review mode, they can review or learn about the grammar by selecting grammar categories or features the tool offers. Each category provides with its brief explanation including relevant examples and with a set of multiple choice exercises with which their grammar knowledge is evaluated by the tool. The result is passed onto the next learning mode, writing practice, where the information of the evaluation result is used to suggest an appropriate level of exercises for the learners. With writing practice mode, they can actually compose a corresponding English sentence to a Korean sentence which is automatically suggested based on the evaluation result from the previous mode, or which they select based on their interest. Each Korean sentence is carefully prepared for the learners to be exposed to various grammatical structures and English expressions including contextual synonyms, and to study English grammar according to grammatical categories. With this module, the tool takes a learner's English sentence and checks whether it is grammatical. If it detects an error, it provides instructional feedback regarding 1) the position of the error where it has occurred in the sentence, 2) the grammatical category the error is link to, and 3) supplementary explanations including relevant examples if necessary.

## 2. Error Analysis of English Writings Created by EFL Learners

Recent trends of error analysis seem to focus on studying learners' output. Analyzing the corpus of learners' actual writing samples can provide a fairly good idea of the learners in terms of their competence and performance since it examines both erroneous and non-erroneous forms of language. The result of analyzing the errors in particular is a valuable source of information since it presents the transitional state of the learners' weakness as well as competence.

Learners' writing samples are used for identifying errors which are then classified based on grammar categories or features. The data used for this research is a collection of English sentences created by junior high

school students. For a general error analysis, the errors occurring in writing data are examined in terms of grammar and rhetoric. However, only grammatical errors are considered since the unit of writing is a sentence which is assumed to be reasonable as an input to mobile devices. The analysis results are used to write a set of error-detecting rules implemented in the tool.

### 2.1. Grammatical Category & Error Analysis

The grammatical categories that the tool provides are selected in order to assist learners for improving their English writing skills. Most of the categories were the ones described in English textbooks authorized by Ministry of Education. The rest were chosen by consulting reference grammar books popular to Korean EFL learners. A learner selects a category or feature to review or learn about its linguistic nature and its usages. Classification of grammar categories is resentence in Table 1.

Table 1. Grammatical Category

<b>Grammar Category/Feature</b>	<b>Subcategory</b>
Agreement	Subject/Verb
	Determiner/Noun
Aspect	Perfective
	Progressive
Comparison	Comparative
	Superlative
Inflection	Inflections according to POS
Mood	Types of Mood
	Types of Sentences/Clauses
Noun Plural Formation	Regular vs. Irregular
	Count vs. Non-count
Spelling	Orthography of Words
Tense	Types of Tense
Voice	Active
	Passive
Word order	SVO vs. SOV

These categories are also utilized at the writing practice mode with which the learner can actually compose an English sentence for a Korean sentence. The tool provides two options for selecting a Korean sentence. The first option is to choose a Korean sentence from a list suggested by the system which remembers the learner's choices of grammar categories from grammar review. The second is for the learner to choose a grammar category by which the system also lists Korean sentences. Each Korean sentence is prepared to imply a specific grammar category.

The grammatical categories and features presented in Table 1 are also used to capture the errors created by Korean EFL learners. The errors present the characteristics of interlanguage which refers to a learner's developing L2 knowledge (Selinker, 1972). Interlanguage reflects linguistic properties of L1, Korean in this case and the characteristics of L2, English. Among the error types found in L2, our data present overgeneralization and interference/simplification. Overgeneralization errors refer to the ones caused by a rule in which it does not fit to describe a grammatical category. This type of errors was most commonly found from our data. The following examples present the errors of this type.

- 1a) *They studys very hard.*
- 1b) *My mother buyed a nice clothes for me.*

The underlined in 1a) and 1b) indicate regular inflectional morphemes representing present and past tense, respectively. The verb in 1a) is a regular verb, but it requires an orthographic variation when the tense morpheme is attached. The verb in 1b) is an irregular verb whose inflected forms cannot be generalized by a rule. However, it is attached with a tense morpheme which is supposed to be applied to a regular verb. In both cases, the learners overly generalized the rules, which resulted in an error although they provide evidence of developing knowledge regarding a systematic aspect of English.

Interference errors show the influence of L1. Many of the errors found in our data displays linguistic properties of Korean.

- 2a) *He angry.*
- 2b) *My favorite is China food.*
- 2c) *She love her family more than anyone.*

Example 2a) presents an incomplete English sentence reflecting one of the Korean sentence structures where an adjective can form a predicate without a linking verb. The expression "*China food*" in 2b) shows an inflectional error. When the corresponding Korean word for "*China*" becomes a modifier to a noun, no additional morpheme is attached. Example 2c) presents subject-verb agreement violation which does not exist in Korean except honorific. It is not only an interference error, but also considered as an error caused by simplification which produces a verb with the same form regardless of its context, person, number or tense.

## 2.2. Error Handling

Learner's sentences are sent to the system on the server for automatic scoring. The types of grammatical errors detected by the automated system are categorized into three classes; 1) morphology, 2) syntax, and 3) content. These categories are further classified into various types of errors according to grammatical categories: 6 types for morphology, 28 types for syntax and 4 types for content. A morphological analyzer implemented in the

system detects lexical errors by checking inflected forms and orthography of each word. Syntactic errors are identified by a syntactic parser utilizing grammatical categories described in 2.1, which focuses on agreement, word order, constituency, and usage among many others. Content errors are different from what is usually used as one of evaluation criteria for essay scoring since the scopes of detecting errors are different; this research focuses on the sentence level rather than a paragraph or higher levels. These errors are identified by comparing learners' sentences with their corresponding correct answers which are provided by EFL teachers and verified by native speakers of English. The errors of this category are detected by comparing the following:

- |  |     |                               |
|--|-----|-------------------------------|
| 1)   | the | tense                         |
| implied in the answer                          |     |                               |
| 2)   | the |                               |
| expressions omitted from the learner's writing |     |                               |
| 3)   | the | expressions unnecessarily     |
| added or irrelevant to the answer              |     |                               |
| 4)   |     | contextual synonyms of a word |

The system is implemented with two types of grammar rules. One of them is to parse grammatical sentences while the other one is to analyze ungrammatical sentences including various types of errors. The latter is known as mal-rules which are designed to diagnose grammatical errors (Lee, Choi and Kim, 2011). In other words, these error detecting rules identifies not only an error but also its type according to error classification described above. The type of an error is one of the resources to produce feedback when the tool detects an error. When the error detecting process is completed, the tool provides instructional feedback regarding the error; utilizing the information in relation to where it occurs and what type it is. The feedback also includes a brief description of the error and an explanation of the grammatical category related to the error, and relevant examples when necessary. The instructional feedback is of great benefit to the learners who spare their time for improving their writing skills on-the-move.

### 3. Mobile-based English Learning Tool

The errors are divided into systematic and non-systematic errors. The systematic errors can easily be described using a set of rules whereas non-systematic ones are usually categorized as idiosyncratic and cannot be generalized. The systematic errors are described using a set of mal-rules. These error-detecting rules are designed to capture not only predictable grammatical errors, but also the errors mostly created by Korean EFL learners because of the influence of L1.

#### 3.1. System Overview

A mobile device is equipped only with a user interface. The actual system including error checking modules and the database is implemented in a server. The Fig. 1 below presents an overview of the overall processing.

Fig. 1. The overall procedure

When a learner activates the app installed in a mobile device, the server provides all the data including the information of the learner and questions and corresponding correct answers to be provided by both learning modes, grammar review and writing practice. The learner answers a question using the interface provided by the app which sends the answer to the server. The tool residing at the server evaluates the answer. The graded result including the feedback will be provided back to the learner through the app. Exchanging the data between the app and the server is performed in the format of JSON.

The system maintains three type of database containing the information on a learner and questions. Table 2 below shows the information of a learner to be stored in the database.

Table 2. Database for learner information

Category	Description
(1) UserID	
(2) Writing Level	determined based on the evaluation results
(3) A list of Question ID	assigned by grammar review & writing practice after answering the questions
(4) Scores corresponding to each grammatical categories	provided separately by grammar review & writing practice

The database including questions is divided into two according to the learning modes which utilize different types of questions. Table 2 below presents the information provided by the grammar review mode.

Table 3. Database for the information of a question offered by grammar review mode

Category
(1) Question ID
(2) Grammatical category
(3) Question
(4) Answer
(5) Explanation

---

 (6) Difficulty Level
 

---

Grammar review mode provides a question selected by learners according to their interests. The question type is a multiple choice from which the learners select a number of their choice. Each question is assigned with its ID and is specified with its relevant grammatical category and the degree of difficulty. In addition, the question is linked with its correct answer and a brief explanation. The system stores the learners' choice of questions and its evaluated score.

A different type of question is provided by writing practice mode. The information linked to a question is presented with the Table 4.

Table 4. Database for the information of a question offered by writing practice mode

Category
(1) Question ID
(2) Question
(3) A set of correct answers & a synonym list
(4) Difficulty Level

Writing practice mode offers a Korean sentence as a question assigned with its ID. The question is linked to a set of correct answers and its corresponding grammatical categories. The questions present higher degree of difficulty than those provided by grammar review mode. When the learners proceed to writing practice mode, it initially suggests a question which is assumed to be most helpful for the learners, based on the information passed from grammar review mode. The information includes the following; 1) a question which may complement the problems the learners has encountered at grammar review mode and 2) a question whose grammatical category has not been studied by the learners. When the learners complete the practice, the tool provides the automatically processed result which includes the total score, the writing level mapped to the score and instructional feedback. As the last step of the process, the database storing the information of the learner is updated with the latest result.

### 3.2. App Interface

The design of user interface for the app is completed and will be implemented with further work. When the app is activated with login, the tool provides the learners with the evaluation result stored from the previous exercises, as displayed in the image (a) below. From the same page, there is an option to choose a type of a learning mode between grammar review and writing practice. When grammar review mode is selected, they can choose a grammatical category for a review. They are also offered with a question of a multiple choice from which they select a number of their choice as an answer. The system, then, grades the answer and provides the grading result with feedback, as shown in the image (c) and (d).

If writing practice mode is selected, the tool offers a Korean sentence which is considered most beneficial to the learners based on the result passed from grammar review mode. When they complete writing a corresponding English sentence, the system scores the sentence. The learners are provided with the automatically scored result with appropriate feedback. This process is presented with the image (e) and (f). When the learners complete the practice, the tool provides their proficiency of each grammatical category they have studied. The proficiency is displayed using a graph, as shown in the image (b). The score to be stored in the database is calculated in consideration of the degree of difficulty assigned to the question.

#### 4. Conclusion

This paper has presented a mobile-base English learning tool that is designed to improve writing skills of Korean EFL learners. The tool provides two different learning modes, by each of which the learners can benefit even when they are on-the-move. These two learning modes interact each other through database where the information of learners and the results of each mode are stored. With grammar review mode, they can learn about various grammatical categories of English through answering a question related to the category of their interest.

The result is passed onto writing practice mode where the learners are suggested with a question considered most helpful for them according to the result. The answer sentence composed by the learners is automatically processed to produce the result which includes the information on the errors detected if any and instructional feedback. When they complete the practice, they are provided with the total score and the level of proficiency of each grammatical category that they have studied. Considering the popularity of mobile devices and their easy accessibility, learners can benefit greatly from utilizing the convenience provided the tool.

## Abstract

Electrical impedance spectrometry (EIS) is modern monitoring method which we used for detect anomalies in porous substances. At the Brno University of Technology, Faculty of Civil Engineering was through projects in EUREKA program developed new apparatus with unique device Z-meter, special probes for different using and user's software which was used in big spectra of application (monitoring of earthen dike, morphology of the bottom in reservoir, moisture of bricks columns, etc.). Students work on the construction of the probes, conception of monitoring and obtaining of the results through their bachelor, master or doctoral thesis. In work they need knowledge from different areas of education like physics, hydraulics, material engineering and others. Because education is also in practical form, it is interesting not only for students from Czech Republic, but also from foreign country.

## 1. INTRODUCTION

One ancient popular wisdom says – ‘He who does not know the past cannot create the future.’

This is not only true for the peoples and countries, but also for every human activity and society. The Faculty of Civil Engineering is the traditional and historically the oldest faculty of the Brno University of Technology (BUT) seated at Veveří 95, 602 00 Brno, Czech Republic. Its history is closely connected with the history of BUT, which falls into the year 1899 when Emperor Franz Joseph I signed the Decree of the Establishment of the Czech Technical University in Brno. This was the first Czech higher education institution in Moravia. In the course of time, it has often passed through booms and declines. Since 1900 the teaching has been extended by the study of mechanical engineering and the course of education of land surveyors (geodetic engineers). On 26 June 1911, the newly built premises were approved and opened, and since September the teaching started there, see Fig 1. The school thus moved from its leased rooms in Brno. In the basement of the right wing of the main building, a library was placed, with underground rooms designed for maintaining library materials. Women were allowed to study at the Technical University thanks to a decision made by the teaching staff on 21 October 1909 provided that they would have appropriate education.

Since the foundation of the school, the teaching of civil engineers has taken place in the studies of civil engineering (since 1989), the course of land surveying (since 1900), and cultural engineering (since 1910). Behind that idea stood up efficiently Prof. Ing. Antonín Smrček, Dr. h. c. Therefore, he became elected a deputy

\* Corresponding author. Tel.: +420 5 41 14 72 84; fax: +420 5 41 14 72 88.  
E-mail address: parilkova.j@fce.vutbr.cz

of the Moravian Land Diet and later also of the Vienna Diet where he collaborated, among others, with T. G. Masaryk. Prof. Smrček was striving to contribute as effectively as possible to the development of his school and the Czech element in Moravia. He elaborated the concept and the factual establishment of water laboratories, which is worldwide ground-breaking and he is their founder. To defend the first laboratories in the Austro-Hungarian Empire, he used both his literary talent and knowledge of both languages, Czech and German, in speeches at international congresses on dams and navigation Pařílková, Pařílek, Veselý, Zachoval, 2010).

Since 1920, the studies of civil and cultural engineering have been replaced with the study of structural engineering. This study consisted of two specializations: constructional and transportational; and water engineering and cultural. In 1927, the course of land surveying was replaced with the study of geodetic engineering. Since 1927, the study of architecture and building construction has been taught.

From 1918 to 1937, the school was named the Czech Technical University in Brno. In 1937, it was named the Dr. Edvard Beneš Technical University in Brno. In 1938, the name was changed to the original Czech Technical University in Brno.

Fig. 1. Faculty of Civil Engineering – (a) Historic Hall on Veveri Street; (b) The Present Status of the Hall

During the period of Second World War (1939–1945), the Brno technical university was closed, just as the other Czech universities. After 1945, the school was resumed under the name Dr. Edvard Beneš Technical University in Brno. Again, the key studies were opened. In 1950, the State Committee for Universities approved the establishment of 31 departments of the Technical University in Brno at the following faculties: FSE (Faculty of Structural Engineering), FABC (Faculty of Architecture and Building Construction), FMEE and ChE (Faculty of Mechanical and Electro technical Engineering and the Study of Chemical Engineering). Since that time, much has changed, but let us be grateful beyond the life and work of many professors and people who built our future and let us to do maximum for future of our children.

When it opened, the university had with four professors and forty-seven students. In the course of more than 110 years Brno University of Technology has matured into an internationally recognized institution offering a cutting-edge education based on the latest scientific and professional knowledge delivered at eight faculties and Institute of Forensic Engineering covering a broad spectrum of fields ranging from technical and scientific disciplines through economics to the arts. According to the Quacquarelli Symonds Limited (QS) prestigious world university rankings, BUT has been among the best universities of the world for several years in succession. For the period 2009–2013 the Brno University of Technology has been awarded the European Commission's prestigious ECTS and DS Label certificates, issued in recognition of quality higher education.

BUT was one of only two Czech universities to be granted the ECTS Label. This label recognizes the proper introduction of the European credit system in all Bachelor's and Master's degree programmes in line with the implementation of the aims of the Bologna Process. BUT was awarded the DS Label in recognition of the proper provision of the Diploma Supplement to all its graduates free of charge. Both certificates are proof that BUT

meets the demanding criteria of the European Union in the area of higher education; in addition, they make a major contribution towards broadening mobility and increasing the internationalization of the university. At the present time more than 24,000 students are enrolled at BUT at 8 faculties – FA (Faculty of Architecture), FECC (Faculty of Electrical Engineering and Communication), FCH (Faculty of Chemistry), FIT (Faculty of Information Technology), FBM (Faculty of Business and Management), FCE (Faculty of Civil Engineering), FME (Faculty of Mechanical Engineering), FFA (Faculty of Fine Arts) and 2 university institutes – IFE (Institute of Forensic Engineering), CESA (Centre of Sports Activities) ([www.vutbr.cz](http://www.vutbr.cz)).

The Brno University of Technology supports internationalization of studies through ECTS, participates in EU projects such as Tempus, Leonardo, Erasmus, CEEPUS, Aktion, DAAD partnership, studies for two degrees and the Euro-engineer degree, organizes lectures of visiting professors, provides courses for foreign students in English, and organizes international conferences. Research and development activities at BUT centre around non-specified research receiving funding from the state budget. Attention is also given to research projects that are clearly defined and supported by contracting authorities such as the Czech Science Foundation, grant agencies of the Czech government ministries, international grant agencies, and scientific and research programmes. A major part of applied research is initiated directly by industrial companies both domestic and international.

## 2. EUREKA program

EUREKA program ([www.eureka.be](http://www.eureka.be)) has evolved greatly over the past 21 years as it has increased from 18 members in 1985 to the current 38 members. This programme as the first European framework opened the door for cooperation with Central and Eastern European countries in the early 1990's. And this chance was fully taken by both research organizations and industry for initiating real European research and development cooperation.

Through a EUREKA project, partners develop new technologies for which they agree the Intellectual Property Rights and build partnerships to penetrate new markets. The internationally recognised EUREKA label adds value to a project and gives participants a competitive edge in their dealings with financial, technical and commercial partners. The types of the EUREKA project are clusters, umbrellas and individual projects. Each of these types of the project has specific rules and plays a key role in different areas of the market.

The goal of the programme Eureka in the Czech Republic ([www.msmt.cz](http://www.msmt.cz)) is to steadily enhance the competitiveness of the Czech economy and increase its technological potential by supporting European cooperation of enterprises and research organisations in the area of progressive technologies. The output of the project solution is new, top-quality products, technologies and services with a high degree of innovation, capable of prevailing on the world market. The programme Eureka does not pre-set thematic tasks, does not centralise financing or selection of projects. It follows the rule that proposals and initiatives must come out from bottom to top (the so-called bottom-up principle), from individual industrial enterprises and companies, research institutes and universities which are spontaneously interested in cooperation. Key criteria continue to be the innovative content, market needs and the quality of the team. Each applicant can ask the special-purpose support in Czech Republic. The special-purpose support is provided to the recipient, which is a legal entity, in the form of grants after having carried out a public tender in research and development pursuant to Act No. 130/2002 Coll. on the Support of Research and Development from Public Funds and on the Amendment to Some Related Acts (the Act on the Support of Research and Development) as subsequently amended. In projects of research and development in the programme Eureka, the portion of the special-purpose support shall not exceed 50 % of the eligible costs of research and development project solution and must meet certain conditions (Parilkova et al, 2010), ([www.eureka3838.com](http://www.eureka3838.com)). The Laboratory of water management research is active co-researcher of the third international project in the EUREKA program, No. E!3838, E!4981 and E!7614. The principal investigator is company *GEOtest, Inc.* Projects include the development and implementation of devices for monitoring porous substances.

### 3. Electrical impedance spectrometry method

The method of electrical impedance spectrometry (EIS) has become a popular analytical method for its information capability and has taken a front place in studying physical and chemical properties of materials and living tissues. It was newly applied for monitoring the boundary between saturated and unsaturated soil when being loaded with water (Gomboš, Tall, Kandra, Parilkova, 2009), for measuring changes in the electrical conductivity of soils in various areas of bodies of earth dikes, for monitoring the water/sediment boundary in water reservoirs (Parilkova, 2010), or streams and in other areas of civil engineering for monitoring of porous substances like wood, bricks etc. (Parilkova et al, 2013).

The basic principle of the method is the measurement of the frequency characteristic of impedance of the measured medium or material, as the case may be. The frequency characteristic of impedance  $Z$  can generally be expressed as the function of a complex variable in the following formula

$$Z(j\omega) = R + j\omega X. \quad (1)$$

Where  $R$  is resistance forming the real part of impedance independent of frequency,  $X$  is reactance, the imaginary component of impedance, the magnitude of which changes with frequency, and  $\omega$  is angular velocity. The complex impedance  $Z$  of the saturated and unsaturated porous material describes its properties.

- Water containing mineral salts is a conductive material. The degree of saturation of the material strongly influences the real part of the measured impedance,
- The solid part (grains) is formed by insulating materials characterized by their dielectric constants and represents the imaginary part of the measured impedance.

#### 3.1. Z-meter III device

The measuring equipment must be enabling to determine both parts of the impedance  $Z$ . To be able to determine both impedance components, the method of quadrature detection must be used. This method of the signal detection is a special type of the synchronous detection based on the multiplication of measured signals by the reference signal, the frequency of which is the same as of measured signal, and its phase is shifted between  $0^\circ$  and  $90^\circ$ . The impedance spectrometers (Z-meter of third generation) constructed for experimental purposes capable of the measurement of complex impedance in wide range of impedance, frequency and signal strength has been built, see Fig 2.

Fig. 2. Z-meter device with external multiplexer

For the implementation, a signal processor of the latest development line of impedance meters of the company “ST Microelectronics” was chosen. Its 32-bit processor enables only two-terminal measurement. The record of

measurement is solved by logging in a text file to a portable medium – a SD card, and it is also possible to connect the Z-meter III device through the USB interface to a PC. Parameters of measurement are entered directly into the device, are depicted on a LC display and, when switched to the measuring mode, the device will display the value of unknown measured impedance in the form of its real and imaginary components.

The device is battery-powered, with the assumed time of operation being 8 hours and with an option to recharge it from a 12V source. The basic parameters are given in Tab. 1.

Table 1. Parameters of Z-meter III device

Parameter	Z-meter III	Parameter	Z-meter III
Impedance range	100 $\Omega$ – 1 M $\Omega$	Communication interface	USB, SD card
Frequency range	1 kHz – 100 kHz	Number of measuring points	1, 8, 16, 32, 64, 128
Accuracy of modulus <b>Z</b> measurement	$\pm 2\%$ of the range	Switch	Internal, external
Accuracy of phase measurement	$\pm 2^\circ$	Power supply	Batteries

#### 4. Education and applications

In last years the new technology in many areas of the work goes very quickly forward. In education this trend is known in new intellectual environment which educators must prepare for their students. In laboratory work for the teaching and learning always been applied new technologies and materials.

Fig. 3. Education of students from TU Luzern, CH in the teaching course Physical modelling

#### 4.1. Teaching and learning

- At the beginning of the tests was monitoring groundwater level, which is usable for the drainage trench. This work is one of the labs work for students of all construction disciplines. Probes are easy handling, the new device from the Z-meter III is comfortable and attracted students from full-time study (teaching courses BS01 and BR05).
- With the method were also acquainted foreign students, and this group after about 20 students TU Luzern, CH in the years 2007-2012 with their teacher Prof. Ing. Francesco Valli. Furthermore students from Portugal, Spain, Belgium and Slovenia studied this monitoring method in the teaching course CR53 Physical modeling in ERASMUS program.
- Learning specialists in the field of geodesy and cartography in the teaching course HR51, upgraded in project "Innovation courses Geodesy and Cartography", CZ.1.07/2.200/15.0144 of ESF was enriched by new knowledge also EIS method, in the area of flood protection. The newly also in monitoring the saturation of the soil, but also present the possibility of documenting drought and irrigation needs of agricultural lands, parks, ecological environment where rare species of fauna and flora. Urbanism, historic towns and settlements makes it possible to monitor suffusion processes, but also the creation of caverns and disorders in which there is a risk forfeiture threats to human life and property.
- Lifelong learning, education experts Czech Chamber of Authorized Engineers and Technicians ČKAIT, specialists CzWA CR, and members cluster CREA Hydro & Energy, Public Service Company, but also on the

Faculty of Civil Engineering of the Brno Technical University in the ongoing courses University of the Third Age. Consulting and advisory center Public Service Company KPC for local government and entrepreneurs in Brno and other educational institutions, introduced the mayor and local government staff with the method EIS and its possibilities in the seminar's forms or micro regions meetings or other events.

Fig. 4. The applied research for practitioners (hydraulic model of safety spillway polder Žichlinek,  $M_1 = 10$ )

Together with all partners of EUREKA projects are continuously search new possibility of applications of monitoring system with Z-meter device.

#### *4.2. Use of field measurements carried out at different levels, educational, vocational or commercial*

To combination different levels of education from different areas of science, science education of students in research projects with the application of knowledge into the field work are very appropriate practical exercises.

- In terrain, the method was applied in program ERASMUS, measurement and processing of doctoral dissertation Spanish student Macarena Guerrero Aspizua – ERASMUS INTERSHIPS, report about my interships in Brno, which was oriented to area of soil measurement.

Fig. 5. Installing the probes into monitoring wells on the golf course together with student from Spain

- Application in practice and the need training of external operating personnel was requested in the monitoring of water resources in artificial recharge, in Basel, CH, leakage of water in dams, monitoring fishpond dikes (eg Kobeřice, Jevíčko), waste storage tank Rýzmburk in a tributary of the Sázava river originating from the preparation of drinking water for Prague (85%, i.e. up to 7 m<sup>3</sup>/s) in the treatment plant Želivka or documenting the effectiveness of remediation topped the dam Karolinka to Stanovnice river, where 4 probe with a diameter of 2.5 cm are given using devices PAGANI directly in the sealing core rockfill dam. Monitoring depth is 13 m number of sensors in each probes is 20 and installation was managed through the grant project cluster CREA.

Fig. 6. Measurement on the earthen dam of the water reservoir Karolinka together with students from Belgium and Portugal

- The system is used for monitoring landslides and functionality hydrogeological wells on the estate Bystrc in Brno, CZ. Paired probes are fitted to a depth of 11 m.
- Move drift sand respectively influence of marine waves to beach is involved on KHBO Brugge-Oostende. To check of obtained results from measurement, in this case it is possible to use EIS method. Because theme and monitoring apparatus with Z-meter was interesting for students on this topic was realized thesis 'Process of Aeolian sand transport using the EIS-method'. The work was start at KHBO and practical experiment was realized in Brno, laboratory of water structures at FCE.
- Research organization IRSA in Bari, IT looking for possibilities of application of new monitoring system through the test of a marine sedimentary rock used for the classic construction where it is necessary to prevent their saturation (Pařílková, Caputo, Masciale, De Benedictis, 2010), (Davis, Topp, Annan, 1977).
- Monitoring of masonry moisture within specific research at the Brno Technical University and also in practice at Rychvald castle. In addition to irrigation, fertilization and drainage is method EIS usable in the treatment of

wood, usually historical structures, processes thermo-remediation with monitoring the effectiveness of the cross-section. Other application area is control of specific agricultural products. The specific divided probe is possible to use for control of storage of bulk materials such as grain. To this time the measurement is realized in one layer. In the solution is interested TU Varna, BG.

Fig. 7. Work with doctoral students and with their teachers in IRSA Bari, IT and in Riga TU, LT

- Riga TU, LT verify the possibility of using the method for monitoring in a uniform system of wastewater treatment in the spa town of Jūrmala.
- A popular theme is the work of the bachelor's, master's and doctoral studies in all forms of education at Faculty of Civil Engineering, department of water construction and water management, as 'Study of pollution transport in soil using electrical impedance spectrometry method', 'Monitoring the morphology of the bottom of water reservoir using EIS method', 'Evaluation of changes in pond dam monitored by EIS Method', 'Influence of material pack of probe on the measurement of sensitivity using method EIS', 'Detection of rainwater infiltration using EIS method', 'Determination of anomalous area of homogeneous earth dike of small reservoir' and others. Further developing of applications is monitoring snow cover, snow reserves, but also the possibility of monitoring avalanches and their falling particularly dangerous for skiers and hikers. During the solution are contacted researchers from Spain and Austria, but also with the Czech Hydrometeorological Institute in Brno as a member of the cluster CREA and the Czech Hydrometeorological Institute in Hradec Králové. The theme was for master's student work 'Monitoring of the snow cover using EIS method for possibility of determining of the snow water equivalent'.
- The options list with examples showed the current state of solutions and application methods. The research team on the basis of wide interest not only in this country but also abroad, works continuously in the project E! 7614. Each year, an international conference of researchers and candidates is organized. In this year it will be in the period the October 30<sup>th</sup>, 2013 until the November 1<sup>st</sup>, 2013 in Karolinka. The conference was also attended postgraduate students involved in the solution.

## 5. Summary

Based on the findings from the measurement performed in real conditions, it can be stated that monitoring the changes in electrical impedance of the environment by the non-invasive method EIS is possible. When applying the method for sensing the course of the water level in soil, a two-electrode connection is convenient. It is sufficiently accurate, sensitive and the obtained courses are clearly reproducible. If it is necessary to know the vertical position of the monitored changes, it is suitable to apply measurement with a vertically divided system. It is recommended to perform evaluation, from the view of its unambiguousness, as relative. The education should be a natural part of everyone's life. Merging the desire for education, teaching and application of new knowledge in practical implementations is the goal of teaching at all levels of university. If it is possible to build on the

historical experience and traditions and combine them with modern and progressive teaching and application of new technological processes, it is well possible to prepare young people for their future.

## Acknowledgements

The development of the EIS method and the measuring apparatus in the application sphere is facilitated by addressing the international projects E!3838, E!4981 and E!7614 of the program EUREKA. We would like to thank the MEYS of the Czech Republic, the company GEOTest, Inc. and Thermo Sanace, Ltd. for their financial support provided for the solution of the projects, without which the solution would be impossible. Also we would like to thank all partners of the cooperating institutions from foreign countries and Czech Republic.

<sup>a</sup>Department of Architecture, Faculty of Engineering and Architecture, Uludağ University, Bursa

<sup>b</sup>Department of Archeology, Faculty of Arts and Sciences, Uludağ University, Bursa

### Abstract

This paper describes a multidisciplinary educational design workshop carried out at the 4000-year old Myndos archeological site in Bodrum, Muğla, Turkey. The workshop, which was a collaboration between Architecture and Archeology Departments at Uludağ University, involved the design of a lightweight structure to be positioned on the archeological excavation site. The aim of the “Lightweight Structures, Mobile Architecture, and Archeology” workshop was to create an innovative, interdisciplinary environment for participants to creatively solve design problems in a limited time.

Instructors from the Architecture Department and the Archeology Department guided 13 architecture students, and 7 archeology students through the workshop. The hypothetical structure was to be utilitarian, and demountable. It should also not damage the ground it would touch. Decisions on scale, structural choice, the choice of materials were left to the students. Informative seminars on the excavation site itself; lightweight structures; architectural patterns, mapping, and visualization; as well as architectural representation were given during the 5-day exercise.

Among multiple benefits of the workshop some that stood out were: (1) students participated in a complex creative problem solving process, (2) students learned to work under time constraints, (3) students familiarized themselves with one another’s profession, (4) students learned to appreciate dissimilar viewpoints, (5) students were able to visualize their designs in the context of the built environment, and (6) students were able to test and share their ideas with local residents.

In addition to these benefits, suggestions for the implication of this workshop in other educational fields are discussed.

*Keywords:* architectural education; design education; design workshop.

### 1. Introduction

The “Lightweight Structures, Mobile Architecture, and Archeology Workshop” took place between 25-29 June 2012, on the archeological excavation site of the Myndos antique city. The workshop was a collaboration between Architecture and Archeology Departments of Uludağ University (Figure 1.a).

Today, Myndos is located in the vernacular, seaside town of Gümüşlük, in Bodrum, Muğla. Due to the unique historical characteristics of its built environment and mostly preserved natural habitat, its population increases during the summer months, as domestic and foreign tourists visit the touristic retreat alongside Gümüşlük’s local residents.

\* Selay Yurtkuran. Tel.: +90-224-294-2142; fax: +90-224-280-8558.

E-mail address: selayyurtkuran@uludag.edu.tr

Archeological excavations of the antique city have been carried out by the Archeology Department of the Uludag University since 2009 (Figure 1.b.). Historically, Myndos was one of the shore cities of the Karia region in ancient geography. In his book titled *Geographika*, Strabon of Amasya, an explorer of the 1st century B.C., described the Termerion Cape occupied by the people of Myndos, following the capes of Astypalai and Zephyrion (Strabon, 2000).

Fig. 1. (a) Myndos, Gümüslük, Workshop 2012 (Photo credit: Taneli). (b) Asar Island, Myndos, 2012 (Photo credit: Kırılı).

The earliest information about the city appears in a text by the 5<sup>th</sup> century B.C. historian Herodotus. Herodotus mentioned that Myndos provided ships to join the campaign of Nakşa under the command of Megabates in 500 B.C. While Herodotus did not mention the number of ships joining the battle, he referred to one event that occurred on a Myndos ship (Gündüz, 2008). Additionally, information about the past of Myndos can be found in the text “Histories” by Polybius. Polybius mentioned that during the Lade battle of 494 B.C., the Rhodos ships reached the shores of Myndos before arriving at Kos Island; and that they had to anchor at Myndos Harbor overnight (Polybius, 1889). The ruins of Myndos surviving through history are mostly of the once modern city constructed with the aid of Karia’s satrap (governor) Mausolos. Historically, Myndos was of importance due to its strategic location as a point of defense against enemy attacks originating from the Aegean Sea to the capital Halicarnassus. Furthermore, it was once on the route of the Mediterranean shipping trade, which today makes the site an important center for archeological underwater research (Şahin, Gündüz, Aslan, 2007).

## 2. Architectural Design Education and Workshops

The role of the workshop in architecture education cannot be overemphasized. To elaborate, a concise definition is provided by Brooks-Harris & Stock-Ward (1999, pg.6): “*A workshop is a short-term learning experience that encourages active, experiential learning and uses a variety of learning activities to meet the needs of diverse learners.*”

According to Fleming (1997, in Brooks-Harris & Stock-Ward 1999), the focus of a workshop is on developing competence, utilizing interactive learning opportunities that emphasize hands-on practice in small groups through practical and intensive interaction. Unlike typical classrooms, the workshop resembles the design studio, which according to Dutton (1991) is an ‘active site’ that calls upon analytic, synthetic, and evaluative modes of thinking since it involves activities such as drawing, model making, conversation, and debate. Much of the process described above relies on an environment that fosters creativity, while allowing participants to generate new ideas for the built environment that effectively take into account functionality and aesthetics simultaneously (Yurtkuran et al. 2010).

The goals of the “Light Structures, Mobile Architecture, and Archeology Workshop” are (1) to contribute to the skill set of architecture and archeology students to engage in group work in an interdisciplinary workshop environment, (2) to properly identify the socio-cultural and architectural problems and potentials of the historical Gümüşlük settlement in a limited time, (3) to create architecturally viable mobile objects with light structures through a collaboration of the fields of architecture and archeology, (4) to produce future-oriented, potentially applicable projects for the Myndos excavation site, and (5) to discuss the resulting designs in a jury comprising workshop coordinators, local residents, and local government officials, thus initiating communication with the participants.

A five-day program containing seminars, city walk-throughs, and design studios was scheduled to accomplish the aforementioned purposes. Twenty students enrolled in the Architecture and Archeology programs during the 2012-13 school year, participated in the workshop under the guidance of academics from both departments. Students were randomly assigned to one of two groups, each with an equal number of architecture, as well as archeology students, to collaborate during the workshop. The workshop took place on the grounds of the Excavation House of the Myndos Antique City. Participants lodged in facilities in nearby Gümüşlük.

## 3. Process of the ‘Lightweight Structures, Mobile Architecture, and Archeology Workshop’

The process of the workshop began with the arrival of the participants to the site via their own choice of transportation. Workshop facilitators made a deliberate choice of requesting participants to use individual means of access to the site. This allowed the participants to experience the site, its surroundings, and the broader geographical landscape individually, allowing for varying encounters in both mode of transportation and

direction of approach. Participants shared these experiences during subsequent group work, thus expanding the collective understanding of the area.

### *3.1. Day 1: Problems and Potentials | Seeing-Comprehending*

The purpose of the first day of the workshop is for the students to share intuitions, experiences, and observations related to the site with other participants, minus the guidance of the facilitators. This atmosphere of free communication allows for the problems and the potentials related to the area to be discussed.

Following the participants' arrival at the site, their settlement in the lodging, and registration, an amount of time was allocated for free observations. Participants initially experienced the surroundings through travel to the location, and successively through immersion into the local architectural fabric. Subsequently, the first seminar "Gümüşlük and Archeology" was presented. The presentation covered the history of the antique city, its geographical characteristics and importance, lifestyles of its residents in various eras, mechanisms of regional governance, and the reactions and approvals of the inhabitants to the existing political climate. Additionally, comprehensive information was provided regarding the city.

Seminars and informative discussions were preceded by individual immersion to the site and free communication with locals to permit untainted first impressions. Consequently, participants were able to compare their personal experiences with that of formal lectures and thereby identify contradicting positions.

Following the completion of the first seminar, participants were asked to complete a series of tasks: (1) to experience the site through sketches by taking into account the information provided during the seminar, (2) to take notes regarding their observations of the city and its inhabitants, (3) to communicate with residents regarding their perceptions of the city, and (4) to document their surroundings through snapshot photography. A relatively short time of 180 minutes was allocated to complete these tasks. This time constraint created a suitable environment for the participants from archeology and architecture disciplines to get acquainted, and for the rapid exchange of information.

Following the completion of the aforementioned tasks, students gathered at the excavation house, favored as the workshop setting. Work groups prepared short presentations describing their observations, experiences, photographs, and interviews with local residents. Student presentations created an environment for discussion. Finally, workshop facilitators clarified the concepts of "problem" and "potential" constituting the main problematic of the workshop, asking the participants to reevaluate the information they collected in light of these concepts.

### *3.2. Day 2: Multiple-perception | Comprehension*

Day 2 commenced with a studio. The goals of the program for the second day were; (1) to allow for information and ideas stemming from the experience and informative sessions of Day 1 to take shape in a studio environment, (2) to have participants perceive new problems and potentials as group members share their experiences, and (3) to allow the design to develop in a different direction, to advance, and to change.

The structure described above is analogous to Kolb's experiential learning theory (Figure 2). Kolb (1984) contends that learning is best conceived as a process, and not in terms of outcomes. The learning process allows for ideas to be "formed and re-formed through experience," and does not consider them to be absolute or indisputable (Kolb, 1984. p.26). According to Kolb, experience has a fundamental role in the learning process. The cycle involves four adaptive learning modes: concrete experience, reflective observation, abstract conceptualization, and active experimentation (ibid. p.40). Kolb (1984, p.41) further delineates learning as a 'process whereby knowledge is created through the transformation of experience.' Kolb's experiential learning theory guided the structuring of the program of the second day of the workshop to focus on comprehension.

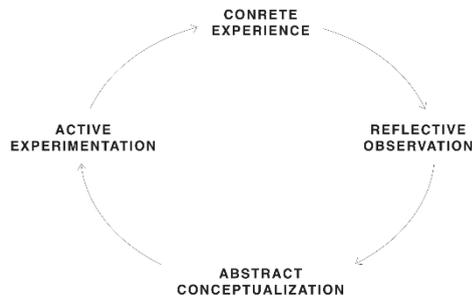

Fig. 2. Experiential Learning Theory (Based on Kolb 1984. p. 42)

Brooks-Harris & Stock-Ward (1999, p.10) identify three key tasks in developing a successful workshop; (1) “understanding workshop participants”, (2) “developing a comprehensive workshop design that addresses the topic for a particular group of participants within a particular context”, (3) “facilitating the workshop in a way that promotes active learning”. The authors (1999, p.11) further contend that Kolb’s Experiential Learning Theory can effectively aid in developing each one of the three tasks. Kolb’s learning styles assist in understanding workshop participants, and their individual learning needs and preferences. Learning processes, as described by Kolb, facilitate establishing adaptable learning activities catering to different types of learning. Finally, Kolb’s four basic learning processes can advise respective skills for workshop facilitation.

At the outset of the studio exercise, participants were asked to transform the excavation house premises into a work environment suitable for them. Following the configuration of the work environment, members of individual groups discussed the data they collected on the first day. Participants critically evaluated the data in light of the concepts of problem and potential, and subsequently determined the problem and/or potential they intended to address.

During the studio exercise, participants focused on creating products, due by the end of the day, which would convey the topics they had discussed earlier. These products can be summarized as sketches, written documents, and critically evaluated photographs. Participants of differing educational backgrounds shared their individual presentation skills to create instruments for conveying effective messages.

In the second part of the studio exercise, 90 minutes were allocated for the groups to tour and analyze the area together. This exercise differed from the excursions of Day 1, in that the focus shifted to problems and potentials discussed in the earlier studio exercise, and architecture-archeology collaboration was achieved through mixed groups.

The second seminar of the workshop was titled “Light Structures – Mobile Architecture” and was presented by Assoc. Prof. Dr. Yavuz Taneli. The seminar focused on identifying structural elements of mobile systems, as well as presenting a multitude of global examples of such structures. Participants were expected to utilize this information to solve or to draw attention to the problems, and/or to strengthen or re-consider the potentials they identified in Myndos. Examples of mobile structures were discussed between facilitators and participants, and their purposes, construction details, and technologies were examined.

The third seminar of the workshop, “Architectural Patterns-Mapping and Externalization” was presented by Instructor Dr. Selay Yurtkuran. The seminar described how an architectural pattern could be mapped experientially, and how observations and evaluations could be externalized.

The fourth seminar of the workshop titled “The Forms of Architectural Representation” was presented by Research Assistant Gözde Kırılı. The lecture introduced the concepts of communication and design message, and

informed the participants on methods for representing ideas most legibly. The presentation was supplemented with numerous examples.

Succeeding the seminars, participants and the facilitators were requested to write down and typographically express 10 words that came to their minds when the Myndos Antique City was mentioned, and to elaborate on the feelings, and perceptions of these words as they were noted, as well as identify their relative strengths. The aim of this exercise was to immediately apply the information provided by the second seminar of the day, “Architectural Patterns-Mapping and Externalization,” as well as creating an experiential map of words most used to describe Myndos and determining their relative values. The word mapping exercise concluded the second day of the workshop.

### *3.3. Day 3: Maturation and Manufacture*

The third day started with a studio. At the end of the studio session, participants presented to fellow students and facilitators, their analysis, ideas, and designs, through photographs, videos, sketches, presentation boards, and models in various scales. Subsequent to the critique, fruitful discussions led to the production of further ideas. Presentations were followed by another studio session. Instructors paid particular attention to act as facilitators rather than teachers.

### *3.4. Day 4: Last Touches*

The fourth day of the workshop commenced with student presentations. During these presentations, participants received their final critiques from each other and from facilitators, and continued to work in the open-air studio. In the following hours, students finalized their designs, and completed their models, presentation boards, and digital presentations. For the final jury, students were requested to prepare three A1 size sequential presentation boards, architectural models in various scales, and to supplement their presentations with music and videos as necessary.

### *3.5. Day 5: Final Jury*

On the final day of the workshop, a jury of fellow students, facilitators, and local administrators evaluated the end products.

## **4. Student Work**

### *4.1. Functional Shell Design*

The group comprising of two archeology, and three architecture students identified Asar Island, where the archeological excavation continues, as its focus for problems and potentials.

Group members observed that archeologists taking part in excavations during the four-month excavation period starting in June are prone to the detrimental effects of the scorching sun. Additionally, they witnessed that domestic and foreign tourists willing to visit the excavation site, unintentionally damaged the findings as they explored the unprotected area. The students proposed a “Functional Shell” over Asar Island, aiming to solve (ameliorate) the problem they identified. The student group identified three main characteristics for the functional shell. The shell is conceived as a promenade on which one can walk, with recurrent observation decks, and opportunities for working comfortably in shaded areas throughout the day.

Participants conducted a variety of analyses to determine the route that the shell would follow (Figure 3). Findings regarding historical traces, pedestrian movement, focal points, and green areas influenced the design.

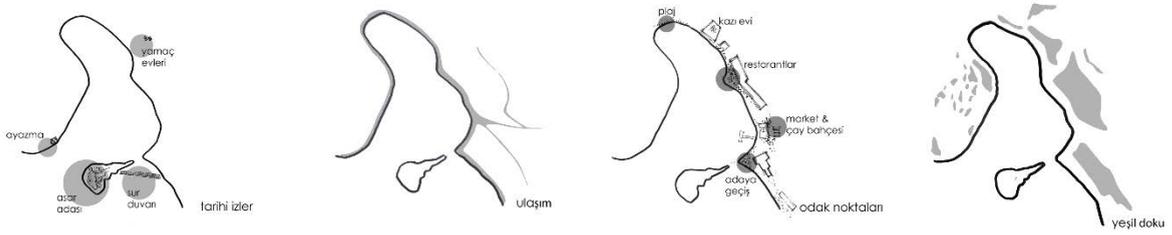

Fig. 3. Analytical diagrams of Asar Island. (a) historical traces, (b) pedestrian movement, (c) focal points, and (d) greens areas.

The work group deliberated that transportation to the island by raised sea bed had significant potential, and thus decided not to intervene in the current situation. Students positioned entrance and exit points of the shell at the location where visitors naturally approach the island on foot, and allowed it to continue its original function.

The proposed shell ascends via platforms towards the peak of the island where extensive excavations have been carried out. Each platform provides a unique perspective to visitors (Figure 4).

Fig. 4. Fonksiyonel üst örtü planı

As the terrace is repositioned over excavation openings, it is elevated considerably to allow for a view of both the Aegean Sea and Gümüşlük. The shell is raised so that archeologists working on site are shaded, yet sufficient natural light and air is available for a comfortable environment (Figure. 5).

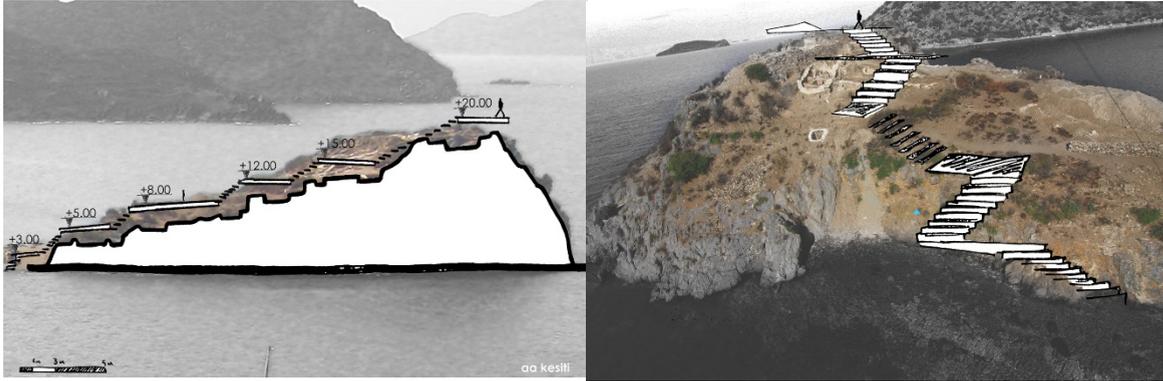

Fig. 5. Functional shell. Section a-a & Section b-b.

Students arranged their presentation boards by including 3 dimensional visuals of the island that they created by juxtaposing hand drawn sketches with photographs, as well as analyses conveyed on plan drawings, photographs they found instrumental, and various information about the island (Figure 6).

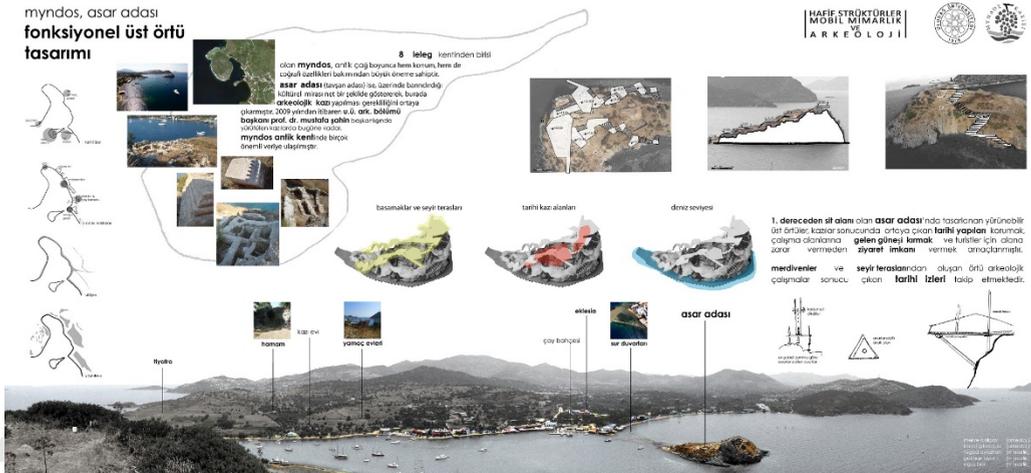

Fig. 6. Presentation boards.

Additionally, the students utilized three-dimensional representations of the island they constructed by combining their analyses with photographs of the architectural model to assess the success of their design in solving or minimizing the problems they identified at the outset (Figure 7).

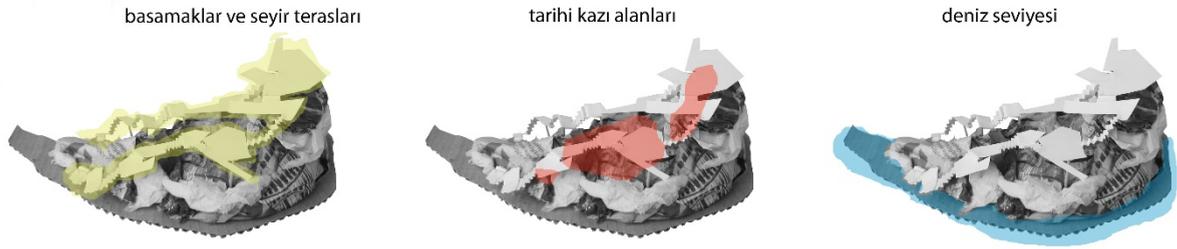

Fig. 7. Three-dimensional analyses. Left to right: Steps and observation decks, excavation sites, and sea level.

#### 4.2. Myndos Sail

Members of another group comprising of 2 archeology, and 3 architecture students observed that the harbor may have had an important role in the Myndos antique city, and that still today a considerable number of ships and yachts enter the harbor. The students proposed a design to transform the interaction between the land and the island into a controlled and enjoyable experience without damaging the fabric of the place.

The design was developed around the idea of placing posts around the existing raised sea bed that connects the mainland to the island, and proposing a new walkway with a further raised platform connected to these posts.

Participants initially analyzed vehicular and pedestrian access to Asar Island and Gümüslük, and also determined locations of archeological findings (Figure 8).

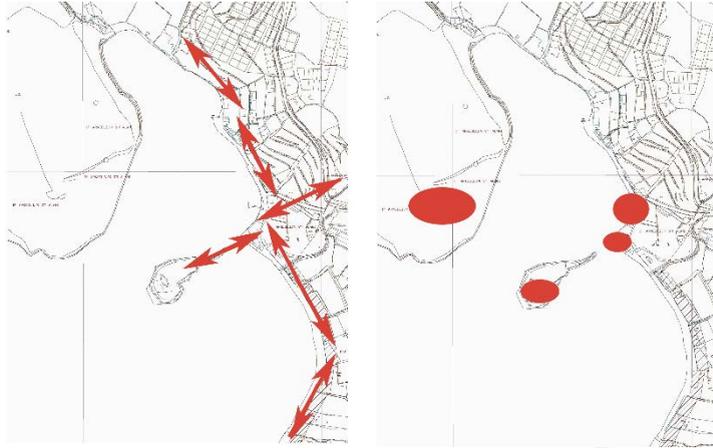

Fig. 8. (a). Analysis of pedestrian and vehicular access; (b) locations of archeological findings.

As the design progressed, the student group realized that visitors to the island may suffer from direct sun light, and consequently they modified their design to include a white fabric shade above the platform. The shade would be attached to the posts supporting the platform. The overall design with its posts, platforms, and white shades, is a reference to the masts, hulls, and sails of ships anchoring in the safety of the harbor over centuries (Figure 9).

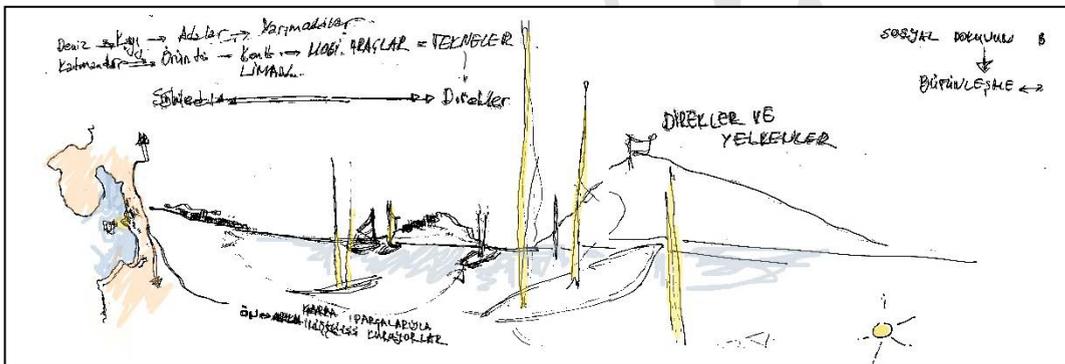

Fig. 9. "Myndos Sail" design drawings.

The student group made effective use of hand drawn sketches in their presentation boards, and supplemented these sketches with three dimensional visuals they created by combining photographs of the surroundings with photographs of their architectural model. The boards also included text detailing their design (Figure 10). Presentation boards for this group, unlike the previous group's work, included the typographical mapping exercise carried out on Day 2 of the workshop.

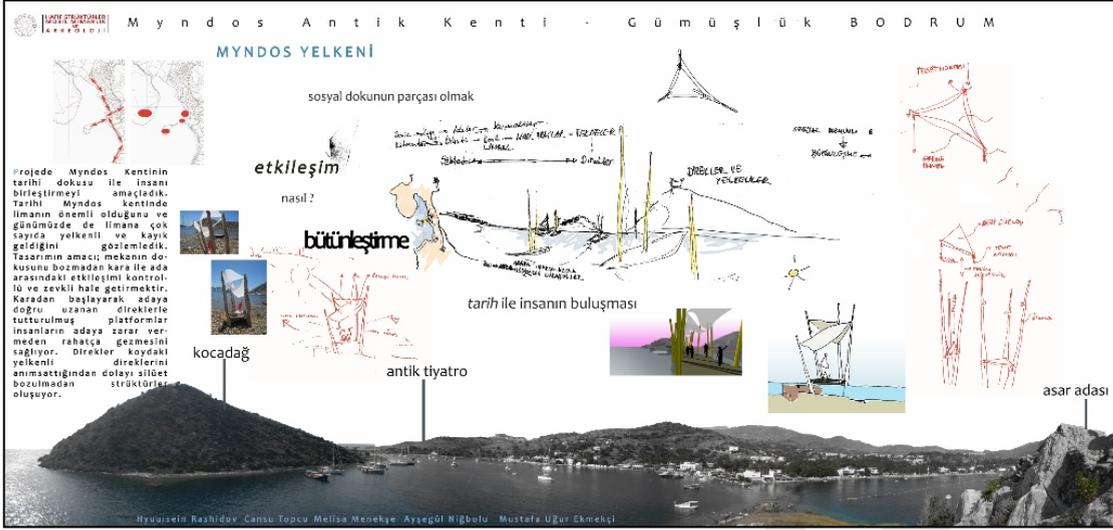

Fig. 10. "Myndos Sail" presentation boards.

## 5. Conclusion

The 'Lightweight Structures, Mobile Architecture, and Archeology Workshop' proved to be an effective exercise in experiential learning for architecture and archeology students. The location as a potential ground for the proposed structures made the studio effort engaging, and allowed an abundance of local residents to voice their thoughts. Presentation boards prepared by the student groups are vivid reflections of the creative process, and its benefits to learning. It can be postulated that similar cooperation among engineering and architecture students would yield similar results.

## Acknowledgements

The authors would like to express their gratitude to instructors and students who took part in the workshop.

# A multidisciplinary design studio: designing an eco-house project on Burgazada, Istanbul

Zafer Sagdic<sup>a\*</sup>, Ipek Kosova<sup>b</sup>

<sup>a</sup>*Yildiz Technical University, Faculty of Architecture 34349 "Istanbul", Turkey*

<sup>b</sup>*Yildiz Technical University, Faculty of Architecture 34349, "Istanbul", Turkey*

## Abstract

This paper describes collaboration among Architecture, Arts, Mathematic and Ecology. A problematic of design titled *Designing an Eco-House Project on Burgazada, Istanbul* with taking references from abstract paintings of Miro and Kandisky and using the complex geometrical forms, which are formed by compositions of triangles, octagons and hexagons, etc. was given to students on the Design Studio 1 of the Department of Architecture of Yildiz Technical University. Burgazada, one of the Prince's Islands of Istanbul, with an almost 2500-years old history, was chosen as the project site. The project process has been continued during the 15 weeks long spring semester of 2012-2013 education year. The project involved designing of a lightweight structure on an ecological house design, which gives minimum damage to the ground and the ecology. The aim of the studio was to create an innovative, interdisciplinary eco-house, which takes references from selected abstract paintings of Miro and Kandisky for students to creatively solve design problems in a SPRING semester time period.

Thus, the paper will have not only the process of A Multidisciplinary Design Studio, but also different design solutions of *Designing An Eco-House Project on Burgazada, Istanbul*.

Keywords: Miro, Kandinsky, ecology, design, architecture, creative thinking, thinking creatively

## 1. Introduction

It is a common way to give some general design problems such as a design of a house or a design of a one-storey office building to first years' architecture students on design studios on a classical education point of view, till today. For the first year of the architectural education students are generally designing buildings that are having small unit spaces, which are created according to the function of that is asked to design. Generally, all of the spaces are like they are from the pages of the book of Neufert, which is used to check dimensions, ratio and proportions in architecture. So almost all of the projects of the group are so similar to each other without having any sense of creation, but with perfectly right architectural fictions on plans and sections, thus they are so good according to the "book".

E-mail address: zafersagdic@hotmail.com

To solve this main problem, one instructor and one assistant guided 15 architecture students from Turkey, Syria and Spain on the design studio during 15 weeks long spring semester of 2012-2013, used Jeffrey and Craft's *teaching for creativity- teaching creatively theory* to ask an architectural creation of eco-houses on Burgazada to the group. Each student selected a site on Burgazada. And started to create their own *dream eco-house*.

The design of the house should have a lightweight structure, which was not only to be ecologically utilitarian, but also give less harm to the ground it would rest upon. Choosing one abstract painting of either Miro or Kandinsky was the starting point of the project in the first moment, just after a workshop had been organized on the attendance of a famous Turkish painter, Aysun Dostol. She gave 3 seminars titled, *The Information of Paintings of Mirao & Kandinsky and Their Era; Dadaism; and Making of Collages*. Then, she held a workshop of 3 dimensional modeling collages with references from the paintings of Miro and Kandinsky.

Thus, the process was including 4 pahases chronologically: 1.the creating of 3 dimensional innovative collages from the paintings of Miro or Kandisky during a workshop with a professional Turkish painter; 2.the giving decisions of having ecological point of view on the house design, 3.creating polygonal structural choice as having references from selected painting either of Miro or Kandisky, and finally 4.the design process of the project. Moreover then this, during 15 weeks long semester, informative seminars about the site were given to the students on the first 2 weeks, and from the 3<sup>rd</sup> week to 10<sup>th</sup>, not only three basic digital programs, which are chronologically photo-shop for architectural representation, sketch up for understanding 3 dimensional modeling quickly and auto-cad for drawing the design project, were touch to students on three different workshops, but also 3 seminars about eco-design, 2 about architectural patterns and geometrical form creating and 1 about light-weight structures were given to them, as well.

## 2. Methodology

On modern educational programs there are 2 main methods. One is offered by Kolb (1984) and named as an *experimental learning*, and is offered by Jeffrey and Craft (2004), which is called as a *teaching for creativity- teaching creatively*. Here, the second one was chosen and design projects were created according to the references of the paintings of Miro or Kandinsky on an artistic point of view, which is pointed out by the related theory.

According to Jeffrey and Craft (2004), the former is defined as 'using imaginative approaches to make learning more interesting and effective' (Craft, 89) and *teaching for creativity* involves *teaching creatively* (Craft, 90) and notes that, "young people's creative abilities are most likely to be developed in an atmosphere in which the teacher's creative abilities are properly engaged" (Craft, 90).

There is a great deal of research and conceptual analysis, on an architectural education parallel to the researches and developments on educational field, which has explored aspects of pedagogical approaches which foster pupil creativity around the world especially on USA. (Torrance, 1984; Shallcross, 1981; Kessler, 2000; Hubbard, 1996, Halliwell, 1993; Fryer, 1996; Edwards and Springate, 1995; Craft, 2000; Beetlestone, 1998; Balke, 1997). However, none of these studies has, examined the relationship between these two facets of creativity not only in the university, but also on architectural education.

The data, which was drawn upon by Jeffrey and Craft (2004) comes from a research of 1971 and is now internationally famous with reciprocal connections with schools in Sweden, relations with communities in Gambia and the recently retired head teacher has lectured in the United States and recently visited China.

On their example, data collection was through qualitative methods, consisting chiefly of interviews with teachers, support workers, students and families. The research focused on the learners' experience of creative teaching in general, focusing on their perspectives, recorded through extensive field notes. Relevant documentation was collected such as governors' and inspectors' reports, timetables, and test results. Photographs were used extensively as data and as stimuli for exploring children's<sup>†</sup> perspectives. At one stage, students were given cameras to select their own observations for discussion. By comparing the various different kinds of data, both within and across cases, we were able to identify prominent issues and themes connected to the major subject of creativity in education and the effect this had on the various participants.

Thus, a kind of similar method was used on first year's design studio students. Each student selected a site on Burgazada and then not only by taking the reference paintings of Miro or Kandinsky, but also with the results of the eco-researches that they made, they designed their projects.

### 3. Teaching Creatively And Teaching For Creativity

The relationship between *teaching creatively* and *teaching for creativity* can be seen by using a framework based on Woods' (1990) features of creative teaching - relevance, ownership, control and innovation.

#### 3.1. Teaching Creatively

According to NACCCE (1999) report, imaginative approaches should be used to make learning interesting and effective during the semester for teaching creatively. A major effect for students was an immediate experience of the dynamic, appreciative, captivating and caring ethos (Jeffrey and Woods, 2003). The construction of this type of ethos has many 4 objectives but in terms of teaching and learning one of the school's major aims was to make the learning experience relevant to learners, to make it interesting. According to Jeffrey and Craft for students this meant an ethos that was dynamic and active:

Learners appreciated the qualitative aspects of each focus of learning. Thus, creating is also made exciting, literacy experienced as a whole range of delights and emotional journeys through designing and architecture is developed as a passion for designing, discovery and experimentation are felt during the process of technology provided intensely focused activity involving, frustration and satisfaction and the arts were valued as opportunities for expression, as well.

During the students are formulating their curriculums, the knowledge to be investigated on the process and the contexts in which not only teaching and learning took place, but also personal creativity was tired to be pushed up to set a framework for creative engagement on their projects.

The group experienced the process between studio hours as adventures just on the example of Jeffrey and Craft. The lecture's '*hands on*' approach was a paramount feature of learning to make design relevant and encouraging ownership:

The group was told the story of how the practice of 'designing a eco-house on an island site' developed -

<sup>†</sup> The group of students are from priliminary school, which were selected as group members on Jeffrey and Craft's example).

the setting up the parish boundaries on the first year's architecture students.

The instructor and the assistant of the lecture prioritised strategies that engaged the learner<sup>‡</sup> and they acted creatively to adapt the strategies to the appropriate age range, context and individual. The focus was on the professional relevance of the design studio to the first year students as showing what was the architectural background of a design, which was to be learnt or experienced during 15 weeks long semester. This is related with the exemplified the description of teaching creatively which was given by NACCCE, in 1999.

### 3.2. Teaching For Creativity

The instructor also enacted those *teaching for creativity* principles according to (NACCCE, 1999), as follows: encouraging the group to believe in their creative identity; identifying the group creative abilities not only architecturally, but also related with art; fostering creativity by developing some of the common capacities and sensitivities of creativity such as curiosity, recognising and becoming more knowledgeable about the creative processes that help foster creativity development and providing opportunities to be creative. This was done by firstly having 4 weeks long teaching of the history of Ottoman architecture and encouraging ownership of learning and then by passing back control to the learner and encouraging by making students' own movies as innovative contributions. Control of learning by a young person is not a new experience (Pollard 1996). Being on this process is an opportunity to have ideas, which are innovative and expressive.

One of the major characteristics of creativity itself is, as craft argue on 2002 possibility thinking (Craft, 2002) and it was referred also that it was used at the education in technology-based activities on the group of upper-graduate students such as on this example, movie making to encourage the group to take control and act innovatively, as well.

According to Wood and Jeffrey (1996), the group experience and imagination would be a major part of the process of investigating knowledge using such devices as possibility knowledge (Woods and Jeffrey, 1996) and possibility thinking (Craft, 2002) and according to Lucas (2001), as well. *Teaching for creativity* could involve generating 'learner inclusive' pedagogy, according to Jeffrey and Craft where the learner is encouraged to engage in identifying and exploring knowledge. This idea is tried to develop further here, on this selected group of upper-graduate architecture students (Craft and Jeffrey, in press; Craft, 2003).

### 3. Content And Context Of The Lecture

The 15 weeks long semester had 5 different educational phases,

1. Site seeing on Burgazada;
2. Choosing of the sites of students on Burgazada;

<sup>‡</sup> Here, upper-graduate students.

3. Having 2 seminars about ecological design, landscape architecture and eco-details on the house;
4. Designing an eco-house by taking references of Miro and Kandinsky;
  - 4a. Having 3 seminars about paintings of Miro and Kandinsky and Dadaism and collage making,
  - 4b. Organising of a 3 dimensional collage workshop (taking the reference of 1 painting of either Miro or Kandinsky)<sup>§</sup>
5. Design Process:
  - 5a. Designing of plans and elevations,
  - 5b. Taking sections,
  - 5c. Designing of ecological details
  - 5d. Creating of details of interior design
  - 5e. Creating of details of landscape
6. Making presentations on the auditorium;
7. Discussions of each project on final jury.

## 5. Projects And Discussions

There were 15 submitted projects from the group: 9 took the reference of paintings of Kandinsky and 6 took the reference of paintings of Miro. **4 of the students** of the group who selected Kandinsky's paintings as references designed their spaces as some rectangular shapes that have some cross points with the other ones on different sizes on different directions. And they tried to catch all artistic sense of humour on the design of this cross points on their eco-houses. They used light weighted steel in structure and on their landscape design they again selected to use rectangular forms to have the main axes, thus their designs have an intensive harmony with the design of their *dream eco-house*.

**6 students**, who selected Miro's paintings as their designs reference points, designed their dream eco-houses as a festival of using the complex geometrical forms, which are formed by compositions of triangles, octagons and hexagons, etc. not only on plans, but also on the 3<sup>rd</sup> dimensional structure design, as well. Even the details of the interior design and furniture design of these eco-houses have the same architectural creation point of view. The landscape design of these 6 projects has complex axes, more than having straight lines, the idea of creating landscape design has a dynamic fluid structure and framework combinations.

<sup>§</sup> Each student chose his/ her reference painting & painter according to his/ her point of view.

**5 students** of the group selected to use the paintings of Kandinsky as the starting reference of the design of their *dream eco-house*. These students used a combination of complex geometrical forms with the simple rectangles, not only on their dream eco-house, but also on the design of the landscape, as well. Each of their house projects is unique in shape, not only on 2 dimensions of plans, but also on the 3<sup>rd</sup> dimension, as well. The landscape architectural point of view of these projects has harmony with the design idea as having small useful units on the gardens as daily spaces, swimming pools, romantic small draw wells, and etc. one project of this group is like a *drop of water*, very much effected with the fluidity idea of Zaha Hadid, who is a famous architect with her contemporary architectural examples on all over the world. That idea has come to actualize after having some drop like intersectional points on the 3 dimensional collage of the owner of the project, which also has a parallelism with the idea of designing an eco-house on the ecological point of view.

Three best project designs are as follows:

#### 1. *A Harmony of Triangles on Our Life*, by Muhittin Eksi

The design idea is related with the triangles that we have on our life; everything that is related with our life, such as school-family-work, love-faith-hope, eat-drink- sleep, sea-sun-sand and etc. The space organisation is resolved very creatively as a result of *thinking creatively- creative thinking* method, using different triangles on different sizes, and thus by having living spaces on their cross-sectional points, not only on plans, but also on 3<sup>rd</sup> dimension and landscape design, as well.

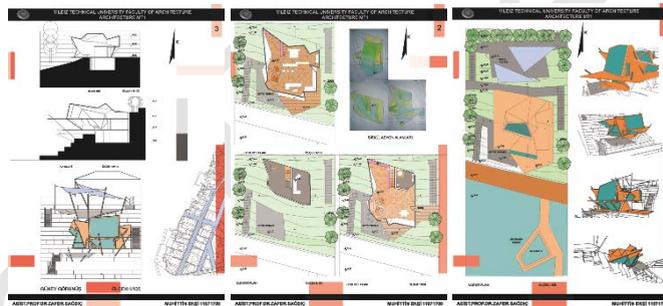

Fig.1. *A Harmony of Triangles on Our Life*, by Muhittin Eksi

#### 2. *A Drop of Water*, by Adnan Koyuncu

The design idea is focused on a creating of a drop of water. Thus, the designer student of the project has been very much affected with the fluidity idea of Zaha Hadid<sup>\*\*</sup>, after taking references on his design from a painting of Kandinsky. On a ecological point of view the house design has a lightweight steel structure and thus, it gives the less harm to the ground. All of the interior design solutions and details of furnitures and landscape details are created by the same point of view, having fluidity on each and every part of the dream eco-house.

<sup>\*\*</sup> Zaha Hadid is a famous architect with her contemporary architectural examples on all over the world.

Fig.2. *A Drop of Water*, by Adnan Koyuncu

### 3. *A Continuous Life Cycle*, by Barancan Dagistan

The design idea is related with the life-cycle of the human being, which has different stops, and thus the spaces related with them in function are created in an action-space relationship such as eat-kitchen, sleep-bedroom, stay the day long-living room, work-office room, and etc. The dream eco-house has a fluidal space usage of a daily life cycle in its' spaces and thus, its' spaces have a kind of m2 sizes according to the will and the daily usage of the owner of the house. Even the starting point of the project has a reference of painting of a Kandinsky, the facades and landscape design of the house is affected by the famous Spanish architect Gaudi's creations as artistic point of view, as well.

Fig.3. *A Continuous Life Cycle*, by Barancan Dagistan

## 6. Conclusion

Among multiple benefits of the exercise some that stand out are: (1) students participated in solving a creative design problem, (2) students learned to work on an estimated time period, (3) students familiarized themselves with creating designs on a relationship among mathematics and arts while thinking on ecology, (4) students learned to appreciate different point of views on the same project site, (5) students were able to visualize their designs in context, (6) students learned 3 important digital programs.

# A new horizon in logopaedics: Speech therapeutic story – innovative use of a story in the therapy of children speech impediments

Dorota Bełtkiewicz\*

*Pedagogical University of Cracow, Podchorążych 2, Cracow 30-084, Poland*

---

## **Abstract**

A speech therapeutic story is an innovative method of working with a child, combining the plot of a therapeutic story with speech therapy. The aim of using this aid is to provide the child with a two-dimensional help, namely to teach it the correct pronunciation as well as to support it emotionally through the reduction of fear and the encouragement for verbal communication. The attractive form of a speech therapeutic story (interesting presentation, multimedia form, the use of a puppet) is to arouse positive emotions in the child: overcoming the fear and the sense of isolations, boosting its self-esteem, consequently motivating it to articulatory training, and after the achievement of the desired result – giving the feeling of self-acceptance and success.

*Keywords:* Speech Therapeutic Story; therapy of children speech impediments; logopaedics; speech therapy; verbal communication; therapeutic stories; bibliotherapy

*E-mail address:* kontakt@dorotabeltkiewicz.pl

## 1. A New Horizon in Logopaedics – Speech Therapeutic Story

Speech therapy is often associated with immense efforts, tension, and stress. Small children, in particular, who - as a result of their speech impediments and disorders - must attend sessions with a speech therapist, get tired easily, quickly lose their concentration, withdraw into themselves in front of a therapist, sometimes even rebel and refuse to cooperate. These are very often children who feel rejected by the people around them due to their problems with verbal communication.

Such difficulties may go in tandem with two types of fear (Bełtkiewicz; 2013). First of all, it can be **fear of rejection**, expressed as anxiety and nervousness in the face of situations that threaten a child's self-esteem (Conrad and Hendl; 2005). Second of all, it is **fear of failure**, which may intensify due to a public performance, during a speech therapy session, or a casual communication situation (Bełtkiewicz; 2013).

Despite all the negative emotions that can accompany children during a speech therapy, there is a need for early diagnosis and intensive training. This is due to the fact that difficulties in verbal communication often affect a child's overall development and their functioning in a peer group. Such abnormalities should definitely be eliminated before a child starts their school education, as the improper use of the language can have a negative influence on a child's cognitive processes, literacy, and social skills. The linguistic achievements that a child already has while starting school will be invaluable when meeting the increasingly sophisticated demands made by teachers and parents (Cieszyn and Korendo; 2012).

Therefore, the optimal solution is to provide children with two kinds of support: psychological and logopaedic. To that end, an effective way is to use a tool which I have developed – a speech therapeutic story. It involves the combination of a traditional storytelling therapy, i.e. interacting with a child using a specially-designed fairy tale which carries psychological support, with a speech impediments therapy, logopaedic instruction, and exercises.

## 2. The concept of the tool

**A speech therapeutic story** is a tool that combines both psychological and speech therapy impact and is to be used while working with a child. The tool is based on interspersing a traditional plot of a therapeutic story with speech therapy instruction and training.

The method is aimed at children **over three years of age** who have been diagnosed with a speech impediment or language disorder that can be subjected to treatment at this stage of a child's development. Typically, speech difficulties take the form of dyslalia and result from the restricted mobility or abnormal arrangement of speech organs during the articulation of a given sound (Kaczmarek; 1977). In addition, a speech therapeutic story addresses such issues as a shortened frenulum or the premature loss of primary teeth; hence, it aids dental and orthodontic treatment and rehabilitation. Speech therapeutic stories are also intended for children who stutter, as the exercises such stories contain stimulate the flow of speech. The following article is dedicated to the topic of a speech therapeutic story being an adjunct to the treatment of the dyslalia speech disorder.

An important advantage of a speech therapeutic story is its capacity to increase a child's motivation. This is facilitated by narrating the story, which gives a child a sense of participation in a fairy-tale world, and also a sense of mission and being in control.

### 3. The story's composition

The proposed therapeutic tool is based on a plot of a therapeutic story, which usually serves as a secondary preventive measure (supporting a child in a situation which is emotionally difficult and generates anxiety) and whose task is early detection of undesirable phenomena and early implementation of corrective action (Woynarowska; 2005).

A therapeutic story is based on permanent, formal elements such as the main theme (an emotionally difficult situation), the main protagonist who is experiencing an emotionally difficult situation and negative emotions (including social emotions) which control his behaviour and the way he interprets various events, other fairy-tale characters that support the protagonist (they provide understanding and acceptance, and also illustrate other strategies of action and understanding), and the story's background marked by a buoyant and optimistic mood (Molicka; 2011).

In the story, the psychological and logopaedic problem refers to both the main character and his integral elements - speech organs. It is important to put an emphasis on a certain dualism here: it is not only the main character (usually a child) who is an important protagonist of a speech therapeutic story but one of his speech organs too. That speech organ (typically the tongue) causes a child to articulate sounds incorrectly and is not only animalised but even personified – it can think, feel, and take decisions (Bełtkiewicz; 2013).

The plot contains the same elements as in a traditional therapeutic story:

- 1) **Presenting the protagonist**, who initially leads a happy and peaceful life; the description of his surroundings.

- 2) **Problematic situation**, i.e. a difficult situation in which there is no correspondence between the external conditions and that which the individual is capable of (Kowalik; 1993), and which forces the protagonist - both the main character and his speech organ - to act.

- 3) **Decision to take rational action and start persistent work** on the part of the main character (usually a child) and/or a personified speech organ.

- 4) **Resolution** – occurs as a result of prudent action, perseverance, diligence, or with the help of friends. At this point in the story, the plot is interspersed with oral-motor exercises which are recommended to improve a given speech organ. The organ-protagonist, usually the tongue, is to do certain fitness and physical exercises; it has to do some cleaning in his house - the oral cavity. In addition to articulation training, these exercises, depending on a child's age and abilities, can have an impact on the child's general development, advance his semantic and syntactic system, improve his literacy, and stimulate skills such as memory, visual analysis and synthesis, categorisation, and manual dexterity.

- 5) **Happy ending**, a success, attaining the correct level of speech, free verbal communication.

#### 4. The role of the story characters

The characters in a speech therapeutic story fulfil many important functions. The main character (usually a child) is analogous to a child that is undergoing the treatment. All similarities should be abandoned. The profile of the fictitious character can coincide with the profile of a child at some points, but not to the extent which makes a child feel that the story is about them. Such revelation can have a very negative effect – it can discourage a child from continuing to work further as they may become mistrustful (Bełtkiewicz; 2013).

The role of a personified organ is not only the accurate and artistic representation of speech organs during actual speaking, but also familiarising a child with their own speech problem, impediment, or disorder. An effective way is to stimulate children's empathy, compassion, and positive attitude towards the sick organ or system, their willingness to help it improve by comparing the malfunctioning system or organ to the element of fauna and flora. Therapeutic stories used when working with children who suffered orthopaedic injuries motivate them to undergo rehabilitation by showing the injured limb as a personified crushed twig or a destroyed plant which is in pain and needs help. A similar role is played by the personification of a speech organ which causes a speech impediment, usually resulting from limited motor skills of articulatory organs (Kaczmarek; 1977).

The protagonists must evoke a child's positive emotions and inspire their trust. Characters should become children's guides or helpers during a speech therapy, which may inspire their confidence and involvement in the entire process.

#### 5. The role of positive emotions

A child who experiences various types of anxiety, has low self-esteem, and a negative attitude to all kinds of activities, must be provided with **positive emotions**. Anxiety reduces intellectual competence and has a negative impact on people's achievements in any type of work or study (Goleman; 2007). Therefore, when starting to work with a dyslalic child, it is essential to first reduce their anxiety and induce their positive emotions before a speech therapy begins.

In a speech therapeutic story, this is facilitated by **humorous elements** contained in the creation of the presented world, in descriptions of the characters, in dialogues, and in exercises. They serve to improve a child's mood, to give them a sense of relaxation, and also stimulate their positive attitude towards a speech therapist and a therapy itself (Bełtkiewicz; 2013).

A sense of humour not only brings happiness, but it is also an important tool for the development of stress resistance (Hart; 1995). In addition, Archibald Hart cites the research (by Masten, Ph.D and Garnezy, Ph.D from the University of Minnesota) which shows that children who often smiled and laughed tended to do better at school and were more popular with their peers, even when they experienced more stress than other children.

A speech therapeutic story maintained in **the atmosphere of fun and adventure** reduces anxiety, raises self-esteem and motivation, motivates for action, and reduces the rate of fatigue. In a speech therapeutic story, an

important role in evoking positive emotions is played by supporters – friends or counsellors, who, in fact, may be children’s speech therapists or teachers.

## 6. The mechanisms of interaction

The most important mechanism of therapeutic storytelling is the process of **a recipient identifying himself with the story’s main protagonist**. In a speech therapeutic story, this happens in two ways: a child compares himself to the main character, while at the same time comparing his speech organ being subject to therapy to the “organic” protagonist. Hence, the motivation to act and to cope with one’s own weaknesses and limitations is twofold.

A speech therapeutic story is designed for pre-school and older children in the case of whom making their speech adjusted to socially accepted standards has failed. The mechanisms of this method have been adapted to the stage of preoperational concepts, which is distinctive of children attending kindergarten or just starting their school education. This age is marked by visual thinking, perceiving inanimate objects as alive, and attributing different motives to them (Conrad and Hendl; 2000). A speech therapeutic story takes this developmental feature into account through personifying speech organs and presenting them as characters with the ability to reason and feel. This way of comprehending the problem provides a child with a genuine opportunity to eradicate his speech difficulties by "taming" and "training" the malfunctioning organ. Also, the atmosphere of fun and play is conducive to achieving positive therapy effects.

## 7. The presentation

The most modern and most attractive form of presenting a speech therapeutic story is by using multimedia. Dynamic animation enables the most effective presentation of the way speech organs move during articulation, and clearly shows the duality included in the story: the main character and his integral part - the “organic” protagonist. Using multimedia is also practical from the organisational point of view, as it allows for an easy and repeated playback of the animated tutorials and exercises by a speech therapist. The storyline and the logopaedic material spread on slides makes it possible for a therapist to divide the process of therapy into various stages and to choose the appropriate exercises for a particular child. If a child has not mastered the material yet, it is possible to return to the previous content in order to repeat and consolidate it (Bełkiewicz; 2013). After prior instruction given to a child’s legal guardians, the tool can be used outside a speech therapy office in order to increase the regularity of speech training, which, in turn, contributes to the achievement of intended results at a quicker pace.

Additionally, a multimedia form allows to create a specific interaction between a speech therapeutic story’s protagonist and a child. The animated character can ask a child questions about their well-being or the level of satisfaction with the task they have just completed. Above all, the character can praise the child if they complete a task correctly, which is an important engaging and motivating factor. The characters of literary works and animated films often become very close to children. They are extremely memorable to them. Naturally, this

"friend-guide" cannot, at any stage of a therapy, replace a speech therapist or a parent, who should control the actions performed by a child using the tool.

A speech therapeutic story can also be presented in a traditional form. A speech therapist may narrate a story freely, or read it and demonstrate activities using his own speech organs. He can perform general development exercises using authentic aids, such as toys, puzzle pieces, children's short stories, or jigsaws. This form undoubtedly stimulates a child's imagination, but there is a risk that not every child, especially not a young one, will understand the analogy and the relationship between the main character and the "organic" protagonist. A traditional version can be used, as instructed, by a child's parents; however, the level of motivation of both children and their parents may be much lower than in the case of a multimedia form.

A multimedia form available on mobile devices provides a child with permanent access to the tool, regardless of the circumstances. Apart from the device and the application, such form does not require any additional therapeutic or educational materials.

## **8. Aid materials and other therapeutic forms**

Along with a speech therapeutic story, it is possible to complement your work with children with a wide array of teaching aids as well as elements from other forms of therapy that stimulate their overall development. I have developed a number of speech therapy materials whose aim is to diversify the use of a speech therapeutic story and make the comparison between the "organic" character and a speech organ more apparent.

The most faithful representation of the "organic" protagonist (the tongue) in its "natural habitat" (the oral cavity) is provided by a silicone tongue cover (hypoallergenic, does not restrict movement). The cover represents the story's main character (it has his characteristic facial features and colours) living in a cave. While performing oral-motor exercises, a child identifies himself/herself with the main character, and his/her tongue ceases to be merely an organ, taking on the nature of a person and a friend (Bełtkiewicz; 2013). This solution is especially beneficial for children to whom the analogy presented in a speech therapeutic story - for various reasons - is not entirely clear, but also for children who find it challenging to organise the structure of their own body and to imitate a sequence of movements and routines. Pre-school and early school children are open to new, experimental solutions and curious about aids which they have not seen before; therefore, they consider such innovative teaching aids extremely attractive and appealing, which increases their motivation and may accelerate the desired therapeutic effect.

A finger puppet, made of soft and adhesive material, may constitute another representation of the "organic" protagonist. A puppet performs movements which are analogous to those of the "organic" story character, who is at his home (a fist-sized small dome). Using a puppet, a speech therapist is able to present a child with a routine shown in a story. Next, he can ask a child to repeat the routine with a puppet and then a child's own speech organs. Similarly, a puppet (the "organic" protagonist, the tongue) may be slightly bigger, cover the whole hand, take the form of a "glove," and be presented in a sliding dome - the cave (the oral cavity) with a proportionally bigger capacity. Presenting the "organic" protagonist with a puppet is particularly recommended with children with impaired manual dexterity and impaired imitation skills. A puppet can also serve as a "buffer" during the evaluation of a child's work by a therapist, especially in the case of children who are shy and have a high level of anxiety. Puppets used in tandem with a speech therapeutic story make it possible to intersperse a therapy programme with other forms of therapeutic treatment, including theatre, drama, or poem recitation - all with the use of a puppet (Bełtkiewicz; 2013).

It is also possible to involve a child's entire body by dressing them up as the "organic" character and putting them in a house which resembles a sliding cave. A child's task is to perform the movements relative to the "room" they are in which are the same as the movements the "organic" character has to perform in a speech therapeutic story. This exercise aims to improve a child's spatial orientation and motor skills. Such training can be completed with physical exercises or music therapy. A good solution is to expand the activities with choreotherapy, which evokes additional aesthetic and emotional experiences. Dance therapy has a positive effect on sensory perception, improves a child's motor coordination, and also their sense of rhythm, time, and space (Szulc; 2013). This method is an excellent way to add variety to the treatment of ADHD children, as it allows them to give vent to their energy in a creative way and to fulfil their desire for a change (Hallowell and Ratey; 2004).

All forms of drama accompanying a *speech therapeutic story* and engaging different parts of the body - whether partially or totally - bring multi-dimensional benefits to a child's development. A fairy tale presented to a child via puppet theatre has the additional asset of evoking aesthetic impressions. The beauty of the characters' moral integrity can be greatly enhanced by their appealing appearance, their charming words, or attractive setting. Moreover, it means educating and preparing a child for the future moral and social life, as well as developing their aesthetic experiences (Dyk; 1998).

A speech therapeutic story used while working with a child may be accompanied by melotherapy. Another brilliant idea is to encourage a child to draw their emotions after the speech therapy exercises are completed. An emotional drawing is an excellent picture of the emotional state of a child and an indicator of progress that takes place in a child's psyche as a result of a series of encounters with a speech therapeutic story.

## 9. An example of a speech therapeutic story

To provide an example of a speech therapeutic story, I will present excerpts from a multimedia book entitled "Rrromek and Rrradek" (Dbajki Publishing House; Warsaw, 2013). The book has been written by me and is the first publication of this kind on the Polish book market, to be premiered soon. This book aims to stimulate children's correct pronunciation of the "r" sound.

The storyline is as follows: in the mouth of a several-year-old girl named Rózia (using a name with the "r" sound in the word initial position is intended), the main character, lives the tongue-dinosaur GADajek (a Polish wordplay with the words "gadać" (*to chat*) and "gad" (*a reptile*), which suggests that children can imagine a talkative dinosaur or dragon); his name is Romek (using a name with the "r" sound in the word initial position is intended).

1) The plot starts as in a speech therapeutic story – from **presenting the main protagonist**, who is leading a carefree, peaceful, and happy life.

**Example** – introduction, the description of a happy protagonist – the tongue, GADajek, and his natural environment.

*“Romek was a pink tongue-GADajek, living in a clean and warm cave - the mouth of little playful Rózia. (...)*

*He was growing healthy and happy. He really liked it when the girl was eating sweets, because he loved their sweet taste. Of all the sweets in the world, chocolate was his favourite. It melted quickly in Rózia’s mouth and flooded GADajek’s little house with its smooth sweetness.*

*(...)*

*Lollipops were the sweets which caused Romek the biggest difficulty. He didn’t know how to skilfully slide on their sweet surface, how to go up and down and up and down again. He was too fat and heavy. Each time he tried, he ended up really tired.”*

2) The joyful mood is interrupted by a **problematic situation**, forcing the protagonist - both the main character and her speech organ - to act. **Example** - the emergence of a problem situation (firstly, children in kindergarten laugh at Rózia because she cannot pronounce the “r” sound correctly, a speech therapist diagnoses an abnormality; secondly, a dentist draws attention to the girl’s heavy and unenergetic tongue).

*“In the kindergarten, a lot of children were waiting to meet Rózia. The teacher greeted the girl solemnly and asked her to introduce herself to the whole group.*

*‘I am Lózia... I am five yeals old. I have an oldel blotel. I like to dlaw and play the piano’,<sup>†</sup> she introduced herself. The children giggled and started whispering something to one another. The teacher silenced them, but Rózia was very sad. So was Romek.”*

*(...)*

*‘My dear Rózia,’ Mr Dentist sighed. ‘From now on you are allowed to eat only one chocolate square a day...’*

*‘How come?!,’ GADajek thought with horror.*

*‘You eat too many sweets and your teeth are starting to decay! Please, brush your teeth after each meal. I can see that you have a very lazy tongue, which can’t pull out the remains of the food you eat from every nook and cranny...,’ Mr Dentist continued.*

*‘Thele! Yet anothel pelson who doesn’t know me but dales to cliticise me,’ Romek sighed to himself with anger.*

Before the therapy, Rózia wrongly uses the „r” sound instead of the „l” sound; it’s a standard form of dyslalia called *rhotacyzmus*

3) The protagonist - the main character and the personified speech organ - **decides to take action.**

**Example** – initiative, the will to act (Rózia and GADajek-Romek decide to start systematic work)

*‘This has to stop!,’ Romek thought. ‘I’m getting down to some selious wolk!’*

4) The next step is to **solve the problem through rational activity and persistent work**, with the help of friends. At this point, the story is interspersed with oral-motor exercises which are recommended for improving a given speech organ. The protagonist – the organ, usually the tongue – is to do fitness and physical exercises, and has to do some cleaning in his house – the oral cavity.

**Examples** - making a rational decision to start regular and persistent work (Rózia and Romek decide to start systematic work)

a) GADajek Romek has a task to clean the “door frame” of the cave – Rózia and the reader/listener are licking their upper lip.

Fig. 1. (a) Rózia – a child protagonist; (b) GADajek – the “organic” protagonist, the tongue conceptualised as a dinosaur

b) GADajek Romek has a task to clean the “doorstep” of the cave – Rózia and the reader/listener are licking their lower lip.

Fig. 2. (c) Rózia – a child protagonist; (d) GADajek – the “organic” protagonist, the tongue conceptualised as a dinosaur

c) GADajek Romek has a task to paint the walls of his little house – Rózia and the reader/listener are “massaging” their cheeks with vertical movements from the inside.

Fig. 3. (e) Rózia – a child protagonist; (f) GADajek – the “organic” protagonist, the tongue conceptualised as a dinosaur

d) GADajek Romek has a task to paint the ceiling – Rózia and the reader/listener are “massaging” their palate with back-and-forth movements.

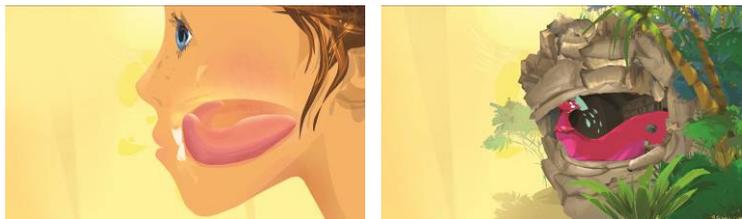

Fig. 4. (g) Rózia – a child protagonist; (h) GADajek – the “organic” protagonist, the tongue conceptualised as a dinosaur

Once the efficiency of a speech organs is achieved, the story is interspersed with pronunciation exercises in the order which corresponds to the logopaedic process of evoking sounds. When a child is able to produce a given sound in isolation, the therapist introduces other exercises which train the pronunciation of sounds in configuration with other sounds - as funny sound or songs - and then in words in correct positions. These exercises, depending on the age of a child, may be of a general development nature. In addition to providing training in proper pronunciation, they can develop a child’s semantic and syntactic system, improve literacy, and stimulate other skills such as memory, visual analysis and synthesis, categorisation, and manual dexterity.

**Examples** – Rózia and Romek are training persistently and solving puzzles.

a) GADajek has to put into the basket only those fruits whose names contain the “r” sound – speech training, phonemic hearing training, categorisation.

Fig. 5. Training in articulation and phonemic hearing.

b) GADajek has to read the text, replacing pictures with words - training in the pronunciation of the “r” sound, training in reading and choosing grammatical forms.

Fig. 6. Training in articulation, reading, and grammar.

5) After a happy ending occurs – i.e. the elimination of a child's speech impediment - a child develops a sense of self-acceptance and pride. An important theme in the storyline is **praise and recognition**, which strengthens the main character's (usually a child's) and a speech organ's self-satisfaction. This feeling can be fueled when there occurs an opportunity to demonstrate new skills to someone else. A good trick is to introduce a new character coping with a speech impediment, whom the "already-cured" protagonist can offer advice and with whom he can share his experience. This particular element raises a child's empathy, reinforces their sense of achievement, and boosts their self-esteem.

## Conclusions

Speech impediments of a dyslalic type are common in pre-school and early school children. Therefore, an early diagnosis and intensive speech therapy are essential. A speech impediment is often not the only problem a child has to tackle, as it entails other difficulties, such as low self-esteem, a sense of rejection, chronic anxiety, or stress related to speaking in public. These factors can thwart even the most meticulously designed and carefully executed speech therapy process. It is therefore important to support a child in two ways: psychologically and logopaedically. Strong motivation, boosted self-esteem, and reducing a child's anxiety are the key foundations of starting any speech therapy. To this end, I have developed a new tool – a speech therapeutic story - which, by becoming very close to a child, teaches and entertains them. Not only does the tool make verbal communication better and easier, but it has the same positive effect on a child's life.

<sup>c</sup> Akdeniz University, Faculty of Physical Education and Sports, "Antalya", Turkey

## Abstract

The study aimed to compare the coordination tests in the study and those used in the laboratory and field. Thus coordination tests used in the field and in the lab were applied to individuals in pursuit of these aims and the relation between the results was investigated. It was thus aimed to demonstrate the utilitarian value of the measurement methods in the field in contrast to the high cost laboratory coordination tests. 69 Individuals (male:49: female 20) between the ages of 18-30 participated in the study on volunteer basis. In order to determine the coordination skills of the study participants, Throwing a Ball at the Target Test, Dart Test from the field tests and Double Hand Eye Coordination Test and the Flamingo Balance Test from amongst the laboratory protocols was applied. In conclusion there was a correlation between the double hand eye coordination test and the dart test ( $r=0,245$ ;  $p=0,43$ ). As a result it was decided that the dart test was adequate in measurement of the coordination skills and taking them into account its usability in the field, it was decided that it could be used in place of the expensive laboratory tests.

Keywords: Coordination, Laboratory Tests, Field Tests.

## INTRODUCTION

Coordination; this is the harmonized interaction between the skeletal muscles and the central nervous system during a purposeful act (1). The utilization of these systems for a goal-oriented act is only possible through coordination of the intramuscular muscle-nerve systems. Intramuscular coordination; on the hand is the harmonized working of the different muscle groups towards execution of a goal-oriented act; (2). A muscle cannot work alone in any type of act to carry out an act, when executing an act more than one muscle group participates in the act (3).

Coordination is an important factor that determines the technique. Sports efficiency coordination cannot be attributed solely to conditional or metabolic processes; it also involves psycho-neurological processes as well. **Coordination exercises**, ensure that the acts are carried out in a rapid, high efficiency, safe, aesthetic and goal-oriented manner (4,5). An individual with coordination attributes may produce act of longer duration. Their muscles tire less when carrying out the act thus they are able to sustain the act for a longer period (6,7,8).

E-mail address: onurisbu@gmail.com

Therefore in order to be able to understand the athlete's condition and development during sports workouts and in order to be able to assign the suitable training and to organize the training as efficient as possible, providing the coaches with coordination exercises and measurement tests would be beneficial.

The test concept has a different definition in sports. Test is specific to the individual and is a behaviour sample obtained from the individual that determines the repetitive behavioural invariants. Motor sports tests are affected by many factors such as; technical, tactical, psychological factors. For example the long jump distances are not achieved through only jumping power. The distance achieved is a result of the combination of factors such as, jumping power the ability to apply speed technique, ability to learn, compliance and the competitive environment (9). Scientific sports research allows acquiring new information on workout methodology.

The study examines the relationship between the coordination test between the field tests and the laboratory test by comparing the two classes. Therefore the aim was to determine the usability of field coordination measurement tools in place of the more expensive laboratory measurement tools. Amongst the tests included in the study is the test to measure balance ability. Because balance is perceived as a component of acquired coordination skills. Also as activities requiring skills such as hand to foot, hand to eye coordination, ball throwing and catching skills, are perfect training for motor development in adolescent boys (10) the laboratory test for measuring of hand to eye coordination and ball throwing to a target and the dart test from the field tests were in field tests were included.

## 2. Material and Methods

### 2.1. Subjects:

A total of 69 individuals from students at the Physical Education Higher College, with ages between  $22,57 \pm 2,14$  (years), with heights of  $175,03$  (cm) with weights of  $68,10 \pm 10,34$  participated in the study on a volunteer basis. The sport ages of the participants in the study are  $5,27 \pm 3,81$ (years). All the tests specified below were applied to all the participants during the same day in the sequence given.

### 2.2. Laboratory Tests

#### 2.2.1. Double Hand - Eye Coordination Test

This test measures the motor coordination and learning capacity of both hands working together. The subject holds the two arms of the test device in both hands and moves the pencil. The object is to trace a six pointed star with the pencil. When the pencil strays outside the star, the duration between two full traces of the star is recorded. The subjects take the test standing up in front of the table in a comfortable position so that they can grasp the both arms of the device (11).

#### 2.2.2. Balance Test (Flamingo)

The aim in this test is to measure the balance skills. Flamingo balance device is 4 cm high and 3 cm wide. In order to prevent the balance device from slipping on the floor it is supported by two feet that are 15 cm long and 2 cm wide. The subject is requested to stand on the device with his dominant floor and to hold the other foot

with his opposite hand behind his back. When the subject loses his balance and touches the ground with his feet or when he lets go off the other foot, the chronograph is stopped. The person applying the test helps the subject to regain their balance. When the balance is restored chronometer is started again. Test is repeated until a 60 second interval is completed successfully. Every fall is counted and recorded (12).

### 2.3. Field Tests

#### 2.3.1. Throwing a Ball at a Target Test

The object of this test is to measure hand to eye coordination. The test uses, tape measure, tennis ball, packing tape and three different coloured cardboard. The subject stands behind a line that has been drawn at 3 meters distance from the wall. The wall has a target, whose lowest point is placed at a height of 1,5 meters from the floor. The smallest square in the middle of the target is 10x10 cm, the one outside of that is 30x30 cm and the outer one is 60x60 cm. The subject makes 10 throws at the target. When they hit bulls eye that counts as 3 points than 2 points is awarded for the next square and 1 point for the outer square. No hitting the target is given 0 point. Test is repeated twice and the best score is recorded (13).

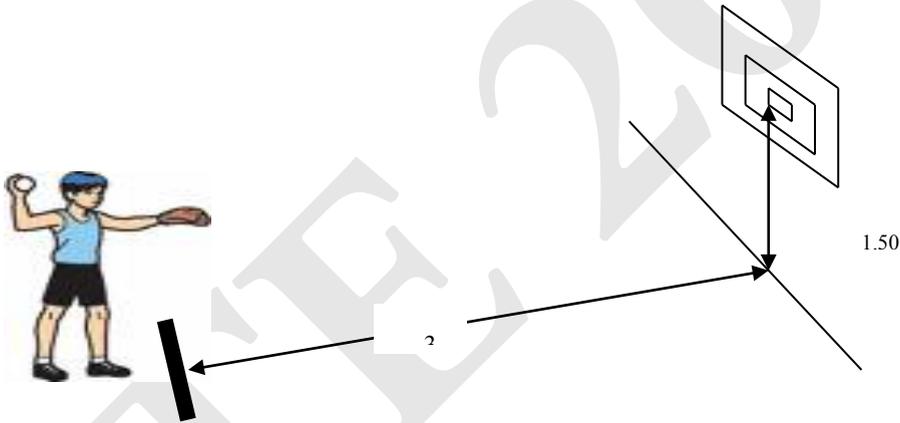

Diagram 1: Throwing a Ball at a Target Test.

#### 2.3.2. Dart Test

Dart board is divided into 20 parts that emanate from the center with 3 sections with different scores. Each section is numbered and the numbers are spread randomly around the circumference. Each sections score corresponds to the number on the outside. The first bounded section is on the outside and any score here counts as double of the number and the inner bounded section counts as triple and sections in between the count as a single score. There is double ringed bulls eye in the middle outer ring counts as 25 points and the inner one as 50. International standards were used in the preparation of the dart performance test environment.

Dart board has been hung at a height of 173 cm from the floor taking its center point as a reference. The throwing line is marked out at a distance of 237 cm from the center. Thus the straight line from the central point to the throwing line is 293 cm long. Before starting the dart performance evaluation, the subject group was warmed up. In order to ensure a standard warming up process a protocol was prepared, and all the subjects were

subjected 5 minutes of hand, wrist, arm and shoulder warming up exercises and stretching exercises. In the second part of the warm up exercises all the subjects threw between 180 darts to 200 darts. In the evaluation of the dart performance evaluation, the total score from 30 darts was recorded. The subjects were separated into groups and the throwing was organized as a series of 10 with 2 throws per series, to give a total of 20 darts, at the same time for all the groups. At the end of each series the 2 day scores were recorded by the researchers or their assistants. This test was repeated twice and the highest score obtained by the subjects was onto a form as their dart performance value (14).

*Statistical Analysis:* For statistical analysis the Windows based SPSS 18.0 statistical analysis software was used. As a result of the analysis (Shapiro-Wilk Test) carried out, it was determined that all the parameters conformed to a normal distribution. Pearson correlation analysis was used to determine the direction and the strength of the correlation between the parameters.

#### 4. Results

Table 1: Balance, Double Hand Eye Coordination, Throwing A Ball at the Target and Dart Test points.

n=69	Balance (point)	DHECE (point)	DHECD (sec)	TB (point)	DP (point)
Min	0	0	30	13.00	284
Maks	11	20	99	24.00	532
Mean	1,60	3,66	62,84	16,93	391,60
Std. Dev.	1,92	4,00	18,02	2.77	60.97

**DHECE:** Double Hand, Eye Coordination Error, **DHECD:** Double Hand Eye Duration, **TB:** Throwing A Ball at the Target score.  
**DP:** Dart Point.

Table 2: Correlation between the Field and the Laboratory Tests.

n=69		TB (point)	DP (point)	Balance (point)	DHECE (sec)	DHECD (point)
DP	(r)	,306*				
	(p)	,011				
Balance	(r)	-,213	,083			
	(p)	,080	,498			
DHECE	(r)	-,065	,245*	,153		
	(p)	,595	,043	,209		
DHECD	(r)	,162	,232	-,031	-,171	
	(p)	182	,055	,803	,160	

There is an highly significant correlation between the dart test in the field test and the throwing a ball at the target test ( $r=0,31$ ;  $p=0,01$ ). Also there is a significant correlation between the laboratory tests, double hand eye coordination test (duration) and the dart test scores ( $r=0,25$ ;  $p=0,04$ ).

#### 4. Discussion

Due to the excessive cost of the laboratory tests and the absence of laboratories in many places that train athletes, prevents the conducting of these tests. In this study the aim was to determine the correlation between coordination measuring laboratory tests and the field tests that are easier and more economically implemented.

There was a significant correlation between the field test dart test score and the laboratory test double hand eye test duration score. Although there was a high correlation between error points and the dart test, this was not considered as significant ( $p=0,05$ ). During the application of these tests the student is standing up and applies the coordination skill without shifting their weight. This is why there may be a correlation between the two measurements. Again there was a significant correlation between the dart test and the throwing a ball at a target field test. Because the movements are the same in both tests such as the targeting, throwing, arm strength parameters, these tests can be used interchangeably. It can be said that the throwing a ball at the target field test can be deemed as a test that measures the required skill at the level required level while being economical as well.

A significant correlation between the balance test and other parameters was not found. Because balance is related to the control of the center of gravity and relative positioning of the body. This control is achieved through the coordination of the elements that assist contraction and this coordination is activated by the stimuli emanating from the primary motor cortex (15). In order to maintain a good balance, the right and left side extensor and flexor muscles, medial and lateral rotators and upper body must work equally in unison (16). This may be the reason why there isn't a correlation between the balance test and tests requiring hand to eye coordination. It can be said that in sports branches that require hand skills, the joint use of balance and hand to eye coordination measuring test is advisable.

Coaches or sports trainers can be advised that using the throwing a ball at the target test provides a similar result to laboratory measurements and the darts test, it can be uses to measure hand to eye coordination as a simpler and a more economical alternative.

4<sup>th</sup> International Conference on New Horizons in Education

# A new type of phonetic alphabet and its applications in language teaching: From practical phonetics to morphology

Snejina Sonina\*

*University of Toronto Scarborough, Centre for French & Linguistics, 1265 Military Trail, Toronto, Ontario, M1C 1A4, Canada*

## Abstract

This paper introduces a new articulatory alphabet, Artalph, invented by the author using innovative, computer-generated phonetic pictograms to aid in pronunciation and in the explication of language grammar rules and conventions. The essay highlights a variety of practical applications for the new system, from practical phonetics to morphology, and differentiates it from the IPA.

Keywords: Innovative phonetic pictograms; articulatory awareness; novel approach to teaching morphology, grammar and pronunciation

## 1. Main text

### 1. IPA anyone?

In the nineteenth century, the phonetician Henry Sweet, the real-life model behind Henry Higgins in George Bernard Shaw's *Pygmalion* (Allott, 2001, 115–145) created one of the most detailed systems of phonetic signs ever. When the International Phonetic Association was established in 1886, it adopted Sweet's Broad Romic alphabet “with only a few minor modifications” (Singh & Singh, 2006, 26), and it became an excellent tool for studying phonetics and phonology—the International Phonetic Alphabet (IPA).

The IPA is a very precise system based on a model phonetic principal: one sign for one sound. I use it whenever I start learning a new language, and I would not have been able to learn English without it. I would also not be able to teach French phonetics and phonology without it. And even this article could not have come into existence without it: as it is customary in linguistic work, I use the IPA signs within this text in square brackets to distinguish them from ordinary letters. To describe the sounds, I will use both the IPA signs and the phonetic terminology found on the International Phonetic Association's website (<http://www.langsci.ucl.ac.uk/ipa/fullchart.html>).

While my use of the IPA will provide firm linguistic grounds to the paper, I will also offer descriptions in simpler terms—descriptions that use pictograms and can be easily understood by any student not familiar with linguistic terminology. My experience of language learning and teaching has taught me that despite its precision,

\* Snejina Sonina. Tel.:+1-416-927-9120

E-mail address: sonina@utsc.utoronto.ca

the IPA is rarely used by teachers and never appreciated by students. When I delved into the question of why, I understood that the IPA's unpopularity results from its encoding complexity: to use it efficiently, both students and teachers need to learn a fair number of new alphabetic signs and corresponding linguistic concepts, which can be daunting. So, although a precise linguistic tool exists to help with pronunciation, many teachers either opt for approximations (if similar sounds are known to students) or struggle to find ways to show an unusual articulation (if comparable sounds are not known to students or finer distinctions are required).

Moreover, in many academic programs and in whole areas of linguistic research the IPA is not used at all. Instead, for example, there exist special traditional conventions for transcribing in Latin letters with diacritical signs languages that do not themselves use the Latin alphabet. These conventions are different for each field, and as such they complicate comparative studies and hinder communication among scholars. For example, in Slavic studies the letter "c" transcribes the dental affricate [ts], but in Sanskrit studies the same letter is used for a palatal affricate [tʃ]. The use of diacritics also differs in both fields.

Quite clearly, then, there is a need for an additional phonetic alphabet: one simpler than the IPA yet also one more universal than conventional transcriptions in Latin letters with diacritics. To help students master the IPA and to facilitate my own language studies, I developed a system of pictographic representations that, with the help of computer graphics, have led to a new type of alphabet. I call this system Artalph—to abbreviate the full name, Articulatory Phonetic Alphabet, but also to emphasize the word "art," indicating the system's potential creative use.

In this paper, I will share my experiences in the practical application of this alphabet when teaching language at different levels. The current article seeks to advertise the usefulness of this new type of alphabet for teaching practice, rather than present the system as a whole. I will therefore only explain the features that are necessary to achieve my practical goal—to offer a few concrete and instructive examples from the classroom. A more complete description of the alphabet is available on my forthcoming Artalph webpage ([www.artalph.com](http://www.artalph.com)).

## 2. What about Artalph?

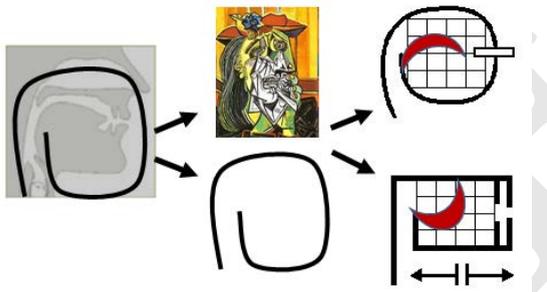

From a semiotic point of view, Artalph is a system of non-arbitrary signs that depict sounds based on their articulation. The idea of representing sound articulation systematically is, of course, not new. Sweet's alphabet that led to the IPA, for example, was based on the articulatory system of his teacher Alexander Bell—the father of Alexander Graham Bell, who together with Thomas Edison invented the telephone. Bell's system was based on representations of articulatory positions required to produce sounds, but it was so complicated that it proved difficult to use: "It seems inescapable that many of the signs in an iconic alphabet look much too much alike" (Abercrombie, 1990, 100).

The novelty of Artalph consists in its visual representation: neither Bell nor Sweet had computer graphics as creative tools, but nowadays it is possible to produce quite distinguishable iconic signs representing the articulation of human speech. Artalph characters comprise a set of symbols, schematic representations of the articulatory organs—the tongue, the lips, etc.—that serve to portray main phonological characteristics. Hence

from a didactic point of view, they are easy **to interpret, to remember and to recreate** thanks to their pictographic nature.

Each character in Artalph is composed of a frame representing the mouth cavity, but I chose different frame shapes for vowels and consonants to visually distinguish them: the frame is rounded and fluid for vowels, but rectangular and solid for consonants. The fluid, freely flowing shape of the vowel frame symbolizes the main distinctive feature of vowel articulation: “It is produced without any kind of obstruction of the outgoing breath” (Ladefoged, 2005, 26). Unlike vowels, consonants in the alphabet are represented as angular and endowed with “teeth,” two additional lines slightly to the left of the mouth opening in the frame, because teeth can be important in consonant articulation. The mouth opening is always graphically represented on the right-hand side of the frame, and the throat opening consequently at the bottom of the left side. Not all graphics reflect mouth physiology closely; sometimes they mix surfaces and symbols in the manner of Picasso drawings of the cubist period, like the rectangle representing the unrounded lips in the vowel character in Fig.1. As a result, each pictogram is able to manifest clearly all main articulatory features of the sound it represents, sidelining unimportant ones. The arrangement of this alphabet thus allows the omission of non-pertinent symbols, or, instead, the use of a “faded” version of the signs that are not relevant for a particular issue in question.

Mouth cavity > Picasso > vowel and consonant

Long and short rimes in Latin poetry

Fig.1 Vowel and consonant shapes; Fig. 2 Dactylic hexameter in Virgil

Such flexibility is also valuable for didactic purposes. For example, in a study of meter in poetry, the exact pronunciation of each sound is not important, but the distinction between vowel and consonant is. Artalph therefore makes it possible to use only the basic shapes for these two types of sounds: this lightens the whole picture and reveals the pattern of alternation of long and short syllables as shown in Fig. 2. The syllable pattern becomes even more visible when the characters are linked with lines at the bottom, and when the characters for long sounds are themselves graphically lengthened, like the last “o” in *cano*. In the textbook *Pronunciation for Clear Communication*, Linda Grant (2010) uses pictures of cars, buses and motorcycles to demonstrate the difference between short and long sounds in English. The characters of the Artalph can themselves be lengthened and are just as visually effective.

### 3. Practical phonetics

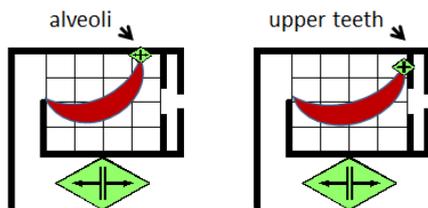

Since the signs of the Artalph represent articulation, their pictographic nature speaks for itself and helps students perceive fine distinctions in the pronunciation of different sounds within one language, as well as in the articulation of similar sounds in different languages. In my experiments while teaching French pronunciation to Anglophones, this system has facilitated phonetic explanations and sharpened students' articulatory awareness.

It is relatively easy to explain the difference between the English alveolar [t] and [d] sounds and the similar dentals in French if both the Francophone teacher and the Anglophone students are familiar with this terminology and aware of the sounds' articulation. If not, which is most often the case, the difference is either ignored or learned through multiple repetitions of trial and error. I once took an English phonetics course at the Ontario Institute for Studies in Education (OISE) and vividly remember our teacher struggling to explain this and several other differences in articulation to native speakers of French, Spanish and Hindu: "I wish I had a 3D mouth model to be able to show you where the tongue is!"

A mouth model—that is exactly what Artalph pictograms offer. They may not be three-dimensional, but thanks to their "cubist" composition, they are able to represent all the pertinent characteristics of any given articulation in one pictogram: the equivalent of a 3D mouth model is available in each character. The pictograms for alveolar and dental [t] in Fig. 3 show the difference in the place of articulation for these two sounds. Fig. 4 represents the difference between two French vowel sounds: [y] as in *tu* and [u] as in *tout*.

#### English alveolar [t] and French dental [t]

Place of articulation:

#### French vowels [y] (*tu*) and [u] (*tout*)

Position of the tongue:

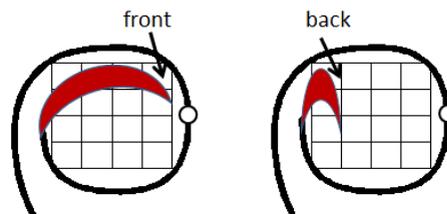

Fig. 3 English alveolar [t] and French dental [t]; Fig. 4 French vowels [y] (as in *tu*) and [u] (as in *tout*)

Unlike the realistic pictures often used in textbooks dealing with phonetics, these pictograms contain only pertinent features, express the nature of the sound through their basic shape (square for consonants and rounded for vowels), and efficiently represent all necessary phonological information in one image. To represent the articulation of a vowel in another system, at least two realistic pictures are required—one for the position of the tongue, another for the configuration of the lips. Moreover, realistic pictures rarely prove helpful in displaying the articulation of consonants, because they cannot show the mode of articulation that is displayed in the enlarged version of the green lozenge that marks the place of articulation at the bottom of the diagram.

The plosive consonant [t] is articulated by a sudden separation of two surfaces: of the tongue and alveoli in English, but of the tongue and the upper teeth in French. To represent this mode of articulation, the lozenge

features two lines symbolising surfaces and two arrows depicting the movement of these surfaces from one another.

To make it even simpler, I just say to the students:

- Look at the pictures in Fig. 3
- Pronounce the sound [t] in English while paying attention to the position of the tongue
- Identify the place of articulation of the English [t] and the corresponding pictogram
- Change it intentionally to the French sound by changing the position of the tongue according to the pictogram
- Listen to the difference in the sound
- Work in pairs: pronounce English or French [t] and ask your partner to tell you which one it was
- Repeat until you get it right

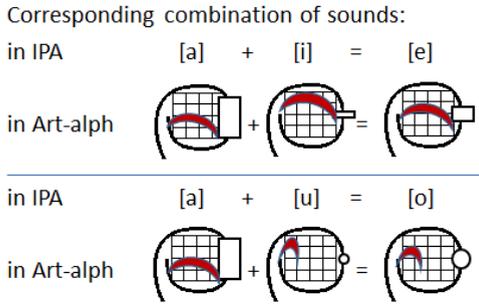

The pictograms shown in Fig. 4 help learners see and sense the difference between two French vowels that constitute a pronunciation challenge for most non-Francophones. Both vowels are closed, which means that the tongue is at its highest point in the mouth, and both are rounded, which means that the lips round during articulation. Yet the sounds differ in the position of the tongue in relation to the front or the back of the mouth. The pictograms clearly show this distinction and assist with the proper articulation of these sounds.

Artalph proves useful in explaining practical phonetics not only to language students. Some years ago I was coaching a singer who needed to perform a few songs in Russian, a language she did not know at all. Pronunciation was crucial for her work, and the pictograms helped greatly in this regard. I imagine that the same would hold true for TV and radio commentators who strive to pronounce foreign names properly.

#### 4. Reading rules

Artalph has further applications. For example, it can prove quite helpful in teaching rules for reading, especially in languages for which they are strict but also complicated, such as Sanskrit. To demonstrate my alphabet's helpfulness for understanding of the phonetic laws behind letters, I will use two common vowel combinations in French: the combination "au" that reads like [o] and the combination "ai," which may read as either an open or a closed [e]. Since phonetic laws have universal application, the same logic will hold in Sanskrit vowel coalescences and its system of vowel strength. Artalph, which also applies universally, can easily assist in otherwise complicated challenges.

### French reading rules: a+i=[e] & a+u=[o] in IPA and Art-alph

### Sanskrit : grades of vowel strength

in Sanskrit, IPA, and Art-alph (ऋ [ɹ̥] & ॠ [ɹ̥̄] not included)

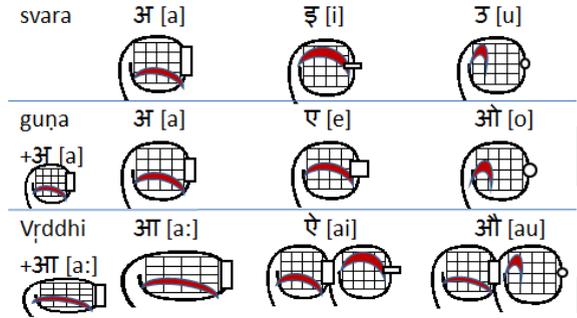

Fig. 5 French reading rules for [a/i/u]; Fig. 6 Sanskrit grades of vowel strength for [a/i/u]

The pictograms of Fig. 5 clearly demonstrate that the sound [e] is, in terms of articulation, the middle way between the sounds [a] and [i]: all three sounds are pronounced with the tongue in the front of the mouth and without rounding the lips. However, the [a] sound is open, while the [i] sound is closed, which is represented on the corresponding pictograms by the lower and higher position of the “tongue” and by a bigger or smaller opening of the “mouth” in the diagram—both in accordance with actual articulation. On the pictogram representing the resulting sound [e], the position of the “tongue” and the opening of the “mouth” represent the average of the previous two. It is just as obvious that [o] is a hybrid between [a] and [u].

Although this fact is common knowledge in phonology and historical linguistics, language students are generally not aware of it; they just learn these combinations of letters by heart without paying attention to the articulation, which would help them understand why this is so. To my knowledge, there is no French textbook that explains the articulatory logic of these reading rules.

Again, to put it more simply, as I would do for my students in the classroom:

- Pronounce the French [a] with the tongue at the front of the mouth, pressed to the lower teeth, and notice how wide open your mouth is
- While pronouncing [a], slowly start closing the mouth and lifting the back of your tongue, striving to reproduce the [i] pictogram of Fig. 5
- Listen to the intermediate sound
- Pronounce all three sounds in this sequence [a] - [e] - [i] - [e] - [a] while paying attention to the position of the tongue

Artalph can be even more useful in the teaching of Sanskrit at universities, where students frequently face the need to learn, in a short period of time, many new sounds, letters, and especially the rules of their combination,

known as *sandhi*. An understanding of the phonetic, or rather articulatory, logic behind these combinations helps with memorization. Using Artalph, I managed to summarize and fit onto one page all sixty-one rules of *sandhi* listed in the *Devavanipravesika* textbook (Goldman & Goldman, 2011). My *sandhi* page helps me find the right rule quickly thanks to the clear pictographic nature of the symbols.

Fig. 6 depicts the strength grades of three Sanskrit vowels, [a], [i] and [u], and it shows the same regularities as Fig. 5, because vowels are “strengthened” through the addition of an [a] sound. However, when a long [a:] is added, both sounds retain their properties and combine into a diphthong without fusing into one sound with average characteristics. According to Goldman and Goldman (2011), “this series of changes is extremely important, ... and must be learned immediately and thoroughly.” The understanding of articulation processes responsible for these changes gained through Artalph helps in this task by showing the mechanism of these combinations. Moreover, the long [a:], lengthened as the whole character, is visually stronger, which helps explain why the sound does not mix in this case: a stronger sound can resist the influence of the following vowel better, and the strong visual representation of it helps learners remember this rule.

And this is not to mention that the Sanskrit alphabet itself is constructed according to phonetic features based on articulation. The representation of its sounds in Artalph thus improves the understanding and articulatory awareness of students who struggle to learn by rote an alphabet that is much easier understood by paying close attention to articulation.

## 5. Vowel harmony and grammar

Artalph is also an excellent tool to explain the rules of vowel harmony typical of most agglutinative languages like Turkish or Hungarian. Generally speaking, the main point of vowel harmony is that the vowel sounds of one word should all agree according to one of their phonetic features. For example, they should all be rounded vowels, or all back vowels, or all front vowels. Since the notion of phonetic feature forms the basis of the Artalph inventory, vowel harmony is extremely easy to represent and perceive when a word is written in the new alphabet: each Artalph symbol, which is used to construct its characters, corresponds to a phonetic feature.

The grammar of agglutinative languages uses numerous suffixes that carry syntactic meaning and usually come in at least two phonetic forms differing in one of its vowel characteristics. For example, the Turkish locative suffix that means “in” has two forms, *-de/-da*, whose vowels differ according to the feature [front/back]. In Fig. 7, all the graphic representations of the suffix *-de/-da* are circled, and the Artalph representation displays that distinctive feature clearly: the “tongue” of the front vowel in *-de* is at the front of the “mouth,” while the “tongue” of the back vowel in *-da* is at the back of the “mouth.”

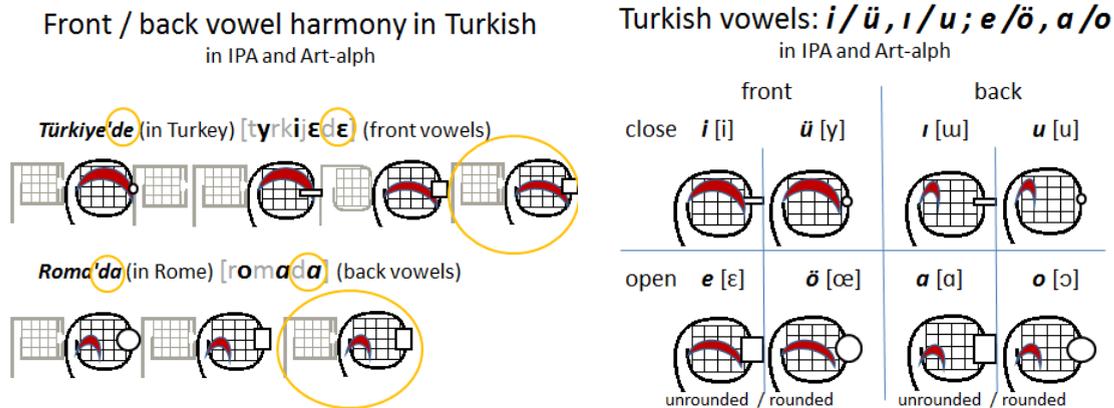

Fig. 7 Vowel harmony in Turkish; Fig. 8 Vowel system in Turkish

In the words in Fig. 7, the consonants, irrelevant to the issue at hand, are represented in “faded” consonant frames, thereby highlighting clearly that all the vowels in the whole word *Türkiye'de* are front vowels, while the ones in *Roma'da* are back vowels: the position of the “tongue” in all of them visually indicates as much.

In simpler terms:

- Look at the pictograms and notice the position of the tongue in the two words
- Notice that Turkish [a] is a back vowel
- Pronounce each vowel in the first word while paying attention to the position of the tongue and experience the front vowel harmony
- Pronounce each vowel in the second word and experience the back vowel harmony

Neither conventional letters nor realistic drawings would ever offer such a direct and simultaneous view, but Artalph allows seeing and comparing the phonetic features in several sounds at the same time. The table depicting Turkish vowels in Fig. 8 offers a perfect example of Artalph’s visual and synthesizing potency.

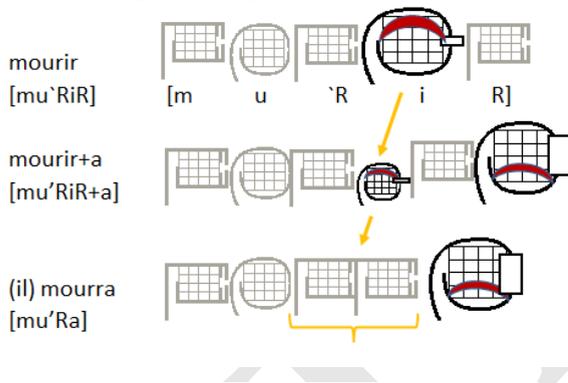

## 6. Grammar and morphology

Vowel harmony is an extreme case of a sound’s dependence on its environment, but it also represents a universal rule: in all languages, sounds influence each other and these influences lead to phonetic changes. Many grammar rules can be explained through historical changes based on phonetic laws, yet they are rarely taught from this point of view, instead being learned by repetition as inexplicable irregularities. In modern Romance languages, for example, textbooks generally simply list the irregular stems for the future tense, and students then mechanically memorize them. The grammar textbooks (Renaud & Hoof, 2007, 315–316; Vercollier, Vercollier, & Bourlier, 2004, 213–214) used in the French program at the University of Toronto at Scarborough (UTSC) do

not even mention that the future tense of modern French was historically formed through the combination of the given verb's infinitive and the verb *avoir*, although understanding this history and the phonetic changes it involved could significantly reduce the amount of learning by rote.

For quite a few verbs, the irregularities are easy to explain, and Artalph helps illustrate the abstract phonetic concepts involved: stress and vowel reduction. I used to simplify complex explanations by saying that once the conjugated *avoir* is added to the infinitive, it robs the infinitive's ending of its stress and makes the vowel in front of the final *-r* so weak that it disappears if the verb is often used. This is a rule for regular verbs: their *-e-* in the ending *-er* is never pronounced in the future forms (*étudier* > *étudierai* [etydje] > [etydiRe]). This is also true in the case of the irregular verbs whose stem ends in *-r* because two sounds of the same nature—like the [R] of the stem and the [R] of the ending in this case—always strive to join. A weakened vowel cannot resist this striving, so we get the “irregular” forms *courir* > *courrai* and *mourir* > *mourrai*, which in fact only reflect phonological regularity. There are always students who confirm that this reasoning helps them. However, I noticed that for quite a few other verbs, this kind of explanation was difficult to follow, even though the examples of these verbs were displayed on the screen with marks for stress and with the disappearing vowels crossed out.

### mourir [mu`RiR] in the future tense

### Articulatory similarity [v] – [w] – [u]

- back rounded vowel [u]
- labial velar approximant [w]
- labiodental voiced fricative [v]

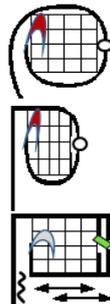

Fig. 9 French verb *mourir*: infinitive and future tense; Fig. 10 Articulation of French sounds [v/w/u]

So Artalph helps explain this in simpler terms:

- Look at the pictograms for the infinitive of the verb *mourir* in Fig. 9
- Pronounce it so that the stressed vowel is louder and **longer** (its pictogram is bigger and longer)
- Pronounce the infinitive with the following “a” so that the final [a] is louder and **longer** but the [i],  
which is now in the weak position, is softer and eventually drops off
- Pronounce the future form “il mourra,” making sure that the two [R] are fused into one sound. Find  
other verbs that form their “irregular” future by dropping the vowel in their infinitive ending

Students themselves usually recognize that the same rule also holds true for many irregular verbs ending in *-voir*, and if they are interested, it is possible to continue exploring this method. Even the forms of *avoir* and *savoir* can be explained, but the explanation requires an understanding of the similar nature of the participating sounds. Romans used only one letter, “V” for [v] and [u] because they knew that these sounds corresponded to variations of one sound that acquires slightly different qualities depending on its environment: in front of a consonant, it becomes a vowel (GAIVS IVLIVS); in front of a vowel, it becomes a consonant (VICTOR). However, our students today need to see the Artalph pictograms and try to pronounce the sounds while paying close attention to their articulation to comprehend this. In Fig. 10, the similarities between the vowel [u] and the approximant [w] are quite obvious—both sounds are closed and require the same rounded position of the lips, as well as the tongue at the back of the mouth. The only difference is that the semi-vowel is twice shorter, which is shown by its narrower shape. As a result, it is a little noisier too, and therefore it is sometimes referred to as a semi-vowel or a semi-consonant.

As for the consonant sound [v], it might look more complicated at first glance, but one can see that the tongue is inactive and rather at the back of the mouth, and that the lips play an important role in the sound’s articulation. The wavy line along the “throat” in the diagram stands for the vibration of the vocal cords and denotes that, unlike its unvoiced counterpart [f], the sound [v] is pronounced—with the participation of the voice. Thus, whenever this sound is followed by a consonant, it has a tendency to lose its consonant qualities when pronounced quickly and without care: when the lip and the teeth do not come into contact, the resulting sound is [w] or [u] because the lips are still tensed and rather closed.

In simpler terms:

- Look at the pictograms in Fig. 10
- Pronounce the sound [u]
- Pronounce the same sound in combination with [a]: [ua]. Pronounce it faster and you will get the semi-consonant [wa]
- Pronounce the sound [v] in combination with [R]: [vRa]. Pronounce it faster and you will get the semi-

consonant [wR]

- Pronounce *avoir* and *aura*. What happened to the *-oi-* part of the ending? (Dropped) What happened to the *-v-* part of the stem? (Became *-u-*)

Clearly, even if teachers or textbook authors are aware of the phonetic reasons for these changes, there is no way to explain the details to students without teaching them all the linguistic terminology first. I once tried to shorten the explanations of alternations *-al/-aux* (*cheval-chevaux, oral-oraux*, etc.) by saying, “Just believe me: phonetically [u] is just an unfinished [I],” but in response I saw only a sea of surprised and confused faces. Students do not really understand such statements if they cannot experience the articulation of these sounds. To experience it, they need to observe their sensations properly, and to do so, they need to see the points of interest in the pictograms of Artalph.

Similar regularities are explained and used as examples in theoretical phonology and language history, but such explanations rarely reach the majority of language students simply because there is so much to explain—from too many new phonetic signs to complicated theoretical concepts like “phonological feature.” Artalph makes the articulation so obvious that there is no need to explain: a pictogram is worth a thousand words. Through the enhancement of articulatory awareness, Artalph thus helps bring linguistics, and especially comparative and historical studies, closer to the level of language practice classes, which in my experiences increase students’ understanding and interest.

### 7. Conclusion: What is useful about Artalph?

Although there are even more applications for Artalph in higher-level linguistics courses, in this article I limited the examples to its use in beginner and intermediate language classes. To conclude, let me mention a few more possible applications related to the features demonstrated above.

In the domain of practical phonetics, my examples of teaching the difference in the pronunciation of dental and alveolar consonants, as well as in that of front and back vowels, demonstrated how Artalph characters combine both articulatory precision and simplicity of interpretation. This same quality makes them extremely valuable in the explanation of complex concepts in theoretical phonology, because they can clearly illustrate articulatory phenomena.

Yet Artalph is not a mere collection of illustrations for IPA phonetic signs. On the one hand, the visual transparency of its characters, iconic signs by nature, evokes an immediate psychological connection between the character and the sound articulation, which the IPA signs could never provide. On the other hand, Artalph’s inventory of symbols lends itself to creative use by students and teachers: in a phonology course, one can ask students to create a representation of an *archi-phoneme* of two phonemes or to represent a phonological rule in Artalph characters. Students love this type of creative task, and it allows the teacher to better judge their understanding of the material than from their use of IPA signs: a mistake in an Artalph character shows precisely and visually what kind of misunderstanding led to it.

Thus Artalph can be used in a range of testing activities, from fun quizzes to final exams. Moreover, even in a practical phonetic course, where the ultimate test takes the form of a sound recording of a student's pronunciation, Artalph can be used for intermediate testing and to check students' comprehension of phonetic differences between sounds and their awareness of sound articulation.

In the same way, Artalph characters can test students' knowledge of reading rules, and marking this type of test will take significantly less time than listening to all students' recordings. I could even imagine a multiple-choice exam: "Choose and circle the Artalph character corresponding to the following letter combinations." The whole point in using this system is to teach reading rules through understanding and articulatory awareness, instead of through rote repetition. The IPA signs do help the study of reading rules, but only because they are precise—one sign for one sound. They do not facilitate articulation, because this system uses the same encoding principle for words and sentences as it does for individual letters: IPA employs symbols representing certain sounds, while Artalph characters are icons reflecting articulation.

The few examples I provided explaining the rules of vowel harmony or irregularities in the formation of the future tense through articulation showed how Artalph helps demonstrate the logic behind these phenomena through the practical study of sounds involved in morphological changes. Such practical explanations increase students' deep understanding of grammar and morphology. They can also facilitate the study of lexical clusters with stem alternations, and, most important, the recognition of cognates in other languages.

The overall didactic utility of Artalph lies in its transparent form: all its signs—the characters, which represent sounds, and the symbols, of which the characters are composed—are easy to interpret and reproduce. This transparency results from Artalph's higher level of phonological abstraction in comparison to the IPA: it is based on a new principle—one sign for one phonological feature. Since most symbols representing the features are, in fact, transparent icons, all characters formed by them are easily graspable. Certainly, this new principle and the visibility of phonological features within the character are only possible when the characters are graphically displayed on a relatively large scale. The whole Artalph system would be impossible without computer technologies: when the IPA was created, teachers did not use PowerPoint presentations and students did not read on the iPad tablets that allow for all sorts of enlargement.

But since most of us are currently using these electronic devices in our teaching and learning, it made sense for me to create and now make available to my colleagues the Artalph signs. The whole system is explained and available online (<http://www.etudes-francaises.net/dossiers/sonina.artalph.pdf>), and by the beginning of the new academic year, I will have a new, fully operational website ([www.artalph.com](http://www.artalph.com)) with the complete system of signs available to be copied and used as they are or to be modified according to specific teaching needs. I am sure that many colleagues will find ever more creative applications for this articulatory alphabet, and I look forward to seeing them.

### Abstract

The purposes of this research were summarized as follows that a path of success in administration of feminine administrators has started and been gradually developed through their working life. This can be concluded that a path of success in administration of feminine administrators was resulted from 2 main factors: internal factors and external factors. The internal factors included good personality, commitment, and self-development affecting subordinates, students and academy to succeed in a sequence. Moreover, the family life needed to help support and motivate them to work successfully. External factors are the process of cooperative administration engaged in its success and their experience to help develop schools from the small, medium and large, respectively. Supportive factors are likely to be appropriate. Problems and their solution together with the explanation to the solution under the law and the administration of the school administrators were brought as a role model and a mentor with the administration. As a result of the success of the school administrators, it was found that the academy became reliable and faithful among community. Parents have confidence in the management of schools for looking after their children. Also, subordinates trusted in administrations resulting in the strong teamwork of school staff. They were happy for their working system and enthusiastic in providing learning activities that would help develop the ability of the learners.

## Background and Importance of the Problem

Since the past two decades, it can be seen that this world has been changing continuously especially on feminine who has started to take roles in this society increasingly. As a whole image, feminine have educational level higher than men. Therefore, the participation rate of work on feminine has been increasing. In Thailand, when compared the quantity of 100 male, there are 80 women who are working. The Grant Thornton Research Center (2012) revealed the survey results from 39 countries all over the world, the Thai feminine were the first level of holding the executives position or at the average of 45%, and this was the first level of Asia. For the reason that feminine were at the first level in this position, this is because at the present time, Thai society open the opportunity to women and gives them reliability more than in the past because both feminine and men are considered as equal in ability. Moreover, some caused from accepting the cultures from foreign countries to Thailand which opens the opportunity for Thai feminine more. This is the one of the reasons that the Thai feminine are able to step up to the high position as well (Ajchara Boonyahansa, 2012). From now on, feminine will step up to be the leaders of organization in every level from local to nation level, business and politic sectors, politics and government. In the past, feminine who ever sat behind have been starting to absorb and substitute majority areas which are occupied by men since the past time by knowledges, ability, natural delicacy of women, efforts and self-development by patient mind, strength, morality as motherhood nature ( Jinda Wangworawong, 2011).

**The researches studied about the success in occupation by focusing on the influence of variables in terms of situation and private variables towards the success in career revealed that there were several elements affecting the success in career of both genders, however, there were some elements which had the variables inserted in the middle which would affect the training and development and this could lead to the administrative progress in the future. It could be seen that the elements mentioned above could be the ways to lead to the success differently between women and men (Tharenou, Conroy & Latimer, 1994). Moreover, the research about the ways affecting the feminine administrators was successful in their life identified that the feminine brought the Buddhism morality to apply to their administration.** Most of the feminine were calm and conscious in controlling their emotions; they were willing to listen to the reasons of personnel in school. They were the persons who convey the policies from the original affiliation very well which made the works they carried out successful. Whereas the factors supporting the success of profession included marital status, educational level, support from family, leadership, and emotional intelligence, support from commanders and subordinates, calmness, consciousness in controlling various emotions, willing to listen to the reasons of the personnel in school, as well as being the persons who convey the policies from the original affiliation very well (Walaiporn Siriprom, 2008).

This can be seen that the feminine administrators have the ability and can be successful in their operation of educational administration as well. In order to step up to the administration position to become the women administrators are worthwhile to be studied. This is because the research results suggested that the administrators really took important roles in the organizations and they are acceptable that the success of organizations depended on the abilities of management by the personal group at the administrative level that how much the effectiveness they could manage. Most of the women administrators usually pay attention to the details of operation in every aspect; therefore the women likely become to be successful in the organizations increasingly. With this reason, the researcher is interested to study about the ways of the feminine administrators to reach success in terms of educational administration in the educational institutes under the Secondary Educational in Thailand. However, this research did not focus on the success comparison between women and men administrators, it emphasized the management of women administrators which made the results of success in the educational institutes in order to be the basic information and affect the success in administration of educational institutes of women administrators.

## Objectives of the Study

- 1) to study a paths of success in administration of feminine administrator under the office of secondary educational.
- 2) to study the administrative success results of feminine administrators under the office of secondary educational.

## Methodology

### 4.1 Stages of research methodology

- 1) Study the literatures and researches related to the administration to the success of feminine administrators in order to apply to be the conceptual framework of instruments construction;
- 2) Select to case study by having the criteria of considering the success;
- 3) Create the instruments under the framework and present them to the advisor for investigating and improving. Then get 3 experts to examine the instruments for getting advice and to take in consideration about the quality in terms of the content validity.
- 4) Improve the instruments and do the complete volume for the data collection. Moreover, there will have the information examination by using the Data Triangulation technique.
- 5) Analyze and conclude the research results, this is the analysis in terms of analytic induction. The typological analysis is used in terms of theory to create the subjectivity conclusion, analyze and interpret the data, conclude the research results, discussion, and recommendation;
- 6) Present the research results by using the analysis method to describe as the main, and present the Tables and data related to the research;

### 4.2 Population used in the research

Due to the case study type, therefore the researcher selected only one feminine administrator successful in the administration on educational institutes and collected the data all-around in terms of work, family life, and colleagues. The study focused on the steps and processes to the administration on educational institutes to be successful for the administration of the women administrators. Therefore the criteria of case study were selected.

### 4.3 Research Instruments

This research is about the case study focusing on the qualitative data. There were 3 types of instruments for data collection which consisted of In-depth Interview, Field Notes, and Documentary.

### 4.4 Statistics used in the analysis

This research was about the case study type using the analysis type of qualitative data. The descriptive analysis was used to be the main.

## Conclusion

The purpose of this research was to study the ways to be successful in the study of ways to success in the administration on educational institutes of women administrators of Sodsai School, Khon Khan province. The research process in type of qualitative research was used to emphasize the case study by using the time period for the field of research, total time period was 3 months. The instruments used for collecting data were divided into 3 types as follows: 1) In-depth Interview, 2) Field Notes, and 3) Documentary. The ways to be successful in the administration on educational institutes of Mrs. Saui Sodsai consisted of 2 major factors including the internal factors and external factors. The internal factors included the personality, family life, and the external factors included the work process, work experiences, support factors, and problems and ways to solve problems. The results caused by the success in the administration on educational institutes to become the self-contributions, contributions of subordinates, students, and communities. All mentioned above affected the success of the educational institute.

## Discussion

Internal factors in terms of personality, it was found that Mrs. Suay Sodsai had good personality, dressed in clean suits, tidy and appropriate to the occasions, good manners, punctual, and wide vision, knowledgeable and intelligent, be able to make decisions well, good human relations, high responsibility, wide heart, and be ready to listen to others' opinions. In term of family life, it was found that the lifestyle was sufficient economy type, loved family, loved the work, and upheld the concept of life in accordance with the philosophy of sufficient economy by following the Po-Luang traces.

External factors; in terms of the work process, it was found that she was good at the planner and was able to use the plan to be the instruments for administration effectively, she was able to make a decision and analyze as well as having good commandments and administrate by using the modern information, excellent in communication, realized to give authorities and responsibilities to the appropriate persons, and for the work experiences, it was found that to originate and develop the schools since the beginning was equal to collecting experiences of administration all-around. This caused strength, confident, brave for the administration on educational institutes by rearranging from small school to middle size school. At the present time, for the administration of big size schools, the administrators have to bring the change to the educational institutes to be successful by participating in activities, various projects in order to get a lot of rewards. For support factors, it was found that for the administration on educational institutes, not only the administrator who makes school successful but also external cooperation, such as the cooperation from other organizations, special ability, technique, strategies of administrators in order to acquire the success by using the good governance. The most important to be successful include the cooperation network both from the administrators, teachers, and the personnel in school, students, and alumni. All mentioned above are the parts to push the administration of the administrators be successful.

For problems and obstructions caused by the administration, Mrs. Suay would use the experiences she ever administrate to help solving problems by informing, making understanding briefly and justice in accordance with the legal principles and standard of administration of the educational administrators. However, the problems were too difficult to the existed abilities, she would have the consultants whom she admired her to be the model, who was her husband. Her husband was considered as leading administrator at the province level who had experiences. This can be considered as her luck for Mrs. Suay who has the successful partner in administration on educational institutes as well.

2. The results of administration on educational institutes to the success of Mrs. Suay Sodsai according to the contributions or successful results of the administration, standard criteria of the educational

administrators of The Teachers' Council of Thailand B.E. 2540, as she was assigned to hold the position of B. school chief by finding the funds of constructing the temporary building without the budgets of government sectors. Moreover, she takes the roles of developing the profession of educational administration. She used her efforts, intention, hard-working to study and seek for knowledges as well as sent the contributions for the contest until she was accepted and successful in administrating school. This helped her to step up to be the experts for investigating and evaluating the contributions until she could get the promotion to be the special professionals

In terms of administration on educational institutes, she used the framework of plan to determine the roles of person who were responsible of plan, project work, and activities. Moreover, she stimulated to rush the work of activities project, conducted according to the policies in order that the work could continue by determining the time and still followed and inform, supervised, made a decision, and had commandments for the subordinates to maintain the rules and regulations of the government sectors every time, then participated to the conference or requested for the opinions from the school committees. Moreover, because she had had experiences in the administrative for a long time, this helped her be able to use the commandment correctly and quickly till she could be acceptable by subordinates and this always affected the benefits to the government sectors.

Moreover, there were contributions of learning and teaching management, supplemental activities of educational management, people trusted and admired the educational management of school, and other related works both internal and external educational institutes in order to enhance and develop the community to be strong and admired the school and originated the network between school and community which made a result that there were resources from community to be back or return to develop the school sustainably.

## **Recommendations**

### **1. Recommendations for application of the findings**

#### **1.1 Recommendations for research application**

1.1.1 The research results revealed the administration on educational institutes of the case study school, the results originated by the success in the administration on educational institutes by considering the contributions from the standard criteria of administration on educational institutes B.E. 2540. The results of success were originated by both contributions of oneself and subordinates, students, community. All of these would affect the results to the educational institute. The researcher proposed that if this research had to be applied to be successful in the school or organization, it should be compared the context of administrators and school as well as cultures in school or organization carefully.

1.1.2 The research results revealed that the external factors in terms of support factors can be seen as the wide image but it takes important roles in every administrative process in order to reach the success. Hence the enhancement or development of oneself to get the support factors to enhance the administrative process to success, get effectiveness and efficiency.

#### **1.2 Recommendations for further research**

The research results revealed that the ways to be successful in the administration on educational institutes of women administrators, the Secondary Educational Service Area Office 25, Thailand should study the research related to other factors affecting the success in administration on educational institutes of women administrators, the Secondary Educational Service Area Office 25, Thailand in order to find the ways and methods to help the women administrators have progress in the administration on educational institutes increasingly. And the results originated by the success in administration on educational institutes by considering the contributions from standard criteria of administration on educational institutes B.E. 2540, therefore this could

consider the successful results from other criteria or analyze the results which cause success from various researches further.

## Abstract

The main objective of this study is to make a descriptive analysis in order to investigate the possible relationships between the consciousness of body's development and the comprehension of emotions' development in primary school.

Besides, a study has been made on a sample of 43 pupils aged between six and seven years, divided into two groups: an experimental group and a control one, in a Primary School of Mugnano del Cardinale. The first group has made some psychomotor activities in a four months' period; the second hasn't taken part at the school education path projected for this study.

The two groups have been put together casually and are quite alike from a socio-cultural point of view.

At the end of the psychomotor activities the sample group has made the TEC, a Test of Emotion Comprehension .

From the research we have seen that there is a correlation between corporeity and emotions. The experimental group has reached a much bigger consciousness of the body language right from the investigated emotions. The control sample, instead, even if it has a basic knowledge of the fundamental human emotions, has had difficulties to associate the mimic face to the corresponding emotion, this way it mixes up the different emotions. This demonstrates that corporeity and emotions go at the same pace.

**Key words:** emotions; actions; consciousness; face mimic; psychomotor;

---

## 1. Introduction

In our study we have tried to underline the union between corporeity and emotions, considering the close connection between emotion and action. Frijda defines emotion as “preparation to action”, Arnold, following the same footsteps, talks about emotion as a “tendency to action”. “Emotion is the energy that directs, organizes, amplifies and modulates our cognitive activity and, in turn constitutes the experience and the expression of this

\* Corresponding author.  
Email address:

activity.” (Dodge, 1991) We can't consider the emotional experience as a pure corporeal phenomenon, as James conceived it or a merely psychic phenomenon, as Cannon stated.

Overcoming what is called Cartesio's error, that is this dichotomy mind and body, we aim at enhancing an individual's global education noting the unity of a human being and seeing in the emotional experience the union between the corporeal and the psicho-affective dimension, as stated by Damasio, emotions represent the synergetic convergence between mind and body, because they are certainly a mental process but their “stage” is the body. Neuroscience has demonstrated that we have motional centers in our brain, such as amygdala and hippocampus responsible for emotions' and memory regulating that favor a different type of learning rather than the cognitive one. We must combine cognitive, emotional and physical development. Psychomotility pursues such an objective, considering physical education as a sub-layer of the psicho-affective development.

The term is often associated with other psychomotor skills such as: whole, whole, integration because it is a discipline, born in France in the 60s, which has the objective of reconciling two opposite terms, the two Cartesian duality: the body and the mind, reaffirming the unity of the human being. The locomotion is concerned with the totality of the child wishes to emphasize the inseparable interconnection between processes and events engines and sensory-motor on one side and processes and events affective, emotional, cognitive and other .

The psychomotor culture has spread in Italy in the early '70s, at the center of psychomotor practice there are three basic thoughts, into three main areas:

- the centrality of the body as a manufacturer and builder of sense;
- the action as primary manifestation of subjectivity and the construction of reality;
- interaction, and at the same time as the founding instrument of any evolutionary process, cognitive and affective.

In the implementation of any action the emotions play a fundamental role in the motivational aspect, evaluation, performance. The action and emotion feeding, however, only in the presence of the other and it does not matter if this presence is real or just evoked.

The emotion is the means by which we determine what is important for us, allow us to go in search of well-being and to escape the malaise, warning us to guarantee our survival in the event of situations: warning, threat, submission, alliance, attachment, protection.

Through the practice psychomotor is possible to interpret the action as an expression of emotion proven and socialize their own "feel" with each other.

The discovery of mirror neurons is precisely the biological roots of intersubjectivity that allows us to understand the meaning of the action and emotion of the other. The intentional state of a person is primarily emotional even when apparently has only informative, communicative.

The movement of the body is communication, and language is an important vehicle for the cognitive maturation and integration psicho-affective.

When we speak of didactic character psychomotor to take care of the child by asking the objective of strengthening its motor development by attaching it to the cognitive, we aim to achieve an education that enhances the psicho-affective and emotional level of the child, education being in addition to education of knowledge.

It is in the body that is the way of access and processing of emotional world and psychomotor education, which is said and global demands, must take into account the emotions of the child, his individuality, his growing needs .

The link between body and emotion is still very little in the planning of the school's academic, but should be of primary importance to observe the child in the way he expressed himself, in his way to appear and do things.

The child, in fact, favors the body and movement, use of space, time, objects, actions, games, of posture, muscle tone, tone of voice, gaze and facial expression to know and be known, to experience the world and the things of the world.

We should not limit the use of educational planning body but changing the programming perspective considering the alphabet of body language as a symbol of the emotions of the child. In this way, it facilitates the construction of meanings to be assigned to the world and themselves.

In the implementation of a program of psychomotor skills is through play and through play activities motor that allows the child to proceed in the stages of its evolution and in a continuum according to its emotional maturation.

## 2. Objective

Our work is aimed at achieving the emotional awareness. Awareness that starts and plasma through the ability to recognize, understand and know how to manage emotions through the body. The body is understood as a tool to convey meanings affective and emotional. The study aims to verify if, as some scholars believe, through the achievement of a greater awareness of our sensations grows even greater awareness of our thoughts.

## 3. Methods

We have structured play activities of motor and psychomotor character in cooperative games, to support the children increasing acknowledgment of their own body's awareness and the feelings that emerge when one perceives a particular emotional state.

The sample of children examined consists of two groups: an experimental group class 1 B, consisting of 25 students (15 M-10 F), from the primary school of Mugnano del Cardinale and class 1 A, composed of 18 pupils (11 F-7 M) of the same institute.

The experimental class took part at the psychomotor activity, distributed in six lessons, divided in six phases: an introductory phase activities, a static phase, a subjective phase, a movement phase, an interpersonal relationship phase and final circle time.

An introduction to the nature, the causes of emotions, about why you perceive and how you perceive, a static phase, which involved most of the time the analysis of facial expressions of the face and body expressiveness, a subjective phase, which went to investigate the ability of the child to become familiar with your body, a movement phase, which has been useful to the cash flow of emotional energy accumulated by children, increase, at the same time, the ability to improve ambulation, balance, posture, muscle tension, alternating tension and relaxation phases, one phase of the interpersonal relationship, designed to promote socialization, the growth of empathy, ability to collaborate, negotiate and improve self-esteem: the feeling of being an integral part a group that can't benefit from the improvement of self-esteem.

Let's see in detail the activities proposed and carried out within the primary school.

### 3.1. Lesson I (Divided into two meetings)

1) Introduction: Brainstorming on the basic knowledge of basic emotions: anger, joy, fear and sadness. When and why you experience such emotions, to arouse the attention of children through the story of short stories.

2) Stage static: Emotions: The coordinator suggests different emotions and each member of the group tries to show them the way you prefer: through facial expression, body movement, imitation of an animal. Children will capture and reflect on how they feel when they experience the emotion mimicked. The emotions mimed were, therefore, joy, anger, sadness, fear.

Game of mirrors: The children mimicked different emotions: joy, sadness, anger, fear, through the movement of the hands, arms, around the body, through the expression of the face.

The children imitated the coordinators and, subsequently, their companions.

3) Subjective phase: Snowmen in the sun: Players have imagined to be snowmen freshly made and therefore must stand still in an upright position with your arms at your sides and all their muscles; imagining, then, to see the sun rise and the temperature increase more and more. With the heat, the snowmen have melted to become a puddle of water. Children, therefore, you are lying on the floor and have all the muscles loose.

We repeated the exercise several times imagining that the snow has reformed the snowmen, the sun has them loose again, and so on. For children to have "shaken" arms, hands and legs to get rid of the snow.

4) Movement phase: If the emotions have colors: the coordinator explains how we can think about the different emotions as if they were the colors, we placed four colored circles on the floor:

- red: anger;
- Blue: sadness;
- Yellow: happiness;
- green: neutral condition.

Then, running from the starting line, reached the circle, who had chosen according to the mood of the moment.

5) Phase of interpersonal relationship: Find the leader: We have placed the children in a circle, chose two leaders and two detectives. The detectives, however, were out of the gym when they were chosen leaders. The leaders had to make the movements of the body (free) and all the other children had to imitate them, the detectives had to identify the leaders and understood by those who were leaving the movements that were making all the children.

6) Circle time: How to show your emotions? Was it easy or difficult to imitate companions? What kind of capacity is needed to track the movements of someone else? How did you feel when someone could not follow your movements? How does it feel to have all the muscles in tension? And be totally relaxed? How did the "leaders" to make sure the attention of other players? Reflections on the mood of the day and on the choice of the color of the circle.

### 3.2. Lesson II

1) Introduction: Take awareness of the way in which we perceive and manifest the main basic emotions, how to recognize them in our face and in that of another? and in the body?

2) Stage static: Masks of emotions: The players sit in a circle. One of the children of the circle makes a face that expresses a strong emotion, and then removes it with his hands as if he was taking away from his face a mask that passes close to the player, the player sitting to his left, wearing the mask of the partner and imitates his grimace, then removes it and mimics a new emotion and so on all in turn. The emotions mimed will be: happiness, sadness and anger, and the players choose which mimic.

3) Subjective phase: Puppets: The children will pretend to be puppets. To start, should stand upright with your feet firmly on the ground, his arms up and fingers extended upward, as if they were hanging resistant wires. So, they have to imagine that these wires are loose very slowly, in such a way that their body starts to fall. Therefore, they must begin to move the fingers, then the hands, arms, head and chest, and finally, bend your knees slightly. So they have to repeat the same movements in reverse until they find themselves again standing with his arms stretched out as much as possible to the top. Children must repeat these movements several times, varying the speed of execution.

4) Movement phase: The children mimicked with their whole body the stages of birth and growth of a tree. They envisioned to be with their branches reaching towards the summer sun to lose their leaves in autumn, to cope with lightning, storms and blizzards of winter, enjoy the sadness of being bare and naked and flourish with the beautiful spring. Their entire bodies participated in the miracle of life and the passing of seasons that have evoked different emotions and moods.

5) Phase of interpersonal relationship: Hide and seek like wildfire: The game starts out as a normal hide and seek. The player who is "under" runs behind the rest of the group. When you can touch the other participant, the

two go hand in hand and together they try to tap a third and a fourth player, who will also join them. When you reach the four units, the group was split into two pairs, which start in the hunt for the other two participants, and so on until only one person not to be touched. If the game goes on, this will be chasing the other.

6) Circle time: How do we show different emotions? (For example, through the movement of the body, through facial expression, posture, etc. ...) As it moves our body? You are able to tell when your muscles are relaxed and when, instead, are tense?

### 3.3. Lesson III

1) Introduction: brainstorming based on the emotion of negative anger: what are the external factors triggering such emotion? Emotions come and go, what to do to not be angry?

2) Stage static: Remove off her back: compiling a list of situations in which you feel the emotion anger. To brainstorm with the kids, trying to bring out some ideas on how to address them. Have the children complete the sentence "I get angry when ...". At the end of the arms and legs to unstick the children to come unstuck from off the accumulated tension.

3) Subjective phase: Do that feeling that: Standing players sit in a circle. In turn, a volunteer goes a step further and show how they feel through facial expressions and body movement. So says his name in a way that reflects the same emotion and returns to his seat. At this point the rest of the group takes a step forward and repeats the action and the name of the person who performed it, and so on all the other volunteers. (To mimic emotions can be chosen from among the main ones: anger, sadness, joy, fear).

4) Movement phase: Run like the wind: you have to explain to children that the coordinator is the head of the jungle, which has the responsibility to watch over them while they play. The participants represent a group of extremely noisy children running fast like the wind through the forest, screaming and laughing. The only danger in the jungle are the lions. Children should not lose sight of the coordinator because when the coordinator sits down and puts his hand over her mouth all need to sit down and shut up immediately. Only silence and their immobility may mislead the lions, causing them to move away. As a signal that the danger has passed, the coordinator yells, "run like the wind." All children are raised and resume to run as before.

5) Phase of interpersonal relationship: Walk the blind: the children are divided into two groups. Half the players will act as protectors, the other half by explorers, eyes closed. It will be built an obstacle course and in pairs, a protector, and a scout will have to cross the path. The explorer will have to get their hands on the shoulders of patrons and be guided. The coordinator may give verbal instructions to help patrons in guiding explorers.

6) Circle time: Logging into the causes of negative emotions, how they manifest in the body and what to do to overcome them. Do you ever not be able to decipher emotion? Does not understand why you try it? Happy to show you even when you are sad and / or angry? How do you feel after a long run in the forest? The explorers trusted companion who guided them? Who was driving the companions was able to do it?

### 3.4. Lesson IV

1) Introduction: what are the events and external causes that trigger the anger? Our partner feels anger for the same reasons? On his way to feel anger is equal to or different from mine?

2) Stage static: Living links: The players sit in a circle, standing. The coordinator chooses one to initiate a "living link". This shouts something that makes him angry. Who is angry for the same reason cries another event that makes him angry. If several players are angry for the same reason, the last of the chain cries another event that makes him angry. This continues until all players are not related to each other. At the end of the circle is broken and all the children shrug their arms, legs, shoulders, hands.

3) Subjective phase: Important names: all children are in a circle, in turn rise, say their name and an adjective to indicate the mood of the day, following the mime through facial expression and movement of the body of the emotion experienced. The emotion can be chosen from: anger, sadness, joy, or neutral emotion.

4) Movement phase: Walk in this way: the coordinator asks a "leader" to run for the gym walking in a particular way that reflects a certain emotion (choice of anger, sadness, joy, fear, neutral emotion), the others imitate the leader until the coordinator does not say "stop". All become immobilized in the position in which they find themselves for five seconds. In turn, the other children will assume the role of leader, the leader leads the group in a different walk.

5) Phase of interpersonal relationship: Silent greetings: All players run around the room greeting each other in a friendly non-verbally. The coordinator can make suggestions. The aim is to encourage eye contact, smile and see how many different ways players use to greet each other.

6) Circle time: Anger causes problems or, sometimes, it is useful to "solve a problem"? Discuss the similarities and differences between the various types of walking. How does it feel to imitate and to "step into the shoes of the other"?

### 3.5. Lesson V

1) Introduction: When we are angry we need to vent our anger ... how we do it?

2) Stage static: Hands up: You have to show the children how you can shake your arms freely in the air, shaking hands with ease. When all the children shake their arms, the teacher shouts a word that reflects a certain degree of anger. The players respond starting a "mock fight" between their hands. After 30 seconds it screams: "Hands up" and the children must raise their hands and arms as high as possible. Repeat the exercise, with different levels of anger. It ends with a "conversation" between your hands and quiet with a handshake.

2) Phase subjective: This and that: The coordinator shows players that need to imitate simple movements (eg, standing on one leg, touching the ear, jump, clap). When they receive the statement "Do this" players copy the movement. When the display is "Do what", no one has to move. The game must be repeated several times. If a player commits a fault must lie still for two rounds.

3) Movement phase: Sleeping monsters: the children pretend to be monsters. The "monsters" running through the forest (the gym) until a sudden tiredness not forcing them to lie down and close your eyes. At that point, the coordinator begins to wander calmly to the gym to check if the "monsters" are really asleep. Who moves checks to see if the others are asleep or not.

4) Phase of interpersonal relationship: Come to the giggles: the children sit in pairs opposite one another and decide who is A and who is B. must keep eye contact and strive to remain impassive. When they're all sitting quietly, the coordinator says, "giggles" and all players A must try in every way to make people laugh players B (without touching). When the coordinator says, "giggles" (which can happen at any time) the players switch roles.

6) Circle time: We are able to control our movements and block us when we are asked to do so? What is the difference in our breath when we are calm and when, instead, we are "asleep"?

At the end of the activity the entire sample made the TEC Test of Comprehension Emotions, F. Pons and P. Harris, 2000.

The TEC is composed of 23 numbered cardboard tables, in two versions, male and female.

The first five panels depict four different emotional expressions each, randomly altering. For each of them we ask the child to identify facial expressions that characterize that specific emotion. The emotions investigated were: joy, sadness, fear, anger and neutral condition.

The remaining tables are divided into two parts: the first part is a little story with emotional content, where the face of the protagonist is left blank, while the lower part represents four different emotional expressions and asks the child to choose the one that corresponds to story's main character's experience.

The questions were increasingly difficult because the test had to investigate the development of understanding of the emotions on the basis of nine members, ranging from the simple recognition of emotion (labeling), to morality.

#### 4. Results

During the administration of the test, all the children's answers were marked on special coding sheets, the raw score (relative to 19 items) achieved by the individual performance of each individual child was calculated and the percentile score was obtained, crossing the raw score with the children's age (calculated on the child's month of birth) and subsequently organized the data into excel environment.

**Table 1.** Standardized scores on the italian sample (percentiles). To get the weighted score of a child of a certain age, one compares the raw score value (the total score of the coding folio) with the age related column. For example a 3 years old child that gets a 4 score is placed at the ninety-third percentile, while the same score obtained from a 7 years old child is placed at the eight percentile.

RAW SCORE	3 YEARS	4 YEARS	5 YEARS	6 YEARS	7 YEARS	8 YEARS	9 YEARS	10 YEARS	11 YEARS

Table 2. Related to data control class 1 A.

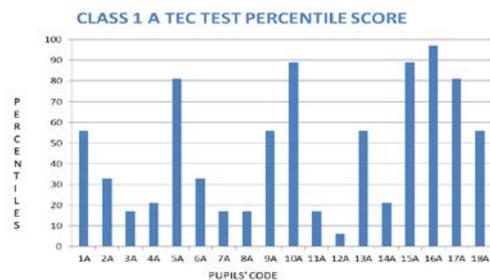

CODE	RAW SCORE	YEARS	PERCENTILES
1 A	6	6	56
2 A	5	6	33
3 A	4	6	17
4 A	5	7	21
5 A	7	6	81
6 A	5	6	33
7 A	4	6	17
8 A	4	6	17
9 A	6	6	56
10 A	8	7	89
11 A	4	6	17
12 A	3	6	6
13 A	6	6	56
14 A	5	7	21
15 A	8	7	89
16 A	8	6	97
17 A	7	6	81
18 A	6	6	56

From the graphs it is clear that the experimental class has reached percentile scores much higher, compared to those obtained from the control class.

Fig. 1: A) Class 1 B Tec test percentile score

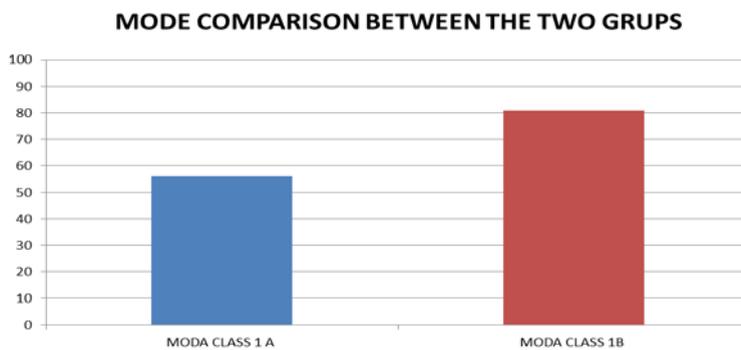

B) Class 1 A Tec test percentile score.

Once the mode was calculated, we compared the two groups: the control group achieved a mode equal to 56 percentiles (this shows a basic understanding of the emotions), while the experimental group is at a percentile score of 81.

Fig. 2: Moda comparison between the two groups

## 5. Discussion/Conclusion

As it can be seen from the graphs N. 1 and N. 2, above, points percentiles of the experimental class are much higher than those obtained from the control class. According to the results obtained from the study conducted by the authors of Italian standardization of the TEC, the children of six years should achieve a raw score of 6, reasoning in percentile equal to 56. The children in the class sample obtained as modal response in just 56 percentile, while those who have conducted activities that have a psychomotor, reached percentile scores, so high, as to have exceeded the average of the scores of the Italian champion, having obtained a fashion percentile equal to 81. This is shown in the graph N. 3.

From the results of the TEC test, it was demonstrated that, thanks to our intervention, the capacity of recognizing the facial expressions of the investigated emotions, has produced excellent results.

The children had a greater development of the understanding of emotions. This confirms our starting hypothesis: from the body and through the body, it is also possible to develop the psycho-affective dimension.

From the survey carried out we have realized that there is a considerable correlation between emotional literacy and motor literacy. Our study presents some strengths and weaknesses, of course: our strength is to detect the close connection between physicality and emotions, the point of weakness we have found is the more limited scope of the survey which goes to show that every emotional state is regulated in the body. We could not redo to previous research carried out in this context.

### Abstract

Our team recognizes the value of the bodily entity and movement emerged among the new research in the field of psychology to understand, build and adopt new models of teaching intermediation of bodily activities in education. The stress on the only predominance of mind can lead to neglect the role played by the body / brain in the learning process. In the last years has emerged a new perspective, the 'embodied cognition, which helps to overcome the traditional dualism between body and mind, because the cognitive processes are based on sensorimotor processes. Based on these assumptions, the 'physical education is used here to promote teaching laboratory activities, the gym becomes a more funner setting for children in which to propose activities in different school subjects. With our work we focused on learning of English in the gym, using physical activities as a means for learning cognitive and psychosocial, because the sport's language is universal, it is an instrument of growth of a person in a context of sharing rules. Our work has been developed through lessons given at the gym, during which the teacher described the deliveries, using English language. We called for a reflection on the coalition between corporeality, mind and language to valorise the child actively involving him in the learning process and not forcing him to reproduce the language according to the old-fashioned grammar. This approach urges in pupil, in a natural way, the desire to communicate and express demands, needs and requirements according to a conversational approach in English language.

## Introduction

"If you want to create a new world, education must also be renewed." Mahatma Gandhi

It is at this stage of the history of ideas and educational systems that the discourse on teaching and the role of teachers in a renewed school, acquires a social and cultural insight, never known before. Through a more sensitive school to the whole of the subject-individual-person is important a pedagogy that puts at the center of school life a non-intellectualized person, but a subject socialized through bodily experience. What does this mean? Rethinking the teaching and change the relationships, activities, curricula. In the teaching process is necessary to activate more engaging languages, able to assign to the word the body thick that can actually makes it communicative. The school, therefore, must look to both to the operation of multiple forms of expression, peculiar to the various channels of communication, and to the transfer of contents to release processes of self-reflection, otherwise compromise. The knowledge about the body and mind that are transmitted at school are mostly related to a body and a mind made immediately objects. Instead, you must find a way to use a body and a mind as living, subjective, lived. For these reasons, it becomes necessary to think of an engaging teaching, able to put students in conditions allowing them to experience the bodily experience, as we are first of all corporeality and we represent ourselves through our body. The body is the center of gravity of the educational relationship and of a didactic able to bend the knowledge in their interdisciplinary dimension and according to a perspective that takes into account the interaction between body, mind, and language through a playful approach (Caon, Rutkas, 2004) .

The authors, Caon and Rutkas, capture the sense that our study intends to pursue to eradicate the logical-abstract concept that today's society has about the mind and learning, which focuses on the " mind language" and its incorporeal aspects and much less on the reality and motor actions, in spite of actions and movements have a central role in the processes of training and mental representation.

### *1.1 The 'man "three-dimensional" mind, body and language.*

In general, when we think about the mind we focus on the perceptions and "ideas", not on the move: but actions and movements play a central role in the processes of mental representation starting from the embryonic stages, when the embryo begins to make a series of movements that constitute the building blocks of future motor behaviours.

The movements are not a pure mechanism, a means to get something: motor actions play an important role in the formation of the mind, condition the 'learning and are the basis of language.

According to Denicolò the child never separates the hands from the thought, learns with the body and this happens in every moment of his life.

In the contemporary psychoanalytical reflection, they often recognized a secondary role to the body, although the clear information given by Freud on the close connection between the 'I and body, between psychic representations and somatic functions.

A consequence of this exclusion was the creation of a concept of mind increasingly detached and independent of underlying biological aspects and an inevitable distancing of psychoanalysis by the disciplines that deal with the body as biology, medicine, psychiatry, pharmacology, neuroscience, etc.

Even the bravest attempts like those of psychosomatics have never abandoned the assumption of a central role and the omnipotence of the mind which is the true subject of the existence acts, offering in this way a fundamental dualism and a preeminence of psychic aspects on the physical ones.

Recent studies show, however, as the brain is only a part of the "mind": learning, adaptation, thoughts, experiences, creativity, language are processes that might not be possible without a body, The body has an integral role in our mental development. (Popper, 1996)

It is the body, through its senses, which nourishes the brain with information that it can get from outside and allows us to build new opportunities for our development.

### *1.2 The role of the school between body, mind, and language. Empirical analysis of an educational research in an Italian school.*

Our team proposes a not self-referential school, but open to society, to the processes of change that can improve its educational effectiveness in terms of outcomes of training. A school that expresses its educational curricular offering and taking into account a possible coalition between body, mind, and language by taking a playful approach (Caon, Rutka, 2004). This new perspective comes to life from the theories of authors such as P. Dennison "movement is the door of learning, McLuhan" there is no learning without fun and there is no fun without learning", A. Damasio "research has convinced me that emotion is an integrated part of learning.", A. Einstein " learning means experience, anything else is just information."

The research project was born from the need to promote innovative methodologies in the school for the learning of a foreign language through the body, assuming that sensations, movements, emotions and integrative functions of the brain also live in the body and thanks to the body.

The study group, in fact, through an examination of the scientific literature supporting the interactive dialogue between mind, body and language, has built a supplement to a scientific background on which to build the proposal.

Then he fostered an operational project in a school to launch an empirical investigation to verify the relapse.

In the proposed route is developed a playful learning environment in which every child has fun learning. We have used, in addition, verification tools for reading and understanding and observational checklist to analyze the psycho-relational aspects that have determined the operating setting.

## **4. Objectives**

The objectives that have guided our research were to determine whether thinking and learning are processes that do not occur only with the head, but with the whole body, if the brain is closely related to the "mechanisms" of our body and designed to grow along with the movement and whether in view of an interaction between mind, body and language we can lay the basis for an innovative teaching that makes the body the main vehicle for cognitive and psychosocial learning.

## **5. Method**

The research is empirical. The sample examined is a fourth grade of primary school, composed of 19 students, including 10 males and 9 females. We haven't used no control group, as a descriptive analysis was based on what

was detected before and after the implementation of the methodology. To measure this gap has been used a multiple-choice test consisting of ten questions that explored the skills of the students on how to receive / writing, for each of which the child had to choose the correct answer from three possible options, having a total of 30 minutes of time. This test was administered before the implementation of the methodology to detect the starting level of the students and after to check the possible improvements related to the new approach.

To check listening comprehension we have used unstructured tests, including mini-dialogues, after which the teacher attributed to pupil a rating from 1 to 10. To measure the social and relational skills of students have been implemented initial, ongoing and final observations of test samples, making use of check-lists.

The protocol, whose activities have had a period of 12 hours over three weeks, involved the use of different methodologies:

- embodied cognition, for which they are proposed games exercises in which the teacher makes deliveries using mostly English language;
- role playing and mimicry;
- cooperative learning and circle time;
- playful language teaching based on the game and movement.

Inspiring by the theoretical assumptions of Giovanni Freddi we have supported the basic principles on which to base playful methodology, such as:

1. the senses: in learning the student must be able to use all the sensory channels;
2. motor skills: the language is a pragmatic and functional means of communication;
3. the semiotics: the foreign language is part of the verbal language that is just one of the many languages that the student has at its disposal;
4. interpersonal relationship: the playful language teaching should foster relationships between the students and the teacher;
5. pragmatism: with boys is crucial that the language is presented as a useful and practical tool to do things;
6. emotion: you can learn the language best if it is associated with positive emotions;
7. authenticity in the game you create a real situation on a psychological level.

## 6. Results

The results were listed in excel and shown through the graphs n. 1 and n. 2. In red you can see the increase in oral and written skills, monitored following the protocol, in blue are represented, instead, the skills measured at the input.

Fig. 1 - Increase oral skills

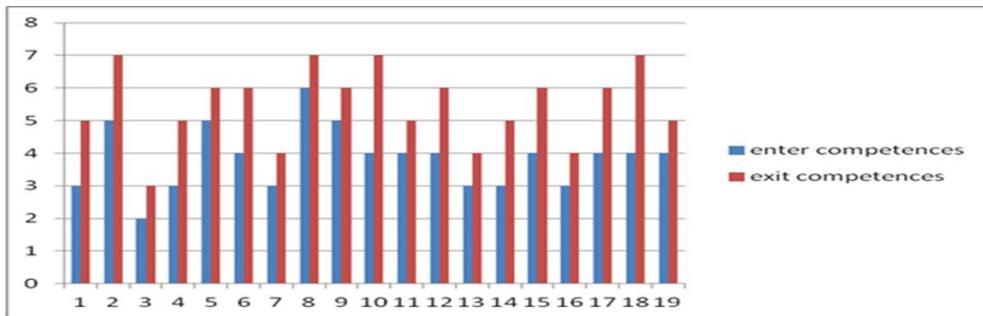

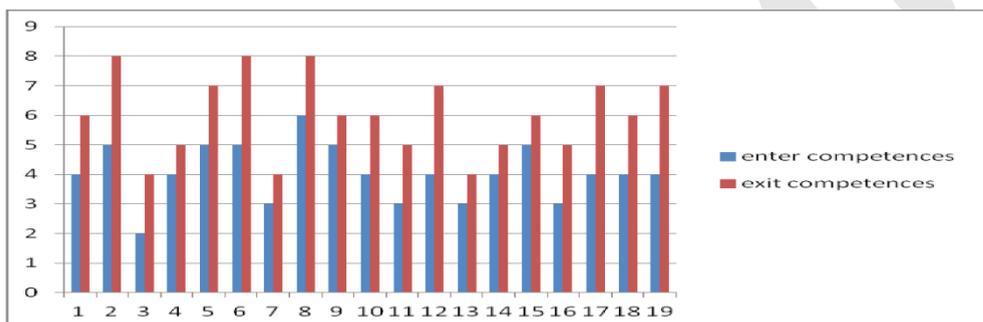

Fig. 2 - Increase writing skills

## 7. Discussion

As shown in the graph there has been a considerable increase in the oral and written production and reception's skills of a foreign language passage.

The subject number 3 is affected by DSA, and even if he starts from a lower level of its ability than the average, showed, however, a light improvement in the output test. Basing on the data collected in the classroom through observations and in relation to disciplinary knowledge and skills, considered as indicators of learning in regular assessments, it appears that there is an improvement on both the attentional capacity of the pupil, as well as an improvement closely linked to learning the language. We arrived at these results by reference to specific indicators of learning such as:

- oral reception: Understand oral texts in known contexts and for different purposes related to 'personal experience and interpersonal relationships;
- speaking: to respond in a relevant way to personal questions and interact with classmates and teacher through guided dialogues;
- receive written: read and understand several types of simple texts for specific purposes and uses;
- writing: write simple messages according to a given model and produce simple texts following a track.

Referring to these indicators we were able to estimate, as regard to language learning, an improvement in the performance of reading and understanding the text. From a psycho-social point of view we have monitored a light increase of self-esteem, a little improvement in the relationship between pupil and teacher, pupil and class,

pupil and family. There were positive results not only in the students involved in the project, but also in the teachers themselves because the methodology used does not foresee complex procedures and so it is easily applicable.

## 8. Conclusion

In conclusion, we can say that despite living in an abstract culture often makes us forget that the concreteness is a very important aspect of learning, because children need tangible examples, to manipulate reality, to do active games and movement the modern school is trying to respond to this new three-dimensional view of the subject-person. (Gamelli, 2001)

The schools are trying to break with this piecemeal, notional and mnemonic approach of knowledge, ushering a season that does school with the body (Balduzzi, 2002), which clearly expresses the need for a do-education taking care of the subjectivity fully considered. These innovations give the start to a teaching that makes its own instances acquired by the movement of so-called "active pedagogy", developed between the last decade of the nineteenth century and the first half of the twentieth century, in opposition to the traditional humanistic education. From Dewey to Bovet, from Decroly to Claparede, from the Montessori Ferrière, it was argued that the school would have exercised the intelligence on the concrete experience of reality. In the wave of these illustrious theorists our team recognizes the value of an innovative teaching method that foresees the link between the activities of study and reflection on the experience of life, making use of three-dimensional human mind, body and language, to allow learning and child development (P. Bourdieu, 1988). And this is the goal of our research: the meeting of the world of education with the world of life, rather than with an abstract world. A "full contact" with the experience of knowing.

"Tell me and I will forget, show me and maybe I will remember, involve me and then I will understand!"(Confucio)

The Confucius's thought holds the value of our research, because through our experience we have demonstrated that an interaction between body, mind and language is possible, this coalition has established itself as a new frontier for teaching, because it breaks with the traditional lecture's patterns and the rote learning. The connection between these three elements is the winning agreement for the future school and for teaching that breaks the mold with the classical tradition of the lectures and the rote learning. The combination of these three elements, appears to be the winning meant to get out of an abstract culture that often makes us forget how the reality is a very important aspect of learning.

## Abstract

Global warming has been raised as a key issue recently. The carbon emission is considerably affected by the energy consumption of daily life among plenty of causes, and the need of changing people's behavior formed a consensus for reducing the energy consumption. Because people's lifestyle can be affected by those who create the built environment to a great extent, designers' awareness about sustainable lifestyle facilitates people's behavior change into sustainable one. The basic assumption is that, if some information insinuating eco-friendly design is provided in an ambient way to the designers during the design education, the awareness about sustainable design can be significantly improved. In this paper, we identify the effects on the design process when the eco-friendly design information is provided to students together with visual information of comparative evaluation. A game theory-based scenario was utilized to stimulate the competitive design activities among students. We propose a design education assistance system that reflects the outcomes of the experiment. In conclusion, providing the competitive evaluation comparison with ambient information about sustainable design helps develop the design awareness on sustainability with better outputs.

## 1. Background

Global warming caused by carbon emissions has become a key issue, and is considerably affected by the energy consumption of daily life (Bin & Dowlatabadi 2005, Wei *et al.* 2007). In order to reduce the energy consumption it is necessary to change the people's behavior (Pierce *et al.* 2008, Makonin *et al.* 2012). The lifestyle is inherent to some extent, but most parts are formed by the interactions with environment (Thaler & Sunstein 2008). The probability is high that the surrounding environments are generally created by architect and urban planners. Changing environment where people live is more influential to environment issues caused by the carbon from buildings and cities. This environment is generally built by designers who plan the buildings and cities. So, it is important to change the designer's awareness into sustainable one. Since providing specific information through visualization is effective to the recognizing about information and changes in people's awareness (Holmes 2007), the various information of eco-friendly design and urban conditions are provided continuously in an ambient way to the designers during the design education for increasing the awareness about sustainability. Therefore designers can be induced to make future cities and buildings sustainable.

## 2. Research Objective

Architectural design is a process of deriving the design solution through the physical and cognitive stages that resolves multiple design requirements and constraints. The design process is characterized by designer's individual peculiarities (Gough 1981) but a significant portion can be affected by learning and teaching (Akin 1996, Oxman 2001). In particular, there are various interactions between the designer's cognitive behavior and acquired information on the process for solving the design problems (Kim & Kim 2007). Thus, acquisition of information during the course of the designing carries a lot of clout. The architecture students learn the knowledge of designing through the professor's lectures or acquire the data for oneself from the precedents with similar conditions. In this paper, we experiment on educational approaches about the effective delivery of information that induce the students to make sustainable design outputs. We identify the effects on the design output, when eco-friendly design information is provided to students with visual information of competitive evaluation of other student's design. In addition we propose a design education assistance system that competitive evaluation and ambient information helped to improve the sustainability of student's design outputs through the visualization of design processes integrated with the competitive evaluation.

## 3. Research Method

A pilot study was conducted to achieve the purpose of the research that the ambient information is influence on awareness changing and then reflection on the design output. Participants were limited to 4 or 5 graders of the Department of Architecture in order to confirm the design outputs within short time. We had given a house design problem of different site-condition everyday of three-day experiment. Each site has a relatively small area (about 80m<sup>2</sup>, 127m<sup>2</sup>, 135m<sup>2</sup>) comparing the number of family (a family of 6 or 7, and 3families). And the design problems emphasize the natural light which is generally regarded as important and is one of the environmental elements (Figure 1).

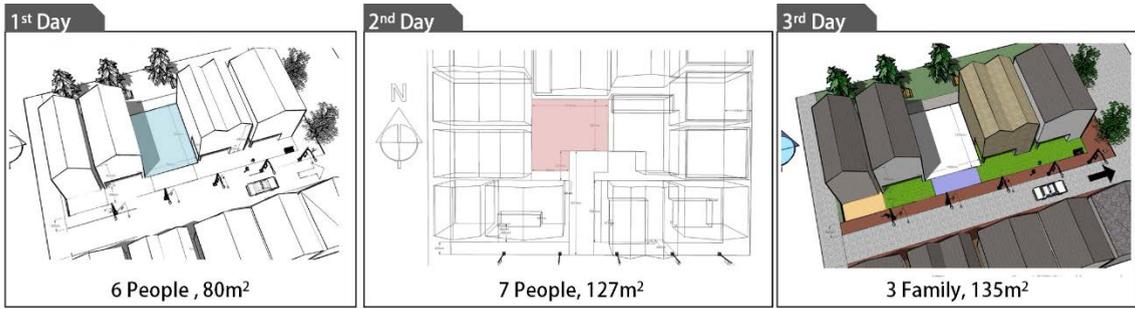

Fig. 1. Site conditions: The building codes are followed in the codes of Seoul in Korea. There is limitation on the building height (about 10m).

Eight students were divided four teams. Each team was consisted of two students and designed during two hours per a day. The design outputs was assessed and scored, and the evaluation result was notified to each team before the next experiment. Process and the outputs of the design were recorded by the video, image and voice for the evaluation. Each team worked in separate room, so couldn't check the contents of other teams. Teams were divided into two groups by providing information about environmentally friendly building. And they were subdivided according to the specific conditions. This grouping creates 'competitive-only atmosphere' or 'competitive and cooperative atmosphere' which requires more time to exchange information with other team members(Figure 2).

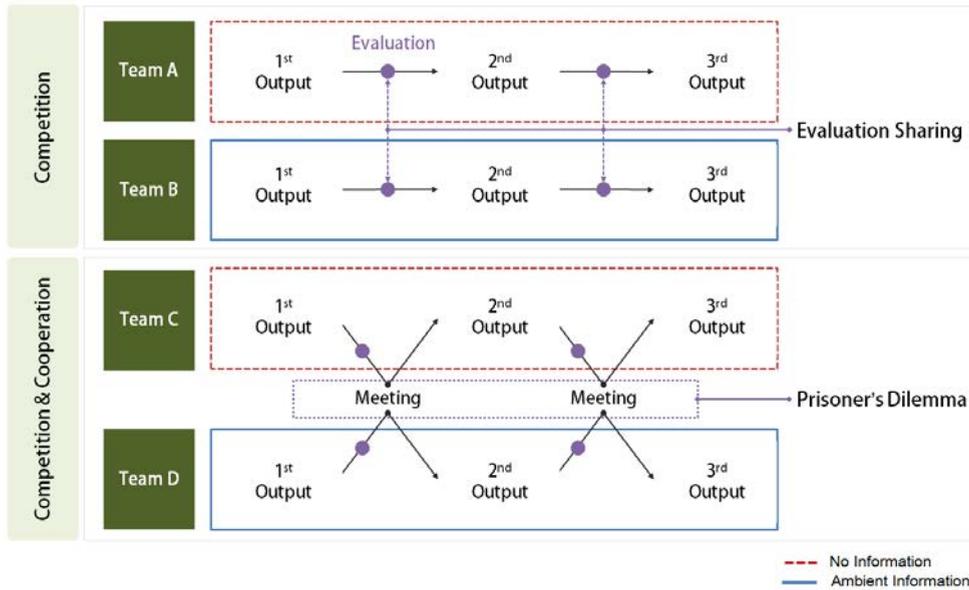

Fig. 2. Design experiment process

Figure 3 is the provided design data example about environmentally friendly buildings. In the experiment, the way of providing the ambient information was not fully arranged due to the time limit. So, the information of

eco-friendly building such as nature friendly materials, natural lighting and ventilation, energy-saving systems, water circulation systems and planting of building was randomly attached on the worktable to make students respond quickly. And this situation about providing the information was not announced to students.

Fig. 3. Providing of ambient information

To encourage participation of the experiment, students get into competition with others. The evaluation of each team's design output was differently offered like figure 4 along the competitive environment. The evaluation in competition condition was presented both own score (bar graph) and other team's score (line graph) by factors. On the other hand, the teams that are provided meeting times (in competition and cooperation condition) were offered own score (bar graph) by factors and the opposing team's total score (dot on bar graph).

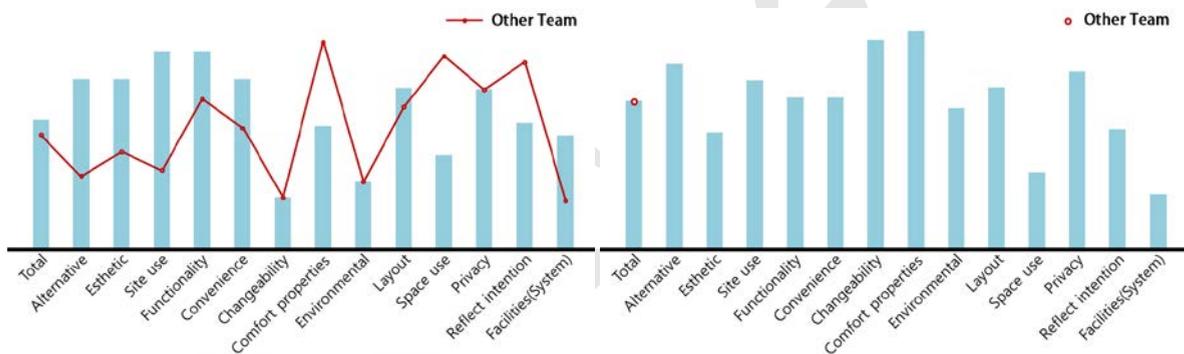

Fig. 4. Example of evaluation graph about 2nd day's outputs; competition team(left), competition & cooperation team(right)

In the meeting time, each team exchanges opinions with others on the design considerations in previous design operation. That moment, interchange of idea applied prisoner's dilemma, the game theory, for preventing design standardization resulted from share of every data (Table 1). Each team gets the score of 1 point when both of them contain the same element in the design, 2 points when one team contains any elements but the other team doesn't contain, and 0 point when neither of them contain the elements. Applying the game theory, it is possible that students have own unique design elements and strategically share the design information.

Table 1. Way for scoring applying of prisoner's dilemma

	Inclusion	Exclusion
Inclusion	1, 1	2, 0
Exclusion	0, 2	0, 0

#### 4. Experiment Analysis

The recording files were used to trace the design process of students. In this performance, the way of gathering and utilizing the ambient information and the effect on the design outputs of the acquired information was tried to be verified. And the effect of the competitive and cooperative relations between the teams was verified too. Referring the voice and video recording files, students' thinking and practice were investigated using the dialogue between the team members during the process for drawing the design outputs. Among four teams, the design process of team D (competitive and cooperative condition) was chosen for the first analysis (Figure 5).

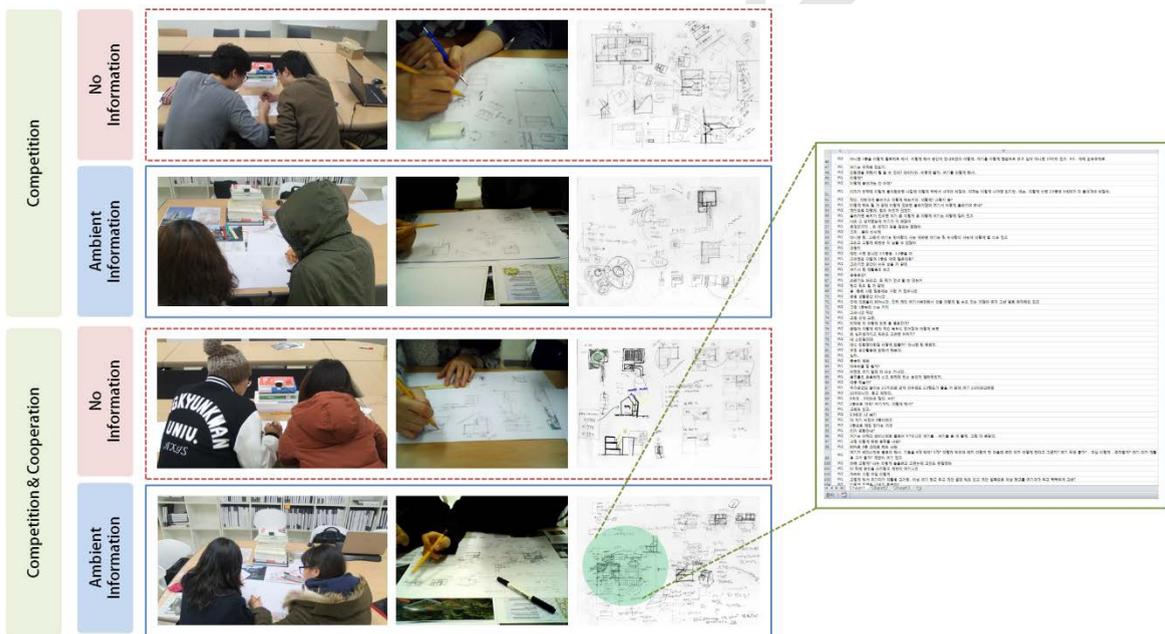

Fig. 5. Appearance of students conducting an experiment and design outputs and dialogue sample of team D

First of all, students decided the type of rooms by floors and draw up the programs. At this time, each room was composed efficiently by substantial consideration about the sunshine and view that are required by dwellers.

There was a feature that reflects the factors pointed out from the other team at the meeting time before the design experiment, when students laid out the plans. The opposing team comments that the children's room was planned to be best in contradistinction to other family's rooms. So, one student took up the position that other family's rooms plan to be better too. Similarly, students introduced the elements again that high scored at the evaluation from tutor. As the practical space-use got the high score on the evaluation, students introduced the same element used on the first day to prevent the creation of dead-spaces (Figure 6).

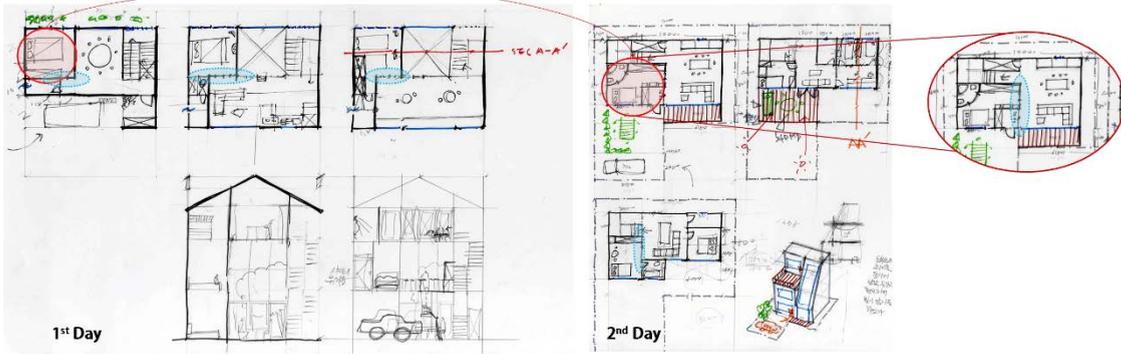

Fig. 6. Movement of rooms toward south (red line) and application of a sliding door (blue dotted line)

In the process of floor planning step, the furniture arrangement was discussed. The students tried to apply the unique furniture which had seen before to save the space. At this time, one student found the similar case with their design in the attached pictures on the worktable. Then, they reconsidered and canceled the idea of special furniture. Instead, they decided to compose the space and arrange the furniture following the example on the table (Figure 7),

Fig. 7. Two alternatives and reflection of ambient information

On the other hand, the design process of team A (no ambient information, no meeting time) was affected by visible evaluation graph with other team. These students tend to be more concerned for evaluation result than students of team that could have meeting time for exchanging the opinions. They looked into the evaluation graph and check the low scored elements again and again before and after experiment (Figure 8).

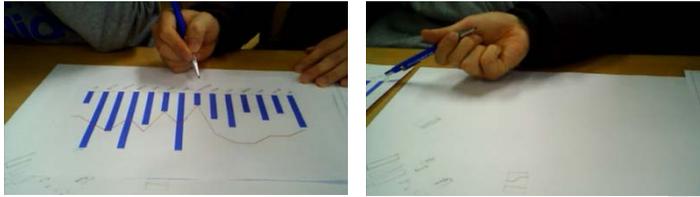

Fig. 8. Checking evaluation graph before and after experiment

In a case of team A, they got poorer ratings on the domain of alternatives, aesthetic, and facility than team B. So in opposition to general space assignment widthwise for a family, they suggested the spatial division lengthwise (Figure 9: left). Students decided that an alternative is more profitable to all dwellers and more effective in using space than first design, so they choose the alternative as a final form. And the mass of building had the unique bumpy exterior, didn't shape like a box at earlier experiment (Figure 9: right). The requisite of facility was mentioned on the drawing board. However, students didn't cover the facilities on the design due to lack of knowledge about facilities system and pressure of the restricted hours.

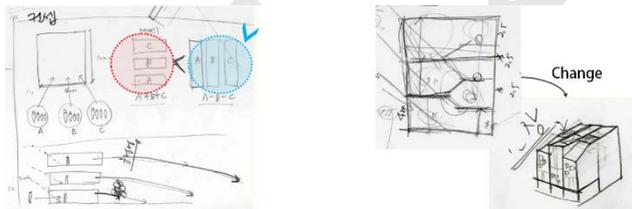

Fig. 9. Creating alternative(left) and changing of the building mass(right)

Through this experiment, it is proved that students are affected by ambient visible information, visible evaluation from tutor and exchange of opinion with other students in the design process. Especially, the competitive spirit goes a long way towards developing the design. The greater diversity of design objects are created when the students in competitive condition that is combined with cooperation condition. The system which is reflected the result of experiment is enabled to provide effective design education. That system increases the student's awareness about sustainability as strengthen the competition through the ambient information, visualization of design process and output's evaluation among the students. Therefore, it would help build future cities or buildings that formed salubrious environment where citizens live, if the education assistance system is developed.

## 5. Proposal of the Education Assistance System

As the design processes can be generally visualized like figure 10 (upper) (Kim 2006), it is have the merit of effectiveness for design tutor to confirm and guide the design operations of many students easily. So that they manage design studios and assess the students. Design object is offered as various alternatives along the

designer's cognition or restriction on design problem and continually repeated the processes that combine or eliminate the design elements along the tutor's evaluation. The objects are turned up as a final one last. At first time, the design objects begin as conceptual design such as simple sketches or bubble diagrams and finally become an architectural design plan or three-dimensional object. Figure10 (lower) is visualized team D's design outputs of 2nd day in the same way (Figure 10: upper).

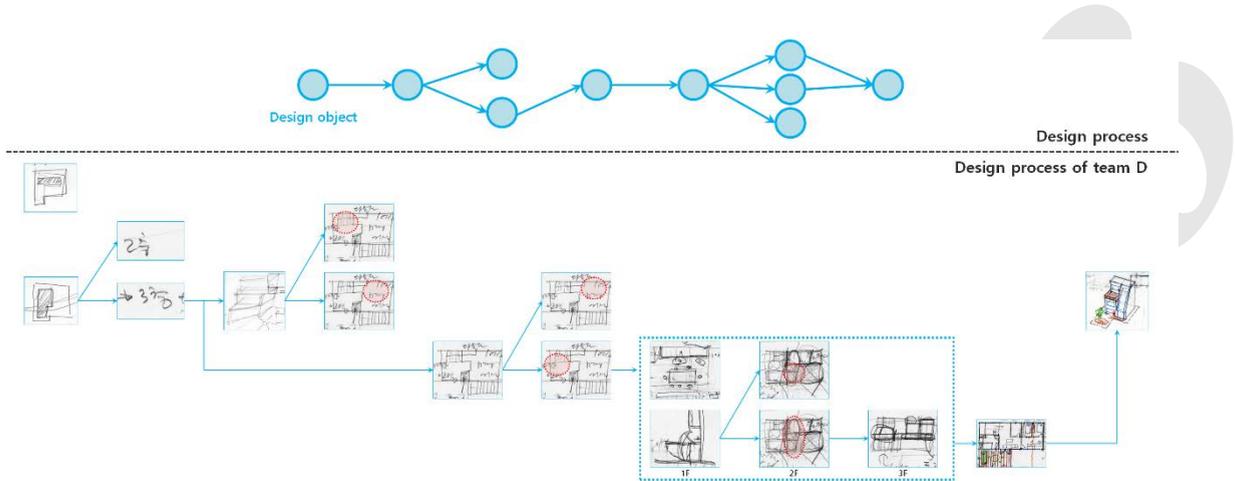

Fig. 10. The example of design process visualization(upper) and visualization of team D's design process(lower)

When the students develop their design, by the experiment and theories, the acquired knowledge and provided information excessively influence the designs. And if the delivery of provided information is interactive, the effect can be maximized. In this paper, we reflect the results of the previous experiment, so organized the visualization system that provide the needed information for design with the evaluation of design outputs to the students on the design process like figure 11. The students received the design problem and then analyzed and comprehended the design requirements or constraints. And the student's design outputs are advanced by the ambient information provided constantly and intended to develop the design quality through comparing evaluation with other students during design process.

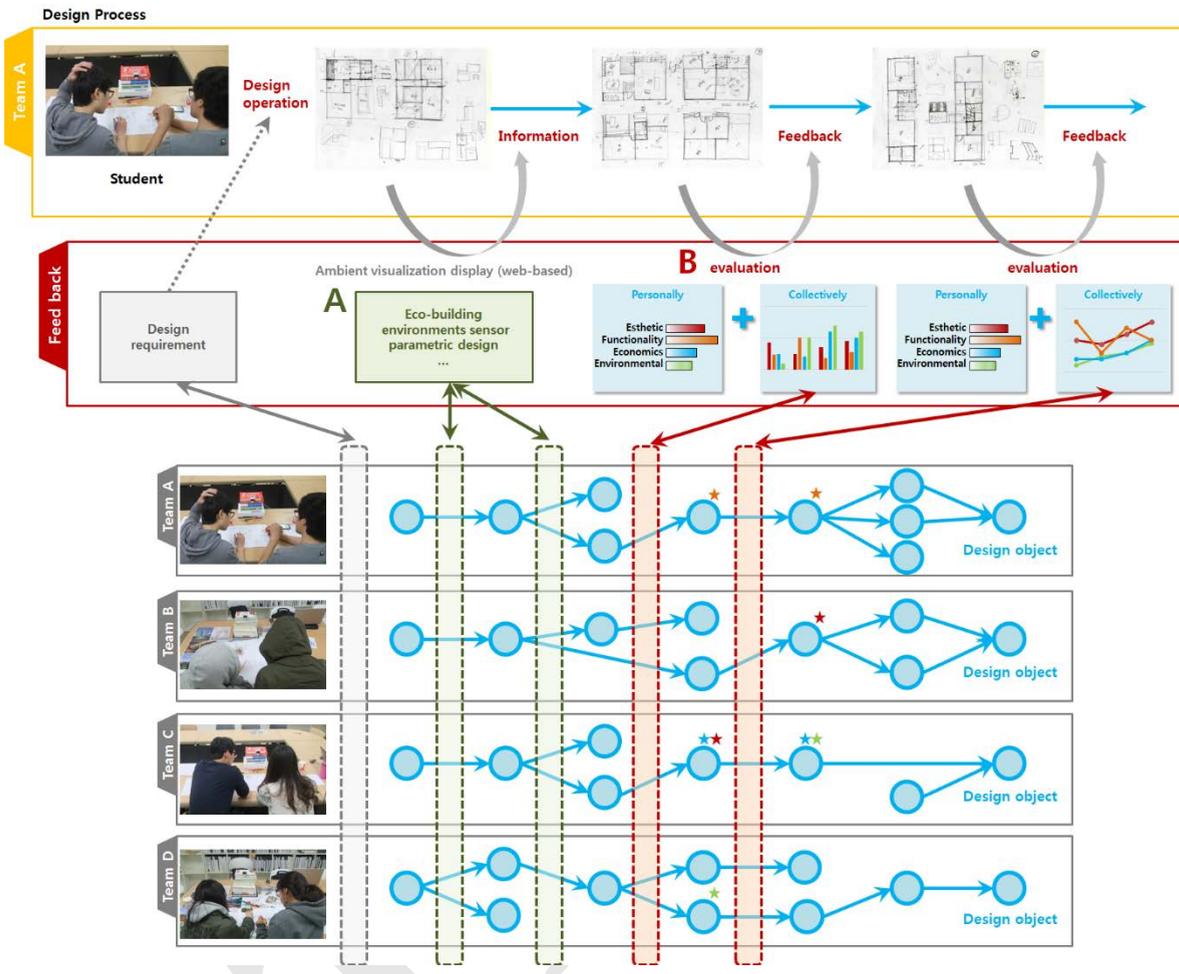

Fig. 11. Example of design process visualization integrated with providing information and competitive evaluation

- A : Provide the sustainable design information continuously by installing the monitor on the corridor where many students moved or in the design studio. Students with smartphone get more detailed data like a system plan using the QRcode that linked web data. In additionally, if the screen or the sculpture that visualize the indoor environmental information such as air pollution and then some for design is served additionally to student, it is possible to raise awareness about environment of students.
- B : Provide the professor's evaluation that based on sketched alternative designs that inputted into system for final result. And that is evaluated each design's element such as aesthetics, functionality and so on. The evaluation is shared with other students, thus enhance the cognition of competition among the students. The repetitive evaluation of design object using the system is enabling to expect to improve quality of student's design output.

## 6. Conclusion

This study aims for students to have environmental awareness naturally and improve quality of the design through information visualization of eco-friendly design and output evaluation to architecture student in process of learning the knowledge for design. To achieve this purpose, we use the way that visualize the eco-system designs' examples for student to increase understanding and reflecting acquired knowledge about sustainability from theoretical lecture. Also, providing the competitive and comparative evaluation with strategic information exchange among the students via game theory helps increase the students' awareness about sustainability more. Finally, when the students become the professional designers, the nature friendly practices and knowledge that have been formed from this educational system are naturally reflected in the design of cities or buildings. Then, the urban and residential environment is built salubrious and comfortable for people. Furthermore, the lifestyles of people living in this type of cities or buildings will be maintained in more sustainable ways.

## Abstract

One of the fundamental consequences of research is that there is a relation between leadership approaches of teachers and their teaching methods in the environment of class. It may be said that the teachers who have transactional leadership style more tend to teach through presentation, who have transformational leadership style more tend to teach through invention, who have transformational leadership style more tend to teach through research-examining and who have liberal leadership style more tend to teach through cooperation.

Keywords: teacher, leadership styles, teaching strategies

## 1. Introduction

Management is a function that has the same roles regarding business, public agency or non-governmental organizations and it performs similar functions. In order to implement the management function to achieve certain objectives at any time, therefore, it is necessary for the general manager of a business enterprise, for the branch manager a public body or for a teacher responsible for managing a class. The manager who performs planning, organizing, leading, or auditing functions of the management implements executive function through giving orders and secures the implementation of these orders by employees. The manager performs the executive function through two principle ways: one is completely based on the authority; the other on the leadership. In the authority based management, the manager applies the powers given to him on legal, economic or cultural ways. In the leadership based management, on the other hand, the manager can makes use of such unauthorized tools as effective communication, motivation, cooperation, reward, charisma, persuasion, endearing etc. Also taking external and internal environment conditions into account, employees can be said to be more effectively oriented through leadership tools in the majority of today's organizations. Taking into account the conditions of the external environment and internal environment, it is more effective to direct employees with leadership tools in the vast majority of today's organizations (Özdaşlı & Yücel, 2010). Therefore, nowadays, the concept of leadership stands as one of the most important concepts in terms of management and organization. A similar situation is also true for the management of the school and classroom. Today, although technological advances continue with an increasing pace, teachers who have leadership quality are one the most important elements in terms of educational environments. Although self-adaptation of teachers to these changes is an essential requirement and it is necessity for them to improve themselves according to the conditions, it is impossible to fill in the place of teachers using technology. At this point, the concept of leadership plays a role (Kılıç, 2006).

In relation to leadership, it would not be a proper approach to make a determination as "this is the best leadership style ". However, it is possible to assess the advantages and disadvantages of each leadership style according to the time and conditions of the current organization. Therefore, in this study, our aim is not to identify the best leadership style for the teachers. The main purpose of this study, giving the leadership styles adopted by teachers of the sample group, is to determine whether these styles have an impact on their teaching strategies. Leader and leadership are different concepts. Leadership is the ability to convince people to direct towards the objectives that are set beforehand; the leader, on the other hand, is defined as a person who brings individuals together forming the group and direct and persuade them to the objectives of the group (Erdoğan, 1994).

When we look at the relationship between a leader and his/her follower, we often witness that the writers usually emphasize followers follow leaders as their own wishes. The process of a real leadership cannot be mentioned unless leaders and audience act together in this process (Doğan, 2007). However, what we know for sure is that leadership entails the use of influence and power. This effect can be fed with one source or different sources. One of the sources of this power is the position of the leader in the organization (Kurtz & Boone, 2007). In this context, we examine the relationship between teachers and students, the teacher can be said to have legal influence and power on students

Leadership style is the ability to use the power of a person while directing the behaviour of others (Kurtz & Boone, 2007). According to Hersey, Blanchard and Johnson (1997), basically three types of classifications on leadership styles are mentioned in the literature. These are autocratic leadership, democratic leadership and liberal leadership. Autocratic style is leader oriented. Leaders give their decisions without consulting his followers. In democratic style, the leader will delegate tasks, asks his followers for suggestions and tries to ensure the participation. In the liberal style, supervision and control are at the lowest level (Kurtz & Boone, 2007).

When we look at the contemporary classifications of leadership in the literature, we see that a number of different styles are discussed. We can list some of them as; for the work (operational), transformational, paternalistic (fatherly), learner, super, vision-based, cultural, symbiotic, servant (Robust, 2011) and ethical leadership. Of these, operational, transformational, paternalistic and the liberal leadership styles are included in the study.

When we look at the trends in recent literature on leadership styles, we primarily see that operational and transformational are divided. Transformational leadership style is a an approach which is directed at reshaping strategies and tactics of the organization and this style instils vision, innovation and creativity to his followers. Giving priority to the normal tasks to be performed, operational leadership is a leadership style that uses money and status in order that its followers show extra effort (Daft, 1998; McKenna, 2001).

Paternalistic leadership style is related to the interaction between leaders and subordinates. This interaction is manifested in a positive way. Paternalistic leadership style includes leader's taking care of every aspect of his subordinates lives a father / mother love, rewarding his employees, helping and supporting them. However, while dealing with his employees he always reminds who has the authority. In other words, paternalistic leadership is the leadership in which the relationship between the superior and subordinates is like that between the father and child (Çalışkan, 2009).

Teaching and learning concepts are different concepts. Learning is an individual permanent behavioural change as a result of interaction with one's environment. Teaching is a process of performing learning (Türkmen, 2003). According to Tezci, Önal, Uşun and Güven (2008), based on a specific plan and program, training activities which are implemented in schools to achieve specific goals are called teaching. For learning to occur, it is necessary to create a suitable learning environment.

One of the main causes of the problems of students who fail to grasp the subject in spite of much work during the process of teaching is that students do not know which strategy is more suitable for them. As the teaching strategies are very important for education, teachers should know which strategy is more appropriate very well and they should teach the subject in accordance with these strategies (Açıköz, 2009). In the widest sense, the strategy refers to the approach or the path to be followed to achieve the goal in any matter or case. One of the issues that are effective in the success of students and more comfortable comprehension of the subject is the teaching strategy. (Tok, 2012). Teaching strategy is the determination what tools and materials should be used and which method should be applied to implement effective education. Therefore, it has a very important role in achieving the desired objective of the course (Akar, 2006). Choosing the most appropriate teaching strategy for students, teachers can enable permanent knowledge by transferring the knowledge of students from temporary memories into their long-term memories. These strategies mostly used for the cognitive behaviours can also be used for affective and psychomotor behaviours (Sözer, [anadolu.edu.tr](http://anadolu.edu.tr)).

In the educational activities carried out in the process of teaching and learning, what students do about learning is highly important. In fact, to learn new information, every student has a strategy they follow. Therefore, learning strategies, with the participation of students in learning activity, has been mostly developed by themselves. Students acquire these strategies either from their lives or by trial and error, or more with the contribution of anyone else (mostly the teacher). Many studies have figured out that students generally know learning they do not know when and how to use them. Now that learning strategies are important factors that significantly affect student achievement, teaching of these creates great benefits to the students. Starting from the first years of primary education, helping students develop a number of learning strategies is extremely convenient. In order to achieve this, enlightening the teachers about these teaching-learning strategies is undoubtedly emerging as a key requirement. Expository, discovery-based, research and investigation based, mastery and cooperative teaching strategies are the most widely used teaching strategies in teaching - learning processes (Gürbüz, 2011).

*Expository teaching*, it is the process of transferring information, concepts, to student in a regular and sequential manner (Tan et al., 2002). In expository teaching strategy, first, generalizations are made by giving information, then; this information is presented to student choosing examples to provide a better understanding of generalizations. For this reason, the person who has the most significant effect in this strategy is the teacher. Applying deductive approach, teachers allow student to move towards the whole track (Tezci et al., 2008). In *discovery-based teaching strategy*, the teacher creates an environment in which the student learn through their own effort by analysing the facts and events rather than presenting already organized and prepared information (Sözer, [anadolu.edu.tr](http://anadolu.edu.tr): 79). Through this strategy, referred to as learning by doing or experiencing, the student is enabled to discover the subject following concrete components before making abstractions and generalizations, and so, significant learning is accomplished (Tan et al., 2002). *Research and investigation based teaching strategy*, the teacher, offering problems particularly to draw their attention, also help them in solving these problems (Açıköz, 2009). *Mastery teaching* is based on the idea that the differences between the students stem not from the difference between the levels of learning but from environmental differences. For this reason, environmental factors preventing the child from learning should be exposed (Tezci et al., 2008). Mastery learning is applied to a class and materials to be learned are divided into units. Achievement levels of these units are determined. If the learning occurs around 80-85%, this means the individual is successful. If the student falls below this percentage, the student is classified as to have failed. After this process, in order to determine what they have learned and what they haven't, students are given a monitoring test. The purpose of this test is to reveal learning difficulties. After determining learning difficulties of the student, adjustments are made to resolve these difficulties. If the student has reached to the desired level, one more screening test is applied. This monitoring test is the equivalent of the previous test. Generally, the vast majority of the students have reached to the desired level after this test and are ready for the second unit (Tok, 2012). *Cooperative teaching* is a method trying to improve the achievements of students by providing their active participation in classes. In this method, students work in small groups and they help each other to learn (Sezer & Tokcan, 2003). Creating a positive dependence between

the members of the student group, a right or a wrong thing is attributed to the whole group. Individual accountability matters while a student share new things which he/she has just learned. Learning efforts of students will be rewarded as a group. Feedback to other group members is ensured in individual preparations. Each student in the group is encouraged on topics such as decision-making and leadership. By creating group aim, the progress towards the aim is measured from time to time. By implementing the structure and management of the group effectively, The Teacher makes it known that materials, created by a student in the group or all members of the group, are for the success of the entire group (Felder & Brent, 2007).

Teachers can exhibit three leadership styles in the classroom as autocratic, democratic, and liberal leadership. There is a linear relationship between the learning environment and leadership styles of teachers who are the leaders of the class (Çiftçi, 2003-2004). Teachers exhibiting democratic leadership allow students to ask questions and the opportunity to express their thoughts, besides; they give them the right to take the initiative. Teachers exhibiting autocratic leadership do not allow students to express their ideas; they do not create a debate environment and they do not cooperate with them. Teachers who adopt liberal leadership style causes indiscipline and disorder; hiding behind the pretext of being democratic, they do not deal with students (Ilgar, 2007). Researching the existence of a relationship between leadership style and class management of teachers, Kadak (2008) has figured out that teachers show the three types of leadership style as autocratic, democratic and semi-democratic and there is a positive relationship between personality traits and teaching activities. Recent studies on the leadership attitudes of teachers have suggested that imposing pre-determined facts into the brains of students by providing authority and discipline (paternalistic and operational leadership) is a matter of the past. On account of their facilitating and encouraging roles (transformational leadership) teachers, in recent years, let students investigate and study the their own worlds, ask questions, teach their own realities, and discuss with teachers and classmates (Burke, 2011). Grasha (2002) has grouped education types of teachers into five parts as specialized, formal authority, personal model, facilitator and authority delegation. In official authority style, which deals with doing things right, acceptable, and in standard ways, teachers pursue a presentation way in which they transferring their knowledge without paying attention to relationship among students (way of teaching through presentation). In facilitating style which is close to the transformational leadership style, teachers ask questions to students, offer alternatives, ask for searching options, and they follow their teaching strategies through innovation and research. There is a tendency to independent projects and teams of students (through co-operation training) in authority delegation style which allows students to work independently, show close behavioural patterns to those of liberal leadership style, emphasize the authority.

## **2. Research**

### *2.1. Purpose, Sample and Limitations of the Study*

The main objective of this study is to determine whether leadership style of teachers has any effect on their teaching strategies which they apply in classroom and while performing the course. Main body of this research is composed of teachers in the centre of Isparta, a province of Turkey. In the light of the information received on 05/17/11 from Isparta Provincial Directorate of National Education, it is found out that a total of 2,200 teachers are employed in Isparta and its villages. Based on formal authorization of the Directorate of Education of Isparta Province, the questionnaire has been sent to all schools for teachers working at primary and secondary schools in the centre of Isparta. Convenience sampling method is used in the selection of teachers and every teacher who agrees to answer the questionnaire is included in the sample. Under these conditions, 235 teachers have responded to the survey. As this research has been conducted only in the province of Isparta, a further generalization cannot be made. In addition, the limitations of this study can be listed as: people's being unable to analyse their own behaviour enough, difficulty in defining leadership, teachers reluctance to filling out surveys, inclination of teachers to show themselves as successful, and their different perceptions of the questions.

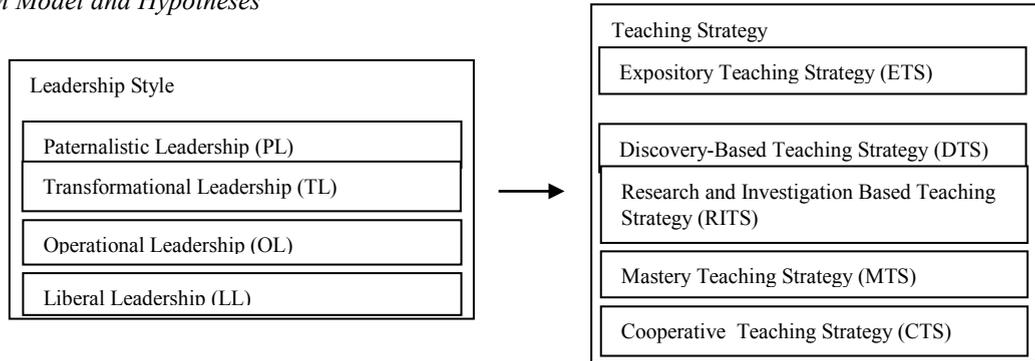

## 2.2. Survey Form and Scales

Survey technique has been used as a means of data collection. Two scales are used in the form of the questionnaire. The first scale (teaching strategies scale (TSS) includes what teachers benefited from (expository teaching strategy, discovery-based teaching strategy, research and investigation based teaching strategy, mastery teaching strategy, cooperative teaching strategy). TSS is prepared especially being benefited from literature parts of the article "Teaching Strategies Preferred by Turkish Teachers" prepared by Saracaloğlu et al. and master thesis of Akar (2006) titled "The Effectiveness Of The Discovery Learning Strategy On The Mathematics Achievement At The Second Step Elementary Education". Expository teaching, is assessed with the query "Generally, I lecture the Courses."; Discovery based teaching strategy is assessed with the query "I provide suitable examples for mental development of student and I ensure the student to comment on my examples"; Research and investigation based teaching strategy is assessed with the query "I lead the student to do mental research on the problem"; mastery teaching strategy is assessed with the query "I find out why Every student does not learn"; and cooperative teaching strategy is assessed with the query "I create working groups". There are 4 questions for each strategy on instructional strategies scale. There are questions about leadership styles of teachers in the second scale. Leadership styles are paternalistic, transformational, operational and liberal leadership styles. The scale is prepared based on the master thesis titled "Relationship between leadership styles and effecting tactics of leaders to their subordinates: a research on five-star hotels managers" prepared by Derya (2010). Each style is measured with following question: paternalistic style (a total of 5 questions), "I am almost like a mother / father for my students"; transformational style (a total of 7 questions), "I always encourage and appreciate my students to do new things"; liberal style (a total of 5 questions), "I would like to find his solution when a student has problem"; operational style (a total of 7 questions), "I explain in detail the ways for the fulfilment of the tasks" Five-point Likert type metric expression is used for answers of statements in the scales. For example, for the expression "I always do long-term plans", there are following answers: "1-never", "2 - rarely", "3-occasionally", "4 - Often", "5 - Always". In addition, six questions are asked to examine the demographics of teachers. Obtained answers in survey forms have been coded and analysed using "SPSS for Windows 21.0".

## 2.3. Data Preparation

To prepare the data file, lost data, extreme value, normality, homogeneity are firstly tested after the data previously used in the research part of the thesis have been saved in SPSS 21.0 package program. *Missing data:* We have examined whether the ratio of answers which are left blank for each survey to total materials are 15% or over or not. Assignment operation has been implemented to 13 respondents missing data (on averages). *Extreme Value:* 43 questionnaires whose "Z" and "T" points are over + 3 and - 3 are excluded from analysis. In total, 192 survey data have been analysed. *Normality:* N-Par Test results are examined; there is no normal distribution in terms of leadership style scale (Sig (2-tailed) = 0.000); instructional strategies scale (Sig (2-tailed) = 0.000). Therefore, logarithms of the data have been taken to normalize. *Homogeneity:* data are determined to be homogeneous because sig. value of the "homogeneity test" result is bigger than 0.05. The data are analysed using SPSS 21 and Eviews statistical programs. Demographic findings, factor analysis and correlation analysis have been done using SPSS 21 and regression analysis has been done on Eviews.

#### 2.4. Research Model and Hypotheses

Model of the research is compatible with the model referred to as descriptive and status designator. With these models, variables and relationships between variables can be defined and some predictions can be made on the basis of these definitions (Kurtuluş, 1996). The aim of the study, in the direction of the related literature and in the context of the model hypotheses are as follows.

- H1.1. Paternalistic leadership style has a positive effect on the tendency of teaching through presentation.
- H1.2. Operational leadership style has a positive effect on the tendency of teaching through presentation.
- H1.3. Transformational leadership style has a positive effect on the tendency of teaching through discovery.
- H1.4. Transformational leadership style has a positive effect on the tendency of teaching through research and investigation.
- H1.5. Liberal leadership style has a positive effect on the tendency of teaching through cooperation.

#### 2.5. Demographic Findings

Based on the analysed data, 55.7% of teachers (107 people) are female, while 44.3% of them (85 people) are male. 80.2% are married, and 19.8% are single. 3.1% of teachers younger than 24, 59.9% are from 24 to 40 age group, 35.4% are in the age group between 41 and 60, 1% are over the age of 60 and 0.5% of them have not specified their ages. 69.8% of them are primary school teacher and 24% of them are high school teachers, while 6.3% have not specified the school. It is seen that 23.4% of teachers that is analysed have less than 5 years of professional experience. However, 76.6% of them –majority- have more than 5 years of professional experience. Both leadership tendencies in terms of classroom management and teaching strategies in terms of implementing the course curriculum of those people who have spent years in their profession is an expected result. 35.9% of participants (69 people) are classroom teachers, 12.5% of participants (24 people) are Turkish literature teachers, 9.9% of participants (19 people) are foreign language teachers, 8.9% of participants (17 people) are science teachers, 6.8% of participants (13) people are mathematics teachers, 5.2% of participants (10 people) are social studies teachers and the others are religious, fine arts, technical education, physical education and kindergarten teachers.

## Factor Structure Formation and Reliability Analysis

Table 1. Factor Analysis Results of Teaching Strategies Scale

Expressions	Factors				
	ETS	DTS	RITS	MTS	CTS
Usually, I lecture during lessons.	.698				
I present concepts, principles and generalizations in a neat and orderly manner, and I explain by giving examples.	.566				
I do not go elaborate on the details; I give importance to the general outlines of the subjects.	.467				
I use a motivational teaching approach based on student activities.		.783			
I set examples in accordance with the mental development of student and I let comments on examples.		.694			
I make students think on the actual size of the event, and I encourage them to make objective decisions.		.620			
I lead students to develop a proper overview of the problems and the habit of reaching to the solution.			.710		
I ensure the student analyse the collected data related to the events, and make conclusion.			.630		
I direct the student to do mental research on the problem.			.620		
I make the student notice the situation creating problem.			.576		
I ensure that all students complete their learning.				.787	
I figure out why each student does not learn.				.682	
I provide bringing together the factors playing role in teaching - learning process in a way to ensure the desired behaviour for a student.				.479	
I compare the previous thoughts of students with what they have learned after finishing of the topics.				.464	
I apply physical activities which students will use their skills.					.793
I make it easy for students to benefit from the capabilities each other, work together and share responsibility.					.767
I ensure that students learn from each other.					.737
I create work groups.					.734
<b><i>Cronbach Alpha value</i></b>	<b>.653</b>	<b>.700</b>	<b>.690</b>	<b>.725</b>	<b>.802</b>

As a result of factor analysis of the data obtained through Teaching Strategy Scale (TSS), five dimensions have come into existence. The first of five dimensions is referred to as expository teaching strategy (ETS); the second, discovery based teaching strategy (DTS); the third, research and investigation based teaching strategy (RITS); the fourth, mastery teaching strategy (MTS), and the fifth is referred to as cooperative teaching strategy (CTS). Kaiser-Meyer-Olkin (KMO) test applied to the analysis of the main components has shown the sample size (KMO value, 846) is adequate for factor analysis. The result of Bartlett's test, which is applied to determine whether the data of variables have normal distribution, is significant (118.277,  $p < .01$ ). 5 factors, eigenvalues of which are greater than 1:00, have been obtained as a result of processing the data variables of TSS and varimax rotation. The resulting factors accounts for 55.516% of the total variance. Internal consistency coefficients obtained for each of the scales as a result of the reliability analysis of five Scales (Cronbach's alpha values) are given under the table respectively. Scales are seen to have reliability levels in the field of social sciences. It can be expressed that scales, obtained as a result of the Varimax rotation factor analysis, measure a structure similar to that of theory and that they have structural validity.

Table 2. Factor Analysis Results of Leadership Style Scale

Expressions	Factors			
	PL	TL	OL	LL
Like a father who knows what's best for his child, I know what's good for the students.	.810			
As a teacher, I give advice to my students like a father and direct them.	.713			
To me, the teachers should show interest and attention to the students their as if they were their children.	.656			
I'm almost like a mother / father for my students.	.610			
As a teacher, my current experience and knowledge is a guide to students.	.503			
I have a clear stance with my values and I apply the piece of advice myself.		.672		
I always encourage my students to do new things and appreciate them.		.623		
I encourage the co-operation, participation and self-confidence of my students.		.569		
I encourage my students to come up with new ideas to solve the problems and apply them.		.503		
I organize the task that anyone can fulfil within the framework of a program in advance			.650	
I want to be sure that I am understood completely by the students about the tasks I have assigned.			.610	
I explain the ways in detail in performing tasks.			.589	
I decide how my students will perform the duties and tasks.			.562	
I always like the realization of the standards I set for a student.			.509	
When a problem occurs among my students, I wait so that they resolve among themselves.				.795
Before deciding on a something, I wait for it to happen spontaneously.				.763
I would like students to find their own answers to questions about the problems.				.742
When a student has a problem, I want him to find solutions to the problem himself.				.721
Most of the time, I do not interfere with anything in my class, and I do not want to be interfered.				.705
<i>Cronbach Alpha values</i>	<b>.745</b>	<b>.675</b>	<b>.655</b>	<b>.810</b>

Serving to both factors, 2 topics of TSS – numbered 3 and 5- are excluded from the analysis. 4 dimensions are formed as a result of factor analysis conducted on the data of Leadership Style Inventory consisting of 24 questions. The first of four dimensions is referred to as Paternalistic Leadership (PL); the second, Transformational Leadership (TL); the third, Operational Leadership (OL); and the fourth, the Liberal Leadership (LL). Kaiser-Meyer-Olkin (KMO) test applied to the analysis of the main components has shown the sample size (KMO value, 785) is adequate for factor analysis. The result of Bartlett's test, which is applied to determine whether the data of variables have normal distribution, is significant (1473,057,  $p < .01$ ). 4 factors, eigenvalues of which are greater than 1:00, have been obtained as a result of processing the data variables of OSO and varimax rotation. The resulting factors accounts for 58.087% of the total variance. Internal consistency coefficients obtained for each of the scales as a result of the reliability analysis of four Scales (Cronbach's alpha values) are given under the table respectively. Scales are seen to have reliability levels in the field of social sciences. It can be expressed that scales, obtained as a result of the Varimax rotation factor analysis, measure a structure similar to that of theory and that they have structural validity.

## 2.6. Impact Analysis Findings

According to R-squared- determination coefficient- value of the regression model 6% of the variance of expository teaching strategy is explained by the three independent variables. The calculated F value is valid at .000 level ( $p < 0.01$ ). The relationship between the dependent and independent variables is statistically significant. When positive Beta values are examined, it is seen that these three leadership styles affect expository teaching strategy. Expository teaching is affected, respectively, by operational leadership and liberal leadership after transformational leadership most. Only if does it remain steady for other independent variables, a cumulative increase in operational, transformational and liberal leadership styles of teachers provides ,216 units; ,148 units

and ,065 units of increase in education through presentations, respectively. According to these findings, H1.1 is rejected, H1.2. is adopted. 21.52% of the variance of discovery based teaching strategy is explained by the three independent variables. The calculated F value is valid at .000 level ( $p < 0.01$ ). The relationship between the dependent and independent variables is statistically significant. When positive Beta values are examined, it is seen that these three leadership styles affect discovery based teaching strategy. discovery based teaching strategy is affected, respectively, by paternalistic leadership and operational leadership after transformational leadership most. As long as it remains steady for other independent variables, a cumulative increase in operational, transformational and paternalistic leadership styles of teachers provides ,375 units; ,200 units and ,095 units of increase in discovery based teaching strategy, respectively. According to these findings, H1.3 is adopted. 27.36% of the variance of education through research and analysis is explained by the four independent variables. The calculated F value is valid at .000 level ( $p < 0.01$ ). The relationship between the dependent and independent variables is statistically significant. If Beta values are examined, it is seen that these four leadership styles affect research and investigation based teaching strategy. It is affected, respectively, by paternalistic leadership, operational leadership and liberal leadership most after transformational leadership. If it remains steady for other independent variables, a cumulative increase in operational, transformational, paternalistic and liberal leadership styles of teachers provides ,314 units; ,220 units ,120 and ,016 units of increase in research and investigation based teaching strategy, respectively. According to these findings, H1.4 is adopted. 27.36% of the variance of cooperative teaching strategy is explained by the two independent variables. The calculated F value is valid at .000 level ( $p < 0.01$ ). The relationship between the dependent and independent variables is statistically significant. If positive Beta values are examined, it is seen that the two leadership styles affect cooperative teaching strategy. It is affected, respectively, by liberal leadership most after transformational leadership. Providing it remains steady for other independent variables, a cumulative increase in transformational and liberal leadership styles of teachers provides ,566 units; ,278 units of increase in cooperative teaching strategy, respectively. According to these findings, H1.5 is adopted. 34.90% of the variance of education through mastery teaching is explained by the three independent variables. The calculated F value is valid at .000 level ( $p < 0.01$ ). The relationship between the dependent and independent variables is statistically significant. If positive Beta values are examined, it is seen that the three leadership styles affect teaching through mastery teaching strategy. It is affected, respectively, by transformational and operational leadership most after paternalistic leadership. As long as it remains steady for other independent variables, a cumulative increase in operational, transformational and paternalistic leadership styles of teachers provides ,443 units; ,296 units and ,272 units of increase in education through mastery teaching strategy, respectively. According to these findings, H1.5 is adopted.

## Conclusion

One of the main results of the study is that there is a relationship between the leadership styles of teachers and the methods they use in teaching environments. Of hypotheses, especially in relation to the results of other studies, only H1 hypothesis (paternalistic leadership style has a positive effect on expository teaching strategy.) is rejected. As expected, "teachers who have paternalistic leadership style are more effective in education through the presentation" query is not confirmed in the context of our sample. Other hypotheses have been adopted. So, it can be expressed that teachers who have operational leadership style tend to have more educative ability through presentations; teachers having transformational leadership style tend to teach more effectively through discovery; teachers having transformational leadership style tend to teach better through research and investigation and teachers having liberal leadership style tend to teach better through co-operation. Moreover, more serious results which are not expressed initially as a hypothesis have been obtained. If an overall assessment is made in this regard: 1. Teachers who have operational leadership style, that is, the teachers who give priority to normal tasks to be performed tend to use teaching methods a certain level except for collaborative of education type. 2. Teachers who have paternalistic leadership style, that is, those who deal with students, support them as well as always keeping the authority tend to use other teaching strategies, especially full teaching strategy, except through presentation and teaching strategies. 3. Teachers, who have transformational leadership style, that is, those who instil their students with vision, innovation and creativity as well as dealing with them, have a tendency to use all teaching strategies, particularly, cooperative teaching strategy. 4. Teachers who have liberal leadership style, that is, the teachers who do not interfere with the events more tend to use cooperative teaching strategy, through the invention strategy and teaching and research strategy.

# A review on processes of writing about art from the perspective of visual arts

Aygül Aykut\*

*Erciyes University Faculty of Fine Arts, 38090, Kayseri, Turkey*

---

## **Abstract**

Writing about art can be seen as an engagement pertains to historical researchers and people who have acquired criticism as a profession. But it's not only the area of interest of historians and critics but also of artists and art students. It can be seen as a necessity for art students who are closely interested in interdisciplinary issues to gain certain skills such as being able to writing critiques, reports and articles about today's visual works or to keep the record of visual history. Yet, it's just possible by having knowledge of the nature, research methods and problems of art to research and interpret these issues and transform them into a written text through a certain system.

The purpose of this research is examining the process and problems starting from theme selection and can be extended by interpretations in forming, shaping and presenting the ideas in the process of developing writing skills of fine art students.

*Key Words:* Research methods in art literature, visual art education

## 1. Introduction

One should consider modern art practices and its condition in Europe to define subject area and characteristics of fine arts. Art is a creative and intellectual engagement analyzing and questioning new art types and understandings produced by artists. Modern art, on the other hand, is a dynamic field including broader approaches, techniques, concepts, theories, traditions and social functions. Art practices contain rapidly developing contents, media and materials in technology to varying degrees. They are managed in galleries and museums by commissions in public sphere and cooperative or independent works mediating in visual or public environment. These activities are formed by various, broad, private, multiple or interdisciplinary media and presentation types such as painting, sculpture, installation, design, film and video, photography, web-based projects, performance, literature and script-based works.

Developments in modern art practices are presented in special art practices in fine art program or program module through the social relation of art practice and space project the relation of space and process. Thus, the reflections of knowledge and experience are combined by practices and processes. Searching for new ways of conception, questioning and exploring via conception and knowledge production are a special esthetic approach in art.

Higher education in fine arts presents a unifying approach for production, theory, critical reflections of professional practices, technical development and public indicators. Diversity is an apparent characteristic of fine arts education in Europe. The most remarkable point in here is that fine art programs continue to define special characteristics of their own structuring by concentrating on their education program approaches (Inter-Artes Handbook, 2008).

Thus, fine art students can become creative art practitioners. Students learn the importance of developing and maintaining their intellectual, theoretical and practical skills as well as professional applications and their imaginations in personal development. Students should define application areas, theories and relevant professional skills required for research and should become an active part of education. Fine arts education includes improvisational and traditional investigations focusing on working styles and creativeness.

Art is of vital importance for all society and art program plays an active role in forming necessary creative human capital. Art graduates can work as artists as well as build a career in the fields of art teaching, curatorship or art management, criticism or the relation of art with other fields.

Art studio constitutes a basis in art education and it's an important place where ideas are shaped. Art studio is a place reserved for personal works of students as well as shared with other student groups and used by everyone and its usage can be discussed with lecturers. Studio is a laboratory where students experiment and test their ideas and approaches to make mistakes and explorations. On the other hand, some students can form their own studio environments in advances levels. Applications included in fine arts education and works make joint contributions to the development of importance and quality of cultural experience. Artist-teacher plays an important role in fine arts program (Inter-Artes Handbook, 2008).

**Special skills** that are expected to be gained by fine arts students in their **first year** in accordance with proficiency criteria defined by European Union are as follows:

- Discovering and becoming familiar to the language, tools and materials of fine arts
- Understanding, being aware and having knowledge of broad theory, cultural and social context concerning

the applications in modern art and fine arts history

- Carrying out communication/organization and technical skills concerning art practices based on a professional working process
- Assessing critically his/her own works and the works of others

- Declaring and expressing his/her own ideas by means of appropriate visual, verbal and written instruments
- Developing an art practice including the production and exhibition of an art work
- Generating creative ideas, experimental methods, concepts, suggestions and solutions
- Developing a cooperative/independent discussion or investigation concerning his/her personal activities
- Showing conceptual and esthetic awareness and understanding the relation between viewers and artwork
- Forming a conceptual framework through which he/she can develop his/her own works
- Obtaining information about how to find his/her way in professional field (Inter-Artes Handbook, 2008)

On the other hand, **general characteristics** and **skills** defined within the context of fine arts qualifications are as follows:

- Improving fundamental research skills such as decision, analysis, synthesis, selection and summarizing that unifying the information on a critical basis
- Understanding and developing the knowledge of methods, concepts and theories in education field
- Using the reasoning methods for several complex situations or concepts by an appropriate way
- Having an active place in the works carried out in the working areas by art specialists
- Maintaining his/her works through unique and variable context
- Performing his/her learning tasks and workloads in an independent, professional and ethical way
- Having an active interaction with art consumers and developing his/her exhibition skills
- Carrying out his/her applications and works by using his/her ethic, economic, security and health applications information (Inter-Artes Handbook, 2008).

According to European Union ELIA competence criteria, fine arts students are expected to express themselves in written and verbal terms in addition to visual language in their **first year**. On the other hand, one of the fundamental skills that a fine arts student must gain is to combine his/her personal expression style with subjective visual styles and to express them in his/her works through appropriate materials and techniques. Although developing visual expression skills in arts education is always seemed as the first target, it's also important to the same degree for fine arts students to gain the skill to express their ideas both concerning their own works and art world in written and verbal form.

## 2. Results

Writing experiences of the research were carried out in the course of Workshop III of Erciyes University, Faculty of Fine Arts. Data of research were obtained through interviews and document analysis which are qualitative research methods. Interviews were made with eight (8) students participating in the course of Workshop III by using the interview form that can be found in Annex 1 and all interviews were recorded. The documents of research include writings of students of type of experimentation and report.

It was seen that general and specific skills that students have to gain at the education level of undergraduate of Turkey Fine Arts Education correspond the first academic year of the programs in the degree of Europe. It is thought that this situation was realized because of the reason that it was given place to basic arts education instead of workshop course in Turkish programs. For this reason, the first level criteria of European Fine Arts Undergraduate program was taken as base in determination of specific and general qualifications determined for course of Workshop III.

**Table 1: Student Personal Self Assessment Form for Painting Workshop III**

\*Measurement Tools used for course of Painting Workshop III in the Research (Written and verbal

expression)

Name and Surname of Student:	
Development / Improvement:	<p>What are the issues make you develop in your works during this semester and what are the issues that u-you feel you have self-developed?</p> <p>How well could you bring your needs and intentions together?</p> <p>Explain.</p>
Critical Analysis:	<p>Evaluate your work that you have offered in an attentive and impartial manner. In which ways you think that your work is analyzed?</p> <p>What are the imparting meanings of your choices and materials that you used? Such as tone, value, saturation, placement, relationship with audience etc. Explain.</p>
Planning:	<p>What were the strategies that you had developed during the stage of conclusion in exhibition of your works?</p> <p>What do you need to achieve success and ensure progress?</p> <p>Explain.</p>

Students are requested to express their thoughts about their works on personal evaluation forms based on verbal and written expression criteria and to make a verbal expression of fifteen minutes and then written expression of 600 words (approx. 2 pages) in my course program that I had prepared within the scope of course of Workshop III of Erciyes University, Faculty of Fine Arts in the academic year of 2010-2011. (You can find form 1, 2 and 3 in the following)

**Table 2: Painting Workshop III General Assessment Criteria (Written and verbal expression)**

Research and Information 40%	Concepts 40%	Presentation 20%
Compliance of content with the desired information	The get to the root of the information	Using clear and concise statements
Relationship between theory and context	Logical organization	Setting up an effective context (introduction, body conclusion paragraphs)
General perspective	An open discussion	High-quality analysis
	Independent own thoughts, comments	As long as necessary
	Association with information given in courses with sources.	Quotations and mentioning quotations
	Good analysis of the samples	Proper and multiple references

**Table 3: Application / Painting Workshop Arts Practice Assessment Criteria**

Verbal ability to express ideas 40%	Research and inquiry 40%	Contextual information and insight 20%
Being aware of relationship between method and material.	Using information given during the course in the area of application.	Ability to research methods and materials used by artists
Demonstrating an innovative approach about the interpretation of methods or materials.	Bringing method and material applications together by inquiring, skills and abilities.	Evidences of relationship between information in the area and own application.

After the applications, students were interviewed. Students were asked whether they had problems during verbal and written expression and they were asked to analyze the processes.

## Conclusion

The results according to data obtained from interviews and documents of the research are as follows:

- 80% of students participating in research could not express their thoughts about arts applications in their written statements.
- 80% of students think that verbal expression skills in explaining a concept of arts applications may help the development of written expression skills.
- 70% of students believe that they can write easily in issues which they had made a lot researches or they understand.
- 80% of students like to write research reports and 70% of them said that they like to write in type of experiments (descriptive).
- 90% of students believe in the necessity of writing their artistic process down.
- 90% of students do not believe that especially writing before the writing and verbal works can create positive contribution in artistic processes and they said that their ideas and thoughts have changed after verbal and writing works.
- 90% of students believe that writing skills and artistic creative production show parallelism.
- It was understood that 80% of students do not have a coherent writing experience before the courses.

All works which will be carried out to develop writing skills of fine arts students and contributions that their writing skills may add value to creating process has always been a matter of course open to debate. For example, Nolan explores the relationship of writings about the works of artistic writers with the general of arts in his article in which he examined writing characteristics of artists about their arts. The writer tells that he is interesting in a myopic philosophy of art requiring corrective lenses by writing these articles and criticizes the low profile of the comments of thinks over these kinds of articles.

In summary, as a result, it can be said that experiences of fine arts students participating in the study, in their own works and artistic processes may be believed to affect their creativity processes of ability of presentation in writing in a positive manner.

### **Annex 1 Interview Form -**

Applied before and after the activities.

- Is it necessary to explain your works verbally?
- Is it necessary to explain your works in writing?
- Explain your answers about both two cases with reasons.
- Does verbal expression affect your artistic creating process and how?
- Does written expression affect your artistic creating process and how?
- Did you ever explain your works that you had been carried out before this course verbally? Explain.
- Did you ever explain your works that you had been carried out before this course in writing? Explain.
- Does talking about your works seem hard to you or writing about them? Can you please write the degree of difficulty from one to ten of both two activities?
- What types of writing do you know? Do you have a font type that you feel yourself successful?

# A study on multiple linear regression analysis

Gülden Kaya Uyanık <sup>i\*</sup>, Neşe Güler <sup>ii</sup><sup>i</sup> Sakarya University, Hendek Education Faculty, Department of Educational Sciences, Sakarya, Turkey<sup>ii</sup> Sakarya University, Hendek Education Faculty, Department of Educational Sciences, Sakarya, Turkey

---

## Abstract

Regression analysis is a statistical technique for estimating the relationship among variables which have reason and result relation. Main focus of univariate regression is analyse the relationship between a dependent variable and one independent variable and formulates the linear relation equation between dependent and independent variable. Regression models with one dependent variable and more than one independent variables are called multilinear regression. In this study, data for multilinear regression analysis is occur from Sakarya University Education Faculty student's lesson (measurement and evaluation, educational psychology, program development, counseling and instructional techniques) scores and their 2012-KPSS score. Assumptions of multilinear regression analysis- normality, linearity, no extreme values- and missing value analysis were examined. The data that verify the assumptions were analyzed with multiple regression and lessons measurement and evaluation, instructional techniques, counseling, program development and educational psychology were estimate the KPSS respectively.

*Keywords:* Multiple Linear Regression educational sciences, KPSS

---

## 1. Introduction

Regression analysis is performed so as to determine the correlations between two or more variables having cause-effect relations, and to make predictions for the topic by using the relation.

Answers are sought in this research to questions such as “are there any relations between dependent and independent variables?”, “if there are any relations, what is the power of the relation?”, “is it possible to make future-oriented predictions regarding the dependent variable?”, and “if certain conditions are controlled, what influences does a special variable or group of variables have over another variable or variables?” (Alpar, 2003).

The regression using one single independent variable is called univariate regression analysis while the analysis using more than one independent variable is called multivariate regression analysis (Tabachnick,1996, Büyüköztürk, 2002). Through univariate regression analysis, the relations between a dependent variable and an independent variable are analysed, and the equation representing the linear relations between the dependent and

\*Tel: +905545856264, E-mail: guldenk@sakarya.edu.tr

the independent variables is formulated. The regression models with one dependent variable and more than one independent variable, however, is known as multivariate regression analysis (Köksal, 1985; Tabachnick, 1996; Büyüköztürk, 2002).

In multivariate regression analysis, an attempt is made to account for the variation of the independent variables in the dependent variable synchronically (Ünver & Gamgam, 1999). Multivariate regression analysis model is formulated as in the following;

$$y = \beta_0 + \beta_1x_1 + \dots + \beta_nx_n + \varepsilon$$

*y = dependent variable*  
*X<sub>i</sub> = independent variable*  
*β<sub>i</sub> = parameter*  
*ε = error*

The assumptions of multivariate regression analysis are normal distribution, linearity, freedom from extreme values and having no multiple ties between independent variables (Büyüköztürk, 2002).

The sample data used in the research were obtained from the end-of-the-term scores received from the measurement and evaluation, educational psychology, curriculum development, guidance, and teaching methods courses in the fall semester by 240 undergraduate students studying in the departments of Psychological Counselling and Guidance, Turkish Education, and Science Education of the Educational Faculty of Sakarya University in the 2011-2012 academic year as well as from the scores received from the KPSS exam (state employees selection examination) in 2012. Through the multiple linear regression analysis, it was checked whether or not the five independent variables in the standard model were significantly predictive of the KPSS score, which was the dependent variable, according to the ANOVA statistics.

## 2. Method

This is a descriptive study analysing whether or not the five independent variables in the standard model (namely, end-of-the-term scores received from the courses measurement and evaluation, educational psychology, curriculum development, guidance, and teaching methods) were significantly predictive of the KPSS score- the dependent variable- based on the ANOVA statistics.

### 2.1. Research Data

The research data were composed of the end-of-the-term scores received from the measurement and evaluation, educational psychology, curriculum development, guidance, and teaching methods courses in the fall semester by 240 undergraduate students studying in the departments of Psychological Counselling and Guidance, Turkish Education, and Science Education of the Educational Faculty of Sakarya University in the 2011-2012 academic year as well as the scores received from the KPSS exam (state employees selection examination) in 2012.

## 2.2. Data analysis

Firstly, the availability of the lost data was checked in the research through frequency analysis. Then, multivariate normality, linearity, freedom from extreme values, and multi-linear relation- the assumptions of multiple regression analysis- were analysed.

Prior to multivariate normality analyses, univariate normality assumption was analysed for each quantitative variable. In order to do this, the skewness coefficient and kurtosis coefficient, and histogram charts were examined.

For the multivariate linearity assumption, scatter diagram matrix was prepared.

In order to check the unidirectional extreme values, it was checked whether or not the Z scores of the variables were in the  $\pm 3$  range. So as to check the multidirectional extreme values of the data, the Mahanobis distances were used.

So as to see whether or not there were any multiple ties, the simple correlations, variance increase factors (VIFs), tolerance value and the condition index (CI) were examined.

Through the data which was analysed so as to see whether or not they satisfied the assumptions and which were cleared for this purpose, the linear regression analysis was performed.

## 3. Results

Firstly, the data were analysed for convenience for regression analysis. For this purpose, following the missing data analysis, multivariate normality, multivariate linearity, freedom from extreme values, and ties between independent variables were researched, respectively.

For the analysis of the lost data, the data were analysed descriptively, and it was found that there were no missing data. The related findings are shown in Table 1.

Table 1. Frequency Table for Missing Data

	Measureme nt	Edu.psyc.	Teach.Meth.	Guidanc e	Curric.Dev.	KPSS
Being	240	240	240	240	240	240
Missing	0	0	0	0	0	0

Prior to multivariate normality analyses, univariate normality was analysed for all of the quantitative variables. In order to examine the univariate normality assumptions, the skewness coefficient and kurtosis coefficient of the variables were analysed.

Table 2. Descriptive Statistics

	N	Skewness		Kurtosis	
		Statistic	Std. Error	Statistic	Std. Error
Measurement	238	.028	.158	-1.327	.314
Educ.Psych.	238	-.046	.158	-.746	.314
Inst.Methods	238	-.141	.158	-1.258	.314
Guidance	238	.059	.158	-1.396	.314
Curri.Develop.	238	.146	.158	-1.343	.314
KPSS	238	-.053	.158	-.728	.314

According to Table 2, since the skewness coefficients for all the variables are within the acceptable  $\pm 1$  range, the variables may not be said to be skew. An examination of the kurtosis coefficient obtained for the variables in the table shows that the kurtosis coefficients calculated for the variables apart from educational psychology and KPSS are outside the  $\pm 1$  range. In examining the normality premise, skewness values are more important (Büyükoztürk, 2002), and because the kurtosis coefficient does not differ greatly from the normal, this variable may be said to distribute normally. The normality premise of the variables could also be shown by drawing a histogram chart.

For the multivariate normality and linearity assumption, the scatter diagram is examined for each group. Figure 1 shows the scatter diagram matrix for all the groups.

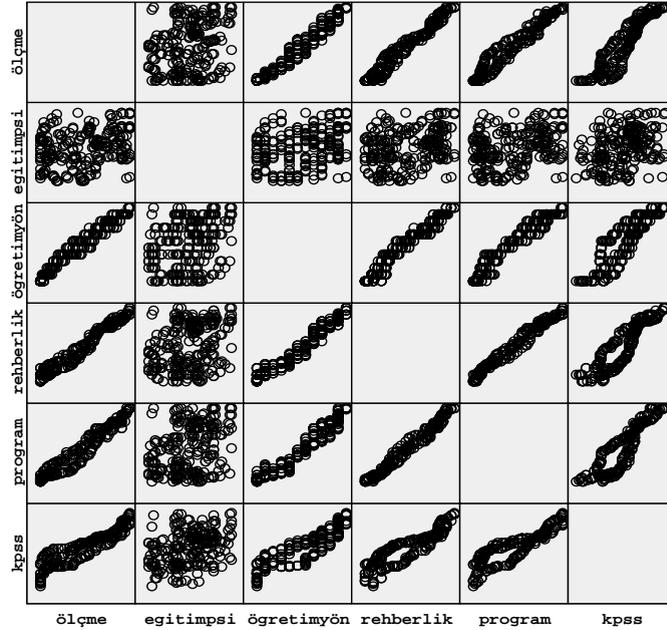

Figure 1. Scatter Diagram Matrix

On examining the scatter diagrams in Figure 1, it may be said that the diagrams are almost elliptic in shape.

Having examined the data so as to check the multidirectional extreme values by using the Mahanobis distances (for  $df=4$ ,  $p=0.01$ ,  $\text{Chi-square}= 13.2767$ ), person 31 and 21 were excluded from the analysis.

So as to see whether or not there were any multiple relations between variables, the simple correlations, variance increase factors (VIFs), tolerance value and the condition index (CI) were examined. The findings concerning these values are shown in Table 3 and Table 4.

Table 3. Multiple Relations Coefficients

	<i>B</i>	<i>Std. Error</i>	<i>Beta</i>	<i>t</i>	<i>p</i>	<i>Zero-order</i>	<i>Partial</i>	<i>Part</i>	<i>Tolerance</i>	<i>VIF</i>
<i>Constant</i>	163.350	25.580		6.386	.000					
<i>Curr.Dev.</i>	6.606	1.471	1.642	4.491	.000	-.171	.283	.254	.124	1.821
<i>Measure</i>	3.449	1.291	.889	2.671	.008	-.210	.173	.151	.229	4.678
<i>Educ.Psy</i>	1.174	.315	.226	3.730	.000	.187	.238	.211	.872	1.147
<i>Inst.Meth.</i>	-5.915	1.167	-1.479	-5.069	.000	-.263	-.316	-.287	.138	6.644
<i>Guidance</i>	-5.641	1.870	-1.340	-3.016	.003	-.219	-.194	-.171	.116	6.780

When the simple correlations are examined, it is seen that none of the correlations coefficients are higher than .80. This case points that there is not any multiple relations between variables. If variance increase factors (VIF) equal or higher than 10, there is a multiple relations between variables and when looking at the Table 3, it can be seen that VIF values for all variables are smaller than 10. In addition to these, if tolerance values are higher than .10, no multiple relations between variables is decided. When examining the Table 3, all tolerance values are higher than .10. In Table 4, it can be seen condition indexes (CI).

Table 4. Multiple Relations CI Values

Model	Factors	Eigenvalues	Condition Index	Variance Ratios					
				Constant	Curr. Dev.	Meas.	Edu.Psy.	Ins.Meth.	Guidance
1	1	5.912	1.000	.00	.00	.00	.00	.00	.00
	2	.066	5.457	.10	.00	.00	.18	.00	.00
	3	.018	8.293	.72	.00	.00	.78	.00	.00
	4	.002	12.053	.01	.26	.10	.02	.32	.04
	5	.001	19.992	.02	.03	.80	.00	.67	.00

---

6	.001	22.271	.15	.70	.10	.02	.01	.96
---	------	--------	-----	-----	-----	-----	-----	-----

---

In cases when the CI is bigger than 30, it is regarded that there are multiple relations between variables. Yet, as is clear from Table 4, all of the CI values calculated are smaller than 30. Thus, it was concluded that there were no multiple relations between variables.

With the data which were analysed whether or not they satisfied the assumptions and which were cleared accordingly, the regression analysis was done.

The findings obtained by doing the multiple linear regression analysis concerning whether or not the five independent variables in the standard model predicted significantly the KPSS score - the dependent variable- according to the ANOVA statistics, and the degree of emerging model's predicting the dependent variable in consequence of the standard regression, and the degree of the model's explaining the variance in the dependent variable are shown in Table 5.

Table 5. Multiple Linear Regression Analysis Results Related to KPSS Scores

Variables	B	SH <sub>B</sub>	$\beta$	T	p	Paired-r	Partial
Constant	9.811	2.261	-	4.340	.000	-	-
Measure.	1.157	.114	1.421	10.136	.000	.924	.554
Edu.Psyc.	.090	.028	.082	3.230	.001	.348	.207
Ins.Meth.	-.339	.103	-.404	-3.291	.001	.884	-.211
Guidance	-.195	.165	-.221	-1.181	.239	.894	-.077
Curri.De.	.078	.130	.093	.604	.547	.891	.040
		R=0.932	R <sup>2</sup> =0.87	F <sub>(5,232)</sub> =306.534	p= 0.00		

---

An examination of Table 5 makes it clear that the five independent variables in the standard model are significantly predictive of the dependent variable KPSS score according to the ANOVA statistics [F(5, 232)= 306.534, p< .05] . In consequence of the standard regression analysis, the model's degree of predicting the dependent variable was found to be R= .932. The model's degree of explaining the variance in the dependent

variable was  $R^2=0.87$ . Looking at these coefficients, it may be said that the model predicts the dependent variable very well.

The absolute value of  $\beta$  (Beta) in Table 5 indicates the order of importance of the independent variables. The variable with the highest  $\beta$  value is relatively most important independent variable. On examining the contributions made by the independent variables in the model to the model, it was found that the end-of-the-term-scores received from the measurement and evaluation course made the biggest contribution with the value of ( $\beta= 1.421$ ). It was followed by the scores received from teaching methods, guidance, curriculum development, and educational psychology courses, respectively. Although the contributions made by the scores received from guidance and from curriculum development were significant, they entered the model due to the property of the regression analysis, and they were found to make the smallest contributions to the model with their determination coefficients of .221 and .093, respectively.

Based on the regression analysis results, the regression equation was obtained as it is shown below:

$$\text{KPSS} = 9.811 + 1.157 \text{ Measurement} + 0.090 \text{ Educational Psychology} - 0.339 \text{ Teaching Methods} - 0.195 \text{ Guidance} + 0.078 \text{ Curriculum Development.}$$

#### 4. Conclusions

This study analyses whether or not the five independent variables in the standard model (namely, end-of-the-term scores received from the courses measurement and evaluation, educational psychology, curriculum development, guidance, and teaching methods) were significantly predictive of the KPSS score, the dependent variable, based on the ANOVA statistics. The primary aim of the research is to exemplify the multiple linear regression analysis with its stages.

For our purposes, the end-of-the-term scores received in the measurement and evaluation, educational psychology, curriculum development, guidance, and teaching methods courses in the fall semester by 240 undergraduate students studying in the departments of Psychological Counselling and Guidance, Turkish Education, and Science Education of the Educational Faculty of Sakarya University in the 2011-2012 academic year were analysed for the power of predicting the KPSS scores. Firstly, the assumptions necessary for the multiple linear regression analysis were examined in the research, and the regression analysis was performed with the data which were thought to satisfy the assumptions. The standard model's degree of predicting the dependent model was found to be  $R=0.932$ . The model's degree of explaining the variance in the dependent variable was  $R^2=0.87$ . Looking at these coefficients, it may be said that the model predicts the dependent variable very well. On examining the contributions made by the independent variables in the model to the model, it was found that the end-of-the-term-scores received from the measurement and evaluation courses made the biggest contribution with the value of ( $\beta= 1.421$ ); which is followed by the scores received from teaching methods, guidance, curriculum development, and educational psychology courses, respectively.

In consequence, it might be recommended that similar research studies concerning determining the variables predictive of the scores received in KPSS - which is a hurdle that prospective teachers should overcome before starting their career after graduation from educational faculties – should be conducted with different variables and with larger samples.

## Abstract

In this research, whether the questions in University Entrance Exam (OSS) and the questions asked to students during the exams in schools coincide or not has been investigated. This study is a qualitative one. Samples of the research are 55 students from 3 different classrooms in 11<sup>th</sup> grade, in the 2011-2012 education years in Mahmutbey High school. The data of the research has been gathered by application of the determinant questions of the previous years' University Entrance Exam (OSS) and the course books to the students. This study shows the performance of the students during the exams. Research also covers the accordance of determinant questions in the previous University Entrance Exam (OSS) and the exercises in the course books which has the approval of Ministry of Education (MEB). Students are asked to answer 10 questions and the data acquired has been analyzed by researchers. As a result of the survey, it has been seen that the students were more comfortable while answering the multiple choice questions and had difficulties with the classic questions. It has been seen that the questions in the MEB approved books and the OSS questions of previous years are consistent. Although the questions are consistent, the reasons why the students are more successful in the multiple choice questions rather than the classical questions have been investigated. Especially in the written exam, it has been seen that students had problems with the questions where they had to calculate the determinant, having the knowledge of logarithm and triangle rules. It has been detected that the majority of the students were unable to answer these two questions.

## 1. Introduction

When the secondary school's studies on the linear algebra has been analyzed, the Ercerman (2008), the majority of the student's knowledge on the linear algebra, in the context of the conceptual and procedural information is being, inconsistent, incomplete, and that are the complementing information and has determined that the operational information has the weight of. However, the Oktac (2008), did not see enough importance on the linear algebra topics during the secondary education by comparison with the other areas of the mathematics and stating that the processed is shorter and less content of those are being representing (Aydin, Delice, Kardes 2011). Linear algebra is an abstract field of mathematics which was used to introduce MA and PhD levels in Turkish Universities until 1960. After that it has been lectured at undergraduate level. The importance of linear algebra topics can be discussed in two dimensions. The first one is the applications of linear algebra not only to mathematic departments but also to other departments of faculties of arts and science, engineering faculties and

\* Corresponding author. Tel. : +902123834330 ; fax: +9002123834314.

E-mail address: aygor@yildiz.edu.tr

even social sciences. And the second one is creating a base for abstract lectures which is introduced in the sophomore year. Since Linear algebra course is one of the most important subjects of mathematics, which are the basis of abstract algebra, students are required to learn them at a higher level (Ozdogan & Aygor, 2011). The objective of the Linear Algebra course is to enable the students to create the mathematical proof in their minds. The Student's intuitive dimensions on the Linear Algebra are to explain the mathematical relationship between the cause and the effect. These should be given in the first half or within the two-thirds of the courses. It is also important, in terms of similarity of movements of mathematicians before the 1850's. (Uhlir, 2002). As the use of linear algebra have a wide field of the application and the mathematics education employees have been effective to make a number of studies in this area. However, as almost no work has been done on the educational aspect of these courses in our country, the textbooks of which was written in Turkish or been translated to Turkish are that either very few or inadequate. The studies in Linear Algebra field are; a) The historical researches to develop new programs, and to reveal some of the reasons of the student's learning difficulties, b) Aiming at balancing the use of geometry in the linear algebra and to make researches in the cognitive flexibility, on the issues such as the formal structure of the linear algebra, c) To be classified as the evaluation of the teaching of the Linear Algebra by the software programs (Aydin, 2009). The basic causes of the students who are living the learning disabilities in the linear algebra, is that the students are not thinking in abstract, enough even though the linear algebra has an abstract form, the linear algebra has an axiomatic character and the students has been listed in the poor knowledge math basis "(Tatar, 2006). The conceptual exercises and the introduction of the types of the exploratory concepts enable the understanding of the linear algebra in the abstract form. The elaboration of this course is to teach on the basic concepts, rather than the concrete examples and by this course the Linear Algebra is quite easy to build a relationship basis. The Linear algebra has a powerful form of the self-expression, and is open to all the students; the need to be done via the algebra teachers is to guide their students in transfers as it was guided to themselves. However, a lively and accessible approach makes this course vivid and useful. This new approach that has been brought by Uhlir to the teaching field of the linear algebra has been seen in the linear algebra textbook that presents itself as wrote (Uhlir, 2002) "(Aydin, 2009).

Determinants are a major issue in the High school 11<sup>th</sup> class math program in Turkey. There are difficulties experienced in learning and teaching of this subject. It is observed that determinant subject is handled very abstract in schools and some learning difficulties appear caused of this situation. Harel focused on the reasons of learning difficulties of students about basic concepts of linear algebra and how a way should be followed to resolve this situation, in a research he made in 1989. It is expressed that's the first reason of these difficulties is that the terms are abstract, the second is that application areas are unusual for students and the third is that most of the students don't know proof methods yet.

At the various levels of the education, in our country, for the students who wish to pursue their education in a further education institution, an examination is carried out with the purpose of the selection and placement by the Center. These exams are made to measure of the student's achievement, ability, or the level of readiness expected and for this purpose a measuring is often carried out by some quality selection exams. The vast majority of tests is done by the Student Selection and Placement Center (OSYM) in Turkey, (Deniz & Kellecioglu 2005). Basturk, in his work of 2011 "Negative reflections of preparation process to the university entrance exam on students' mathematics learning" named work is stating that for the students, the University Entrance Examinations are held either at the end of the high school or enter the examinations when they graduate. However, due to the existing race, the exam preparation starts within the lower grades. In this way and without having a good math infrastructure, the students are facing with many practical ways. Therefore, the high school teachers, should not rush in making short and quick ones, in particular, and without fully adopted of the long method by the students, had been proposed.

The written exams, problem solving and organizing the problems, to produce new and original ideas and monitoring the information and the assessment feedback, and to analysis the ideas for measuring behavior and the alike, it is considered to be the most appropriate test type (Tan and Erdogan, 2004). The teachers and the

students are accustomed to this type of exams and are used in all levels of educations starting from the primary school levels. The respondent which is being applied to this question of the multiple-choice tests should read the expected questions carefully and to decide on the correct answer and do reflect accordingly by tagging the option. There is no freedom of answering multiple-choice tests. The answers are limited by the options (Ozdemir, 2008).

The textbook, "is either a selected book or had been prepared in relation to the teaching of a course" or "Specifically measured and reviewed according to a particular school, class and course and been recommended as a basic reference book for the students and the teachers "(Oguzkan, 1993, 83). A textbook includes the tested and verified information (Kula, 1988, 98). As can be seen, the teaching textbooks has significant effects on what the students can learn and what do teachers may teach (Semerci, 2004)

## 2. Research

The samples of this study, during the academic year of 2011-2012, has been included the students of the Mahmutbey High School and as of 55 students from various three classes of the eleventh grades. In this study and on the determinant subjects, the questions used in school exams and in the university entrance exams overlapping had been investigated. To do this, under the supervision of a math educator's and in accordance with the opinions of a high school math teacher's, 5 multiple-choice questions and five classical problems which were in question of the 11th year's math textbooks of the National Education Grade and also were out in the OSS exams, a total of 10 questions, were asked to the students to answer. In the process of the preparing for the exam, firstly in relating to the determinants and on the gains of which were in the math programs and the mathematical textbooks, were studied. The reason of the application of the formal examination was; in what matters the students were in the lack of knowledge and to be able to observe where they were in the errors. Because the students were used to the techniques of the tests and although the answer on how to do was nameless, they can access to the correct answer by approaching to the answer choices. The exam's time were set at 50 minutes.

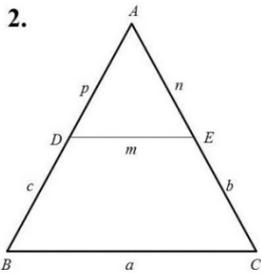

### 2.1. Problem used in research

In order to obtain the data of this study, the following questions were provided for the students. The examination had been prepared, in order to measure the students' knowledge about the determinants and therefore a five multiple-choice questions and the classical five questions were asked as a consist of a total of 10 questions. The reason for the formation of the multiple-choice questions and as well as of the classics; to become able to observe that on what type of exams, the students were more successful, and on what matters they were in the lack of the information and where their errors were.

#### 2.1.1. Multiple-choice questions

1. Determine the value of  $a$  for which the matrix  $\begin{bmatrix} 1 & 3 & 5 \\ 3 & 0 & 7 \\ 1 & 3 & a-9 \end{bmatrix}$  is not invertible.

- A) 15    B) 14    C) 11    D) 6    E) 5

2. According to figure at the left,  
 $|DE| \parallel |BC|$  and  
 $a, b, c$  are the lengths of  $ABC$ 's sides and  $m, n, p$  are the lengths of  $ADE$ 's sides.

Evaluate the determinants of  $\begin{vmatrix} 1 & 2 & 3 \\ m & n & p \\ a & b & c \end{vmatrix}$

- A) 6 B) 3 C) 2 D) 1 E) 0

3. Evaluate the determinants of  $\begin{vmatrix} 99876 & 99877 \\ 99874 & 99875 \end{vmatrix}$

- A)  $(99870)^2$  B) 99872 C) 99882 D) 4 E) 2

4. Find the slope of line  $\begin{vmatrix} x & y & -3 \\ 2 & 1 & 0 \\ -3 & -2 & -1 \end{vmatrix} = 5$

- A) 1 B)  $\frac{1}{2}$  C) 2 D)  $\frac{1}{3}$  E) 3

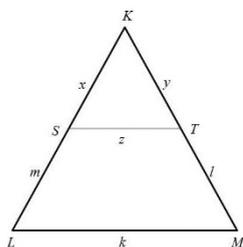

5. Evaluate the determinants of  $\begin{vmatrix} \log_2 8 & \log_4 5 \\ \log_5 4 & 1/\log_{27} 3 \end{vmatrix}$

- A) 10 B) 9 C) 8 D) 6 E) 5

2.1.2 Classical questions

1. Determine the value of  $k$  for which the matrix  $\begin{vmatrix} 1 & 2 & -3 \\ 1 & -3 & -1 \\ -1 & 3 & k+2 \end{vmatrix}$  is not invertible.

2.

According to figure at the left,

$$|ST| // |LM| \text{ and}$$

$k, l, m$  are the length of  $KLM$ 's sides and  $x, y, z$  are the length of  $KST$ 's sides.

Evaluate the determinants of 
$$\begin{vmatrix} 3 & x & m \\ -2 & y & l \\ 1 & z & k \end{vmatrix}$$

3. Evaluate the determinants of 
$$\begin{vmatrix} 3726 & 3727 \\ 3724 & 3725 \end{vmatrix}$$

4. Find the slope of line 
$$\begin{vmatrix} x & y & 1 \\ 2 & -3 & 5 \\ -1 & 2 & 0 \end{vmatrix} = 3$$

5. Evaluate the determinants of 
$$\begin{vmatrix} \log_5 6 & \log_3 9 \\ \log_4 16 & \log_6 5 \end{vmatrix}$$

## 2. Findings

The findings of the study were evaluated as qualitatively. This research is composed of two types of questions, as the classic and testing. A similar sort of questions has been selected for both of the question types. The objective of this is to measure in which way the students were more successful in the exam. Depending on the option chosen by the student, the test question would be either as a right or wrong answer. Also, the element of the luck, plays a role in the test method exams. In the classical tests, while the student solves the question, may start from the right but can result to improper handling or may stop in the middle of the process, or may solve the question correctly. In the classical tests, it can be seen more comfortable that which of the issues were known and what issues had not been discovered yet, by the students. Thus, by comparing of these two exams, it can easily be discovered that either the students really learned the subject or not. On the basis of the class, the student's answers given to these classical questions are; in the form of the true, false, empty and incomplete solutions. However, the answers to the test questions are grouped as true, false and empty and transformed into the form of the solution table. And as acknowledged from the following tables, each of the three class' students was more successful in the test questions.

**Table1.** According to the classes, the number of true, incomplete, blank and false answers in classical questions

Questions	Class A			Class B			Class C		
	T	IC	F	T	IC	F	T	IC	F
1	30	7	11	32	5	10	20	11	8
2	5	10	17	7	8	25	2	6	20
3	25	9	16	28	10	7	18	10	13
4	8	10	25	9	11	25	5	4	25
5	6	8	22	8	10	20	4	4	18

**Table 2.** According to the classes, the number of true, false and blank answers in multiple-choice questions:

Questions	Class A			Class B			Class C		
	T	F	B	T	F	B	T	F	B
1	40	10	5	43	6	6	35	20	-
2	20	29	6	22	24	9	10	27	18
3	42	10	3	45	8	2	25	14	16
4	23	25	7	25	22	8	11	30	14
5	21	25	9	26	20	9	8	25	22

As can be seen from the above tables, all of the students participating in the survey of the classical questions were being forced during to solve the 2nd, 4th and the 5th questions. The reasons that they were being forced were the determinant question issues were contained the logarithm and the geometry.

question by the wrong way. A number of students could not imagine to seek the benefit from the similarity of triangles and had tried to directly calculate the value of the determinant. This question that was prepared as the subject of geometry and the determinant as had been mixed and the difficulty was, in bringing together of these two subjects, were for the students.

Answer of Student C for 3<sup>rd</sup> question:

3.  $\begin{vmatrix} a & b \\ 3726 & 3727 \\ c & d \\ 3724 & 3725 \end{vmatrix}$  determinantının değeri nedir?

$$ad - cb = (3726 \cdot 3725 - 3727 \cdot 3724)$$

$$= \dots$$

This question can be solved very easily by using the properties of the determinant. The students calculated the determinant directly, because they did not know this feature. Some of the students made the same mistake as well as the student C's paper that the figures were larger and either could not do the multiplication and also could not find the result.

Answer of Student D for 4<sup>th</sup> question:

4.  $\begin{vmatrix} x & y & 1 \\ 2 & -3 & 5 \\ -1 & 2 & 0 \end{vmatrix} = 3$  doğrusunun eğimini bulunuz.

$$x - y = 1$$

$$2x - 3y = 5$$

$$-5y + 4 - 3 - 10x$$

$$-10x - 5y + 1$$

The student D had been solved the determinant correctly, but he cannot find the slope, because he has a lack of knowledge geometry. Most of the students in this question were unable to make a combination of these two issues and had responded the question in wrong way.

Answer of Student E for 5<sup>th</sup> question:

5.  $\begin{vmatrix} \log_2 6 & \log_2 9 \\ \log_4 16 & \log_6 5 \end{vmatrix}$  değeri nedir?

$$\begin{vmatrix} \log_2 6 & \log_3 3^2 \\ \log_4 16 & \log_6 5 \end{vmatrix} = \begin{vmatrix} \log_2 6 & 2\log_3 3 \\ 2\log_4 16 & \log_6 5 \end{vmatrix}$$

$$= \begin{vmatrix} \log_2 6 & 2 \\ 2 & \log_6 5 \end{vmatrix} =$$

The student E was also inconclusive, because he did not know the rules of logarithms very well. As it was created by combining the two issues in the question, and again, some of the students had been good knowledge on the determinants but not in the logarithm and could not solve any problems related to the logarithm in the question correctly. Another part of the students, even though they were aware on the subject of the logarithms, of whom that they do not know on the subject of the determinant had been solved the question in the wrong way.

#### 4. Conclusions and Recommendations

According to the research that had been done by Başturk in 2011, from the primary education to the highest level, almost all the entrance examinations are being done by the multiple-choice questions, in our country. The quickly evaluation of these examinations which were done by these questions and especially in cases where the number of candidates are large, is a specialty sought. At the same time to be objective evaluations on these examinations had brought the feeling of confidence by the community (Baker, 2001; Dillon, 2004). By the effects of the entrance examinations and at the every stage of the primary and the secondary educations, these multiple-choice tests are being used in the courses and at the assessments. On the mathematics teaching, the student's expressions to be given in writing and with the reasons, has an important place in learning. Unfortunately, it is impossible to provide this via the multiple-choice tests. By these types of the questions, the student's ways of thinking and the ways of solutions cannot be valuated.

Durmuş (2004), in his study, had been determined that if a subject's question is not being asked during the OSS examinations or the request to be just a little question, has negative impact on the motivation of the students and that also raises the index of the difficulty. Tall, (1993) in order to identify the learning difficulties in the mathematics had remarked that there were some different studies going on and for the reasons of the difficulties in these studies that had been referred to the "Lack of the knowledge on the basic mathematics" and "Not being able to compile the verbal expressions, to the mathematical symbols" and "The lack of knowledge in Algebra, geometry and trigonometry to connect". Similarly, Kacar and Tuna (2005) has expressed that the students who are coming to the universities in short knowledge would be negatively affected in the implementations of the programs and would live difficulties (Gurbuz, Toprak, Yapici, Dogan, 2011).

Yenilmez and Cimen (2012), in their study's subject had stated that the students are not focusing on the understanding of the concepts and learning, instead their efforts were focusing on the achievement of the examinations. If these difficult issues weight to be increased in the university entrance examinations than the interest and the motivation of students will be increased on those issues too.

When our examinations are considered it is concluded that the students are more successful in the test examinations than the conventional tests. The textbooks, although they had been created that in both, for the university entrance examinations and conceptual figure so as to permit the students to be more successful in the test examinations is intended towards the education with to be in line of the university entrance examinations. As can be seen from the tables, the students that they have failed in the classical questions and in which the questions were particularly by low success of the 2, 4 and 5 questions. Within the process of the determinant, in the second and fourth questions where the concept of the geometry has passed were difficult for the students. The students also needed information on the geometry, in order to solve the question. Although knowledge on the determinants had been for some students, but due to the lack of the knowledge of geometry and in part, while those who have knowledge of the geometry, but in the lack of knowledge on the determinants had been caused for them not being able to solve the question of the determinants. On the fifth question, where in the determinant process occurrence were, in the concept of the logarithms had become difficult to the students. The students also needed knowledge about logarithms to solve the question. In this question, some of the students could not solve the question due to the shortcomings of the determinant knowledge and some of the other students were on the

shortcomings of the logarithms information. In the test questions of the 2, 4 and 5 as of the classical examination questions and although had been in the same type of question, the achievement of the students were higher than the test examinations. The reason of this is; some of the student's to reach to the correct answer by using the answering choices and some of the students do remember the path of the solution by seeing the answers and some of the students, even without knowing the correct answer, are marking the correct answer by the chance of.

In this study; within the types of the questions that had been asked by combining the two issues, if the students have a lack of knowledge, the questions were remained unsolved. These types of questions had proved that can be solved easily if the student is fully equipped. The problems had been faced by the students were the processing error, being closer the logic of the test in solving, and the lack of information and also been observed as misconceptions. The causes of the students to fail had been recognized as they are preparing themselves for the multiple-choice examinations and also they are not used to solve the classical method questions and therefore they do more errors.

The multiple-choice examinations, although is applied as the university entrance examination, this examination cannot provide the information's retention. At the same time the student's ways of thinking and the preferred solutions cannot be seen by this type of examinations. Therefore, we suggest to the teachers that, not only to prefer to focus on the OSS examination tests and regarding to the retention of the information, also to practice on the conventional examinations. On the mathematics education and while the teachers are teaching, to use a long way to ensure that the students may understand the topics, instead of memorizing the rules and make them to be aware of on why and how it is by standing on the questions and ask to the students in the written examinations that the answer of the questions to be explained and that is important regarding to the retention of the information.

## Abstract

This study was designed to identify the effects of gender, mother's and father's educational level on the intelligences of kindergarteners from different socioeconomic backgrounds. The population of the study included six-year-old kindergarteners from independent kindergartens and the preschool classes of elementary schools attended by children from different socioeconomic backgrounds in Viranşehir, Şanlıurfa. The study sample comprised a total of 208 six-year-old children attending a kindergarten and three elementary schools which were presumed to represent the lower, middle and upper socioeconomic status and selected randomly from among the schools in the population. Data were collected by using a Demographic Information Form and the Teele Inventory of Multiple Intelligences (TIMI). These data were by using One-Way and Two-Way Analysis of Variance (ANOVA). The results showed that socioeconomic background create a difference in children's multiple intelligences.

*Keywords:* Preschool education, kindergarten, socioeconomic background, multiple intelligences;

## 1. Introduction

Ways to be more successful in education have always been discussed by scientists. Studies on how the brain works have shed light on meaningful and permanent learning. Early studies focused on the extent to which brain functions can be used and on measuring intelligence (Köroğlu and Yeşildere, 2004).

Intelligence was long thought to include one single factor. However, nowadays it is widely accepted that it includes multiple cognitive skills and abilities. Thus the belief that multiple abilities cannot be explained by one single construct (Çakan, 2002). In addition, as a result of the developments in education and psychology, the view that classical tests are not enough to evaluate children and that their potential also started to gain ground.

The Multiple Intelligences Theory, which emerged under these circumstances, holds an important place in education in terms of pinpointing what individuals are able to do (Abacı and Baran, 2007; Köroğlu and Yeşildere, 2004). This theory opposes an IQ-based approach to human intelligence, emphasizes that intelligence is multi-dimensional, asserts that individuals have different learning styles, puts the individual in the center, and pinpoints the importance of individual differences (Köksal, 2006; Ergül et.al., 2007). This theory centralizes individual learning styles, interests, abilities and inclinations (Vural, 2004).

The Multiple Intelligences Theory first appeared in 1983 in Howard Gardner's book titled "Frame of Mind" outlining seven different intelligences (Amerson, 2006; Çuhadar, 2006). According to Gardner, different kinds of intelligences are effective tools people use to live, learn, solve problems, and be humans. Although intelligence is shown to have different dimensions, these dimensions have similar structures and traits (Mendi et. al., 2004).

According to Gardner, human beings genetically have all of these intelligences. Research findings show that differences in children's intelligences appear not only due to hereditary and biological factors but also due to their nourishment, and environmental and cultural factors (Radin, 2008).

Environmental factors cover the environment within which the child lives. From the moment a child is born, he starts gaining experience within his society and is exposed to the opportunities presented by the sociocultural environment and his family (Üstün, 2004). In order to enhance children's existing potential, environments to meet their interests and needs. Their environments should be enriched with various fields of experience.

Family, like in other developmental areas, has a crucial and determining role in a child's mental development. Therefore, the role of a kindergartener's home environment cannot be overlooked. Lack of materials at home due to the family's low socioeconomic status (not being able to buy musical instruments, for instance), the quality of the place lived in (the possibility of having high naturalistic intelligence for children living in villages), the family's effect on an individual's choices (forcing a child who wants to become a painter to instead become a doctor) and the structure within the family (nuclear or extended family) may all have an effect on an individual's fields of intelligence (Saban, 2004).

Especially in the first five months of a baby's life, the capacity to learn increases quickly owing to the fast development of the brain and the nervous system, thus making environmental stimuli crucial for cognitive development (Kağıtçıbaşı, Bekman and Sunar, 1993, p.29). Rather than heredity, the experiences that the individual gains later in life play a crucial role for the brain to execute these functions. Therefore, it is of utmost importance to present children with an environment full of rich stimuli during pre- and elementary school. The more objects (stimuli) encountered, the more connections are formed between brain cells. These form the basis of learning in adulthood (Gürkan, 2003). Therefore, teachers should take into account individual differences in learning and organize the learning environment accordingly (Ülgen, 1995).

The Multiple Intelligences Theory made individualized instruction and life knowledge and skills important. In order to fulfil the duties demanded by the society, the individual has to use more than one kind of intelligence at any given time. That is why it is important to improve different types of intelligence. Gardner also emphasizes the need to consider the use of multiple intelligences as an achievement criterion (Sevinç, 2003).

It is believed that a high-quality education advances children's potential for learning and that there is a relationship between potential for learning and intelligence. Similar to adults, children also have a certain level of intelligence that can be increased via education. It is asserted that when learning environments are organized according to this fact, it greatly contributes to child development.

### *1.1. Significance of the Study*

Pre-school is the most important period in children's lives. In this period, children go through important developmental stages and their intelligence develops the fastest. The Multiple Intelligences Theory is an important approach in revealing the child's existing potential and in determining the dominant and non-dominant fields of intelligence. Determining children's intelligences at an early age is important for families and teachers in terms of providing healthy and correct guidance and counseling. The socioeconomic status of the family may also

have significance in achieving guidance and counselling. Therefore, it is essential to investigate the intelligences of kindergarteners from different socioeconomic backgrounds.

This study was conducted in order to investigate the multiple intelligences of kindergarteners from different socioeconomic backgrounds in relation to gender, mother's and father's educational level, and the common effect of the variables.

## **2. Method**

### *2.1. Study Group*

The study group comprised 6-year-old children attending kindergartens affiliated with the Ministry of Education during the 2011-2012 school year in Viranşehir, Şanlıurfa. The study group was chosen as a result of interviews carried out with the Directorate of District National Education, school principals and teachers. The interviews showed the socioeconomic status of schools. Nine preschool classes from three primary schools and one kindergarten were selected by sampling. The socioeconomic status of families was decided by looking at their salary brackets. Those with a monthly income of up to 1,000 TL (~500€) were placed in the lower SEL, those between 1,000(~500€) - 2,000 TL (~1000€) in the middle SEL, and those above 2,000 TL (~1000€) in the high SEL. As a result, 50 children from lower SEL, 57 from middle SEL, and 101 from higher SEL, 208 children in total, were chosen for the sample. Of those children in the study group, 99 (47.60%) were girls and 109 (52.40%) were boys.

Among the mothers of children in the study group, 65.37% were primary school graduates, 14.94% were secondary school graduates, 11.05% were high school graduates, and 11.05% were higher education graduates. Among the fathers, 45.70% were primary school graduates, 9.12% were secondary school graduates, 26.91% were high school graduates, and 18.26% were higher education graduates.

### *2.2. Data Collection tools*

In this study, data were collected through the Teele Inventory of Multiple Intelligences Test - TIMI). The Teele Inventory of Multiple Intelligences was specifically designed to examine the dominant intelligences of students in all grades. The TIMI is a forced-choice pictorial inventory with 56 numbered pictures of panda bears representing characteristics of each of the seven intelligences: linguistic, logical-mathematical, spatial, musical, bodily-kinesthetic, intrapersonal and interpersonal. It provides students with 28 opportunities to make selections between two alternatives. The different intelligences are matched with one another and students have the chance to select each of the seven intelligences eight different times in the inventory. Students are asked to select one of the two choices that they feel is the most like them – there are no right or wrong answers in this inventory.

Each picture selected by the students represents a score for the intelligence associated with that picture and the answer sheets are coded accordingly. The intelligence or intelligences that are more frequently selected yield the dominant intelligence of students. The answer sheet enables the student and teacher to determine most dominant intelligences as indicated by the highest scores. The test was used to investigate whether there is a difference between children's intelligence types, socioeconomic status, gender, and mother and father's educational level.

Reliability and validity studies of the TIMI were carried out between the years 1992-1993 by Teele. It was investigated whether the pictures used for validity represented the chosen intelligence, and the TIMI emerged as a valid inventory. In the reliability study carried out by Teele, it was found that TIMI's fields of intelligence were significantly different at the level .01. The validity studies carried out in Turkey by Oklan Elibol (2000),

Göğebakan (2003), Terzioğlu (2005) and Özdemir (2006) also revealed that the inventory was valid. In the reliability study by Özdemir (2006) the relationship between test-retest was found to be significant at the level 0.01 and the test was concluded to be reliable.

In addition to the TIMI, a 10-item “Demographic Information Form” developed by the researchers was also used in order to collect data about the children and their families.

### 2.3. Data Collection Method and Procedures

The data were collected by the researchers in Viranşehir, Şanlıurfa during the first term of the 2011-2012 school year. Before the test was administered, the researchers met and had a conversation with the children. The test was administered by the researchers in a corner of the classroom and the answers were coded on the answer sheets. The process lasted approximately 20-25 minutes for each child. The Demographic Information Form was filled out the same day by interviewing the parents at the end of the school day.

### 2.4. Statistical Analyses

One way and two way analysis of variance (ANOVA) was used in the study to determine whether the scores kindergarteners obtained from the Multiple Intelligence Inventory varied according to the variables chosen.

## 3. Findings

Table 1 represents the summary of intelligences for the children in the study that show significant differences in terms of socioeconomic status, gender, and mother and father’s educational level. Table 1 also shows the common effects of the relationship between socioeconomic status and the variables on children’s multiple intelligences.

Table 1: ANOVA results of TIMI scores in terms of children’s socioeconomic status, gender, mother and father’s educational level, which show significant difference according to multiple intelligences (Summary Table)

Intelligence Types	SES	Gender	SES x Gender	Mother’s Education Level	SES x Mother’s Educational Level	Father’s Educational Level	SES x Father’s Educational level
Linguistic	F= 1.42 p= 0.24	F= 0.04 p= 0.84	F= 1.34 p= 0.26	F= 0.26 p= 0.84	F= 0.65 p= 0.57	F= 1.20 p= 0.31	F= 0.42 p= 0.73
Logical- mathematical	F= 3.01 p= 0.05	F= 2.12 p= 0.15	F= 1.14 p= 0.32	F= 0.68 p= 0.56	F= 2.24 p= 0.08	F= 0.86 p= 0.46	F= 0.61 p= 0.60
Musical-rhythmic	F= 5.14 p= 0.00*	F= 0.61 p= 0.44	F= 1.55 p= 0.22	F= 1.03 p= 0.37	F= 0.01 p= 0.99	F= 0.34 p= 0.79	F= 0.21 p= 0.88
	In favour of middle SES						
Bodily- kinaesthetic	F= 2.41 p= 0.09	F= 1.32 p= 0.25	F= 2.51 p= 0.08	F= 0.70 p= 0.55	F= 1.12 p= 0.33	F= 0.55 p= 0.64	F= 0.57 p= 0.63
Intrapersonal- social	F= 3.99 p= 0.02*	F= 0.49 p= 0.48	F= 0.45 p= 0.64	F= 0.52 p= 0.66	F= 1.10 p= 0.35	F= 0.14 p= 0.93	F= 0.13 p= 0.93
	In favour of Low SES						
Interpersonal	F= 4.71 p= 0.23	F= 0.07 p= 0.79	F= 2.73 p= 0.07	F= 1.51 p= 0.21	F= 1.69 p= 0.16	F= 1.08 p= 0.35	F= 1.44 p= 0.23
Spatial	F= 0.92 p= 0.39	F= 2.00 p= 0.16	F= 0.00 p= 1.00	F= 0.09 p= 0.96	F= 0.55 p= 0.64	F= 0.60 p= 0.61	F= 0.79 p= 0.49

p<0.05\*

As can be seen in Table 1, it was found that children's TIMI scores show significant difference in terms of socioeconomic status in musical-rhythmic intelligence and intrapersonal-social intelligence ( $F=5.14$ ,  $p=0.00$ ,  $p<0.05$ ;  $F=3.99$ ,  $p=0.02$ ,  $p<0.05$ ). In other words, children's multiple intelligences differ significantly according to socioeconomic status in two intelligences. In other intelligences, a significant difference was not observed in terms of socioeconomic status. The results of the Scheffe test, which was used in order to find the groups among which the difference existed, revealed that the average musical-rhythmic intelligence scores of children in middle socioeconomic status ( $x=4.24$ ) was higher than children in low socioeconomic status ( $x=3.26$ ). In addition, children from low socioeconomic status were found to have higher mean scores in intrapersonal-social intelligence ( $x=4.88$ ) than the children in middle socioeconomic status ( $x=4.02$ ). This finding shows that socioeconomic status has an important effect on musical-rhythmic and interpersonal intelligences.

In general the majority of children had an average level of musical intelligence. It is largely up to the environment to teach the art of music and to raise musical artists (Kürklü, 2003). In this case, it can be assumed that children from middle socioeconomic status enter environments in which they can improve their musical intelligence more than those from low socioeconomic status. Teker (2009), in a study in Şanlıurfa, the reflection of local colour in the paintings of 9-12 year-old children. He found that "Anatolian Folk Dance" provides an opportunity for rich expression in children's paintings and that such topics are reflected in colour, scheme, space and expression in different ways. The results related to musical-rhythmic intelligence corroborate the findings obtained in previous studies on multiple intelligences (Gürçay and Eryılmaz, 2002; Karşal, 2004; Şahlı, 2010 and Koca, 2010), and the results regarding intrapersonal-social intelligence exhibit similarities with Aral's (1993) study.

According to the analysis of variance, the study revealed that the common effect of gender alone and the interaction of gender and socioeconomic status did not have a significant effect on children's multiple intelligences.

This finding is parallel to the results obtained by Şanlı (2010), a study whose demographic features were similar to this study.

An analysis of the results displayed in Table 1 reveals that mother's educational level on its own, and the interaction of mother's educational level and socioeconomic status did not have a significant effect on children's multiple intelligences.

This finding is parallel to the results obtained by Şanlı (2010), a study whose demographic features were similar to ours.

According to the analysis of variance, the study revealed that the common effect of father's educational level alone and the interaction of father's educational level and socioeconomic status did not have a significant effect on children's multiple intelligences.

In a study by Uysal (2006), it was found that father's educational level did not have a significant effect on the multiple intelligences of six-year-old children who were attending different pre-schools.

#### **4. Conclusion**

This study analysed the multiple intelligences of kindergarteners from different socioeconomic backgrounds in relation to the variables of gender and mother's and father's educational level, and concluded that socioeconomic status has a significant effect on musical-rhythmic and interpersonal-social intelligences. It was found that in musical-rhythmic intelligence, children from middle socioeconomic status obtained higher mean

scores than those from lower socioeconomic status. On the other hand, the intrapersonal-social intelligence mean scores of children from lower socioeconomic status were higher than those of children from middle socioeconomic status.

The study revealed that the common effect of gender alone and the interaction of gender and socioeconomic status were not significant.

Likewise, the effect of the interaction of mother's educational level and socioeconomic status on multiple intelligences was not significant. Similarly, the interaction of father's educational level and socioeconomic status was not significant.

## 5. Suggestions

Pre-school is the most important stage in a child's life. In this period, it is essential to discover children's interests and abilities, support their developmental areas, and thus encourage them to know themselves for future success in life. Multi-dimensional educational programs should be administered in pre-schools in order to reveal children's individual differences and areas of interest. Additional efforts may be made to equip teachers with the necessary experience and knowledge in order to be able to pinpoint children's primary and secondary multiple intelligences and areas of interest.

Public videos may be prepared by universities and the Ministry of Education to inform parents about multiple intelligences. In addition to these, educational activities such as panels, forums and conferences may be organized.

Other factors affecting multiple intelligences may be investigated by using different and larger samples in future studies. The multiple intelligences of children in kindergartens with a multiple intelligences curriculum may be compared against others.

# A survey on the cognition of the teacher for continuity of elementary and secondary english education in South Korea

Won, Eun-Sok<sup>a\*</sup>, Lee, Jong-Bok<sup>b</sup>

<sup>a</sup>*Mokwon University, Professor of Department of Liberal Arts Education, "Deajon", South-Korea*

<sup>b</sup>*Mokwon University, Professor of Department of English Education, "Deajon", South-Korea*

## Abstract

This study tried to find out how teachers thought about continuity in English curriculum between elementary and middle school. For achieving the goal, the authors implemented a survey toward 103 teachers and analyzed the quantitative and qualitative responses. The most of the participants comprehended own school level English curriculum however, only a few teachers comprehended other school level English curriculum. In case of understanding of activities, it was unveiled that middle school teachers' cognition to the activity was vague as they usually didn't utilize activities in their daily teaching. Furthermore, teachers' cognitions to continuity in activity, difficulty and amount of learning were all negative.

Keywords: Curriculum, Continuity, English Education

## 1. INTRODUCTION

The public school system of South Korea is consisted of 12 grades in 3 school levels (6 grades in elementary school, 3 grades in middle school and 3 grades in high school) and organization of English curriculum is mainly divided into 2 parts; one is 'the secondary' which includes middle school and high school curricula, the other is 'the elementary' which contains only elementary curriculum. Therefore, interrelation of English curriculum between elementary and middle school is loose compared with connectivity between middle and high school because the main department managing curriculum development is separated by school level. The Elementary Education Department controls all of the elementary school curricula and The Secondary Education Department handles middle and high school whole curricula.

Table 1. comparison between elementary and middle school English curricula

	Elementary school	Middle school
Functions	listening, speaking, reading, writing, grammar, vocabulary	listening, speaking, reading, writing, grammar, vocabulary
Main focuses	communication(speaking, listening)	reading & grammar
Teaching method	activity centered	teacher centered
Goal	basic communication skill	achieving

E-mail address: lastgoodman@mokwon.ac.kr

Based on this situation, many studies indicated problems related to the continuity in elementary and middle school English curricula. Lee, Choi, Boo and Lee(2001) mentioned that activities and teaching methods became different as each curriculum pursuit has pursued different goal. Analyzing goals and activities suggested in The National English Curriculum 7<sup>th</sup> Version revised in 2009, while elementary curriculum focused on increasing basic communicative competence related to themes from daily life, middle curriculum stressed development of literacy abilities required in achieving higher academic goals. Yoon(2003) claimed that more than half of the 1<sup>st</sup> graders of middle school felt difficulty and burdened when they studied English as there were huge gap of goals between elementary and middle school curriculum. Therefore, it is important to consider how to secure continuity of English curriculum from elementary to middle school to increase efficiency of English education in South Korea.

This study sets its focus on teachers since they are main players in implementing and utilizing National English Curriculum and the closest observers who can monitor authentic reactions and feedbacks from their students. So, this study tried to investigate teachers' cognition to the continuity in English education curriculum.

## 2. Outline of the Survey

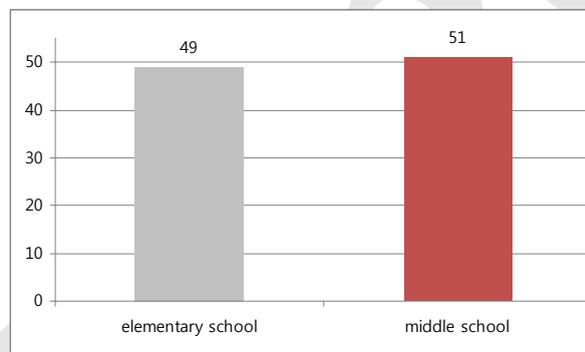

Fig. 1. the number of respondents sorted by school level.

This study tried to investigate how do elementary and middle school English teachers think about continuity in English curriculum. To meet the goal, a survey had been implemented for a month from March to April, 2013. The number of the questionnaires was 15. Among them, 7 were yes-no questions and others were open-ended questions which were put behind each yes-no question to find out the reasons behind quantitative responses.

For conducting the survey effectively, the researchers set school inspectors as the main contact point and utilize their human network to distribute and collect survey sheets. 103 elementary and middle school teachers from various regions participated to the survey. Among the respondents, 49 were elementary school English teachers and 51 were middle school English teachers. After collecting all the survey sheets, the researchers coded all the responses into a data file to analyze it with SPSS 13.0 program and Nvivo. By utilizing Frequency Analysis for quantitative responses and Keyword Analysis for qualitative responses, the results were drawn out.

### 3. Results and Discussions

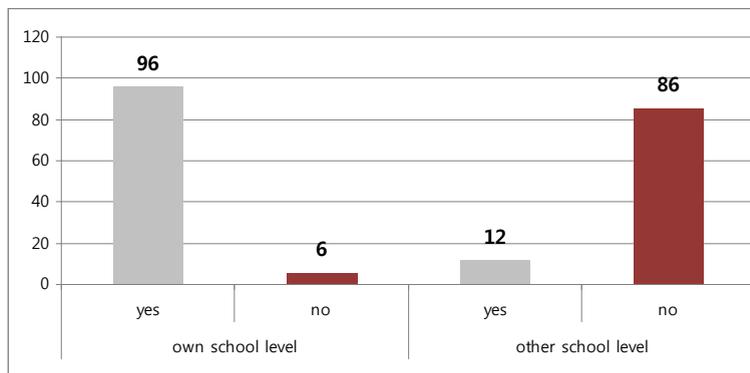

Fig. 2. understanding of English curricula

Figure 2 shows the number of the participants who understood own school level and other school level English Curriculum. As the result, while almost of the participants(96) understood their own school level curriculum, but didn't grasped other school level curriculum(86). In other words, among 49 elementary teachers of the participants, 47 understood elementary school curriculum, whereas only 2 teachers understood middle school level curriculum. Similar with elementary school teachers, 47 middle school teachers comprehended own level curriculum, however, 10 teachers comprehended elementary school curriculum.

Originally, the authors predicted that most of teachers probably didn't comprehend English curriculum of other school level as they hadn't had enough chances to encounter other school level curriculum in their daily life. Opinions from the open-ended question fitted with this assumption. 'busy(68)' 'not necessary (59)' were the top frequent words included in teachers' opinion to the question, 'please describe the reason why you don't understand other school level English curriculum'. 59 teachers mentioned that what they required to teach in the field was already fixed and well arranged in National English Curriculum, so it was not necessary to consider other school level.

Figure 3 shows the number of the participants who comprehended activities in own school level and other school level curricula. 59 knew activities in own level and 51 knew activities in other level. These results are very remarkable because the response tendencies are totally different with aforementioned results.

Results of Figure 2 presents clear discrepancy lying in teachers' understanding between own and other school level English curricula. However, results of Figure 3 shows balanced responses not only between 'yes' and 'no', also between 'own level' and 'other level'. Considering that the activity is one of the elements included in a curriculum, the results were at odds with the preceding results. It allows this situation; a middle school teacher who didn't know elementary school English curriculum answered he comprehended activities in elementary school English curriculum.

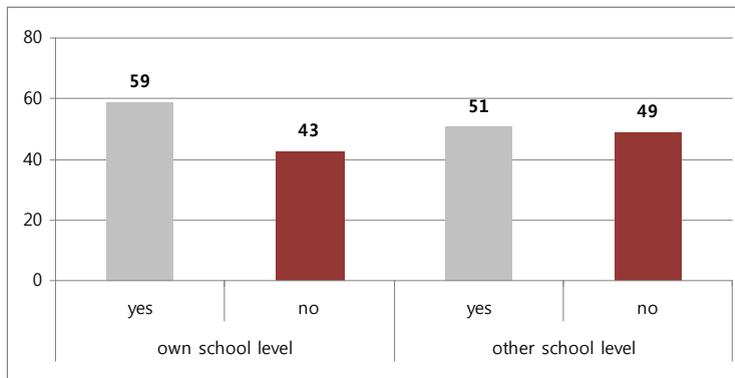

Fig. 3. understanding of the activity in English curricula

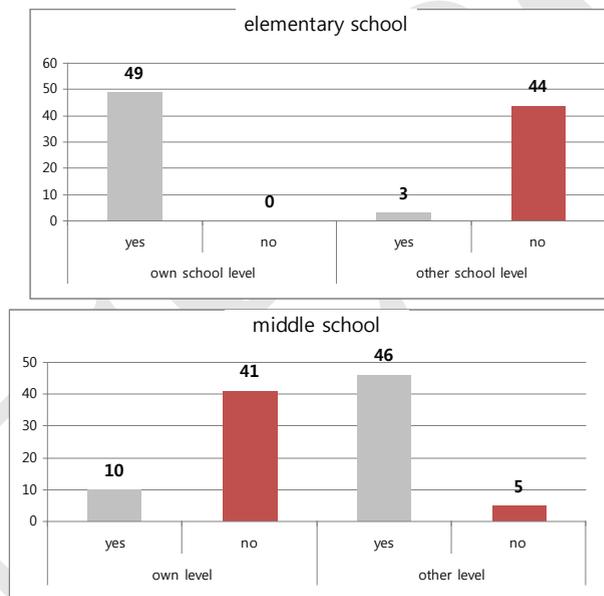

Fig. 4. comparison in understanding of the activity sorted by school level

To find out why 51 teachers chose 'yes' in other school level, the authors divided respondents into two groups by school level. Looking into Figure 4, the response tendencies of elementary school teachers correspond with Figure 2. But, the answers of middle school teachers are totally different from the aforementioned results. The results of Figure 3 were derived from the responses of middle school teachers.

By sorting opinions from 46 teachers, who checked 'yes' in other level in the open-ended question, 'activity-centered'(25) was drawn out as the top frequency word. Summarizing the opinions, middle school teachers

vaguely knew elementary English curriculum contained many communicative activities and they chose 'yes' even though they didn't exactly comprehend actual elementary school activities.

Also, 41 teachers answered that they didn't understand middle school activities. 'no use'(22) was the top frequency word. Although National English Curriculum for middle school, which was already designed to sustain continuity between elementary and middle school, suggested diverse communicative activities, teachers didn't set their focus on using them because reading and grammar were main functions required them to teach, based on students' and parents' strong needs for achieving good score in high school. This phenomenon gives an implication that the teacher's cognition is the most important element to secure continuity in actual English classes.

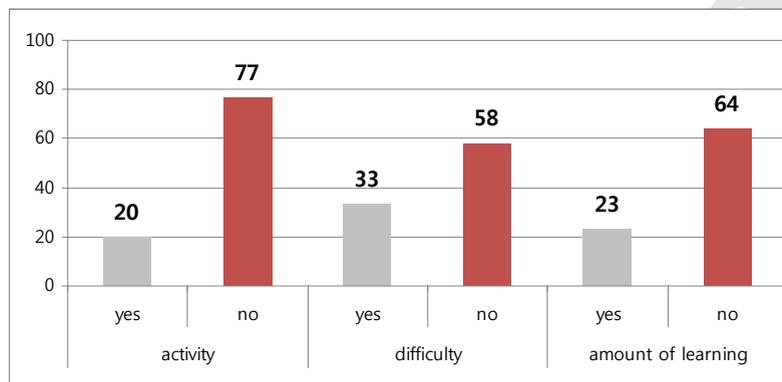

Fig. 5. cognition of continuity for activity, difficulty and amount of learning

Figure 5 shows participants' cognition about continuity in terms of activity, difficulty and amount of learning. To all the elements, proportion of negative cognitions was high in each category.

#### 4. Conclusions

This study tried to find out how teachers thought about continuity in English curriculum between elementary and middle school. For achieving the goal, the authors implemented a survey toward 103 teachers and analyzed the quantitative and qualitative responses. The most of the participants comprehended own school level English curriculum however, only a few teachers comprehended other school level English curriculum. In case of understanding of activities, it was unveiled that middle school teachers' cognition to the activity was vague as they usually didn't utilize activities in their daily teaching. Furthermore, teachers' cognitions to continuity in activity, difficulty and amount of learning were all negative.

## Abstract

Nowadays the main problem that faced by people is adapted to rapidly the conditions of life by the effect of technology. The field that that technological alteration is felt mostly is undoubtedly the experience of individual business. In behalf of to adapt the steps of alteration and innovation of technology, the individual is required to take some steps to improve him in this business life. Either, is required to gain completely different qualifications by retraining totally in new field. Nowadays, the situation which corresponds to words as “Life / Lifelong Learning” creates the main axis of adult education activities. In accordance with transferred above, this study; aimed to planning, implementation and evaluation by the approach of “process” model that provided by the science of adult education to give a professional skill individuals who volunteered.

In the evaluation process; was used Participant Information Form, Self- Sufficiency Rating Scale (at the beginning and the end of the course). At the analysis of research data, were benefit from percentage, standard deviation, and correlation techniques of descriptive statistics.

Keywords: Publishing, Training Model, Typesetting Operator

---

## 1. INTRODUCTION

The developments in science and technology that caused radical changes in our daily lives, at the present time, anymore the knowledge has become a produce by recycling every day again. From the end of the 20<sup>th</sup> century, the rapid change and transformation, has laid the foundations of the creation of human model that aware the requirements of continuous learning / learning of workforce in all business lines (Gültekin. 2004). Anymore, the truth that cultural changes are shorter than human life and we live in the times that could not able to pass a life with information learned in his youth has been stood in front of us (Knowles, 1990). Gaining the qualification related a work and can become perform the profession constitutes the essence of the maintaining life. The development and advancement of the profession of the individual and place this in the basic needs of him constitutes the fact that people do in a process of lifelong vocational training. The process, at the same time also has been put forwarded the fact that individuals are self-managed. Work to establish a life-long learning education system which can control educational content, methods and results of individuals that have gained the ability to self-directed learning has been required to be main task of adult education.

The process of self-development of people, learning trends and capacities, past lives and the interaction of the individual with the environment, has been revealed the truth that the adults stand in a different spot than learning of children. The process that starting with adult learning has shown the fact those adults can also

\* Corresponding author. Tel.: +90 212 540 96 96/2196; fax: +90 212 540 97 97

E-mail address: orhansevindik@arel.edu.tr

learn and additionally they have different interests and abilities from children to us. (Knowles, 1990). The andragogy is a general name given a theory that occurs as a result of studies on adults. The first use of the word Andragogy has been by Knowles. Andragogy has been issued as a concept that used in education of adults against the pedagogical approach used in the education of young people. (Weygand, 2001).

The process of computerizing of written production or an interview or conversation that taken audio recording generally is called as typesetting in Turkey. In the certification training programs which purposed professional, technical and cultural that prepared under the protocol that signed between Ministry of Education, Ankara Metropolitan Municipality and Gazi University, the Typesetting Operator; are defined as qualified persons who transfers to the computer using the keyboard with a letter F, editing the information how desired and have qualifications to redact the job that done, who has ability to do his own job by himself and in certain period. It has been indicated as a third level of profession in a frame of European Qualifications (Qualifications Turkey).

Since 1997, the personnel requirement analysis that directed to printing industry has been made periodically by Gültekin and his friends (Gültekin, 2004), (Tokmak and Sevindik 2004), (Gültekin and his friends 2007). As a result of analysis, has been seen that the sector is in a need of personnel which increases every day. The only research in the field of publishing; has been realized by Kansu and his friends. According to the research which titled as “Advertising Agencies and Labor Market Requirement Analysis of Publishing Industry (Ankara Province -2011-2014)” by Kansu and his friends, between 2011- 2014, the requirement of typesetting for Ankara are estimated to be 315 people (Kansu and his friends 2011).

## **2. Mission (Purpose)**

The purpose of this study, by developing training program directed to adults for the profession (Typesetting Operator) that located in the printing and publishing industry is evaluated the results of the program. The answers of following questions were searched in research for the specified purpose. These questions are;

- What is the direction of change that qualifications of adults which admitted to gain skills related to Computer Applications in Publishing / Typesetting Operator at starting and ending?
- Can content of created course give enough information to the participants?

## **3. Practice (Method)**

In this chapter are included research model, the developed program curriculum, universe, sample, data collection, and resolution.

### *3.1. Research Model*

The research model has been created in 3 stages. At the first stage; has been developed competency-based modular training program under the name of “Computer Applications in Publishing (Typesetting Operator – Typesetter) Course”. The developed program; is approved by the Ministry of National Education and are given an approved certificate at the end of the course. The developed program that occurs 3 modules as “F Keyboard 1 “Editing Page on Computer 1” and “Editing Page on Computer 2” and covers a period of 108 hours. As far in the second stage, by applying course into two consecutive terms have been realized the application of designed model. In the third stage, by giving Self-Sufficiency Scale to the participants both at the beginning and the end of the course; evaluation information has been collected by evaluating themselves.

### 3.2. Universe and Sampling

The trainees who participated to 22. and 23. Term BELTEK Courses has been generated the universe of research. As for the working group covers trainees that participated the courses. In each term, 20 people have been participated to "Computer Applications on Publishing". Both two courses, has ended with 20 people as the number of people at the beginning. To fill Self- Sufficiency Form which left the desire of the trainees that attending courses, has been filled by all participants in the ongoing course both at the beginning and the end of the course. In this way, totally 40 pieces Check-in Self-Sufficiency forms and 40 pieces Check-out Self-Sufficiency forms has been obtained to measure the alterations at the beginning and the end of the course.

### 3.3. Collecting data and Analysis

The data which will be used in scope of the research was collected with Self-Sufficiency Scale that created. The scale was created by taking into account that Typesetting Operator/Typesetter should know in accordance with the content which prepared in the frame of protocol that signed between Ministry of National Education, Ankara Metropolitan Municipality and Gazi University. Prepared Self-Sufficiency scale is presented to the opinion of experts. The scale that revised again according to expert opinions, the data has been collected by filling to the participants at the first day and the last day of the course. The Self-sufficiency Scale consists 21 items related to 3 modules. The question that includes in Self-Sufficiency has been divided into four in itself. According to this; 4 items of Self-Sufficiency Scale are related to Typesetting and the Application, and 6 of them are related to General Printing Information, and 9 of them are related to General Design Information and 3 of them are related to Typographical Editing Information. For each item, 6 point likert scale has been used. According to 6 point likert scale, has been requested to evaluate themselves from participants. According to this, "0" means that the participants have no information about this matter, "5" means that they have enough information on this matter.

The data that obtained in the scope of research analyzed by using statistical programs in the context of frequency, standard deviation and correlation.

## 4. Evidences

### 4.1. Evidences of Demographic and Reliability

The Self-Sufficiency Scale which used in the scope of Research were examined the state of reliability. In general terms to put forward the reliability of Self-Sufficiency Scale was benefit from Cronbach's alpha statistic. After the analysis; the alpha value of the scale that is equal to 7.0 or upper (Hair and Others, 1995) has been determined as minimum criteria to verify the reliability of the scale. The data which shows the reliability status of Self-Sufficiency Scale are presented in Table 1.

Table 1. The Reliability Status of Self-Sufficiency Scale

Cronbach's Alpha	N of Items
,972	44

Looking at the table that shows the status of Self-Efficacy Scale reliability, the reliability of the questions which used in the scope of questionnaire was very high compared to 0.972 according to Cronbach Alfa statistic. The expressions which used in scale have appeared properly understood and significant by the participants.

According the research; the table which shows the gender distribution of the demographic characteristics of the participants has been located in Table 2.

Table 2. Distribution of Participants In Terms of Gender

	Frequency	Percent
Female	22	55,0
Male	18	45,0
Total	40	100,0

Looking at the gender distribution of participants; the participants has been consisted %55 from women, and % 45 from men.

In the scope of research, the table which shows the age distribution of trainees who participated in the study has been located in Table 3.

Table 3. Distribution of Participants In Terms of Age

	Frequency	Percent
Between age 20 to 30	25	62,5
Between age 31 to 40	12	30,0
Between age 41 to 50	2	5,0
51 and over age	1	2,5
Total	40	100,0

Looking at the distribution of age of trainees, has appeared that 62,5% of participants are between 20 to 30, 12% are between 31 to 40 age, 5% are between 41 to 50 age and 2,5% are also 51 and over it. According to the table; participants were mainly concentrated in age from 20 to 30. The frequency of between 20-30 years old that participants are the most intense is also 25.

#### 4.2. Evaluation of General Printing House Information Articles

The Self- Sufficiency Scale which used in scope of the research, 5 items has been given related to General Printing House Information. The distributions that shows input and output values and the mean and standard deviation of items which has been given related General Printing House Information has been located in Table 4.

Table 4. Self-Sufficiency Scale – The Input-Output Distributions of “General Printing House Information” Items

	N	Nr of questions	Range	Minimum	Maximum	Mean	Std. Deviation
General Printing House (Input)	40	5	5	0	5	1,40	1,626
General Printing House (Output)	40	5	3	2	5	3,77	,649
Valid N (listwise)	40						

Looking at the table related to Input and Output ratings of General Printing House Information items which evaluated by participants; is given in input level as value of lowest 0, as highest as 5. The average of evaluation of General Printing House Information (Input) is 1.40 and the standard deviation is 1.626. Looking at the data (Output) of General Printing House Information is given 2 as lowest and 5 as highest. The average of General Printing House Information (Output) items is 3.77 and standard deviation is 0.646.

The correlation between “General Printing House Information” of Self-Sufficiency Scale and Input-Output related items has been examined. The table which shows the correlation values between Input-Output of General Printing House Information Items has been located in Table 5.

Table 5. Self-Sufficiency Scale – The Input and Output Distribution of “General Printing House Information” Items

		General Printing House (Input)	General Printing House (Output)
General Printing House (Input)	Pearson Correlation	1	,811(**)
	Sig. (2-tailed)		,000
	N	40	40
General Printing House (Output)	Pearson Correlation	,811(**)	1
	Sig. (2-tailed)	,000	
	N	40	40

\*\* Correlation is significant at the 0.01 level (2-tailed).

According to the correlation analysis that made between the given values before training and the values at the end of the training which gives to the items that measured General Printing House Information of Participants; between both two values which are given related to General Printing House Information is seen a significant level of differentiation ( $P < 0,05$ ) and this differentiation was detected as strong (0,811) in positive direction.

#### 4.3. Evaluation of General Design Information Items

In Self- Sufficiency Scale which used in the scope of research; 9 items has been given related General Design Information. The distributions that shows input and output values and the mean and standard deviation of items which has been given related General Design Information has been located in Table 6.

Table 6. Self-Sufficiency Scale “The Input and Output Distribution of “General Design Information” Items

	N	Nr of questions	Range	Minimum	Maximum	Mean	Std. Deviation
General Design (Input)	40	9	5	0	5	1,59	1,661
General Design (Output)	40	9	3	3	5	3,89	,597
Valid N (listwise)	40						

Looking at the table related to Input and Output ratings of General Printing House Information items which evaluated by participants; are given the value of 0 as lowest, 5 as highest in input level. The average of evaluation of General Design Information (Input) is 1.59 and the standard deviation is 1.661. Looking at the data (Output) of General Design Information is given 3 as lowest and 5 as highest. The average of General Design Information (Output) items is 3.89 and standard deviation is 0.597.

The correlation between “General Design Information” of Self-Sufficiency Scale and Input-Output related items has been examined. The value which shows the values of correlation between Input-Output items of General Design Information is located in Table 7.

Table 7. Self-Sufficiency Scale- The Input and Output Distribution of “General Printing House Information” Items

		General Design (Input)	General Design (Output)
General Design (Input)	Pearson Correlation	1	,798(**)
	Sig. (2-tailed)		,000
	N	40	40
General Design (Output)	Pearson Correlation	,798(**)	1
	Sig. (2-tailed)	,000	
	N	40	40

\*\* Correlation is significant at the 0.01 level (2-tailed).

According to the correlation analysis that made between the given values before training and the values at the end of the training which gives to the items that measured General Design Information of Participants; between both two values which are given related to General Design Information is seen a significant level of differentiation ( $P < 0,05$ ) and this differentiation was detected as strong (0,798) in positive direction.

#### 4.4. Evaluation of Items of Typographical Editing Information

In Self- Sufficiency Scale which used in the scope of research; 3 items has been given related Typographical Editing Information. The distributions that shows input and output values and the mean and standard deviation of items which has been given related Typographical Editing Information has been located in Table 8.

Table 8. Self-Sufficiency Scale- The Input and Output Distribution of “Typographical Editing Information” Items

	N	Nr of questions	Range	Minimum	Maximum	Mean	Std. Deviation
Typographical Editing (Input)	40	3	5	0	5	1,23	1,681
Typographical Editing (Output)	40	3	3	2	5	3,72	,686
Valid N (listwise)	40						

Looking at the table related to Input and Output ratings of Typographical Editing Information items which evaluated by participants; are given the value of 0 as lowest, 5 as highest in input level. Looking at the table related to Input and Output ratings of Typographical Editing Information items which evaluated by participants; are Typographical Editing Information (Input) is 1.23 and the standard deviation is 1.681. Looking at the data (Output) of Typographical Editing Information is given 2 as lowest and 5 as highest. The average of Typographical Editing Information (Output) items is 3.72 and the standard deviation is 0.686.

The correlation between “Typographical Editing Information” of Self-Sufficiency Scale and Input-Output related items has been examined. The value which shows the values of correlation between Input-Output items of Typographical Editing Information is located in Table 9.

Table 9. Self-Sufficiency Scale- The Input and Output Distribution of “Typographical Editing Information” Items

		Typographical Editing (Input)	Typographical Editing (Output)
Typographical Editing (Input)	Pearson Correlation	1	,746(**)
	Sig. (2-tailed)		,000
	N	40	40
Typographical Editing (Output)	Pearson Correlation	,746(**)	1
	Sig. (2-tailed)	,000	
	N	40	40

\*\* Correlation is significant at the 0.01 level (2-tailed).

According to the correlation analysis that made between the given values before training and the values at the end of the training which gives to the items that measured Typographical Editing Information of Participants; between both two values which are given related to Typographical Editing Information is seen a significant level of differentiation ( $P < 0,05$ ) and this differentiation was detected as strong (0,796) in positive direction.

#### 4.5. Evaluation of Items of Typesetting Information / Application

In Self- Sufficiency Scale which used in the scope of research; 4 items has been given related Typesetting Information / Application. The distributions that shows input and output values and the mean and standard deviation of items which has been given related Typesetting Information / Application has been located in Table 10.

Table 10. Self-Sufficiency Scale- The Input and Output Distribution of “Typesetting Information / Application” Items

	N	Nr of questions	Range	Minimum	Maximum	Mean	Std. Deviation
Typesetting / Application (Input)	40	4	5	0	5	1,64	1,227
Typesetting / Application (Output)	40	4	2	3	5	4,01	,503
Valid N (listwise)	40						

Looking at the table related to Input and Output ratings of Typesetting Information / Application items which evaluated by participants; are given the value of 0 as lowest, 5 as highest in input level. Looking at the table related to Input and Output ratings of Typographical Editing Inform Typesetting Information / Application items which evaluated by participants; are Typesetting Information / Application (Input) is 1.64 and the standard deviation is 1.227. Looking at the data (Output) of Typesetting Information / Application is given 3 as lowest and 5 as highest. The average of Typesetting Information / Application (Output) items is 4.01 and the standard deviation is 0,503.

The correlation between “Typesetting Information / Application” of Self-Sufficiency Scale and Input-Output related items has been examined. The value which shows the values of correlation between Input-Output items of Typesetting Information / Application is located in Table 11.

Table 11. Self-Sufficiency Scale- The Input and Output Distribution of “Typesetting Information / Application” Items

		Typesetting Information / Application (Input)	Typesetting Information / Application (Output)
Typesetting Information / Application (Input)	Pearson Correlation	1	,717(**)
	Sig. (2-tailed)		,000
	N	40	40
Typesetting Information / Application (Output)	Pearson Correlation	,717(**)	1
	Sig. (2-tailed)	,000	
	N	40	40

\*\* Correlation is significant at the 0.01 level (2-tailed).

According to the correlation analysis that made between the given values before training and the values at the end of the training which gives to the items that measured Typesetting Information / Application of Participants; between both two values which are given related to Typesetting Information / Application is seen a significant level of differentiation ( $P < 0,05$ ) and this differentiation was detected as strong (0,717) in positive direction.

## 5. Conclusion and Recommendations

As a result of the study, are reach to the following conclusions.

These evidences which made within the context of creating the design of the course content, implementation and evaluation of the results has been shown to us from the moment when they started classes and applications until the end of the course that the participants have significant and strong alteration in

positive direction. They subjects that they don't have any information at the beginning of the course, in the later period of course have knowledge about these matters and have adopted information which provides basis of related the profession, gained basic experience as a result of applications.

The module that has been generated during the design of program is designed in accordance with the purpose of education and has been determined that the participants' level of knowledge relatively contributes the ascending upper than the beginning. In addition to be in the change of positive direction and development in all modules; appear to have a decrease in the relative of the participants related to Typesetting Information / Application. This decline is expected due to the applications on the use of ten-finger keyboard. By the application of the use of ten-finger keyboard, also has been expected to sufficient in time considering by increasing the practice of hand to use continuously.

The compliance that applied curriculum; come close to the values and the relationship of the results of the correlation analysis that made under group information of each item, has revealed that it is appropriate and integrated as instructional among themselves (in the curriculum) of each training module. During the application of each module has been supported and complemented each other.

## Abstract

Modern society should make higher education accessible to all gifted students, regardless of their economic situation, religion, or health. The society should strive to fulfill the right to freedom of movement of its citizens by removing barriers, in order to integrate the handicapped citizens. This article deals with accessibility to the Czech Technical University in Prague by the handicapped students and their options for successful studies.

*Keywords:* barrier-free; university; education; CTU in Prague; Faculty of Transportation Sciences

---

## Introduction

The Czech Technical University (CTU) in Prague was founded on January 18, 1707, as the first public engineering school in central Europe. Its founder was the Emperor Joseph I, but the initiative belonged to Christian Joseph Willenberg, a highly regarded fortification specialist, who was named a professor by a decree of the general Estates on November 9, 1717. The university was named the “Estates Engineering School in Prague” and the first schooling programs were launched in January 1718. The prestigious “École Nationale des Ponts et Chaussées” in Paris was founded only 30 years later.

Initially, the Estates Engineering School in Prague focused only narrowly on the military and fortification matters. Its curriculum was expanded to include civil engineering only during the tenures of two prominent figures: Jan Ferdinand Schor, its second professor, a painter and architect, and Frantisek Antonin Leonard Herget, its third professor, a land surveyor and water management expert.

In 1803, the Emperor Francis II proposed to transform the engineering school into a polytechnic school. The principle personality behind this effort was Frantisek Josef Gerstner, an astronomer, professor of mathematics and mechanics, and the architect of the horsecar from Ceske Budejovice to Linz, who modeled the school after the polytechnic school in Paris. The Prague Polytechnic existed as a part of the Prague University until its independence in 1815. It was located in the Husova Street in the Old Town. Along with Frantisek Josef Gerstner, its other eminent personality was Christian Doppler, professor of mathematics and practical geometry.

Another milestone in the history of the Prague Polytechnic was the approval of its first Status in 1863, which became the foundation of its new pedagogical organization and management of a higher education institution, headed by an elected rector.

The Czech language was used equally with German, despite the fact that conflicts between the Czech and German staff led to the division into a Czech and German institutes in 1869. A new building was built for the Czech institute at the Charles Square in the New Town, according to a plan by architect Ullmann. In 1878, two state exams were introduced and as of 1901, the school was granted the right to award the doctoral titles in technical sciences.

The school assumed the name Czech Technical University in Prague in 1920. It then comprised seven higher education schools. It was closed during the Nazi occupation and reopened after the liberation in 1945 [5].

The intention of this short historic overview was to show that the CTU in Prague has a rich history and a tradition of remarkable personalities and achievements. Nevertheless, we live in the 21<sup>st</sup> century when a modern European university must offer the highest standards of superb education, competent staff, and well-equipped laboratories to all the gifted students who wish to pursue their degrees. One of the obstacles to education (the article focuses on universities but they can be generalized for any educational level) are various disabilities, which could potentially prevent handicapped students from embarking on or completing the studies. In the contemporary open society, however, disabilities should not be the reason why a student should not study at the institution of his/her choice in the field, in which he/she can prove to be an asset. This is also enshrined in Article 33 of the Charter of Fundamental Rights and Basic Freedoms [6], which guarantees universal right to education.

Making education available to the handicapped students requires adjustments in three areas:

1. barrier-free access to buildings;
2. barrier-free use of buildings;
3. access to lectures and educational materials.

Adjustments in all these three areas are guaranteed both in the Czech legislation and in the rules and regulations of the CTU in Prague.

---

### **Legislation in the Czech Republic**

Rights of the handicapped persons are firmly anchored in the Czech legislation in the form of laws, norms, and methodologies. The legislation, however, does not define the term “handicapped person”. Rather, it uses the term “persons with limited ability of movement and orientation,” which refers not only to persons with physical, visual, hearing or mental impairment, but also to seniors, pregnant women or children younger than three and their accompaniment [7].

The chief legislative norms are as follows:

- Act No. 183/2006 Coll., about local planning and construction regulations, as last amended on January 1, 2013;
- Regulation No. 398/2009 Coll., about general technical requirements guaranteeing barrier-free use of buildings.

The Czech Republic has additional rules and regulations for specialized areas of the issue, such CSN 73 6110 - Design of Urban roads, which requires that proposals for design of local routes must make them safe for all its users.

Regulation No. 398/2009 Coll. [7] applies to the following situations:

- processing of documentation for issuance of territorial decisions;
- processing of simple technical descriptions of plans for issuance of territorial agreements;
- processing of project documentation;
- approval, announcement, and realization of construction;
- issuance of final approval agreement;
- use or removal of buildings or installations;
- building inspections.

Buildings covered by this regulation include buildings containing civil equipment, such as schools, pre-schools, and other schooling establishments. All new or reconstructed buildings belonging to such buildings

should therefore have the parameters for barrier-free use in order to be suitable for persons listed in paragraph one of this section.

---

### **Students with special needs**

The Faculty of Nuclear Sciences and Physical Engineering of the CTU in Prague established shortly after the end of communism in 1992 the TEREZA Center to enable access to higher education to visually impaired students. In 2007, the CTU in Prague established the Handicap Advisory Center to assist students with other than visual impairments. As of 2012, both centers were merged into the ELSA Center for Support of Students with Special Needs [1]. The ELSA Center falls under the competence of the rectorate of the CTU in Prague, specifically the Student Affairs Department. By this move, the CTU in Prague has clearly demonstrated its readiness to tackle the problem and open its educational programs to all the interested students.

Parents or persons with full-time employment, who at the same time pursue their education, fall into the category of students with special needs as well. The CTU in Prague runs a kindergarden called “The Little Lions,” which helps them to combine the student and parental responsibilities. The CTU in Prague is a pioneer among the Czech universities in this regard. This is an issue to which we would like to dedicate a separate article, since one of the authors of this article was active in establishing the kindergarden.

In addition to parents with small children, it is necessary to pay attention to the needs and look for solutions for persons with the following types of handicaps (or their combinations):

- visually impaired or blind;
- impaired hearing;
- physically challenged, particularly the wheelchair-bound.

Persons suffering from these impairments can be referred to as disadvantaged persons or persons with special needs. Since all of these impairments manifest themselves in specific ways, they must be addressed individually. At the same time, solutions in removing barriers must always be of a complex nature.

The term persons with special needs is very important in the context of education, since the health disabilities must include, besides the physical ones, also the following:

- specific learning impairments;
- psychological problems;
- chronic somatic disease.

The Study and Examination Code for Students at the CTU in Prague [2] states that students and applicants with special needs are entitled to modifications in the studies requirements. This easement is governed by the methodological instruction from 2012 about the support of students and applicants with special needs at CTU in Prague.

Between November 2012 and June 2013, the ELSA Center took under its patronage a project to map all the main buildings of the CTU in Prague under the project „Barrier-free Czech Technical University.“ Individual buildings are described in the textual part, along with their visual documentation (maps, floor plans, photographs) and description of the access routes.

Particular problem is posed by buildings that are part of the old building complexes, especially in the protected heritage zones. For example, the Faculty of Transportation Sciences comprises of three buildings, out of which two have already undergone reconstruction to install barrier-free elements as widely as possible. The CTU in Prague is also trying to find a solution for the accessibility to its dormitories by constructing or reconstructing barrier-free rooms. For example, the Masaryk Dormitories now have barrier-free rooms on different levels. The Dejvice Dormitories are not equipped with the elevator, therefore the barrier-free rooms are located on the ground floor, which is also convenient from the point of view of the daily building traffic and fire safety. It will also be technically possible to install acoustic isolation in selected rooms to address the needs of students with hearing impairments [4].

The following overview provides statistics about students with specific needs who studied at the CTU in Prague in the academic years 2011-2012 and 2012-2013, their numbers and types of impairments:

Table 1. Number of registered students with special needs at the CTU in Prague in the academic year 2011-2012:

Faculty	Number of students with visual, hearing or motoric impairment	Number of students with specific learning disability	Number of students with psychological disability or chronic static disease
Faculty of Civil Engineering	0	8	1
Faculty of Mechanical Engineering	3	10	0
Faculty of Electrical Engineering	0	3	3
Faculty of Nuclear Sciences and Physical Engineering	2	1	0
Faculty of Architecture	1	4	1
Faculty of Transportation Sciences	2	0	0
Faculty of Biomedical Engineering	8	2	1
Faculty of Information Technology	1	6	2

Table 2. Number of registered students with special needs at the CTU in the academic year 2012-2013:

Faculty	Number of students with visual, hearing or motoric impairment	Number of students with specific learning disability	Number of students with psychological disability or chronic static disease
Faculty of Civil Engineering	0	14	1
Faculty of Mechanical Engineering	3	14	1
Faculty of Electrical Engineering	2	10	5
Faculty of Nuclear Sciences and Physical Engineering	3	0	0
Faculty of Architecture	1	7	3
Faculty of Transportation Sciences	2	1	1
Faculty of Biomedical Engineering	2	4	1
Faculty of Information Technology	0	9	2

The figures account only for those students who have registered with the ELSA Center. There are, however, additional students who choose to confront and manage their limitations on an individual level. Handicapped students at the CTU in Prague usually do not seek any advantages but try to integrate as much as possible among other students.

#### Service arrangements for students with specific needs

While the preceding section outlined the different limitations students can face and their protection in the legislative and other documents, this section lays out an overview of what the ELSA Center offers to students with special needs [1].

Students with hearing impairments can make a use of visualization and note-taking services, as well as of interpretation services. It is also possible to transfer scripts into the Braille characters and mathematical formulas. Such transfer is, however, time consuming and its completion can last more than half-a-year. Under the digitalization and library services, the study materials are being made accessible, including adaptation of specialized symbolism and transfer of the materials into a tactile form. The ELSA Center also offers services of general assistance, personal assistance and training of orientation in space.

The organizational-methodological service offers to students training of studying and working strategies, which allows them to adopt working methods, which will help them to compensate as much as possible for their motoric, sensory and cognitive impairments. In addition, the ELSA Center arranges individual study programs, where necessary. Technical services guarantee accessibility to the technical equipment, with the possibility of borrowing.

Counseling on how to best take advantage and understand the whole spectrum of services is an integral part of the assistance as well. There are many different services that the ELSA Center offers and the aim is to help students on an individual basis with his/her specific needs.

Students can also receive time compensation, meaning that they are allowed longer deadlines, taking into consideration the student's specific impairment and the task.

---

#### **Studies at the CTU in Prague focused on the barrier-free environment**

At the CTU in Prague, students can choose subjects in which they can learn how design barrier-free environments and thus remove barriers for different types of disabilities. For example, the Faculty of Architecture and Faculty of Civil Engineering provide instruction on how to design and construct buildings not only for people without disabilities, but also for the handicapped.

The Faculty of Transportation Sciences teaches subjects, which take into consideration the needs of the handicapped when designing roads. A special subject "Barrier-free Transportation" gives students the opportunity not only to become familiar with the current legislative regulations, but also to interact with specialists from the field and attend events designed to experience what it is like to be handicapped (see Fig. 4). This is an invaluable tool for taking the perspective of the handicapped when designing barrier-free solutions in their later professional lives.

Students of the Faculty of Transportation Sciences can also participate in the student project "Barriers in Transportation", which focuses on removal of barriers not only from the point of view of transportation and construction, but also from the point of view of information and technologies.

The CTU in Prague offers regular seminars on the subject and cooperates with expert organizations, for example with the Prague Organization for Persons in a Wheelchair (Czech acronym POV) or the United Organization of the Blind and Visually Impaired in the Czech Republic (Czech acronym SONS).

Fig. 2. Entrance barrier – Konviktská building (Faculty of Transportation Sciences)

Fig. 3. Students of the Faculty of Transportation Sciences during instruction in the field

### Conclusion

The aim of this article was to introduce the Czech Technical University in Prague as a public institution of higher education, which recognizes the imperative to take into consideration and make the necessary adjustments to accommodate students with special needs or the handicapped. The ELSA Center, which functions as a standing specialized department to help address the problems and needs of students with disabilities, is one of the answers. The CTU in Prague is also engaged in a project, which aims to remove architectural barriers through building adjustments, and also is preparing an electronic manual for easier access and movement in its buildings. The curriculum contains subjects which teach students how to propose barrier-free environment, i.e. buildings and local roads. We are happy to work at such a university.

## Being Digital Citizen

Aytekin ISMAN<sup>a\*</sup>, Ozlem CANAN GUNGOREN<sup>b</sup>

<sup>a</sup>*Sakarya University, Faculty of Education 54300, "Sakarya", Turkey*

<sup>b</sup>*Sakarya University, Faculty of Education 54300, "Sakarya", Turkey*

---

### Abstract

Digital citizenship can be defined as “the norms of appropriate, responsible behavior with regard to technology use” (Ribble & Bailey, 2007). Based on this definition, this study is aimed to determine whose students are digital citizens and whose are not. Within the scope of this research, face-to-face learning students and blended learning students were compared with of the fact that being digital citizen. In order to make this comparison, Digital Citizenship Survey was used.

Keywords: digital age, digital citizen, digital citizenship

---

### 1. INTRODUCTION

One of the emerging concepts with ICT is the concept of digital citizenship. Along with this concept, individual, social and cultural properties have changed. Digital citizenship can be defined as “the norms of appropriate, responsible behavior with regard to technology use” (Ribble & Bailey, 2007) or “the characteristic of a genuine digital city” (Schuler, 2002) or “those who use the Internet regularly and effectively” (Mossberger, Tolbert & McNeal, 2011).

Three key features are identified for digital citizens. While these features whose digital citizens must have are defined as educate, empower and protect (Common Sense Media White Paper, 2011), by Ribble & Bailey (2007) respect(etiquette, access, law), educate(communication, literacy, commerce) and protect(rights and responsibility, safety/security, health and welfare) are described as these three features. Ribble & Bailey (2007) made these identifications based on some researches (Ribble, Bailey & Ross, 2004, Ribble & Bailey, 2004, Ribble & Bailey, 2005) and adapted features to the students.

\* Corresponding author. Tel.: +90 264 614 10 33; fax: +90 264 614 10 34.

E-mail address: isman@sakarya.edu.tr

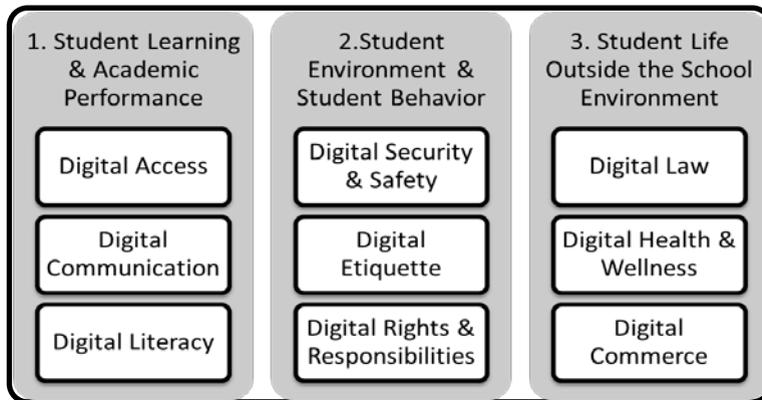

Fig. 1. Digital Citizenship Touchpoints (Ribble & Bailey, 2007)

- Student Learning & Academic Performance
  1. Digital Access: full electronic participation in society.
  2. Digital Communication: electronic exchange of information.
  3. Digital Literacy: process of teaching and learning about technology and the use of technology.
- Student Environment & Student Behavior
  4. Digital Security (self-protection): electronic precautions to guarantee safety.
  5. Digital Etiquette: electronic standards of conduct or procedure.
  6. Digital Rights & Responsibilities: those freedoms extended to everyone in a digital world.
- Student Life Outside the School Environment
  7. Digital Law: electronic responsibility for actions and deeds
  8. Digital Health & Wellness: physical and psychological well-being in a digital technology world.
  9. Digital Commerce: electronic buying and selling of goods.

With these touchpoints, the features which students must have as digital citizenship was identified. Based on these features, in this study the levels of university students' digital citizenship was investigated.

## 2. Method

### 2.1. Population

The population of this study constitute of students of the Faculty of Education of Sakarya University in the 2012-2013 academic year. The population consists of a total of 4395 students. Participation in the study was on a voluntary basis. Convenience sampling method was used in the study. 246 students have applied the scale. 7 students are identified not to complete the scale correctly. Their data have been excluded the study. Totally 239 students data have been evaluated.

### 2.2. Data Gathering Tool

Comparing the students' level of digital citizenship is the aim of this study. For gaining this goal, the Digital Citizenship Scale (DCS) (İşman & C. Güngören, 2013) was used. This scale was developed by İşman & C.

Güngören(2013) and was based on Ribble & Bailey(2007)' s digital citizenship nine touchpoints. DCS has 33-items and it is five-point Likert-type scale. The students answered the items by selecting one of the “Strongly Agree”, “Agree”, “Neutral”, “Disagree”, “Strongly Disagree” options.

Gender, class, education, having computer, using computer hours per day, taking computer training, using the Internet, using the Internet hours per day, purposes for using the Internet, the device used to connect to the Internet, thinking the Internet safe, membership of social network sharing sites, using which social network sharing sites were used as descriptive statistics of the research. According to these descriptive statistics, students' level of digital citizenship were compared.

### 2.3. Data Analysis

SPSS 21 statistical software was used for performing analyses. For analyzing to compare the students' level of digital citizenship, Independent Sample t-Test and One Way ANOVA was used.

## 3. Findings

### 3.1. Demographic Characteristics

For comparing the students' level of digital citizenship, students' demographic characteristics were collected in this research. According these data, 141 male and 98 female, 31 1st class, 65 2nd class, 72 3rd class and 67 4th class, 104 1st education, 59 2nd education and 73 blended education students attended the research. 230 students have computer, 7 students not. 9 students use a computer 0-1 hour per day, 48 students use a computer 1-3 hours per day, 99 students use a computer 3-6 hours per day, 52 students use a computer 6-9 hours per day, 30 students use a computer more than 9 hours per day. 222 students took computer training, 16 students not. 236 students use the Internet, 2 students not. 30 students use the Internet 0-1 hour per day, 62 students use the Internet 1-3 hours per day, 93 students use the Internet 3-6 hours per day, 32 students use the Internet 6-9 hours per day, 21 students use the Internet more than 9 hours per day.

Students use the Internet for different purposes. 202 students for sending and receiving e-mail, 171 students for reading newspaper/book, 176 students for listening radio/music, 167 students for watching TV/video, 121 students for playing games, 181 students for chatting, 75 students for banking transactions, 134 students for shopping, 210 students for doing homework/course work, 64 students for improving foreign language, 200 students for communicating with friends, 190 students for entering the social network sharing sites, 53 students for meeting people use the Internet. 226 students with laptop, 60 students with PC, 24 students with tablet, 116 students with mobile phone connect to the Internet. 146 students think the Internet safe, 88 students not.

229 students are members of social network sharing sites, 7 students not. Students use different social network sharing sites but generally Facebook, Twitter and Google+ are used. 230 students use Facebook, 160 students use Twitter and 130 students use Google+ in our study.

### 3.2. Findings

The data of the scale was assumed to have a normal distribution. Therefore, Independent Sample t-Test and One Way ANOVA parametric analyses were made for this study. For comparing students' the levels of digital citizenship by gender, having computer, taking computer training, using the Internet, purposes for using the Internet, the device used to connect to the Internet, thinking the Internet safe, membership of social network

sharing sites, using which social network sharing sites were used Independent Sample t-Test. For comparing students' the levels of digital citizenship by class and education were used One Way ANOVA.

Students by gender between the levels of digital citizenship were not found a significant difference ( $t(237)=-.785, p=.433$ ).

Students by class between the levels of digital citizenship were not found a significant difference ( $F(3,235)=1.817, p=.145$ ).

Students by education level between the levels of digital citizenship were not found a significant difference ( $F(2,233)=2.189, p=.115$ ).

Students by having computer between the levels of digital citizenship were not found a significant difference ( $t(237)=-.785, p=.433$ ).

Students by using computer hours per day between the levels of digital citizenship were not found a significant difference ( $F(4,233)=1.518, p=.198$ ).

Students by taking computer training between the levels of digital citizenship were not found a significant difference ( $t(236)=1.626, p=.105$ ).

Students by using the Internet between the levels of digital citizenship were not found a significant difference ( $t(236)=-.994, p=.321$ ).

Students by using the Internet hours per day between the levels of digital citizenship were found a significant difference ( $F(4,233)=3.061, p=.017$ ). As a result of the Scheffe test to find significant difference, students using the Internet between 0 -1 hour per day ( $X_{0-1\text{hour}}=118,30$ ) and 3-6 hours per day ( $X_{3-6\text{hours}}=128,84$ ) were found significant difference. Students using the Internet 3-6 hours per day have the higher level of digital citizenship than students using the Internet 0 -1 hour per day.

Relationship between students' purposes for using the Internet and the level of digital citizenship were took a look at one by one. Students by using the Internet for sending and receiving e-mail ( $t(236)=-1.410, p=.160$ ), listening radio/music ( $t(237)=.057, p=.954$ ), watching TV/video ( $t(237)=-.966, p=.335$ ), playing games ( $t(237)=.444, p=.658$ ), chatting ( $t(237)=.053, p=.958$ ), doing homework/course work ( $t(237)=-1.537, p=.126$ ), improving foreign language ( $t(237)=-1.411, p=.160$ ), communicating with friends ( $t(237)=-1.457, p=.146$ ), entering the social network sharing sites ( $t(237)=.287, p=.774$ ), meeting people ( $t(237)=-1.283, p=.201$ ) between the levels of digital citizenship were not found a significant difference. Students by using the Internet for reading newspaper/book ( $t(237)=-2.521, p=.012$ ), banking transactions ( $t(237)=-2.239, p=.026$ ), shopping ( $t(237)=-3.373, p=.001$ ) between the levels of digital citizenship were found a significant difference. As a result of these tests, students using the Internet for reading newspaper/book ( $X_{\text{reading newspaper/book}}=127,86$ ), banking transactions ( $X_{\text{banking transactions}}=129,58$ ) and shopping ( $X_{\text{shopping}}=129,22$ ) have the higher level of digital citizenship than students not using the Internet for these purposes ( $X_{\text{notreading newspaper/book}}=122,30, X_{\text{notbanking transactions}}=124,77, X_{\text{notshopping}}=122,53$ ).

Relationship between the devices for students to use to connect to the Internet and the level of digital citizenship were took a look at one by one. Students by using laptop ( $t(237)=-1.726, p=.086$ ) and PC ( $t(237)=-1.491, p=.137$ ) to connect to the Internet between the levels of digital citizenship were not found a significant difference. On the other hand, students by using tablet ( $t(237)=-4.183, p=.000$ ) and mobile phone ( $t(237)=-3.386, p=.001$ ) between the levels of digital citizenship were found a significant difference. As a result of these tests, students using tablet ( $X_{\text{tablet}}=138,45$ ) and mobile phone ( $X_{\text{mobilephone}}=129,71$ ) have the higher level of digital citizenship than students not using tablet ( $X_{\text{nottablet}}=124,92$ ) and mobile phone ( $X_{\text{notmobilephone}}=123,04$ ).

Students by thinking the Internet safe between the levels of digital citizenship were not found a significant difference ( $t(232)=1.597, p=.112$ ).

Students by being members of social network sharing sites between the levels of digital citizenship were not found a significant difference ( $t(234)=1.713, p=.088$ ).

Relationship between students using different social network sharing sites and the level of digital citizenship were took a look at one by one. Students by using Facebook ( $t(236)=-1.941, p=.053$ ) and the other social network

sharing sites ( $t(236)=.716$ ,  $p=.475$ ) between the levels of digital citizenship were not found a significant difference. On the other hand, students by using Twitter ( $t(236)=-2.556$ ,  $p=.011$ ) and Google+ ( $t(236)=-3.559$ ,  $p=.000$ ) between the levels of digital citizenship were found a significant difference. As a result of these tests, students using Twitter ( $X_{\text{Twitter}}=128,10$ ) and Google+ ( $X_{\text{Google+}}=129,51$ ) have the higher level of digital citizenship than students not using Twitter ( $X_{\text{notTwitter}}=122,66$ ) and Google+ ( $X_{\text{notGoogle+}}=122,47$ ).

#### 4. Conclusion

In this study, Digital Citizenship Survey(DCS) was used and students' level of digital citizenship were compared. 239 students from Faculty of Education of Sakarya University in the 2012-2013 academic year have applied the scale. Within the scope of this study gender, class, education, having computer, using computer hours per day, taking computer training, using the Internet, using the Internet hours per day, purposes for using the Internet, the device used to connect to the Internet, thinking the Internet safe, membership of social network sharing sites, using which social network sharing sites were compared with the students' level of digital citizenship.

As a result of these analyzes variables of gender, class, education, having computer, using computer hours per day, taking computer training, using the Internet, thinking the Internet safe, membership of social network sharing sites between the levels of digital citizenship were not found a significant difference. Using the Internet hours per day, purposes for using the Internet, the device used to connect to the Internet, using which social network sharing sites between the levels of digital citizenship were found a significant difference.

Students using the Internet 3-6 hours per day have the higher level of digital citizenship than students using the Internet 0 -1 hour per day. Students using the Internet for reading newspaper/book, banking transactions and shopping have the higher level of digital citizenship than students not using the Internet for these purposes. Students using tablet and mobile phone have the higher level of digital citizenship than students not using tablet and mobile phone. Students using Twitter and Google+ have the higher level of digital citizenship than students not using Twitter and Google+.

In conclusion, students who use the Internet 3-6 hours per day for reading newspaper/book, banking transactions and shopping with tablet and mobile phone and use Twitter and Google+ have more digital citizen's features. Looking at the results of analysis, this study will repeat for different groups or different variables in future studies.

## Abstract

Brazilian Higher Educational Institutions have an important function in transforming the social reality of the people and the Brazilian National Education Plans accent this role in its goals. In this paper we will reflect on the role of the Brazilian Higher Educational Institutions in building an inclusive society, with social responsibility, based on the National Education Plans and a numerical analysis of information provided by National Institute for Educational Studies and Research Anísio Teixeira (INEP) in their Technical Briefs on the Census of Higher Education.

*Keywords:* Inclusive Society; Social Responsibility; Higher Educational Institution; National Education Plan; Census of Higher Education.

## 1. The Need for Reconfiguration of Higher Education Institutions in Brazil

Never before higher education attained such importance, whether the expansion of its effects, the resources allocated to it, or the role it plays in society, transformed, worldwide, in the knowledge society. (Federico Mayor Zaragoza, 1998.)

Federico Mayor Zaragoza, Director-General of UNESCO in 1998, in the opening speech of the First World Conference on Higher Education, has already signaled about the importance of higher education and its institutional responsibilities, and the ability of educational institutions having a vital power of transformation.

The World Conference on Higher Education in 2009, whose theme was "New Dynamics of Higher Education and Research for Social Change and Development," was also about the responsibilities of higher education. In its Communiqué of July 8, 2009, the World Conference recognizes that higher education is a matter of responsibility and economic support of all governments. Incentives for Education by the Government have become important tools and it is absolutely necessary for the access and quality of higher education. The incentives for Education and the concern for building an inclusive society are factors that contribute to the sustainable development of the country.

Never in history was so important to invest in higher education as a major force in building an inclusive and diverse knowledge, and advancing

E-mail address: denisecandal@gmail.com

research, innovation and creativity. (World Conference on Higher Education 2009. Communiqué of July 8, 2009.)

The participants in the World Conference on Higher Education 2009 indicate that "the past decade has left evidence that research and higher education contribute to the eradication of poverty, sustainable development and progress, achieving the international development goals ..."

With the emergence of new institutions and tools disseminators of knowledge, institutional structures need to focus education efforts to build a new identity, based on the construction of knowledge in the contemporary context.

Annually, in Brazil, the National Institute for Educational Studies and Research Anísio Teixeira (INEP) conducts the Census of Higher Education, collecting information about Higher Education Institutions (IES), undergraduate and sequential specific training and students and teachers connected to these courses. The Census aims to portray the Brazilian Higher Education, providing information to general society in the Census Technical Report on Higher Education. These reports, over the years, have been sensing a growing student demand, and therefore there is a need to think about a reconfiguration of higher education in general.

Several significant changes are occurring in higher education, including the transformation of higher education institutions in social organizations and public entities of private nature. Given this fact, and since the federal system of higher education in Brazil is not able to absorb all the demand, private institutions must be prepared quantitatively and qualitatively, in the interest of promoting social inclusion.

Opening the market to higher education institutions for profit, tax incentives for higher education institutions, student financing programs, among others, are measures that benefit not only students, but also promote the development of private institutions and assist the government, since public education, with complex management, cannot, by itself, meet the demand.

---

## **2. An Overview of Brazilian Period from 2001 to 2010**

Observing the evolution of the number of Brazilians Higher Education Institutions, summarized in Technical Briefs on the Census of Higher Education, in the 1970s, 1/3 of the system was private and 2/3 public. Already in 1980, 77% of the institutions were private, reaching 78% in 1998 (INEP / MEC). The figures for 2001, released by INEP/MEC, demonstrated that 86.8% of the institutions were private, reaching 88.3%, in 2010.

Ano	Total	Pública								Privada

Table 1. Number of Higher Education Institutions by Category Administrative - Brazil - 2001-2010

The amount of Higher Institutions between 2001 and 2010 had a significant increase: 71%. This increase is mainly due to the increasing number of private institutions (74%), while increasing the number of public institutions was 52%.

Ano	Total	Pública								Privada

Table 2. Number of Registrations by Administrative Category Brazil - 2001-2010

Between 2001 and 2010 there was an increase of 110% in enrollment in Higher Institutions, and, although there has been an increase in enrollment in public institutions (74%), the most significant increase was in enrollments in Private Institutions (126% increase) and it is consistent with the fact that the number of these institutions have grown by 74%.

The number of entry into Higher Education Institutions grew by 109%, between 2001 to 2010, 78% of the entering of Private Institutions.

Fonte: MEC/Inep

Table 3. Number of Tickets (All Forms) by Administrative Category - Brazil - 2001-2010

For INEP, enrollment is the sum of ties to a college student between studying and formed, while the number of tickets is the sum of ties to a college student who joined the Institution in the year of the Census, or 2010.

In terms of graduates, Higher Education Census of 2010 shows that there was an increase of 44% of graduates from public institutions, presenting, in 2010, 973,839 graduates, while private schools achieved a 197% increase in the number of graduates, presenting 783,242 graduates in 2010, representing 80% of graduates in general.

Given this significant increase of graduates of registered and enrolled, the role of education, the role of institutions of higher education, especially private ones, can be considered as a factor of social emancipation, for assistance in the construction of citizenship. The new institutions of Private Higher Education are public entities with private nature, and these companies should be viewed not only as institutions that prepare technically and practically for the labor market, but also, and primarily, as spaces of social inclusion and responsible of building an inclusive society, contributing to the formation of ethical citizens.

### 3. Brazilian National Education Plans (PNE) and Social Inclusion

PNE thus seeks integrated actions of the three levels of government, creating an intergovernmental entanglement, ie within each government, in order not to share the social policies. (PNE 2001-2010. **LEI N° 10.172, DE 9 DE JANEIRO DE 2001**)

National Education Plan in Brazil lasts for ten years (2001-2010 and 2010-2020) and presents guidelines and objective goals, followed by specific strategies for implementation. Its implementation is the responsibility of different levels of government, who need to create actions plans in order to meet the targets.

The Higher Educational Institutions have an important role in transforming the social reality of the population, this reality with characteristics of inequality, marginalization and exclusion and the National Plan of Education 2001-2010 and 2010-2020 accent in this paper in its goals.

Given the growing number of students who have access to higher education, from 2001 to 2010, from 3,036,113 to 6,379,299, private education institutions, which represent, in 2010, 74% of Higher Education Institutions have an important role as a social institution and must be committed to social emancipation and redemption of citizenship. This increase in access, by itself can now be considered an advancement in inclusion.

The National Education Plan for 2001-2010 PNE established as a goal for 2010 to provide higher education to offer at least 30% of the age group 18-24 years. The real supply hit in 2010 for this age group was 14%.

No country can aspire to be developed independently and without a strong higher education system. In a world where knowledge outweighs the material resources as a factor in human development, the importance of higher education and its institutions is increasing. To enable them its educational mission, institutional and social, public support is crucial. (PNE 2001-2010. **LEI N° 10.172, DE 9 DE JANEIRO DE 2001**)

National Education Plan PNE 2010-2020, in its target 12, has proposed to raise so qualified, gross enrollment rate of higher education to 50% and the net rate to 33% of the population of 18 to 24 years. In 2009, the situation in the Northeast, 18.4% gross enrollment and net enrollment of 9.4%, is still far from satisfactory.

Assuming the largest expansion of school places in the ES to meet the targets occur in private HEIs and taking into account that the greatest potential for new students of ES is among individuals of lower income and therefore belong families with the lowest financing capacity, there will need to expand programs providing grants and funding, as ProUni e FIES. (PNE 2010-2020)

Nota: Para os anos 2001, 2002 e 2003, exclusiva a população rural de RO, AC, AM, RR, PA e AP.

Table 5. Foreign Gross and Net Enrolment in Higher Education - Brazil and Regions - 2001-2009

The "gross enrollment ratio" allows you to compare the total enrollment of a certain level of education to the population aged theoretically appropriate to this level, while the indicator "net enrollment rate" indicates the percentage of the population enrolled in a given level school aged theoretically appropriate for the population aged theoretically appropriate at the same level. (INEP / MEC)

The mean education can be studied as a factor of social inclusion. Looking at the average education of the country from 2001 to 2010, total, urban and rural, it is observed that the Southeast and South are still above the national average and the Northeast and North, below average. However, one notices a decrease of the difference of urban and rural middle school as well as an increase in the average number of years of study in the age range considered in the survey, approximately 19%.

Thinking in terms of increases in average between 2001 and 2010, each of the regions, the most significant increase was in the Northeast, 35%, still remains the lowest average of Brazil and can not be considered satisfactory. It is noteworthy, also, the increase in average years of schooling of 24% of the Midwest region.

According to the Brazilian Institute of Geography and Statistics, Brazil, IBGE, average schooling is the average years of schooling. The years correspond to the period of study appropriate to the grade and the highest grade or level achieved by the person considering the last grade completed approval.

Even in terms of schooling and its relation to social inclusion, there was an increase in the average number of years of schooling for some population subgroups between 2001 and 2009. Important to notice that there has been a significant increase in years of schooling of blacks, who in 2009 was 8.7 years, increasing by around 28%. The Northeast also saw an increase of 35%, from 6.3 years to 8.5 years of study.

Figure 1. Número Average Years of Study for the Age Group 18-24 years for the Rural and Urban Locations - Brazil and Regions - 2001 and 2009

The Bill no8035/2010 the PNE 2010-2020, his goal 8, is precisely the reduction of educational inequality, aiming at social inclusion. This Meta proposes raising the average education of the population of eighteen to twenty-four years to a minimum of twelve years of schooling for rural populations, the region of the country and less educated twenty-five percent poorest and proposes equal the average schooling between blacks and non-blacks.

Subgrupos/Ano	2001	2005	2009
1º quarto da distribuição de renda	7,4	8,4	9,2
Campo	5,1	6,4	7,5
Região Nordeste	6,3	7,4	8,5
Negros (pretos e pardos)	6,8	8,0	8,7
Branços	8,8	9,6	10,2
Média Nacional	7,9	8,8	9,4

Table 6. Average Number of Years of Study for the Age Group 18-24 years for Population Subgroups Some - Brazil - 2001, 2005 and 2009

Distribution by region of the country in enrollment of undergraduate courses in the form of classroom teaching still performs unevenly and unsatisfactory. The northern region showed an increase in the percentage of enrollment of 4.7% to 6.5%. The Northeast also showed an increase in enrollment and percentage, from 15.2% to 19.3% between 2001 and 2010. The other regions, the Midwest, Southeast and South showed a decrease in the number and percentage of enrollments, rising from 8.6% to 9.1%, 51.7% to 48.7%, and 19.8% for 16, 4%, respectively.

The establishment of a policy of expansion with the aim of reducing inequalities of offerings that exist between regions of the country is a prime topic for building an inclusive society.

#### 4. Final Considerations

You must then focus on the academic discussion of the social function of private higher education institution not only in university extension projects, but also on the concept of social responsibility of the

Institution / Organization. In the case of Private Higher Educational Institutions, we must discuss the concept of corporate social responsibility, in light of the National Higher Education Evaluation (Sinaes), established by Law n. ° 10 861 of 14 April 2004 regulated by Decree n. ° 2051 of 9 July 2004.

In an interview to the Journal of Higher Education, Fabio Garcia dos Reis, Ph.D. in Social History, defends the public-private alliance: "Today, worldwide, private institutions are taking on the role of social train people alongside the State, as partners, and not against him. "Fabio Garcia complete that" the state needs to create mechanisms to monitor and ensure the quality, but not limit the actions of private bodies. Democratization through the private. "

The numbers related to the Institutions of Higher Education Private are significant. In the period 2001 to 2010 was an increase of 110% in enrollment in Higher Institutions. From a total of 6,379,299 students enrolled in 2010, 4,736,001 are in private institutions, and represented an increase of 126%, consistent with the fact that the number of these institutions have grown 74%.

The average number of years of schooling for the age group 18-24 years for rural and urban localities has been increasing since 2001 in regions of the country, reaching an average of 9.4 years Brazil. Given the results of the Technical Report on Higher Education, 2010, of the National Education PNE 2001-2010 and 2010-2020, the new Private Higher Educational Institutions, these public private in nature, should be seen as institutions / companies committed to assist in preparing a scenario for social emancipation, the exercise of citizenship and global development.

The Private Higher Education has not only informative aspects, but also aspects related to sustainable human development, occupying a prominent place in the development of an inclusive society, enabling the transformation of the individual, the region and the country.

---

### Abstract

This action research, conducted at Istanbul Sehir University, was designed to find out how students can be autonomous learners if they are given a chance outside the classroom to reflect on their learning process via keeping a learning journal. The questions of the study were “How do students perceive the role of the teacher?” “How do they perceive the role of themselves?” and “Is it possible to make them more autonomous learners?” The participants of the study were 20 high school graduates, who recently started their university degree programs. They were asked to keep a learning journal on daily basis. At the completion of the module (seven weeks), the journals were collected and the entries were analyzed. A concordance program- Antconc, was used for text analysis.

Keywords: Learner autonomy; action research; meta cognitive strategies; motivation

---

### 1. Introduction

Over the past decades, the concept of learner autonomy has been a buzzword, especially in foreign language learning as language learning encompasses the learner being active and in the center of the learning process. The concept of ‘learner autonomy’ was first introduced and developed by Henry Holec, director of CRAPEL, in the early 1970s. Holec defined the notion of ‘learner autonomy’ as the “ability to take charge of one’s own learning.” and added “it is not inborn but must be acquired by ‘natural’ means or (most often happens) by formal learning, i.e. in a systematic, deliberate way” (Holec, 1981:1). It is worth mentioning that Holec’s report entitled ‘Autonomy and Foreign Language Learning’ published by the Council of Europe in 1979 focused on adult education and was based on the notions of ‘developing individual’s freedom’, ‘increasing sense of awareness’ and moving from being ‘the product of his society’ to being ‘producer of his society’ (Holec, 1981: 1-3) and thus aiming at promoting a lifelong learning. In 1990s, with the influence of ‘constructivism’ and ‘learner- centred theories’ the concept of ‘learner autonomy’ started to appear in curriculum studies and since then has become one of the indispensable goals of any curriculum. Since Holec coined the term ‘learner autonomy’, many other definitions have been offered, however, the definition we adopted for this study is it is the capacity for detachment, critical reflection, decision-making, and independent action (Little 1991:4). By adopting Little’s definition of ‘learner autonomy’, we will limit our focus to observe whether there is a change in meta-cognitive strategies that students adopt and whether their attitude and motivation towards learning has gone through a transformation. Cook states that meta-cognitive strategies “are about learning rather than learning strategies themselves”. (Cook, 1993:114) The autonomous learner shows initiative regarding learning, and shares in monitoring progress and evaluating the extent to which learning is achieved (Schunk, 2005). In that sense, aiming at fostering learner autonomy is in a way providing opportunities or an environment to lead students move from applying cognitive strategies to the second step of applying meta-cognitive strategies; integrating cognitive and meta-cognitive strategies. Fostering the development of learner autonomy rests on the pedagogical claim that in formal educational contexts, reflectivity and self-awareness produce better learning (Pintrich, 2000). Motivation

\* Corresponding author Tel.: +90 212 559 9021.

E-mail address: denizezgivile@sehir.edu.tr

and self-efficacy are also considered to be closely related to learner autonomy as these notions play a crucial role in either fostering or inhibiting learner autonomy. Autonomous learners are believed to be intrinsically motivated and this is mostly associated with setting personal goals. Meece (1994:25) indicates two achievement goals:

- . learning oriented/task oriented: These learners seek to improve their level of competence.
- . performance oriented/ ego oriented:...These individuals are likely to view their abilities as stable traits that can be judged in relation to others.

It is observed that performance oriented/ego oriented learners' motivation tends to be a short-term motivation and depends on the task, environment or the other individuals in class. Nonetheless, performance oriented learners still tend to be more autonomous learners and follow decision making strategies. On the other hand, inability to set personal goals which is directly related to intrinsic motivation is agreed to serve as one of the crucial reasons for underachievement or being trapped in an image of being an underachiever. Krouse and Krouse (1981) state that there are three main reasons for underachievement:

- . skill deficit
- . personality dysfunction ( impulsiveness, fear of failure, high need for approval)
- . deficiencies in self-control

As seen, the underlying reasons for underachievement are more to do with beliefs, values, attitudes and motivational aspects rather than the learner's potential to be able to do the task or perform in a foreign language. It is of great importance to lead students to comprehend and reflect on the reasons why they fail or underachieve and enable them to see the fact that personal beliefs, attitudes and values towards learning need to be deconstructed in time and with effort and decision making and independent action should follow. Teachers' guidance in this process plays the most important role in relation to creating a friendly and low threat environment to be able to work in collaboration towards the goals because it is considered that student achievement; student motivation, academic confidence and learning strategies determine learner autonomy (Thanasoulas, 2000).

## **2. The Study**

### **2.1 Method**

This study is an action research. Action research is a term used to describe the process of identifying a puzzle in the classroom, collecting, and interpreting data. This process is beneficial to teachers and students since it is concerned with improving the immediate learning environment (Finch, 2001). The puzzle in this case is the participants, who, being fresh graduates of high school, do not have many qualities of autonomous learners; instead they expected all learning to come from the teacher. As a requirement of university studies, they have to take the responsibility of their own learning, thus, a paradigm shift was needed. On the first day of their module, the instructor-researcher asked them to keep a learning journal. Throughout the module, the instruction was geared to foster autonomy.

### **2.2 Research Question**

The research question for this particular action research was: “Is it possible to make a paradigm shift in students that start their foundation program at university so as to foster their autonomy in the process of learning?” It has been regarded that students come to university with the set notion that the teacher is the owner of the teaching and learning process. The underlying rationale for this notion is that all Turkish students take a central university entrance exam to be eligible to study at tertiary level. In order to better prepare themselves for this exam, 52.97% of all test-takers attend private courses, where the teacher takes the responsibility of the teaching-learning process (MONE, 2009). This tendency continues at university level.

In order to change this paradigm, the instruction throughout the module was designed to foster learner autonomy. While doing this, four determinants of autonomy, as pointed out by Eccles & Roeser (2003; cited in Thanasoulas, 2000), was adopted as indicators of the paradigm shift. These are student achievement, motivation, academic confidence and learning strategies.

### **2.3 Participants**

20 students that started their college degree programs were asked to keep a learning journal everyday for seven weeks - until the completion of a module. However, at the end of the module, 12 students who regularly wrote entries were taken into consideration and only those students and their journal entries constituted the data of this research.

### **2.4 Data Analysis**

The data analysis process was two-fold: First, the subject pronoun change was examined through a concordance program: *AntConc*. It has been assumed that the subject/pronoun used at the beginning should be “the teacher” or “we”, meaning the class and myself. However, by the end of the study it was expected that the pronoun would turn into “I” as the participants were expected to take more action in their learning. The journal entries started as of 4 October and the last entry was 19 November. Secondly, a total of 47 days of data entries of 12 participants were analyzed using a grounded theory approach that employed further focused codes to explore connections and generate theoretical hypotheses that are discussed in the findings below. The data was examined under two headings: Changes in meta-cognitive strategies, and changes in attitudes and motivation.

### 3. Findings

#### 3.1 Change in Subject/pronoun

Weeks	Week 1		Week 3		Week 5		Week 7	
	We/ T.	I	We/ T.	I	We/ T.	I	We/ T.	I
P1	3	7	8	5	3	9	0	9
P2	14	5	8	9	3	8	2	11
P3	11	7	8	7	2	8	5	13
P4	11	12	15	9	6	9	2	11
P5	14	8	10	9	7	13	8	16
P6	5	1	5	2	3	22	5	19
P7	25	16	11	5	3	20	4	22
P8	2	8	16	7	9	14	3	17
P9	9	3	2	0	0	3	1	6
P10	4	0	5	2	0	2	2	5
P11	5	9	5	6	7	1	4	5
P12	23	0	18	4	11	6	8	8
Total	126	76	111	65	54	115	44	142

**Table 1.** Change in subject/ pronoun

Table 1 illustrates the number of the uses of subject pronouns 'I', meaning 'the class and myself' and 'we', meaning 'the class and the teacher'. In week 1, the total use of the subject pronoun by all 12 participants, 'we' or 'the teacher' was 126 times, whereas the total use of the subject pronoun 'I' was 76 times. Except for the four participants, P1, P4, P8 and P11 (P is the abbreviation for participant), the rest of them (8 participants) intimately connected their learning experience with the teacher, the classroom activities and environment. In week 3, the results show a similar tendency as the participants' total use of subject pronoun 'we' or 'the teacher' was 111 times and much higher than the use of the subject pronoun 'I'. It can be said that in week 2, the participants' dependency on their teachers and classmates continues except for two participants (P2 'we':8/'I':9, P11 'we':5/'I':6), however even these participants show a strong dependence on their teachers. In the following weeks, a different tendency can be seen as the total number of the uses of subject pronoun 'I' increased dramatically (week 5 'we': 54/'I':115, week 7: 'we'44/'I':142). In week 5, 10 out of 12 participants started to change the way they approach learning and to take charge of their own learning. In week 7, except for one participant (P12) 11 of them showed a tendency toward taking more action on their learning.

#### 3.2 Change in Meta-cognitive Strategies

With the development of autonomy, learners are expected to take action on their learning and develop some meta-cognitive strategies. As pointed out by Cook (1993) meta-cognitive strategies are 'strategies about learning rather than learning strategies themselves'. Here, we have taken into consideration three of the meta-cognitive strategies that Cook (1993) indicates: self-monitoring, self-evaluation and planning. After monitoring and

evaluating themselves, learners attempt to use a certain strategy, and come up with a plan to overcome their weaknesses.

[P1/week 1] *“Today we talked about phobias, I learnt different types of phobias such as acrophobia and arachnophobia.”*

[P1/week 3] *“There were some points that I had missed about essays last week. I completed them and I understood my mistakes about thesis statement.”*

[P1/week 3] *“After today everyday I will listen to a video to improve my listening skills and I will watch a film twice a week. I started.”*

As it can be seen above, P1 was not aware of these meta-cognitive strategies in week 1. He had a tendency to report the learning took place in the classroom. However, in week 3, he started to self-monitor. He indicated that he missed out on some points, and evaluated his learning identifying the problematic areas. In week 3, it is clear that he had a plan about how to achieve his objective.

[P9/week 3] *“Today I watched a film and I listened to new songs in English.”*

[P9/week 4] *“Today we learnt passive structures. At home I did some extra practices to learn better.”*

[P9/week 5] *“Today we did listening practice. Also we did some practice about dates and numbers. This was very good for me because I had a problem with dates and numbers but now when I hear I’ll write it down quickly.”*

As it is shown above, P9 indicated that she was doing some extra work outside the class in week 3, however she was not sure how to monitor or evaluate this. However, in weeks 4 and 5, she started to monitor and evaluate (*I had some problems with dates*) her learning process and took actions (*extra study*), and plan (*writing down quickly*) for further improvement.

### **3.3 Change in Attitude and Motivation**

Attitude and motivation are closely related terms that have an impact on student autonomy. Attitudes, as it is pointed out by Brown (1987, cited in Thanasoulas, 2000) ‘part of one’s perception of self, of others and of the culture in which one is living (or the culture of the target language)’ shape how learners see themselves and their second language learning process. Gardner and MacIntyre (1993:3) state that motivation has three parts: ‘desire to do the task, directed effort and satisfaction with the task’. Considering these views, it is assumed that as learners take charge of their own learning and become more autonomous, their attitudes will change and their motivation and self-esteem will increase.

[P3/week 3] *“...At 10 pm I am planning to exit from library with feeling happy for finished my responsibilities.”*

[P3/week 4] *"Today I wrote too bad essay in process writing. I mean I searched the topic too much I didn't have anything to write with my own words. Even though I had a good outline, I didn't write."*

[P3/week 4] *"I listened to Pink songs. Learning new words will help me I believe."*

[P3/week 5] *"Today I woke up and came to university library. I read my books until 2 pm. After that I prepared for my presentation till 7 pm. When I came to class, I looked some resources from the Internet. I don't plan to write an essay I want to be natural. I will try to speak when I close my eyes."*

[P3/week 5] *"I had an oral presentation today. I think I succeeded that because I wanted to be natural so that I didn't prepare writing a paper."*

As it is shown above, P3 indicated the effort he put into accomplishing his tasks and expressed a sense of satisfaction with his accomplishments. Also, it was clear that there was some indication of growing self-esteem as he decided how to approach some of the tasks because he would like to speak English fluently.

[P11/week 2] *"I decided to watch all the movies of one director and then I would pass the another one and I decided to do it in English; yes maybe I don't understand them all but one day it will help me; I hope so..."*

[P11/week 7] *"Back to journal because I couldn't do my homework but I love this language and it is better to write here. I was watching movies of director Tim Burton and I understood nearly all of them."*

As it is shown above, in week 2 P11 mentioned his plan of watching movies, however, he conveyed a sense of inefficiency. He was concerned about his abilities and his success in the future. In week 7, it was clear that there existed a big change in his attitude, as he expressed his sense of accomplishment and satisfaction. Even though he couldn't do his homework, he stated 'how much he loved this language', which showed a high level of self-esteem and a positive attitude.

[P2/week 3] *"I said to myself I will start tomorrow but I am saying today now. I am at class now and waiting for the lecture. I will annoy my teacher because I did not do my homework but I will do it today and I will apply my plan beginning from today. I ordered 'Understanding and Using English Grammar' yesterday from Homer bookstore. I will start reading an English book. I will read three English books per week."*

[P2/week 4] *"Today we got an essay project I am so happy because I wrote my first serious essay; it has an intro, two body paragraphs and a conclusion. I think my English is improving. The book I started yesterday can be very useful for me about planning my time. My English is getting better everyday and I am so hopeful about the future."*

As it is shown above, P2 identified his weaknesses and indicated his study plan about doing some extra grammar study and reading. He had the desire and he was ready to put his directed effort in it. In week 4, the same participant also expressed a sense of accomplishment. He was satisfied with his process, he believed that he had good writing skills and he was improving his reading skills, which indicated an increasing level of self-esteem.

#### 4. Conclusion

This action-research was undertaken to foster students' autonomy in their learning process. The action-research conducted on this sample group validates the assertion that autonomy is an innate skill that is possible to foster. According to American social psychologist Deci, for any individual to be able to reach 'a sense of self-fulfilment', autonomy is one of the three basic needs that should be addressed and satisfied. He posits that when we are 'fully willing to do what (we) are doing and when (we) embrace the activity with a sense of interest and commitment', we are autonomous or self regulated. (Deci, 1996: 2) To foster students' autonomy in their learning process, students first need to be aware of what they are doing and they should be given a chance to be able to pass this initial stage. In many cases it is observed that students are deeply attached to their passive role, which is assigned to them by traditional school system in which any major decision is made on behalf of them even for the crucial meta cognitive decisions such as 'learning targets' or 'evaluating learning outcomes' which should involve the learner. Nonetheless, submitting to this role does not necessarily mean that students lack the 'capacity for detachment, critical reflection, decision-making, and independent action' (Little 1991:4). Teachers and classroom environment should propose and enable students to foster the autonomy they already possess innately and there need to be a shift on the mindset many teachers share, which is students are not ready to take responsibility. Brown and Presley propose four major characteristics that self regulated learners share. (Brown and Presley, 1994: 158):

- . good thinkers use cognitive strategies
- . good thinkers employ meta cognitive strategies. They monitor their process closely.
- . good thinkers have other knowledge (on the other topics)
- . good thinkers possess motivational beliefs

This action research conducted on a sample group validates that students' entries in their journals shared some or in some cases all of the characteristics of a self regulated learner proposed by Brown and Presley. Given the right environment and a chance to be self-sufficient and autonomous, learners realize that they have the skills to monitor, evaluate and make their own decisions to follow certain strategies and plans to direct their own learning.

It was also evident that as participants undertook this process, it had a considerable impact on their attitude, motivation and self- esteem.

# Bridging the gap between educational research and school practice through cooperation of university and primary school teachers

Katarina S. Wissiak Grm, Vesna Ferik Savec

*University of Ljubljana, Faculty of Natural Sciences and Engineering, Vegova 4, Ljubljana, Slovenia*

## Abstract

The existence of a gap between chemistry education research and teaching practice has been the topic of many discussions, and in recent years many efforts have been made to overcome this gap. In the present paper, we contribute to these efforts by reporting about collaboration between researchers and teachers in the PROFILES project from the perspective of university members. In the paper, we assert that primary school teachers must receive very concise and unequivocal instructions for their work in order to ensure that all parts of the project are performed correctly. Collaboration between researchers and teachers is only prosperous if both parties value their own knowledge.

Keywords: chemistry education research, gap between research and teaching practice, collaboration between teachers and researchers

## 1. INTRODUCTION

Research in chemistry education is much younger than research in modern chemistry. It began in the 20th century, which is when journals in this branch also started to be published (J. of Chem. Ed., since ~ 1920; J. of Res. in Sci. T., since ~1960; Int. J. of Sci. Ed., since ~ 1980, etc.). Since this time, chemistry education research has provided a great deal of data and has supported particular groups of professionals, especially those involved in curriculum development or assessment design. However, the question as to the success in reaching the central core of professionals – the teachers in the classroom – remains open. Considerable evidence indicates a continuing gap between research on effective teaching and teaching practice (Robinson, 1998; Costa et al., 2000; Gilbert et al, 2002; De Jong, 2004; Nuthal, 2004). Research is often seen by teachers as too theoretical, too idealistic, or too general to relate directly to the practical realities of classroom life (Hiebert et al., 2002).

According to DeJong (2004), there are four main explanations for the gap between chemistry education research and teaching practice:

- *The need to survive issue.* Teachers believe that they do not have enough time to read research articles because they are already too busy with their teaching in the classroom. Researchers, on the other hand, are required by their universities to publish in highly ranked journals, whereas for teachers publishing in journals does not provide rewards in terms of 'research' output.
- *The mutual expectations issue.* Teachers may be prone to thinking that research should provide quick final solutions for their teaching difficulties, while researchers may believe that teachers are able to understand their reports and transform research outcomes into useful ideas for teaching.
- *The innovation strategy issue.* Chemistry education reforms have often been introduced by using the RDD-model (research, development, diffusion). According to this 'top-down' approach, research projects are launched at universities or other research institutes and the results obtained are used for developing new curricula and teaching/learning materials in separate institutes, which also oversee the further dissemination of

the end products. From this perspective, the teacher role consists only of executing the new programs, therefore creating a sharp distinction between researchers and teachers. Instead, strategies that contribute to bridging the researcher-teacher gap should be implemented.

- *The research paradigm issue.* Over the past several decades, research programs for chemistry education have been strongly influenced by ‘content-free’ theories of teaching and learning. The conclusions of this research have tended to be very general. However, most chemistry teachers are faced with specific content-related difficulties in teaching and learning. This discrepancy also contributes to the persistence of the research-teaching gap.

Anderson (2007) summarizes the barriers preventing, and the strategies promoting, the bridging of the gap between science education research knowledge and its application in teaching practice. He highlights several strategies that can be used to alleviate this problem (see Figure 1), so that more lecturers apply the results of science education research, such as translating research findings into less scientific language, publishing teaching experience, involving teachers in action research, etc.

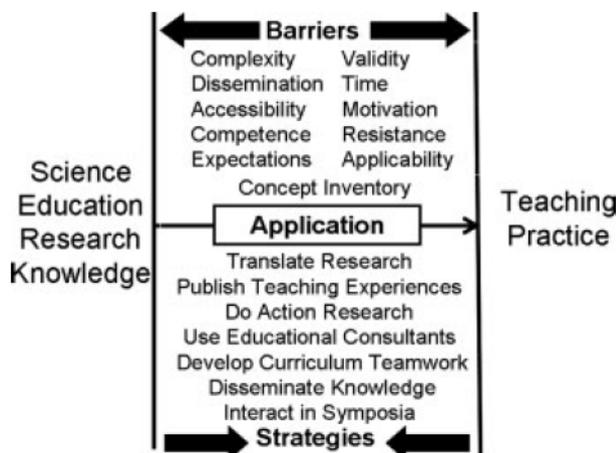

Fig. 1. Barriers preventing, and strategies promoting, the bridging of the gap between science education research and teaching practice (Anderson, 2007).

Most of the actions suggested by other researchers also refer to improving communication and collaboration between researchers and teachers (Gilbert et al., 2002). In order to improve such collaboration, numerous research projects are therefore being launched in which research teams are made up of researchers and teachers. One such project is PROFILES.

The PROFILES project is a 4-year Framework Program 7 (FP7) project funded by the European Commission of the EU (PROFILES Consortium, 2010). The PROFILES project promotes IBSE (Inquiry Based Science Education) through raising the self-efficacy of science teachers and thereby providing a better understanding of the changing purpose of teaching science in schools and the value of stakeholder networking.

Initially, PROFILES involves the development of lead teachers on four fronts (teacher as learner, as teacher, as reflective practitioner and as leader), consolidating their ownership of the context-led approach and incorporating use-inspired research, evaluative methods and stakeholder networking (Bolte, 2011).

In the present article, we report on the collaboration between researchers and teachers from the perspective of university members, based on experience gained in the first two cycles of collaboration in the PROFILES project.

## 2. METHOD

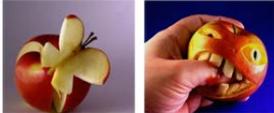

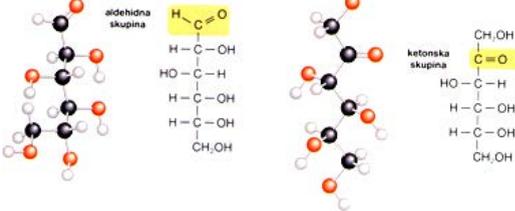

### 2.1 Sample

In the two years of the PROFILES project, 71 teachers have participated in the project, along with 10 university coordinators.

### 2.2 Instruments and materials

As result of the project, more than 35 modules have been developed over the two years in cooperation between university coordinators and school teachers, including several modules covering various learning objectives, with titles such as: “Why is vinegar used as limestone remover?”, “Why is it easier to swim in the sea than in a lake?”, “An apple a day keeps the doctor away”, “How does food containing different fats influence our body?”, etc.

As examples, some typical parts of the modules are presented in Figures 2–5:

<p>(1) Zakaj se to učim?</p>  <p>»Eno jabolko na dan odžene zdravnika vstrani. Jabolko je vir prehrane človeka, mu daje potrebne snovi za gradnjo telesa, energijo, vsebuje snov varujejo zdrave. 100 g jabolka (odvisno od sorte) vsebuje približno 85 g vode, 10,9 g ogljikovih hidratov 3 g vlaknin. Jabolko vsebuje tudi do 40 mg vitamina C, vsebuje tudi vitamin A, E, B1, B2, B6 betakaroten. vsebuje tudi številne minerale, kalija (100 do 180 g), kalcij, fosfor, magnezij in železo. Uživanje jabolka in jabolčnega soka lahko zaščiti možgane od oksidativnega stresa. Raziskava na univerzi Massachusettsu je pokazala, da lahko jabolčni sok zaščiti možganske celice za spomin oz. zmanjša izgubo spomina zaradi staranja.</p>											
<p>Fig. 2. “An apple a day keeps the doctor away”</p>	<p>Fig. 3. Models presenting fructose and glucose molecules</p>										
<p>1. DELOVNI LIST</p> <p><b>HRANILA IN ŽIVILA</b></p> <p>V človeški prehrani najdemo množico različnih živil. Med najpomembnejšimi so žita, iz katerih izdelujejo kruh in testenine, pomembni pa sta tudi sadje in zelenjava. Ta živila so po svojem izvoru rastlinska. Večina živil je tudi živalskega izvora, mednje spadajo meso, mleko in mlečni izdelki ter jajca. Kaj vsebujejo vsa živila, zakaj jih jemo? Pogledaj na embalažo nekaterih živil in skušaj ugotoviti glavne sestavine. Te so navedene v preglednici z naslovom »hranilna vrednost«. V spodnjo preglednico vpiši sestavine živil in daj pomembne podatke.</p> 	<p>Tabela 2</p> <table border="1"> <thead> <tr> <th>Cisti vitamin C</th> <th>Št. kapljic jodovice</th> </tr> </thead> <tbody> <tr> <td>Vzorec 1 (10 mg vitamina C)</td> <td></td> </tr> <tr> <td>Vzorec 2 (10 mg vitamina C)</td> <td></td> </tr> <tr> <td>Vzorec 3 (10 mg vitamina C)</td> <td></td> </tr> <tr> <td>Povprečno št. kapljic jodovice/10 mg vitamina C</td> <td></td> </tr> </tbody> </table>	Cisti vitamin C	Št. kapljic jodovice	Vzorec 1 (10 mg vitamina C)		Vzorec 2 (10 mg vitamina C)		Vzorec 3 (10 mg vitamina C)		Povprečno št. kapljic jodovice/10 mg vitamina C

### 2.3 Procedure

The collaboration between researchers and teachers in the PROFILES project can be summarized in four crucial steps, which are presented in Figure 6 and described later in the article.

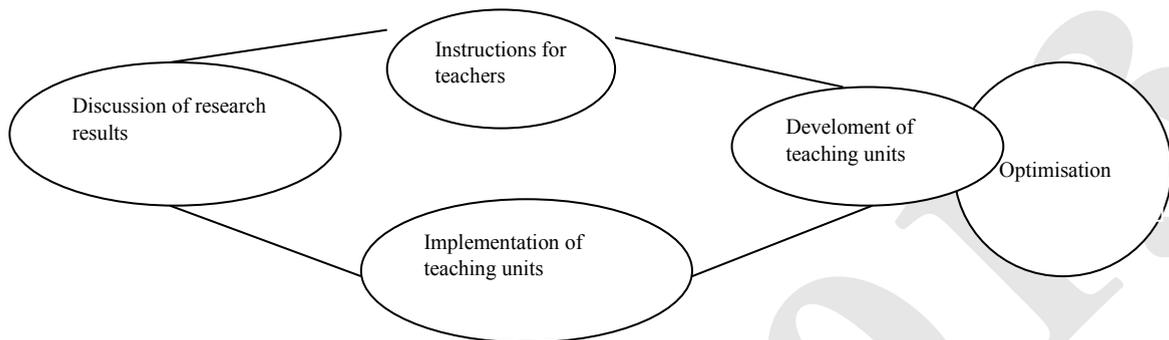

Fig. 6. Crucial steps of collaboration between researchers and teachers in the PROFILES project

#### 2.3.1 Instructions for teachers

Since teachers had to design and implement four precisely structured documents (Instructions for Teachers, Instructions for Students, Pre-Test and Test), the university coordinators provided them with accurate instructions for each document separately, following particular project requests. Teachers received several sample teaching units (modules) on which they could base the design of their own modules. They also received written instructions for designing some specific parts of the module (e.g., experimental work).

#### 2.3.2 Development of teaching units and optimization

The design of each teaching unit had to undergo several steps. Firstly, an initial draft had to be created in cooperation between the primary teachers and the university coordinator.

Each subsequent version of the teaching unit (module) designed by the group of primary teachers was sent to the university coordinator for the first revision. The university coordinator had to revise all of the teaching material belonging to a particular module, as well as giving the primary teachers appropriate feedback, focusing on both the content and the teaching methods included in the teaching unit. Based on the feedback provided by the university coordinator, the primary school teachers had to adapt all of the materials and submit them once more for final revision. The entire optimization process was performed several times in this way for each of the teaching modules conceived.

In the process of optimization, each teacher in the group had an opportunity to take part in a common discussion, and each part in the module was carefully examined together with the university coordinator. The university coordinators did their best to meet teachers' expectations and requirements regarding their common cooperation.

### 2.3.3 *Implementation of teaching units*

After the demanding process of module optimization, the resulting modules were finally implemented in school classrooms. Implementation of the modules was undertaken at different times in different schools. In the present research, classes in which designed and optimized modules were implemented as experimental groups were considered, while all of the other classes, in which teachers taught their students in their usual way, were regarded as control groups. During the intervention in school practice, several questionnaires were completed by all of the students involved in the research. Some of the questionnaires were completed in computer classrooms, while the teaching process was carried out in regular classrooms.

### 2.3.4 *Discussion of research results*

In general, significant differences were detected between groups of teachers regarding the process of further discussion and dissemination of the results obtained. Some teachers only discussed the results within their own group, while some of the groups gave public presentations of their work. The handling of the dissemination of project results was not determined in advance, but several recommendations were given regarding the importance of project result dissemination.

Participating teachers have an opportunity to continue with the work implemented, as in the following year they can become leading teachers in the PROFILES project. In this way, they have an opportunity to share their experience with the new teachers in the project, and to continue and enrich the work already done. Consequently, all of the teachers involved in the project have an opportunity to present the results of their work in public.

## **3. RESULTS AND DISCUSSION**

Based on the experiences of the university coordinators, the following issues should be pointed out regarding effective collaboration with primary school teachers in the process of the development and evaluation of learning units:

### 3.1 *Principal permission for cooperation in the project*

In line with primary school protocol, primary school teachers must provide their principal with evidence of having gained permission for the students to collaborate in the PROFILES project.

### 3.2 *Arrangements before the start of cooperation between primary school teachers and university members*

University members are aware that primary school teachers need to receive well-structured and accurately written instructions in order to start developing teaching units. The instructions must be presented in a way that offers very concise step by step instructions, but at the same time must permit a broad enough perspective for the primary teachers to gain an insight into the global concept of the study, according to the “PROFILES philosophy”. However, based on the experience obtained in the two years of project implementation, university members have recognized that it is of the utmost importance to go into further detail at every step of the project.

### *3.3 Design of the students' and teachers' material*

Due to a lack of time, primary teachers sometimes constructed teachers' and students' instructions at the last minute. In practice, this resulted in students' and teachers' instructions that were not written simultaneously and concisely. Since they were written separately, delayed teachers' instructions caused several inconveniences for university coordinators in terms of receiving the relevant information for the evaluation. When they failed to receive documents on time, university coordinators were frequently in doubt as to what exactly teachers meant with a specific task in the instructions for students. Consequently, the implementation of the module had already been completed before the discussion between the university coordinators and primary teachers could take place.

### *3.4 Design of the pre-tests and tests*

Designing pre-tests and tests requires a very accurate and precise picture in the teacher's mind. We have to know what the desired result of the teaching unit (module) is. More precisely, we need to be clear about what we really want the students to have learned after performing the teaching intervention. As soon as this perception is clarified, we can start considering the test design. Before we can start structuring the individual test tasks, however, the key words from the module content must be determined at the very least. In designing every single task in the test, teachers must be very aware of keeping in line with the content of the teaching unit. They have to consider very precisely all of the new information students encounter in the implemented unit, so that the test covers all of the relevant content included in the module. The pre-test must be constructed in a similar way, taking into account the teaching content students have already learned.

### *3.5 Respecting the members involved in the project and consideration of revisions*

In the development process of the teaching units, the material designed by the primary teachers underwent several optimizations, carried out by university members. Regardless of the work on both sides being time consuming and quite demanding, the desired result was sometimes not achieved in the end. In some cases, modules were brought into the classroom with complete disregard for the final revision of the university coordinator. In future, it would be beneficial to put together a simple code for teachers' cooperation, stating that the process of development and optimization of the teaching unit will be repeated until consensus is reached on the teaching module. Only in this way can we achieve the common goal of bringing a revised and adjusted teaching unit to the classroom.

### *3.6 Blank forms for the evaluation of project results*

In general, primary school teachers are experts in their own field. Considering this fact, university members must pay special attention to providing them with concise instructions for the specific phases of the research project work. Primary school teachers like to receive concise and complete forms that they can complete with the research results obtained in the project. However, they are also pleased whenever university members can assist them in completing various tasks.

### *3.7 Organizing meetings of all of the teachers involved*

In spite of the fact that we live in the Internet era, it is very important to provide an opportunity for all of the teachers involved in the project to meet “live”. Such meetings provide an appropriate atmosphere for teachers to have a chance to talk to each other, to share their experiences and to overcome the difficulties confronted along the way, in order to successfully fulfill their project expectations.

Over the two years of the project implementation, over 15 such “live” meetings were held. Nevertheless, e-mail communications and web-based learning were provided from the start of the PROFILES project implementation and continued throughout.

### *3.8 Encouraging primary school teachers to write a portfolio*

During the PROFILES project implementation, primary school teachers were encouraged to keep a written record whenever they felt the need to make note of a specific observation, perception, hesitation or conclusion, regardless of the phase of the project. In their portfolios, teachers expressed their views and concerns, as well as their positive experiences with the development and application of the modules. The portfolio serves two purposes. The first is procedural, developing science teachers’ reflection, encouraging their professional development and self-concept, and improving the quality of learning and teaching. The second is evaluative, with the portfolio functioning as a tool for science teachers to present their pedagogical competences and knowledge of the new professional experiences related to the project goals, through a process of action research following the main principles of the PROFILES approach (Devetak et al, 2012).

### *3.9 Stimulating primary school teachers to disseminate their work*

Primary school teachers were encouraged by the university members to present their work throughout the PROFILES project. Some of them have also had the opportunity to contribute to the 1<sup>st</sup> International PROFILES Conference, which was held in Berlin in 2012 (Šket, B., 2012).

## **4. CONCLUSION**

From the perspective of the university members, the experience of collaboration between researchers and teachers in the PROFILES project in first two cycles has been encouraging.

In order to ensure smooth collaboration, we found that primary school teachers must receive the instructions needed in a complete, concise and entirely determined form. There is a large group of different people involved in the project, including students, primary teachers, university members and other collaborators. All of them have their own expectations, needs, timetables, styles of working, attitudes, etc. Therefore, not a single stage of the

project can be left to chance. Consequently, the appropriate conduct of all of the members involved is needed in order to carry out all of the phases of the project correctly and completely. Common tasks must be determined in advance, so that all of the people involved are aware of what they have to do to reach the common goal.

Although the university members were aware that the primary school teachers needed to receive well-structured and accurately written instructions, the modules designed by the teachers indicate that the instructions need to be even more concise. In order to develop teaching units that are more “user friendly” – primarily for the students, but certainly for the teachers as well – very concise step-by-step instructions should be provided by the university coordinators. The result should be modules that are brief, concise and provide students with intelligible explanations of the learning and teaching content.

Regarding the preparation of the evaluation material in the future plans of the PROFILES project, it would be beneficial to include the aim that teachers should acquire basic knowledge of test design. Given that teachers have to prepare evaluation instruments on their own for use in the classroom before and after the intervention, they would probably be grateful for the insight provided by such knowledge.

# Building networks of care: Volunteers partnering with teachers in supporting vulnerable children

Ronél Ferreira\*, Liesel Ebersöhn, Maesala Thabe & Willie Pietersen

*University of Pretoria, Lynnwood Road, Pretoria, 0002, South Africa*

## Abstract

In this paper we argue that community volunteers may partner with schools to holistically support vulnerable children, as well as their families and community members on a broad level. More specifically, we present a case where community volunteers (n=35) have been partnering with primary school teachers in developing and implementing school-community supportive plans, focusing on prevention, health promotion, counselling and intervention initiatives. In mobilising this school-community partnership, partners – as lay counsellors – relied on sound networks amongst themselves, yet also on other eco-systemic levels. Our paper stems from a participatory action research study, involving researchers, teachers and community volunteers (society) as research partners.

*Keywords:* Community volunteers; networking; participatory action research; school-community partnerships; school-community supportive plans; SHEBA project; supporting vulnerable children.

## 1. Introduction and contextualization of the study

In this paper we report on a study that explored the development of supportive school-based plans by community volunteers, for which purposes volunteers – amongst other things – relied on networking and their own networking abilities. The study forms part of a broad research project, SHEBA (Supporting Home Environments in Beating Adversity), where the focus falls on the manner in which community volunteers can utilize the asset-based approach (Ebersöhn & Eloff, 2006; Kretzmann & McKnight, 1993) in supporting vulnerable individuals, including children in schools. The SHEBA project builds on another research project, STAR (Supportive Teachers, Assets and Resilience), which was initiated in 2003, and focuses on the manner in which teachers can promote resilience in schools (Ebersöhn & Ferreira, 2011; Ferreira & Ebersöhn, 2011; Ferreira & Ebersöhn, 2012).

Both the STAR and SHEBA projects follow a participatory action research (PAR) approach. For both projects, an intervention is facilitated with the participants, where they become aware of their own strengths, assets and resources, and then plan and initiate school- or community-based initiatives in support of their communities. These initiatives typically result in social change and communities coping with the risks they face in a more effective way. Our approach in conducting research therefore implies the assumption that individuals are able to deal with challenges and face risks by relying on what is available to them – not only in terms of skills and attributes amongst themselves, but also in terms of resources in their immediate environment.

\* Ronél Ferreira. Tel.: +27-12-420-5504; fax: +27-12-420-5511.

*E-mail address:* ronel.ferreira@up.ac.za

In South Africa, many communities deal with challenges such as high incidences of poverty and unemployment, HIV and Aids associated risks, abuse, child-headed households and high occurrence of orphans on a daily basis. Many of these communities face the additional challenge of limited resources and support from external agencies, requiring of communities on ground level to find solutions to the problems they face in their own manner. In resource-scarce communities, the relationship between schools and communities is thus often an important one – perhaps because both community and school may need to rely on one another for support, mutual development and educational advancement (Elliott, Arthurs & Williams, 2000; Torgeson, 2002). As such, the possibility of volunteers extending the hands of teachers and initiating supportive plans in schools becomes more of a reality.

## **2. Purpose of the study**

The study we report on explored the development of school-based supportive plans by community volunteers, in collaboration with primary school teachers. Secondly, we investigated how and to what extent the community volunteers relied on networking and their own networking abilities, in performing this supportive function. As such, our study focused on community volunteers and their potential role in this sphere of life.

For this purpose, we explored and gained insight into how community volunteers collaborated with schools in developing and implementing supportive plans. Our overall aim was to determine the existence or non-existence of a stipulated scope of practice for community volunteers in the school, and furthermore what the potential of networking may be during such endeavours.

## **3. Community volunteers supporting vulnerable communities within the South African context**

Wilson and Musick (1997:695) define volunteer work as “productive work that requires human capital, collective behaviour that requires social capital and ethically guided work that requires cultural capital”. As volunteer work often implies work that is unpaid for, community volunteers typically offer their time and effort free of charge for the benefit of those who need help. Although many volunteers may feel a sense of social responsibility, aspiring to give back to their communities, others may be involved in volunteer work as a way of spending their leisure time or gaining experience (Galindo-Kuhn & Guzley, 2002). In our view the collaboration between teachers and community volunteers (as seen in the SHEBA project) may in this way positively impact on learners’ achievements.

South Africa as a country is marked by the incidence of phenomena that may leave citizens vulnerable and in need of support. This country is comprised of multiculturalism and other forms of diversity. As stated, many communities and settlements in South Africa experience poverty, lack of service delivery and external support, resulting in the members of these communities facing challenges on a variety of levels. Such communities are often characterized by high incidence of child-headed households, single parent families, challenges associated with diseases such as HIV and Aids, and increased levels of abuse and crime (Page, Louw & Pakkiri, 2006). Furthermore, phenomena such as malnutrition, child neglect and abuse may also increase the levels of vulnerability.

However, regardless of limitations in terms of resources and literacy in this country of diversity, teachers and community members are mostly willing to impact positively on the lives of children and to make a difference in the lives of other community members. Against the background of limited intervention from government authorities in South Africa, specifically in resource-scarce communities, the participants in our study took the initiative to establish partnerships with schools in their proximity and their communities in order to develop and implement supportive plans.

Partnerships between schools and community members have always implied the possibility of benefiting both children and the community at large (Strom & Strom, 1999). Community volunteers possess the potential of providing individualized attention to children – something that is often not offered to children in the general classroom, based on the high teacher-child ratio in South African schools. According to Elliott et al. (2000) many parents may be unable to provide assistance at school or to children in terms of activities such as homework, due to factors such as illiteracy or un-involvement. Thus, according to Russel, Blatchford, Bassett, Brown and Martin (2005), as teachers act *in loco parentis* to children, community volunteers may extend this role by assisting children with homework or by providing other support to children and/or teachers that may be required (Russel et al., 2005), such as learner support, improving and safeguarding the school's property, being involved in children's physical activities and assisting with after school care (Strom & Strom, 1999).

#### 4. Research methodology

We relied on interpretivism (Patton, 2002) as meta-theory, thereby embracing participants' own construction of meaning of their reality. As researchers we thus did not impose what we think is right for the kind of context or situation the participants find themselves in (Mack, 2010). As methodological paradigm we relied on participatory action research (PAR) (Chambers, 2005), involving the participants in seeking knowledge for social action. In line with our selected paradigm we assumed that society is relational, contextual and co-constructed in the sense that aspects that took place in the past have an influence on the present, and that individuals do not exist in isolation but are rather related to one another and to their various environments. Throughout, we embraced the nature of collaboration and participation within the PAR approach (Walter, 2009).

As research design, we selected a case study design (Maree, 2007). For selecting the participants we combined convenience and purposive sampling (Maree, 2007). We namely selected the case conveniently (as this study forms part of a broader existing project) and the 35 community volunteers purposefully.

For data generation and documentation, we employed PAR-based workshops, observation, visual data techniques, field notes and researcher diaries. PAR-based workshops are interactive sessions, focusing on problem solving (Chambers, 2005). We, in collaboration with teachers who have been participating in the STAR project since 2003, co-facilitated six workshops over three field visits, during which participants worked in small groups of six to seven participants, documenting their ideas on posters and then reporting back on these in the larger group. During the first field visit, we aimed to determine the participants' prior knowledge and practices at the time, in terms of their contributions towards a supportive environment for schools and also how they relied on networking to accomplish this goal. In addition, we facilitated a workshop session during which community volunteers discussed South African policy documents that could support them in their supportive task, after which they developed action plans to implement when initiating additional or building on existing school-community supportive plans. Some of the policy documents that were discussed are the Inclusive Education policy, Children's Rights document, Child Justice Act, HIV/AIDS and TB policy, Sexual Offence Act and Divorce Act. During the second and third field visits, PAR-based workshops focused on monitoring and evaluation, follow-up discussions on the potential implementation of relevant policy, and additional strategies to further implement the proposed school-community supportive plans and network in providing such support.

We recorded all workshops and transcribed the reports and discussions of the participants. We relied on observation to document what transpired and used field notes to document our observations, the research process and ideas that emerged. We reflected on our personal experiences in our research diaries. For data analysis, we thematically interpreted the raw data by following the steps suggested by Braun and Clarke (2006).

Throughout, we considered relevant ethical guidelines. As the study forms part of the broader SHEBA project, informed consent had already been obtained from the teachers who acted as facilitators and from all the

community volunteers prior to the study. We respected the privacy of the participants and treated all information as confidential. We did not disclose the participants' identities and data are kept in a secured place, Even though the study did not imply any physical or mental harm to participants, we ensured that any potential of emotional or psychological harm was limited. If harm would have occurred in the form of emotional upset, for example, we were prepared to deal with this in a professional and confidential manner (Barret, 1995), by debriefing the participants and then referring them for professional support. During the course of our study, participants were also reminded that they were involved in the study voluntarily and could withdraw from the study at any time, if they wished to do so (Barret, 1995). In seeking trustworthy findings we implemented suitable strategies to meet the criteria of credibility, confirmability, transferability, dependability and authenticity (Patton, 2002).

#### **4. Results**

We discuss the results of the study in terms of the two main sections of investigation, namely community volunteers' development of school-community supportive plans, and the manner in which they utilized networking during this process of collaboration and support.

##### ***4.1 Establishing school-community supportive plans***

In terms of the school-community partnerships that the volunteers established subsequent to their involvement in the SHEBA project, we identified four main themes. First, community volunteers clarified the purpose of their involvement in school-community partnerships prior to initiating supportive plans. Secondly, community volunteers relied on their relationships with other role-players in forming school-community partnership – thereby utilizing networking as basis for such plans (as discussed in the next subsection). Thirdly, community volunteers followed a specific process of approaching their fellow partners, in order to be accepted and appreciated by other partners. Finally, some obstacles in school-community partnerships influenced the establishment of supportive plans.

Regarding the purpose of community volunteers' involvement in school-community partnerships (Theme 1), volunteers aimed to (i) prevent obstacles that could hinder community and school prosperity, (ii) support the community and schools in dealing with challenges, (iii) fulfil a significant role in co-developing the said plans, and (iv) convey income generation endeavours. Concerning the role-players that community volunteers relied on in establishing school-community partnerships (Theme 2), volunteers identified (i) themselves, (ii) role-players within the school context (such as teachers and school principals), and (iii) role-players outside the school context within the larger community, as key agents in supporting the establishment of school-community supportive plans. When explaining the process of establishing school-community partnerships (Theme 3), community volunteers referred to an (i) initiating phase (involving the establishment of relationships and identification of potential plans), an (ii) implementation phase (during which their ideas and proposed action plans were employed), and a phase of (iii) sustaining intervention measures. Lastly, in relation to the challenges that community volunteers experienced in school-community partnerships (Theme 4), they referred to (i) challenges which involved physical constraints and (ii) challenges brought about by an unsupportive environment.

##### ***4.2 Community volunteers' use of networking skills***

Concerning community volunteers' use of networking and networking abilities, we identified the following four themes: the purpose of volunteer networking, career values and skills, processes involved in volunteer networking, and volunteer network partners. In terms of the purpose of volunteer networking (Theme 1), the (i)

pursuit of personal happiness seemed to be an important reason why volunteers networked with others, which implied the experience of positive emotions (such as accomplishment and personal pride), less emphasis on the negative, immediate satisfaction when seeing positive outcomes, and ultimately an engaged and meaningful life. Besides personal happiness, the volunteers referred to (ii) a sense of collective usefulness as another important purpose of networking. To them, being useful in a collective manner entailed a sense of belonging, the sharing of resources and building relations with constructive institutions in the community, in order to include marginalized people, bridge social divides and address challenges in life.

With regard to career values and skills (Theme 2) community volunteers referred to local (i) networking anchors and (ii) skills. Examples of networking anchors include local wisdom, cultural concepts such as ubuntu and “unity is power”, commitment, dedication and perseverance, and mutual support and self-development. Examples of the skills needed for networking relate to basic counselling skills and include effective listening, empathy, communication and reflection.

Processes in volunteer networking (Theme 3) comprised of (i) learning chain processes and (ii) connecting. Learning chain processes refers to the way in which people shape networks, and conversely how networks shape people, while the process of connecting to others involves interpersonal sharing and support, and forming communities of practice, with the implied role of social media. Finally, networking partners that were identified (Theme 4) included (i) volunteer partners (in the form of local community workers, volunteers from other areas, and friends and clients of the volunteers), (ii) partners within the school (specifically leadership – the school principal, management and other committees), and (iii) partners from outside the school (such as charity agencies, the community at large, churches, businesses, the parents and family of children, political representatives, and governmental departments).

## 5. Discussion

The findings reported in this paper demonstrates how community volunteers may support vulnerable communities by relying on the pool of strengths that they possess, as well as those they can access within their immediate environment. In addition, networking (specifically social media) enabled the volunteers participating in our study to access strengths beyond those found in their immediate environment, stretching the conventional belief that the asset-based approach (Ebersöhn & Eloff, 2006; Kretzmann & McKnight, 1993) entails the mobilization of assets, skills and resources within the immediate environment. As such, the participants in our study did indeed employ the asset-based approach in fulfilling their task of supporting vulnerable individuals (in this case children).

Despite this stretch of boundaries to utilize assets beyond those that are immediately available, our study therefore indicates that the asset-based approach may be applied by community volunteers in fulfilling their supportive tasks on a daily basis. The participants in our study were able to specifically support schools and vulnerable children, by working hand in hand with teachers and schools. Their involvement entailed the establishment of school-community supportive plans, such as information evenings, extra-mural activities for children and skills development workshops for parents, which could assist schools and teachers in creating networks of care, where vulnerable children and their families could be supported. In this manner, supportive plans focused on prevention, health promotion, counselling and intervention initiatives.

In initiating school-community supportive plans, the participants in our study first established relationships with the schools and teachers in their areas. After identifying potential support initiatives, they introduced these in schools and implemented them according to the action plans they developed as part of the SHEBA intervention. This phase was followed by one of continuous monitoring in an attempt to sustain and improve on the support they were providing. Throughout the process, they relied on their own assets, amongst other things on

their own and others' networking skills. They namely partnered with people inside and outside the schools in order to be able to initiate the supportive plans they proposed. In this manner, their implementation of the asset-based approach and utilization of networking in this context emphasizes the idea of people (community volunteers) realizing what they have and capitalizing on this (Nelson, Campbell & Emanuel, 2011). This allowed them to achieve their goals and address challenges in collaboration with others.

In addition to relying on the asset-based approach as theoretical framework, in interpreting the results of our study, we relate our findings to network theory. According to Van Dijk (2006) networks can be defined as a collection of links between elements of a unit. A single link of two elements is called a relationship whereas networks comprise of at least three elements and two links. This includes people, groups, organizations and societies. Against this background, the community volunteers in our study can be viewed as social agents linked by communicative interactions, with volunteerism forming part of networking at the various levels and in collaboration with sub-systems such as teachers, schools and the broader society (Van Dijk, 2006).

## Abstract

One of the current phenomena is the asymmetry of information that may generate profit to one party in a commercial transaction but can also cause market failures. With increased advancements in technology, asymmetric information has been on the decline as a result of more people being able to easily access all types of information. One of the ways to reduce information asymmetry on the client side is by increasing their competencies.

Keywords: asymmetric information, communication, information barriers, competence, information literacy, financial literacy, disability

## 1. INTRODUCTION

This time is characterized by its dynamics, i.e. speed of the changes, and by an increase in competition. Significant role in the economy is played by information and communication. In life we meet with asymmetric information, which means, that one party in the mutual relationship has more information than the other party. Asymmetry of information can generate benefit to one side, but may also cause so-called market failures.

It is necessary to find a solution to this problem. The essential role in this is played by government interventions in the economy, respectively to society as a whole, for example by introducing the disclosure requirements. Nevertheless, education may also contribute to reduction in volume of the information asymmetry.

## 2. ASYMMETRY OF INFORMATION

Asymmetry of information is a relatively broad term and is determined mainly by economists. Information asymmetry means that one party in the transaction is better informed than the counterparty. This means that he has more information or different or better information. We can also understand the term as the transaction participants do not have complete information about the situation in which they are situated whether it relates to characteristics of the other transaction participants, information about the results of previous transactions or possible alternatives to the process at that time. Asymmetry of information is one of the causes of uncertainty in decision making. We can also talk about an unequal distribution of information.

The information asymmetry occurs despite the general availability of modern technologies that allows fast transmission of information. However, various information barriers cause imperfections in this transmission. Transmission of information itself represents the time that influences relevance of information and in short-term transactions is a risk that the information does not arrive on time. Therefore, people are looking for ways to shorten the time needed for transmission of information from source to user.

E-mail address: botlik@opf.slu.cz

Information asymmetry can be divided in two areas (causes of origin):

- covert activities, i.e. those activities which cannot be identified and observed at no additional cost;
- hidden information, where one party has access to better sources of information than the other, one side of the market has more technical know-how etc.

Asymmetric information is associated with problems of moral hazard and adverse selection. Moral hazard is associated with dishonest or other inappropriate behavior when one market participant is maximizing his profits and simultaneously reducing utility of others. For example the insured persons tends to bear more risk than they would bear if they were uninsured (this may lead to greater profits for that persons, but also to excessive transfer of risk to an insurance company). Adverse selection is related to inability to choose a better option out of several possible variants, which may cause extrusion of high quality services from the market. For example the client does not have enough information about the quality of service towards the price, and therefore prefers to buy lower quality service at a lower price. This lack of awareness is moreover associated with a lack of competence to locate and select the appropriate service. Thus there is a crowding of better service out, leading to a deterioration of the quality of service on the market and resulting in an imperfect state of the market environment. This situation occurs particularly in specialized services, where the client should have essential knowledge and skills to be able to identify quality solutions.

Generally, asymmetry of information is unfortunately rather on the rise than on the decline. This happens due to the fact that while increasing the amount of information that is available, finding information that is relevant (indeed essential) is therefore more and more difficult. Information is also dispersed i.e. not concentrated in one place. Moreover with increasing amount of information it is harder to assign relevant information together, that in mutual interaction form a new higher type of information. In addition it is not always taken in account who created the information and who receives it.

Asymmetry of information is used in different fields of activity from times immemorial, in politics, warfare, gambling, etc. Simply, wherever one party needs to gain advantage over the other. We can specify several examples of this use:

1. Probably the most typical situation is that the seller knows more about products they sell than the buyer. But the opposite case can also occur. E. g. an insurance agent may not be aware of all the relevant facts about the client, etc.
2. An example of bilateral asymmetry might be a relationship between the loan applicant and the bank. The applicant for the loan is fully conversant with his financial situation, but the bank is not. On the contrary, the bank has much better information about the products they offer. In addition, information is time- and place-based and can be interpreted differently by individual entities depending on their experience, knowledge and motivation.
3. In the tourism industry the asymmetry lies in the transmission of information among service providers, intermediaries and customers. In most cases, subjects are mutually distant and negotiation of services is realized on the basis of limited information about the location, level of service, etc.
4. Asymmetry of information associated with a difficult control of qualified personnel in the performance of their work activities may be the cause of inadequate compensation (payment).
5. In elections, voter has no idea if a politician says the truth; moreover he does not examine in detail the electoral program. Decisions are therefore usually based on a limited set of information in the electoral campaign. This results to adverse selection in terms of voters.
6. The asymmetry of information can be found also in education. Candidates respectively their parents are not able to assure themselves in advance about the real quality of the education provided in a particular school.

The main reason, that there is asymmetry of information, is information barriers. They are obstacles in the flow of information. They can be divided down into:

- architectural (spatial), i.e. barriers that prevent certain groups of people to get to the means of providing information, such as people with disabilities (wheelchair users, blind people, etc.), some social groups (pensioners, children, mothers with strollers, etc.), etc.;
- economic, i.e. the costs of obtaining information, limited resources to fund expansion of information, development of provided services, technology innovation, costs of barriers reduction, etc.;
- language, when user communicates in a language other than the provider;
- time, where we can include the providing of outdated information, eventually delay in providing outputs;
- knowledge, that is caused by a lack of information or technical literacy;
- communication, based on various problems in communication (speech disorders, hearing or visual impairments, shame, etc.) or prejudices (e. g. provider's decision is based on the general awareness of the capabilities of a given social group, etc.);
- cultural eventually religious difference in the perception of information, etc.

It is in the public interest to reduce information asymmetry. In economics, it is possible to achieve by regulatory actions against service providers and intermediaries. It is also about setting information duties for market participants, such is the definition of compulsory content of management reports, etc.

Maintaining too large asymmetry of information is even not always in the best interest of better-informed parties; sometimes it is better to share with part of information to counterparty. This will lead to an increase in confidence, better relationships and therefore the flow of new information could increase the partner's interest and thus better-informed party profit.

To reduce information asymmetry on the side of ordinary clients (citizens) contributes clearly improving their competencies by education.

### **3. INCREASING THE COMPETENCIES**

It results from the foregoing that the requirements for the competence of clients are constantly rising. In addition to continuous technological development, there is the steadily growing number of services offered, which carries a number of diverse data. Thereby are also increasing demands on the client's ability to process information at a level to be able to choose high quality services. They must learn to overcome information barriers. Increasing competencies in a particular area means obtaining some kind of literacy.

We can encounter with a number of key phrases that contain the word literacy. These are for example:

- information literacy;
- financial literacy;
- media literacy;
- energetic literacy;
- natural science literacy
- political literacy;
- reading literacy etc.

From the perspective of the topic of this article are probably the most important information and financial literacy.

Definition of information literacy (CILIP,2011):

“Information literacy is knowing when and why you need information, where to find it, and how to evaluate, use and communicate it in an ethical manner.

This definition implies several skills. We believe that the skills (or competencies) that are required to be information literate require an understanding of:

- A need for information
- The resources available
- How to find information
- The need to evaluate results
- How to work with or exploit results
- Ethics and responsibility of use
- How to communicate or share your findings
- How to manage your findings”

Information literacy therefore implies the skills and knowledge that allow you to:

- use ICT for different purposes and in different contexts;
- recognize the need for information;
- identify, collect, analyze, critically evaluate and effectively use information obtained;
- responsibly and safely use ICT.

Place of information literacy in the process of lifelong learning is specified in the Prague Declaration (UNESCO, 2003), which states: “Information Literacy encompasses knowledge of one’s information concerns and needs, and the ability to identify, locate, evaluate, organize and effectively create, use and communicate information to address issues or problems at hand; it is a prerequisite for participating effectively in the Information Society, and is part of the basic human right of lifelong learning.” Information literacy is thus not only objective, but also the tool.

Crucial role in increasing information literacy is played by schools, colleges and other educational institutions.

For ordinary life is also needed financial literacy. The financial sector is characterized by a significant lack of transparency, which implies requirement for some financial education. In The National Financial Education Strategy (MFČR, 2010) is financial literacy defined as a set of knowledge, skills and abilities that are necessary for the citizen to financially secure himself and his family in contemporary society and to actively participate on the market of financial products and services. Financially literate citizen is familiar with the issue of money and prices and is able to responsibly manage personal / family budget, including the management of his financial assets and liabilities, all with regard to changes in his life situations.

Financial literacy is a specialized part of a broader economic literacy, which also includes things such as the ability to secure income, to consider the consequences of personal decisions on current and future income, to be acquainted with the labor market, to make decisions about spending, etc.

Financial literacy includes:

- money literacy, including skills required to manage cash and non-cash money and transactions with them as well as management tools for this purpose (e.g. current account, payment instruments, etc.);
- price literacy, representing the competencies necessary for understanding the mechanisms of price and inflation;
- budgetary literacy, representing competencies required to manage personal / family budget including the ability to manage different life situations from a financial point of view.

Czech Republic Finance Minister Miroslav Kalousek stated: "So, as is the responsibility of the state to educate citizens in reading, writing or mathematics, so logically should be his duty to provide adequate education in the issue of handling with their own money." It is necessary to say that the minister had truth. It is necessary to implement appropriate lessons at primary and secondary schools, but also we cannot do without further education. Here they should play its significant role e.g. information and advisory centers in banks or independent information portals that would work either under the auspices of the Ministry of Finance, Czech National Bank or the Czech Banking Association.

#### **4. SUPPORT OF EDUCATION OF PEOPLE WITH DISABILITIES**

In more complicated situation are people suffering from some kind of disability, such as impaired vision or hearing. In everyday life, these people encounter a number of barriers, including in obtaining information and communication. Consequently, we can say that they suffer from asymmetry of information much more than the general population.

Therefore it is necessary to create special conditions for communication for this group of people, such as in the Czech Republic where is obligation set by legislation to observe the rules of accessibility of information, thus that form of published information must ensure, that with information related to public administration and enabling remote access could be in necessary extent familiarized persons with disabilities. If this information is published in a version that is not in accordance with the regulations, there must be access provided to web sites that meet the requirements. (Czechia, 2008). In appendix to this document there are rules for creating accessible websites described in detail.

Another, equally important area is the creation of special education programs, taking into account the needs of these people. A few years ago various organizations joined forces and with the support of the European Social Fund they are creating special education programs for young people with hearing impairment.

In the period of 2010-2012 the project CZ.1.04/3.3.05/31.00021, OP HRE 3.3 "Minimizing communication barriers of deaf people when entering the labor market" was solved.

Beneficiary was The Union of deaf people Brno, c.a. and the project solution involved Silesian University in Opava; Janáček Academy of Music and Performing Arts Brno; Free Art, Ltd. (the organization operating in the field of multimedia production); Czech Union of the Deaf, c.a. regional organization Ostrava; Confederation of Disabled People in the Czech Republic, Brno municipal organization; and Moravian Unity of deaf people, c.a.

Under the project for the Deaf training course "Fundamentals of business for people with hearing disabilities" (DVD textbooks) was created (Veselý, 2011). Furthermore were also created computer courses for deaf people ECDL START with the certificate (DVD textbooks). ECDL courses are being held by The Union of deaf people Brno, c.a., Czech-Moravian Unity of deaf people c.a. and Czech Union of the Deaf, c.a. regional organization Ostrava. "Telecommunication Center of The Deaf" (TKCN) was founded and run, whose task is to minimize the communication barriers between the hearing impaired persons and mainstream society, which allows persons with hearing impairments, as well as persons with speech impairments, blinded persons, etc., to use telephone connection in the visual, voice and text form. Four operators are working in it. They were selected after

completion of accredited courses of call center operators for persons with disabilities (also carried out in the project). Details can be found out on <http://www.tkc.cz/>.

CZ.1.07/1.2.08/02.0007 project "Equal opportunities for children and pupils, including children and pupils with special educational needs" has been solved in the period 2010 to 2012. The beneficiary was the Free Art, Ltd.; the project involved Silesian University in Opava and Kindergarten, Primary school and Secondary school for the hearing impaired persons in the Wallachian Mezirici.

The aim of the project was to help students, future graduates of Kindergarten, Primary school and Secondary school for the hearing impaired persons in the Wallachian Mezirici with the transition from the protected environment of special education into the open labor market world.

Multimedia interactive learning tool for deaf pupils was prepared substantively (Veselý, 2011a), applied and put into the pilot operation. This tool approaches pupils in easily understandable form and contains basic, simply memorable principles of successful entry into the labor market, both in the form of self-employment and in the form of employment. In both cases deaf people can be helped to overcome communication barriers arising from the fact that the deaf have limitations not only in voice communication but also in writing. These limitations are strikingly evident in understanding the laws and norms, in job interviews, etc. Moreover, methodological material has been also processed for this tool.

On the website <http://www.praceiproneslysci.cz/> it is possible to found amongst others:

- the final version of the educational material "Do not be afraid of the labor market ... even if we do not hear" in PDF format;
- complete script and layout for software processing in PDF ;
- the final teaching product in the form of the installation file (Veselý, 2011b);
- methodology including video record of exemplary workshop using educational drama in teaching students with hearing impairments.

Project CZ.1.07/1.2.39/01.0004 "Teaching financial literacy for hearing impaired students of secondary schools in the Zlin Region" was launched on 1.5.2012 and will be completed in late 2014. Well as in the previous project the beneficiary is Free Art, Ltd. and partners are Kindergarten, Primary school and Secondary school for the hearing impaired persons in the Wallachian Mezirici and Silesian University in Opava. The aim of the project is to prepare substantively, produce, validate and implement interactive multimedia tool for teaching financial literacy (on DVD) for secondary school students with hearing disabilities.

In this stage of the project material content has been processed in the text form (Vaněk, 2012) for:

- household economy (personal finances);
- prices and inflation;
- money;
- financial products and markets;
- consumer protection.

On the basis of this content, literary script and layout for software processing for this tool has also been prepared. Currently, work is in progress to create animated and live-action motion pictures and text and graphics segments processed into thematic modules, etc. After this, software processing of this multimedia teaching tool is going to happen. Tool will be complemented with a booklet summarizing the main points of methodology in printed form. Handbook in electronic form will also be created. Details about the project can be found at [www.financeproneslysci.cz](http://www.financeproneslysci.cz).

The common characteristic of all mentioned tools is that the individual chapters are solved at several levels.

The first level is solved through dialogue or debate played by a larger group of deaf people inducing the topic (e.g. I want to get married, have a baby, buy a house or car, and yet not to get into financial trouble, so what costs

can I afford at certain income?; Should I go after the high school to college, to work or should I start a business or should I stay home and take rent? etc.). The aim of this is to induce discussion under the guidance of a teacher in which students themselves critically assess the situation and come to the conclusions. Then, they are confronted with the educational materials that offer different solutions - correct but also misleading ones, which are then being explained.

Further optional levels provide the necessary theory, glossary of technical terms, links to other relevant sources of information and, if appropriate, useful explaining numerical tasks (e.g. calculating interest on a mortgage, creating the payment schedule etc.) There are also be model forms (e.g. an insurance contract) and their explanations. All chapters are being linked by cross-references and explanatory notes.

All items are being implemented with a high degree of interactivity and audiovisual elements and provide space for individual development of each topic by both the students and their teachers through the open chapters allowing students with the teacher's help supplementing different played scenarios on the base of their own experience.

## 5. CONCLUSION

One of the solutions of reducing information asymmetry is by increasing the competencies of citizens as market participants. Special attention deserves people with disabilities. In the final chapter of this article, there are mentioned three examples of projects in which there were created specially designed teaching tools for people with hearing impairments.

4<sup>th</sup> International Conference on New Horizons in Education

# Cinematography education in Turkey: current situation, new perspectives and suggestion

Mustafa Sozen \*

*Akdeniz University, Fine Arts Faculty, 07200, Antalya, Turkey*

---

## Abstract

The cinematography progressively adding up new horizons due to digital technological possibilities; the dimensions of production, fiction and presentation are taken new forms. This formation under the basis of different expression qualities constitutes a new artistic restructuring. In other words, digitalization in cinematography by redrawing aesthetic boundaries of visualization has already started to create an original cinematographic aesthetic. Performing some changes and transformations in the curricula of conventional cinematographic education appears as a mandatory necessity as digitalization is a distinct technological expression (lingo) and, as an extension to this, a distinct aesthetic structure. This study trying to scrutinize the current status of Turkish cinematographic education and the projections for future is constituted of two main complementary axis: one is the reactions of digital technology in cinematographic art and the other is in which vision and to what extend these reactions are considered in cinematographic education.

Keywords: cinema, digital technology, aesthetic, cinematographic education in Turkey, curriculum

---

## 1. INTRODUCTION

The essential property determining cinema ontologically is that it is an art telling about feeling and experiences concerning life in the context of a narration founded on the ground of images. Films have presented to their audiences different vision forms and emotions which they find intensively pleasing since they created themselves as a language (Bordwell &Thompson, 2008).

With the beginning of the twenty first century, cinema technologically entered a quick transformation process. When the technology of digital images production entered cinema, optic films disappeared; films even happened achievable by means of images produced only in the computer media without needing any camera, and this change led to occur a structure passing beyond traditional narrations.

Digital cinema, with its most general and understandable definition, comprises the production, distribution and screening processes of motion pictures by using digital technology instead of 35 mm film tapes being a traditional method.

### 1.1. Scope and Limitations of Study

The study was established on the argument that digital vision technology and cinema have the perspective of impacts in dimensions of shooting, montage and screening and that digitalization is a different technological language and -as an extension of this- a different aesthetic structure.

The contribution the digitalization brought along to cinema art is that it adds new dimensions to vision,

narration and sense correlations and this tends both artist and audience to change their viewpoints. As a natural extension of this, telling about new design methods together with traditional visual design methods education in universities giving cinema education and depending on this, making changes and transformations in conventional cinema education curriculum appear as an obligation.

This study, the aim of which was to examine the situation of cinema in our country and projections of it towards the future, was established on the undergraduate education, and specialties of associate and postgraduate education couldn't be handled. The study comprises two main axes completing each other: The first is impacts of digital technology on cinema art, the other is which vision these impacts take place in and to what extent they take place in cinema education in universities of our country.

## **2. MEDIUM IS THE MESSAGE: DIGITAL IMAGES, NEW DIMENSIONS**

Since digital technology entered cinema world much, as the language of computer technologies, changes and transformations started to be lived in semantic and syntax structure of cinema. The limitlessness the digital brought about has radically changed the concrete making-production conditions and the conditions of getting images being the object of cinema completely have changed. While the re-presentation of the existent reality was available in the stock term, this obligation disappeared in digital term and an absolutely new reality was produced through computers. This both led the narration forms in cinema to differentiate and also caused new narration forms to occur. Moreover, audiences started to change their positions across new narrations and narration forms and this revealed the necessity of handling reception aesthetics.

## **3. DIGITAL TECHNOLOGY AND NEW MODULATIONS IN CINEMA**

Cinema, which is ontologically in absolute relationship with technology, has continuously renewed and developed its own narration language every time with technological developments within development process. Digital cinema also makes transformations in conventional narration forms. Monaco (2010) states that "when images, audios and texts are digitalized once, everything is possible. The struggle between things we want our communication tool makes for us and the capacity of the running of these has ended".

With quick development and wide use area of the computer technology, techniques of digital transfer, record, re-production and presentation, cinema started to transform into artistic media that can be deemed "new". This transformation is so great that it is shown as the most important change after the discovery of sound in cinema (Erkilic, 2006).

### **3.1. Modulations in Production Dimension**

In conventional production style, images of objective world were recorded onto the film called the stock by means of the camera, and then given to the screening by passing through chemical and optical operation processes. Images occurred by the camera through recording real scene one to one. In the montage stage, the narration was founded by aligning the shot parts side by side.

In digital recording technology, if wanted, the narration can be established as objective world through digital cameras or through images created in the computer media. The greatest difference here is that the image can be got in ontology dimension without camera. Another primal property is in the dimension of the narration construction. That images are aligned successively, namely relationships between images are separate (from algorithms) presents the facility of making variations in the construction of the montage or narration.

The most apparent face of digital technology in the production dimension of cinema has occurred in animation area. A new type of motion picture made with three dimensional computer animations has come out (Wands, 2006). Another dimension necessary to be mentioned is that real people and virtual characters, who are produced in the computer media, take place as partners in the same film. These are the concrete examples showing that limits have disappeared and become vague in cinema aesthetics.

### **3.2. Modulations in Dimension of Screening**

Digital screening puts audiences into the centre more in contradiction to the before conventional production shape and this creates changes in the perception aesthetics of audiences. With the presentation of the real and virtual together and of the combination of the dominant perception and emotion loss, classical dramaturgy's identification, catharsis and enjoyment concepts take a new appearance in terms of the watching experience.

For example, in the result of that images, the getting of which is not possible with conventional ways, are got with digital image technology, James Cameron's 'Terminator 2: Judgment Day (1991)' or Wachowsky Brothers' 'Matrix (1999)' films present a new perception aesthetics by creating immersive and perfect environments for the audience.

The leading modulations in the dimension of screening are new presentation techniques like three dimensional (3-D), real-D and IMAX. In conventional cinema, images have two dimensions as width and height, but objective world has three dimensions. In cinema, the illusion of the third dimension is got by a technique based on the pattern matching of two eyes. While both two dimensional (2-D) and three dimensional (3-D) films can be shown with Real-D technology, 3-D films have more realistic three dimension illusion creation and so they give a better watching pleasure. IMAX technique presents very high quality of image and the experience of watching on very largest screen as well. In IMAX technology, 3-D films occur by two special projectors through reflecting image onto the screen; audiences can watch by converting this image to the normal through using glasses having polarization property.

### **3.3. Modulations in Narration Dimension**

It was said before that digital technology, with limitless facilities it presents, creates new narration forms with the combination of image, animation, sound and text. In other words, media such as film, photograph, text and graphics that could exist only as separate before can be used hereafter in one common platform with digital technology and thus sharp limits between them vanish. This necessitates a new aesthetics as far as cinema undergoes changes in terms of language and grammar.

This new aesthetics is named with the term of liquescence. Because it has a narration form not being linear and hierarchic. Linguistic context is not simple and static; with its complex and dynamic characteristic, it has a projective structure not reflective like conventional aesthetics.

For example, the artist called Toni Dove trying to establish a hybrid structure describes an application he realized: "My works are in a Bermuda triangle between plays, theatre and film. Sometimes I feel as though I make buildings from films or I am an automat creator or puppeteer both being non-living and giving reaction. I always had a feeling of making cinema spatial, namely making it dimensioned in a way of opposing the linearity of successive story time by allowing it into the process as an experience. My motors help me analyze time, memory and story and re-edit them and constantly keep them in a fluent and unsteady line (Wands, 2006).

The most important name in this area is doubtlessly Peter Greenaway. According to Greenaway stating that "We must save cinema from the dominance of literature; cinema can get rid of the service of storytelling only thanks to this", cinema must be a thing passing beyond presenting moving pictures providing a perspective on the screen; and must be interactive. He points out that thing, which have been made until now as cinema, are not deemed cinema; thanks to digital technology, cinema is possible now. Greenaway gives creating numerous images in the same time on the screen, breaking the frame space and re-arranging it as a series of samples of new narration forms necessary to occur, instead of linear movement of the film, thanks to digital technology. His most known study is called 'Tulse Luper Suitcases'. This study/experience comprises three feature-length films, one Internet site, one computer game, numerous stories and books published on various places, ninety two DVDs, sixteen episode TV series and exhibitions.

3-D films, narrations based on interactive relationship and narrations founded in virtual reality can be given as examples to modulations which will be widespread in the near future.

It was said before that three dimensional cinema experience has a potential of creating more effect on the audience than conventional technologies within the context of identification, catharsis and enjoyment concepts. Therefore, film is realized by figuring out reactions audiences will give while it is in the production stage yet, and this means shaping reactions of audiences.

Interactive cinema describes that the audience and the watched film are in reciprocal relationship and this relationship is structured in a way that allows the facility of affecting each other. While in other production forms of cinema there is distance feeling and one-sided relationship between the audience and film, interactive cinema is conspicuous because this relationship is reciprocal and this is a narration form giving a chance of being subject to its audience first time. Based on reciprocal interaction, since narration is determined according to preferences of the audience, the audience is positioned as one of important subjects determining film. However, since the mentioned preferences are determined by the director and film production team, the audience really doesn't give direction to the narration at will and plays one of subject roles defined for themselves. The first example that we can give for interactive cinema is 'Kinoautomat installation' realized by Czech director Raduz Cincera in 1967. In this installation there are two buttons on a special remote control on each of 127 seats prepared peculiarly in cinema hall. Each of these buttons one of them is green and other is red has been put to give a separate direction to the film. In the end of every scene watched by audiences, the director or the determined person get on the stage, presents two options concerning what Mr. Novak, who is the main character of the film, will do, and wants from audiences to choose one of these two options. The film goes on according to what audiences choose and the final realizes with the end which audiences determine. The important difference of this project is that audiences being in the interaction are designed as individuals not as a community and the whole watching process is a personal preference voyage. In other words, in interactive cinema the watching experience has quite personal characterizations and in this sense, interactive cinema has the potential of creating important changes in cinema watching culture (Oz, 2012).

Virtual reality is three dimensional simulation models providing reciprocal communication facility with a dynamic medium created by computers, and creates a feeling of being in virtual world in its users in a supernatural way. The designed systems significantly increase the comprehension and perception power of the audience/user. That is to say that they create an experience, in which the user feels himself as a physical part of the world represented in all emotional levels, rather than presenting a world to see and hear like cinema does.

### 3.4. Position of Digital Technology in Turkish Cinema

The Turkish cinema, which has lived technical and economic woes for long time, has started to benefit from opportunities of digital technology. While young directors prefer low-budget digital equipments, the leading film producers use the cutting-edge system technologies for expensive and spectacular effects. For example, Ugur İcbak, as a vision director, in many films, has brought systems like Digital Betacam or High Definition into the application. Therefore, he calculates changes the film lives in the postproduction stages, can provide most truly and at the shortest time necessary preparation and material for every kind of digital effect during the shooting in the film set and so can drop high costs wanted at the postproduction stage to the low as possible.

In Turkey, a great number of films have been shot with digital cameras for the last 10 years. Umit Unal's 'Nine (2003)', Ahmet Ulucay's 'Making Ships from Watermelon Zest (2002)' or Ugur Yucel's 'Heads or Trails (2004)' films are a few of the first samples shot with digital cameras. Nuri Bilge Ceylan's 'Three Monkeys (2009)' film is a leading film which has been shot with digital camera and the screening of which has been realized with digital projection. Another sample we should mention is Biray Dalkiran's 'Hell (2010)' film and it carries the property of being the first three dimensional film of Turkey.

## 4. CINEMA EDUCATION AND DIGITAL TECHNOLOGY IN TURKEY

Cinema education in Turkey is a relatively new phenomenon in Turkey. Cinema education firstly has been started in Cinema-TV Institute taking place in the body of Istanbul State Fine Arts Academy in 1974. That education in this area greatly delayed is understood when compared with the foundation of the cinema school in the Soviet Union in 1918.

In Turkey, cinema education is given within the 3 primary types today. These are direct cinema education, educations given from visual image creation and cinema courses and such applications.

Educations in 'Radio-TV-Cinema' departments of 'Cinema-TV', Communication Faculties and Fine Arts Faculties form two principal axes of direct cinema education. Education in cinema faculties usually has curriculums towards communication and broadcasting area and on growing individuals who have gained a notion towards this. As understood by its name, topics of radio, TV and cinema are taught in the context of broadcasting and communication. Cinema education in fine arts faculty handles the art phenomenon in primary plan, mostly has lessons towards art notion in the curriculum and goals to grow individuals towards this. Despite the fact that its name is Cinema-TV, the taken education is mostly towards cinema because lessons towards television stay in the background\*.

Education modulation from visual image creation is a very new area. It gives education, in which students

\* Schools and departments giving the similar education can take different names. The name 'Faculty of Art and Design' is given to faculties newly opened as equivalent to Fine Arts Faculties. Another change necessary to be mentioned is that the name of Cinema-TV departments in Fine Arts Faculties of Dokuz Eylul University and Yasar University has been changed as Film Design. Another thing necessary to be mentioned is an apparent differentiation hasn't been formed in visions and missions of these departments in these faculties. For example, when looked at the Cinema-TV curriculum of Fine Arts Faculty of Afyon Kocatepe University that it is very close to curriculums of the Communication Faculties is seen.

can establish relation between different contemporary disciplines such as graphic design, cinema, photography and animation, under the name of Communication Design, Visual Communication Design or Media and Communication founded in the body of the communication faculties in the beginning of 2000s. Students continue main branch program in the direction of their own abilities as of the second year and also can take lessons of different departments. They widen their experiences by taking compulsory and optional lessons from areas varied with sub-modules like Photography, Graphics, Cinema (Producing-Directing-Vision Directing and Scriptwriting) and Animation Cinema.

Radio and TV Programming in vocational high schools has been founded to meet intermediate staff need of this area. Photography and Cameraman programs are designed in the way to include professions such as digital image processing, advertising photography, architectural photography, large format photography and cameraman and aim to give a notion of getting profession by means of digital equipments.

With respect to cinema, course and likewise educations, it's seen that private education of cinema as well as cinema education given in universities presents an appearance becoming widespread. These can be linked to institutional structures or can totally be private enterprises. For example, while courses like TURSAK (Turkish Cinema and Audiovisual Culture Foundation) and Mithat Alam Film Centre or Cinematheque Film School taking place in the body of Bogazici University are based on institutional structure, the course carrying on activities under the name of Digital Film Academy has private enterprise structure<sup>†</sup>.

The first structuring, which has the relation between cinema education and digital technology and made this a private education area, is 'Cinema and Digital Media' department taking place in the body of Izmir Economics University. The only lack of this positive development is that curriculums of them still a lot resemble general tendency of communication faculties. They seem far from replying requirements of a new cinema language for now.

## 5. SUGGESTIONS FOR NEW MODULATIONS

With the increase in the diversity and quality of images produced in digital cinema, images started to be produced with collective working of engineers and directors. Because these films necessitate high technical profession and occur as a result of many steps. So, the staff must have quite high level of technical knowledge as well as comprehension concerning both potential and limits of using digital instruments (Wands, 2006). Doubtlessly, with continuous change of digital cinema technology, this brings about the problem how the required education of technical staff will be shaped. When looked at the OSYM (Student Selection and Placement Centre) catalogue of the 2012 year, it is seen that any of universities in Turkey (except one school) hasn't an attempt about digital cinema.

<sup>†</sup> A good example of private courses is the education that Modern Music Academy gives to 'Film Music Department'. The reason is that both it is the first in Turkey and also there isn't any education given in this area. Given there aren't many musicians who have taken film music or music education towards visual production, the difference of this education can be understood immediately. In parallel with cinema's both sector and art development in many countries, film music education has been started to be given place in institutions giving music education for the last 30 years.

## 5.1. Problems Concerning Available Education Programs

- In cinema education area the vacancy numbers of the Communication and Fine Arts Faculties are quite many and this greatly indicates the lowness in the quality of education as a problem. For example, cinema academy of Munich educates in classes of about 10 students<sup>‡</sup>.

- It's seen that programs giving this education mostly take place in the body of Communication Faculties. Cinema departments of Fine Arts Faculties have a claim that they raise candidates as cinema staff, but Communication Faculties are places making science education in the main sense. In these faculties, lessons towards 3 various profession areas as radio, television and film studies are given within cinema education and this creates a serious axis shift about what the given education is.

- While cinema education in Turkey has quantitative largeness, its qualitative highness doesn't exhibit any bright appearance. One of main reasons of this (as real politics) is the form of high school education and university entrance exam. Students win these departments by entering central exam system through constantly doing tests at ages of 17-18. Abroad, people, who have got undergraduate degree and determined their way on this, are accepted to the film academies with the talent exams and given to them education focused on profession areas<sup>§</sup>.

- Since technical equipments are both very expensive and have short semi-annual life, students take education with inadequate technical equipments.

- Curriculums generally have a conventional structuring which doesn't take the future into account. Communication Faculties and Fine Arts Faculties have similar curriculum programs within their inside. In these programs, in which information of lots of disciplines are given, both enough flexibility and specific visions/missions differentiating themselves from others are not seen.

- Education in both two areas can't bring the theory and practice together; in this sense, the incongruity with the sector is in huge dimensions. Because that education is not in the academic understanding towards the occupation but in the body of the university reveals the necessity of giving lessons in wider areas to students.

- When looked at curriculums, the continued cinema education comprises some general culture, some theory and some a few productions not passing beyond the in-class working. Awaiting another thing from students, who have taken cinema culture from this curriculum model, is not possible. Already students have mostly this tendency. A great majority of students coming to these schools say they want to be directors. The number of one's wanting in the areas such as vision, montage, etc. is extremely less. That this model can't take the country cinema to anywhere seems clearly.

- People, who are working in this area now and reply to the requirements of the market, are obliged to learn

<sup>‡</sup> Those indicated here are educations in the undergraduate degree. Numeric data are like those according to 2012 OSYS (Student Selection and Placement System): *Undergraduate Degree*: Fine Arts Faculties, Cinema-TV. (360 persons); Communication Faculties, Radio-Cinema-TV Departments (2720 persons); Communication Design, Media Design, Visual Communication Design Departments (947 persons).

*Associate's Degree*: Vocational High Schools, Radio and TV Programming Departments (1810 persons); Radio and TV Technologies Departments (945 persons); Photography and Cameraman (552 persons).

<sup>§</sup> For a few years some faculties have left the central examination system and started to get students through the talent examination. Dokuz Eylul University Fine Arts Faculty Film Design Department is one of these examples

their information in different disciplines and occupations and transfer into this area.

- When looked at the technology-art language correlation of cinema education in Turkey, it is seen that this is nearly ignored in programs of the State universities. In this sense, it can be said that the education can't pass beyond patterns of the twentieth century.

## 5.2. Suggestions

- Since the image production technology constantly renews itself and starts to transform to a more complex structure, developing education programs according to this is an obligation. Because in order to better comprehend reflections of digital technology on cinema, knowing its affections with both technology and other modern arts is necessary.

- The current situation in cinema education (relevant departments in Fine Arts Faculties and Communication Faculties) lives certain compressedness in terms of missions and visions of their faculties. It is necessary to remove education from this structuring and to take it into a private structuring model like cinema faculty/academy. As in samples in Europe and America, education must be made via a cinema academy\*\*.

- As in all art branches, the most important property separating cinema education from the education model of other universities is that it should be based on application by depending on disposition and ability rather than information transfer. This principle should take place as determinant in curriculums.

- Since all processes of the cinema of the future (from production to distribution) will be produced within digital technology, in education programs, digital image production information (in the context of hardware and software) should constitute the skeleton of the curriculum. After the graduation of students, technological innovations and substructure must be continuously updated for them to find job opportunity as full-equipped and ready. For example, the sector has demands like “we want people, who know using High Definition and can apply this in cinema” and so education should be designed according to this. The only department towards this is ‘Cinema and Digital Media’ department taking place in the body of the Communication Faculty of Izmir Economics University. When looked at the curriculum of this department having a vacancy of 40 people (despite this positive development), that lessons concerning the communication theory are intensively available and lessons, which will give information about today and future of digital technology, are in the limited number seems as an important lack.

- Visual effect design is an indispensable application area for today's cinema. For example, decades of people have prepared the effect images on digital media in the film called ‘The Conquest’ (2012) being one of the most expensive productions of Turkish cinema. In cinema education there isn't any sub-module towards this area. This ignored area should be taken into cinema education.

- Another element is that not only the production aspect but also the screening aspect of digital cinema should be taken into account. In Vocational High Schools, technicians, who will be able to use special software and

\*\* Munich Film Academy in Germany, VGIK in Russia, Lodz in Poland and FAMU in Czech Republic can be shown as examples of these schools. The equivalent of these in Turkish university education system may “Vocational school”. Vocational schools giving four-year undergraduate degree towards occupation seem a structuring model which most easily will be able to adapt into higher education system.

screening instruments such as 3-D, Real D and IMAX, should be raised <sup>††</sup>.

- Since raising new ones, instead of the available academicians not knowing digital technology, will take time, a calendar study towards this should be done.
- Given the fewness of the number of both academicians and applicants in real meaning, special programs must be realized for professionals of the occupation to take place absolutely within education process.
- It is seen that in cinema, with respect to new technologies, the foundation universities produce a mission much more beyond of the State universities. For example, Bahcesehir University presents an appearance adapting new generation technologies in cinema world into education platform and assuming a leading role in this area.

## AS RESULT

Cinema has passed through many stages thanks to technological developments. Sound cinema, color cinema and three dimensional cinema are a result of technological developments. Films using innovative technologies and making a breakthrough have accelerated this advancement. Digitalization, which has started to develop at the end of the 20<sup>th</sup> century and provided a great advancement at the beginning of the 21<sup>st</sup> century, affects cinema art as well as many areas. This technology taking place of analog technology leads systems like the production-screening and distribution in cinema area to change.

Although digital cinema hasn't started to give its most mature products now and shows all indications of conventional cinema, it is seen that tendencies different from the narration language in traditional sense are entered even with the results got. This new art, which is dimensioned with the use of sound, movement and text, gains cinematographic properties and is made interactive by various methods, transforms into cinematographic narrations that are multi layered and convenient to new readings by moving away from linearity. For example, today in many films, real people share the same stage with virtual characters created through computers.

Knowing the image processing techniques well but applying these techniques to digital media (shooting, effect, montage etc.) without evaluating them in a scientific, artistic and conceptual frame makes the result of the narration unqualified aesthetically. In the same context, only building a conceptual background well without knowing the image processing techniques doesn't happen adequate for the result of the design.

When students have notions of developing the cinema education they took together with digital technology ability and of putting it to application easily, they can reveal easier and multi-alternative works. In this context, a Turkish film, which has been shot in digital standards, will be able to be screened and watched all around the world.

# Collaborative strategic reading practice with adult EFL learners: a collaborative and reflective approach to reading

Ferhan Karabuga<sup>a\*</sup>, Ebru Sire Kaya<sup>b</sup>

<sup>a</sup>*Kahramanmaraş Sutcu Imam University, School of Foreign Languages, 46100, Kahramanmaraş, Turkey*

<sup>b</sup>*Cukurova University, ELT Department, 01000, Adana, Turkey*

## Abstract

Collaborative Strategic Reading (CSR) involves the use of four reading strategies in collaboration with peers and facilitates the comprehension of the text and

leads to gains in terms of student achievement, participation, and motivation. The present study aims to find out the effects of this approach on adult EFL learners' reading comprehension and reading-related problems. 40 prep-class university students, having three hours of reading classes per week, participated in the study and they were labeled into two groups as experimental and control groups. The results revealed that CSR affected the comprehension and reading related problems of adult EFL learners positively.

*Keywords: reading, reading comprehension, comprehension strategy instruction, Collaborative Strategic Reading, adult EFL learners*

## 1. Introduction

Reading is a process of problem solving in which the readers make an effort to comprehend meaning not only from words but also from ideas, information, claims, and arguments in a text. On the importance of reading in a second language learning or teaching environment, Bright and McGregor (as cited in Brusch, 1991) state that "where there is little reading, there will be little language learning" (p. 156). Besides, reading is one of the first steps to enable learners with language input, and an opportunity to understand the structure of target language.

As Almasi (2003) and Grabe (1991) state, good readers monitor their reading process attentively and progressively, and implement different reading strategies to achieve comprehension on the ongoing text. According to Wenden (1991), reading strategies are "mental steps or operations that learners use to process both linguistic and sociolinguistic content" (p.19), which can show differences between proficient readers, and poor readers in terms of strategy use. To stress the importance of reading strategies, Palinscar and Brown (1984)

E-mail address: ferhank36@hotmail.com

suggest that strategic reading helps students, especially low-achieving ones, avoid comprehension failure, and enhance their retention of the text.

In the field of reading, the importance of training language learners to be strategic readers has been underscored by many researchers (Klingner, Vaughn & Schumm, 1998; Palinscar & Brown, 1984; Paris et al., 1983) in the past decades. Considering the significance of reading strategies and changes in language education, many researchers and educators have tried to develop different reading approaches varying in terms of characteristics, context, opportunities, and implementation etc.. Among the reading approaches or methods developed by researchers, and educators, Collaborative Strategic Reading (CSR) was developed and designed to facilitate reading comprehension for students with learning, reading and behavior problems included in general education classrooms (Vaughn, Klingner & Bryant, 2001). What is aimed with CSR is to teach learners how to monitor reading comprehension, and how to use clarification procedures to understand a text clearly (Vaughn et al., 2001). While implementing this approach, cooperative learning plays a crucial role since the students support their learning with their peers, and teachers.

The strategies included in CSR practice are: (a) preview (before reading), (b) click and clunk (during reading), (c) get the gist (during reading), and (d) wrap-up (after reading). *Preview* is a pre-reading activity aiming to motivate students' interest in reading, to activate prior knowledge, and to help students in generating questions about the text (Klingner & Vaughn, 1999). During the process of previewing, students are taught how to scan the text quickly by looking for clues about the context, setting, characters, and crucial features of what they will read. *Click and Clunk* is a strategy implemented during reading with the purpose of teaching students how to monitor what they are reading, and to identify the information that they know more about, and information that causes students to experience difficulties in understanding (Vaughn & Klingner, 1999). *Get the gist* is another strategy practiced during reading which intends to teach students how to identify the main idea of a passage, and exclude unnecessary details (Vaughn & Klingner, 1999). Through this strategy, students are taught to determine the most important point in the text by rephrasing it in their own words. *Wrap-up* is an after-reading strategy aiming to provide students an opportunity to review what they read, which is expected to assist with understanding and remembering what is learned from the text. (Vaughn & Klingner, 1999). The goal is to generate questions about the text and summarize the key points to check the understanding the whole text.

Research has been interested in the implementation of CSR from different perspectives, and with participants from different contexts. Klingner and Vaughn (1996) investigated the effect of two approaches to reading comprehension strategy instruction- reciprocal teaching in combination with cross-age tutoring, and reciprocal teaching in combination with cooperative grouping-with seventh and eighth grade ESL students who were disabled in terms of comprehension of English language text. The findings of the study reported significant gains in reading comprehension of both groups. The results also revealed that minimal adult or teacher support as in reciprocal teaching can help ESL students with learning disabilities improve their comprehension.

In a subsequent study, Klingner et al., (1998) claimed that "one challenge in developing an intervention was to adapt previously successful strategy instruction models to be appropriate for heterogeneous classrooms in a way that would balance strategy instruction, and content learning, motivate a range of students, and seem feasible to classroom teachers" (p. 5). They achieved that by incorporating a cooperative learning phase in their CSR model with the aim of fostering strategic reading, and facilitating social studies learning in heterogeneous, culturally and linguistically diverse classrooms with learning disabilities. The study was carried out with fourth

graders in three heterogeneous classrooms. The results revealed that the students in the experimental condition made greater gains in reading comprehension but did not show difference in content learning. Also, the findings suggested that the strategies of click and clunk, and get the gist were used most consistently, and effectively.

In another study, Klingner and Vaughn (2000) investigated the effect of implementing CSR on helping behaviors of fifth graders. The aim was to see the frequency, and means by which bilingual children helped each other, and their peers with limited English proficiency in content classes. Trained teachers, the nature of group discussions, and students' verbal interactions were analyzed to examine the application of reading strategies, and how students supported each other while practicing CSR. The remarkable point of the findings is that the overall amount of time students spent on academic-related strategic discussion was much more than that found in previous studies. Besides, they were observed to help one another to understand the meanings of challenging words, to get the main idea, and to formulate and answer questions on what they read. According to findings of the study, it can be suggested that although scaffolding can be particularly challenging for bilingual students helping their peers with limited English proficiency, it can be achieved if students are self-motivated, know how to provide assistance, and they are provided guidance on how to interact effectively.

A similar study was conducted with the aim of determining the effectiveness of CSR for enhancing reading comprehension of learning disabled, average-, high-achieving students and low-achieving students. Klingner et al., (2004) implemented CSR in ten classrooms and with their teachers. The five of teachers and their classes were assigned to the CSR condition while the other five teachers with their classrooms were assigned to a control condition. The teachers in CSR condition were trained in terms of not only how to implement CSR but also why to do it. After feeling competent enough in CSR, the teachers started to practice it in their classes, and they were observed, and given constructive feedback. The findings revealed that the students in CSR classrooms had greater improvement in reading comprehension than the students in control group. That study draws attention to the fact that teachers can be trained to implement strategies in their classrooms and suggest that some variables related to teachers such as prior knowledge and confidence may affect the quality of CSR implementation as well as the gains in terms of students.

Vaughn et al. (2011) addressed the questions related to efficacy of CSR with adolescent readers when implemented by well-trained and supported novice CSR implementing teachers, the effect of prior knowledge of meta-cognitive strategies on moderating the effect of CSR on reading comprehension and lastly its efficacy with struggling readers. The findings indicated great differences in favor of the treatment students in reading comprehension but not on reading fluency, which suggests that CSR is an effective and feasible method that can be integrated into reading and language arts instruction with positive impact.

Although previous research of CSR has added to our understanding of how it effects reading comprehension process of students from different levels, age groups and with diverse abilities, much remains unaddressed. First of all, the reading-related problems of the target group has not been determined clearly as to see whether the practice of CSR helps students overcome their problems or difficulties. Also, the previous studies have generally been conducted with elementary or secondary classrooms and with L1 readers or L2 readers from different countries. However, the practice of CSR has not been applied with adult Turkish EFL learners in a university context. To understand the feasibility of CSR with adult Turkish EFL learners, research is needed to bridge the gap, and enable empirical results for university English teachers who are interested in improving the reading comprehension of their students, and also in increasing their repertoire of reading instruction models. Besides, the

present research adds the notion of reflection into process as the previous studies mostly depended upon just standardized reading comprehension tests, and interviews with participants. However, the present study takes the perceptions, ideas, suggestions, criticisms, and feelings of learners into consideration via reflective learning logs to make students fully involved in the process, and encourage autonomy.

Bearing the research gaps in mind, the present study probes to investigate possible effects of the Collaborative Strategic Reading (CSR) practice on the reading problems and reading comprehension of adult EFL preparatory class students.

## **2. Method**

The present study was conducted within a descriptive and experimental research design aiming to gather information about the effects of practicing CSR with prep-class adult EFL learners.

### *2.1. Participants*

Identified by convenience sampling strategy, 40 prep-class undergraduate students attending different departments of Kahramanmaraş Sutcu Imam University participated in this study. Two groups were conveniently selected from already existing fifteen classes and they were appointed as experimental and control groups. There were twenty one participants in experimental group and nineteen participants in control group. The participants were of different age, gender and backgrounds but the present study did not take these variables into consideration.

### *2.2. Instruments*

In this study, five types of instruments were utilized to collect the data: pre- and post- reading comprehension tests, minute papers about their reading related problems, Collaborative Strategic Reading Learning Log, Reflective Learning Log and field notes taken by the researcher.

### *2.3. Data Analysis*

The data, obtained through data collection tools employed in the present study, were analyzed by using both qualitative and quantitative analysis techniques. The pre- and post-reading comprehension tests were analysed by using SPSS 17.0 in order to determine the comprehension level of participants in the experimental and control groups. The reflective learning logs and minute papers of students were analysed through content analysis.

## **3. Findings and Discussion**

The findings obtained through statistical analyses and content analysis in accordance with each data collection tools are presented under three headings.

### *3.1. Findings from minute papers*

The minute papers about reading-related problems of adult EFL learners in the experimental group were collected and analysed through content analysis. The frequencies and percentages were calculated out of twenty four students since there were twenty four students at the beginning of the study. The results obtained through content analysis are presented in Table 1 below.

Table 1. *Reading Related Problems of Adult EFL Learners*

Item no	The common problems related to reading in a foreign language	f	%
1	Unknown vocabulary	23	95.8
2	The type of the text ( expository, narrative etc.)	12	50
3	How to answer the questions	8	33.3
4	The length of the text	8	33.3
5	Comprehending the text or passage	7	29.16
6	Having to deduce from the text to answer the questions	7	29.16
7	Grammar	6	25
8	Feeling inefficient to comprehend what is asked for in questions	6	25
9	Feeling incompetent	6	25
10	Time limit	5	20.8
11	Spelling of the words	4	16.6
12	The topic of the text (appealing to the interests and background knowledge)	4	16.6
13	Dislike for reading or reading classes	4	16.6
14	The level of the text ( in terms of difficulty)	3	12.5
15	Dislike for English language	2	8.3

Table 1 suggests that the basic problem or difficulty of the students in the process of foreign language reading is unknown vocabulary, which is claimed to hinder their understanding (Item 1). 95.8 % of the students think that when the number of unknown vocabulary increases, they become biased towards reading the text as they feel that they will not certainly understand. The second problem that gets the most point in Table 1 is the type of text. 50 % of the students claim that when the texts are expository, they lose their interest, and so they do not comprehend anything. Especially if the expository text is out of their studying field and too scientific, they have no interest in reading. On the other hand, the text is claimed to draw their attention mostly when it is in the form of narrative text.

As for Item 4, the length of the text in hand reflects that the students get bored when they read a long text, and they get lost in the content. Also, 33.3 % of the students claim that they forget what they read if the text is too long. Besides, the problem of not knowing how to answer the questions gets the same point as the length of the text. That is to say, 33.3 % of the students in the experimental group state that not knowing how to answer the questions hinders their reading comprehension. On the other hand, Item 3 shows that 29.16 % of the adult EFL learners in the present study can not comprehend the reading material even if they can read with ease. Also, deducing from the text is a burden for them which is stated by 29.6 % of the students. The students claim that it is very difficult to make deductions in English as they can not relate the events or situations in the text and that what they deduce does not become true in general.

Table 1 also points out that the students raise their concerns about grammar in order to comprehend the text. 25 % of the students feel that they can not understand the meanings of sentences and create a coherence between the sentences in a text when they do not know the grammatical structure used through sentences. As for two other items, the problems related to feeling incompetent in foreign language reading and feeling inefficient to comprehend the questions about the text (Item 8) have the equal percentages (% 25) with the problems related to grammar in the text. The problem of feeling incompetent in foreign language reading may stem from the problems related to unknown vocabulary and grammar. The inability to comprehend what is asked for in questions may result from the fact that the students prefer questions whose answers are given directly in the text, which they feel easier than making deductions.

Another problem of EFL learners is the time limit, which 20.8 % of the students claim to demotivate them. The students' views in terms of time limit reveal that since it takes time to fully comprehend the reading material, they become too excited when feel the time pressure on their shoulders. Furthermore, 16.6 % of the students in the experimental group stated that spelling of words makes the process of comprehension difficult for them. In fact, this problem can be examined under the title of vocabulary problem. But, the students especially emphasised the issue of English spelling, which they claimed to create confusion in their minds while reading and to result in failure in understanding the meanings of sentences. The problems related to the topic of the text and dislike for reading and reading classes have the same percentages with the problem of spelling (% 16.6) as shown in Table 1. The students in the study suggest that topic of the reading material should appeal to their interests and background, and if not, they do not want to read. They especially state that the topic isolated from their backgrounds and interests lead to disinterest in foreign language reading. Besides, the students do not like reading and reading classes, which may stem from problems or difficulties they encountered with reading before. The level of the text also creates problems for EFL learners in foreign language reading which is stated by 12.5 % of the students. Because when the level of the text is not suitable enough for learners, they may lose their interest as they think that they will experience failure.

Finally, Table 1 indicates that 8.3. % of the students do not like English language, which affects their foreign language skills and how they regard them. Students state that they do not want to read in a foreign language, and they can not achieve comprehension as they do not have an interest in English language.

### 3.2. Findings from Reading Comprehension Tests Supported by Field Notes

The results of the pre- reading comprehension test were utilized to shed light on the equivalence concerning the reading comprehension level of participants in both experimental and control groups. Table 2 presents the findings about pre-reading comprehension test results of the experimental and control groups.

Table 2. The *Pre-Reading Comprehension Test Results of the Groups*

Group	N	Mean	Standard Deviation	Minimum	Maximum
Experimental Group	21	10,47	5,89	5	25
Control Group	19	9,47	4,97	5	20

**p= . 567 (p>.05)**

The interpretation of Table 2 reveals that there was not a significant difference between two groups before the launch of the study ( $p > .05$ ). Even though there is a slight difference in the mean values of two groups, it is not a level to signify the inequality between the experimental and control group students. Table 3 illustrates the findings from post-reading comprehension test of the experimental and control groups.

Table 3. The *Post-Reading Comprehension Test Results of the Groups*

Group	N	Mean	Standard Deviation	Minimum	Maximum
Experimental Group	21	18,09	3,70	10	25
Control Group	19	11,05	5,15	5	25

**$p = .000$  ( $p < .05$ )**

As presented in Table 3, the results of post-reading comprehension tests illustrates that there is a significant difference between reading comprehension level of the experimental group and control group. Although there was not a huge gap between two groups at the beginning of the study as presented in Table 3, there seems a change in favour of the experimental group in pursuit of the implementation of CSR practice.

The results regarding the pre- and post comprehension level of adult EFL learners in the experimental group were also supported by the field notes that were kept by the researcher during collaboration process and discussion process. The field notes of each week showed that the students in each group took part in the process and contributed to progress of each other. While working with their peers, the students made conversations to fill in collaborative learning logs. The students were also observed to regard the other groups as rivals, which seemed to encourage them. The field notes of each week showed that the number of correct answers to the questions about the texts that were read increased, and the students were observed to be more motivated when they did the exercises correctly.

### *3.3. Findings from Reflective Learning Logs about Reading Related Problems of Adult EFL Learners Supported by Field Notes*

The reflective learning logs were analysed by using content analysis. Some headings were created according to the statements of the students in terms of what they thought CSR contributed to them. There were 168 papers that were filled by twenty one students for eight weeks. The similar statements in terms of CSR's contributions were summed according to how many times they were stated, and the percentages of total numbers were calculated in 168 papers. The students' statements in regard to CSR's contribution to their reading related problems and their percentages are presented in Table 4.

Table 4 illustrates that the students in the experimental group stated mostly their ideas on collaboration which constituted 94.04 % of the statements in 168 papers. Their logs also suggest that the students thought that collaboration made the process of comprehension and reading easier. Via group discussions, they pointed out that they could understand the texts easily, and also they could find the meanings without looking up any dictionary. One of the students in the experimental group supported this finding in his reflective log as: "any word that is unknown to me may not be unknown to my peers and discussing with my peers provides me to make predictions about the meaning of sentences". Collaboration was also stated to eliminate the problem of being shy about asking the teacher the meanings of words frequently by some of the students in the experimental group.

As for another issue, the minute papers had shown that the students had regarded unknown vocabulary as the biggest problem in their reading as presented in Table 1. In the same vein, Item 2 and 3 reveal that the students maintained that CSR contributed to their vocabulary knowledge (80.95 %) and thus supported them in dealing with unknown vocabulary during their reading process in a foreign language (85.71 %). Besides, they claimed that CSR contributed to the improvement of vocabulary knowledge, and memorability of words (72.2 %), which in fact can be attributed to discussions they maintained with their peers. Besides, 69.04 % of the statements indicate that the students could concentrate more on the reading texts with the help of collaboration, discussion and using strategies. Especially the strategies of ‘get the gist’ and ‘wrap-up’ were claimed to require concentration in the reading process. Furthermore, CSR approach was argued to help to improve the reading comprehension, and to understand the questions or exercises easily which were observed to constitute 67.85 (equal for both items) of the statements in 168 reflective learning logs. Similarly, the students specified that the strategy of ‘preview’ helped them to have an opinion about the text, and helped them to use their background information actively, which constituted 64.28 % of the statements observed in 168 reflective learning logs.

Table 4. *CSR's Contribution to Overcome Reading Related Problems*

Item no	Students' Statements in Reflective Learning Logs	f	%
1	Collaborating with peers	158	94.04
2	Helping to deal with unknown vocabulary (Click & Clunk)	144	85.71
3	Improving the vocabulary knowledge (Click & Clunk)	136	80.95
4	Helping to the memorability of vocabulary (Click & Clunk)	121	72.02
5	Concentrating more on the reading text	116	69.04
6	Helping to improve reading comprehension (Wrap-up& Preview)	128	67.85
7	Understanding the questions easily (Wrap-up)	128	67.85
8	Using background information actively (Preview)	108	64.28
9	Helping to summarise the text in their own words (Wrap-up)	103	61.30
10	Finding the main idea easier than before (Get the gist)	94	55.95
11	Feeling comfortable and confident (Due to collaboration)	92	54.76
12	Supporting group discussion	91	54.16
13	Helping to make inferences from the text (Preview & Get the gist)	83	49.40
14	Increasing interest in reading texts in English	81	48.21
15	Feeling more competent	69	41.07
16	Keeping the record of learning via CSR logs	66	39.28
17	Increasing interest in English language	44	26.19
18	Improving the grammar knowledge	24	14.28

Item 9 illustrates that through collaboration, CSR approach helped the students to summarise the text in their own words (61.30 %). The strategy of ‘wrap-up’ both required students to generate questions about the text, and make a summary of the text in their own words briefly. In reflective learning logs, the students stated that although at the very beginning, it seemed a bit difficult to summarise the text with their limited English proficiency, they later found it useful to summarise what they understood from the text in a few words. In addition, 55.95 % of the statements in reflective learning logs review that CSR approach helped the students to find the main idea easier than before. The strategy of ‘get the gist’ was stated to make it easier to find the main idea.

Furthermore, the students in the experimental group were of the opinion that CSR together with logs supported group discussion. The students also stated that group discussion made them feel more comfortable and confident in comprehension. These two items were found to have approximately equal percentages (about 54.5 %). As observed in the field notes, discussion within groups and between groups made students to understand the text comprehensively, and so decreased the rate of mistakes in exercises related to reading text. As the students could do the exercises correctly and comfortably, they seemed more confident.

As observed in reflective learning logs, the students found the strategy of 'get the gist' for each paragraph a bit difficult in the first weeks. However, as time passed, they seemed to overcome that problem with the strategies of 'preview' and 'get the gist'. Parallel to this finding, 49.40 % of the statements in reflective learning logs suggest that discussions within group and between groups in CSR help the students to make inferences from the text and overcome their problems in the reading process. Moreover, Item 14 shows that CSR approach increased the students' interest in reading texts in English (48.21 %). This finding may also be attributed to collaboration, peer discussions, and feeling more competent. Besides, 39.28 % of the statements indicated that the students were of the opinion that they could keep their record of their learning via CSR learning logs. This means that they could follow their improvement, see where they were less competent, and where more.

Besides, 26.19 % of the statements revealed that CSR approach was stated to increase the students' interest in English language, which was a surprising finding. That finding can be attributed to the fact that when students experience failure in one aspect of language learning, they may develop negative attitudes towards the whole process. Therefore, students having problems with reading comprehension may start regarding English language very difficult and boring, which was observed in the minute papers of the students about their reading related problems.

Finally, the Item 18 shows that the statements related to improvement of grammar knowledge constituted only 14.28 % of the 168 reflective learning logs. This finding may result from the fact that groups' ideas on CSR logs were written on the board, and their ideas were discussed between groups. While writing the suggestion or ideas on the board, the teacher corrected the sentences, and the students may have corrected their sentences on the logs. Through collaboration and fix-up strategies, the students may have improved their grammar knowledge.

As a conclusion, the findings have shown that many of the reading related problems of adult EFL learners are observed to be eliminated or at least decreased with the help of CSR approach. Those findings suggest that CSR has effects on reading related problems of adult EFL learners in the process of foreign language learning.

#### **4. Conclusion**

The results of the minute papers collected from the students on problems or difficulties they experience with reading in a foreign language indicate that majority of the students have difficulties with reading comprehension. They attribute their failure in reading comprehension to the lack of vocabulary knowledge, grammar, inability to comprehend the text and questions, time limit, feeling of incompetency, and disliking English language and reading in English etc. In this sense, Salataci and Akyel (2002) suggest that most of the problems or difficulties

experienced during the process of reading in a second or foreign language stem from unawareness of reading strategies and lack of training on them. The students heavily depend upon the teacher, and so have no control over their learning. However, collaboration with peers may teach the students to take responsibility for their learning. Moreover, strategy training and practicing cooperatively may enable teachers and the students to eliminate the problems concerning reading comprehension in EFL classes. Following the practice of CSR with adult EFL learners, the students in the present study have been observed to be in favour of implementing CSR in reading classes. The participants account that CSR is effective in terms of improving reading comprehension and overcoming vocabulary related problems and affective factors such as feeling incompetent and uncomfortable. Each strategy employed in CSR approach was observed to make a contribution to one specific aspect of comprehension. For example, the students could use their background information and make inferences with the help of *previewing*, deal with the vocabulary via *click and clunk*, generate questions and answering them by using *wrap-up* and find the main idea with the help of *get the gist*.

Bremer, Vaughn, Clapper and Kim (2002) suggest that CSR approach provides benefits for the students in terms of developing skills related to working in groups or collaboration. Parallel to this suggestion, the present study found that students liked the idea of collaboration and group discussion as they stated that collaboration and group discussion made the process of comprehension easier and more comfortable. Therefore, the findings from the present study indicate that CSR approach encourages cooperation and working together in EFL reading classes. Furthermore, collaboration and strategies embedded in CSR approach are claimed to help the students overcome vocabulary related problems during their reading process in EFL classes. Besides, instead of depending too much on the teacher, the students were observed to learn from each other, and supported each other's learning, which facilitates autonomy among students. In this way, their awareness was also observed to raise in terms of how they can deal with problems during comprehension process and what they can do to improve their reading comprehension. To conclude, despite challenges and concerns, CSR seems to be a convincing answer to many problematic areas of reading comprehension in a foreign language.

4<sup>th</sup> International Conference on New Horizons in Education

# Commercialization of education in Russia in the first decade of the 21st century

Sergey Shirin<sup>a\*</sup>*<sup>a</sup>St. Petersburg State University, School of International Relations 191060, St. Petersburg, Russia*

---

## Abstract

The study is based on a methodology proposed by European Association for Education Law and Policy for their research conducted in 2009 and devoted to commercialization, competition and corruption in European education. In the article, the attempt is made to apply their methods to analyze the extent of commercialization of Russian education system which existed before the adoption of new educational legislation (coming into force in 2013). The subjects of examination in this article are: competition law in education, case law in fair trading concerning commercialization in education, instances of educational liberalization and standardization in Russia from 2000 to 2009.

Keywords: commercialization, education in Russia, educational policy, educational legislation, liberalization of education

---

## 1. Introduction: Purpose and Method

The new law "On education in Russian Federation" that was adopted in December 2012 is considered by public opinion and by some experts as the law on commercialization of education (BBC, 2012). Under contemporary circumstances, an urgent academic issue is the question of commercialization of Russian education system which is on the world Top-20 (Pearson, 2012). Does the new legislation bring any novelties into this field? To answer this question, we need first of all to understand to what extent Russian education had been commercialized before the new legislation started to be worked on. This article is an attempt to assess the level of commercialization of education in Russia in the first decade of the 21st century.

Some scholars have already done their research of some aspects of this problem. E.G. Popkova, V.V. Chashchin, and D.V. Bogdanov (2013) point out that the amplification of the requirements for quality and level of education of the labor force leads to the formation of modern mechanisms of interaction between the labor market and educational services, which is put into practice in using of personnel marketing, which fundamental task is the creation of an attractive image of an enterprise, as an employer, to ensure its human resources activities with optimal quantity and quality. M. Esyutina, C. Fearon, and N. Leatherbarrow (2013) highlight some of the quality issues associated with the Bologna process and reflect on how the statements underpin quality of learning and mobility in a European higher education area context. They explore some of the issues raised from the documentation and examine some early experiences and challenges from a leading Russian university as part of a wider examination of higher education in a Russian context. M. Luk'lanenko, O. Polezhaev, and N. Churliaeva (2013) explain that engineering education in Russia is undergoing reforms, but the history of this

form of higher education does not indicate that it will succeed in bringing it into line with current world standards, or even making it more able to contribute at a high level to Russian economic growth. But there are no works specially devoted to the whole issue of commercialization of Russian education yet. Academic discourse provides us with no specific conclusions about the extent of commercialization of education in Russia under the circumstances of the former educational legislation.

Meanwhile, one can find some works devoted to the assessment of the level of commercialization in some other countries during that period of time (Wang, Kok, McClelland, Kirkbride, 2011; Greaves, Scicluna, 2010; Rukhadze, 2010). Many of them are based on methodology proposed by the European Association of Education Law and Policy (ELA). Before its annual conference in 2009, this association sent out a questionnaire concerning different aspects of commercialization of education to interested people in European countries. The answers helped some academics who were members of the association to make their conclusions relevant for different European countries. Russia was not in that list. Here we make an attempt to answer the questions put by ELA meaning Russia as the object of research.

## 2. Findings and Interpretation

Is providing free education a commercial service according to national legislation? This was the first ELA's question.

The term "educational service" is found in the Law of the Russian Federation (RF) "On education" № 3266-1, dated 10 July 1992, in the articles and clauses devoted to paid education. Only three times in the text of the Law use of the term concerns not only paid education, but also a free one. In part 8 of Article 19, it was stated: "Educational institutions according to agreements and together with enterprises, institutions, organizations may provide training to students as an additional (including paid) educational service." Similarly, in part 4 of Article 50, one can read that students of all educational institutions have right to "receive additional (including paid) educational services." Thus, paid services are only a part of a more general notion of "educational services". So, free education could be regarded as a service as well, and it's providing, according to part 8 of Article 19, was possible "with a license (permission) to the specified activity" only. In addition, parts 16 and 17 of Article 28 placed the general principles of financing of educational services and financing of educational institutions and educational services by the federal government.

It turns out that education belonged to the sphere of services, rather than to the social sphere, regardless of being paid or free.

However, as the Law stipulated that educational organizations might be established in the legal forms provided by the civil legislation for non-profit organizations only (Article 11.1 of the RF Law "On Education"), commercial organizations were not allowed to carry on educational activities and, therefore, education was not regarded as a commercial service.

The second question of the questionnaire was whether providing paid education was a commercial service according to national legislation or not.

RF Law "On education" № 3266-1 dated 10 July 1992 stipulated the right of educational institutions to attract additional financial resources, within the limits of the procedure established by RF legislation, by selling additional educational and other services specified in the statutes of educational institutions (part 8 of Article 41). But the fact of providing paid education services did not mean their commercial nature. To become commercial, they were necessary to be provided not just for attracting additional financial resources, but for profit. According to part 2 of Article 46, paid educational activities were not considered as business, if the derived income was used

for covering costs of the educational process (including salaries), its development and improvement in the educational institution. If there was no business activity, one could not speak about commercial services.

Article 46 was relevant only for non-governmental educational institutions. Federal and local government agencies were not free at the disposal of revenues from providing paid educational services at all. Revenues might be used in accordance with the statutory objectives only. Therefore, such institutions generally could not be considered as ones carrying out commercial activities by means of paid educational services. Their services, rather, should be recognized as non-profitable ones. In addition, Article 47 of the Law «On Education», which determined the list of business activities of educational institutions, did not include the paid educational services in this list.

In the question number three, ELA asked to describe other activities provided by educational institutions and their qualification as (public) services or otherwise.

In addition to the purely educational activities, educational institutions in Russia carried out research and development work, library services, publishing and printing activities, they were involved in organizing recreational activities, including theatrical shows, sport, cultural, educational, and recreational events, etc. Educational institutions might also have non-commercial educational enterprises for students doing industrial practical work. All these kinds of activities were considered as non-commercial ones only if received income was reinvested in the educational process of the institution, and if such activities were stipulated by the institutions' charters (part 3 of Article 47 of the RF Law "On Education").

ELA asked also, were schools allowed to have commercial activities, and if affirmative, under what conditions.

The RF Law "On Education" determined that educational institution was a legal entity. And according to the norms of civil law, it might be a party of economic transactions, i.e., to run business within the limits prescribed by the Civil Code of Russian Federation and other Federal Laws.

These limits were listed in Article 47 of the Law "On Education". Educational institutions might be engaged only in business activities stated in the Law. There were only a few activities from the entire spectrum of civil transactions: the transfer of property rights (lease), commercial representation (commission, agency), purchase and sale (in the form of retail sale), participating in particular partnerships. However, here were added indefinite "other profitable secondary operations not associated directly with the production and selling of goods, works and services that are mentioned in the statute". This significantly extended the range of possible types of business activity. Educational institution might be engaged only in the types of business activity specifically stated in its charter. By this fact, educational institutions significantly differed from other legal entities that have the right to carry out any activity not prohibited by the Federal Laws, unless it contradicts the object and purpose of the activities, stated in the Charter of legal entity. Educational institution was eligible to participate in the establishment of any commercial and non-profit organizations as a founder, shareholder, partner or co-investor.

Along with the general (educational) activities, state or municipal educational institution might also provide additional paid services: supplementary education programs, special courses and cycles of disciplines, tutoring, advanced study, other services not stated in appropriate educational programs and state educational standards.

These services could not replace the general educational activities funded from the respective budgets. Otherwise, the money earned through such activities, must be withdrawn by the founder (by state and / or municipal authorities) to its budget.

In addition, the founder or local government had the right to suspend business activity of educational institutions up to the court decision on this matter, as a lever that could restrain educational institutions managers enterprise, if it caused damage to the educational activities determined by the statute.

As a general rule, income from any activity of state or municipal educational institution must be used by it in accordance with the statutory objectives, i.e. for organization and provision of educational process.

The next question was, whether there was any case-law on the applicability of competition law to activities of HEIs.

Strictly speaking, there was. Although it probably should be a matter of the activity of education and HEI related authorities, not of the activity of HEIs themselves.

Private HEIs, which were licensed by the Ministry of Education or, later, by Ministry of Education and Science, had the same rights as state-operated ones. Ministry occasionally issued acts that limited competition in higher education that impaired the rights of private HEIs, in comparison with state universities. In such cases private institutions sent the requirements to check such acts to Federal Anti-monopoly Service (FAS). For example, in practice, as a result of the adoption of certain regulations which were issued by former Ministry of Education or the Ministry of Education and Science, it turned out that private educational institutions might participate in the competition for governmental grants and funds, but even if they won, they could not get budget money, because the Law «On Education» and the Budget Code contained certain amendments that did not allow to provide private institutions with such grants and funds. FAS responded to such appeals, explaining the contents of Article 15 of the Law "On Protection of Competition". This article prohibits to limit competition in governmental, ministerial and departmental decisions.

Such decisions were contained in the Protocol #4 of the Expert Council of the Federal Anti-monopoly Service of Russian Federation on the development of competition in education and science dated 4 June 2007, and Protocol #6 of the Expert Council of the Federal Anti-monopoly Service of Russian Federation on the development of competition in education and science dated 29 April 2008. Amendments to the RF Law "On education" and the Federal Law "On Higher and Postgraduate Professional Education" based on these decisions were drafted and referred to the Ministry of Education and Science and the Ministry of Economic Development of Russian Federation for further joint elaboration and introduction to the Government of Russian Federation.

In particular, with the help of FAS, they succeeded in liberalization of participation of private universities in the competition for state support of innovative universities in the framework of national project "Education".

The next question was as following: are state funded HEIs selling courses at market prices which are also provided by commercial educational institutions operating on the market?

The average cost of education at the state universities was in Russia higher than in private ones. Brands of state universities were created, as a rule, in Soviet times, and, in recent years, administrations of the universities actively used these brands, regularly raising tuition fees. Private universities, as a rule, did not possess such resource as a recognizable brand name.

ELA asked also, has there been case law on the extent of the activity of public interest of HEIs?

In Russian legal system, social relations are not regulated by case law. Therefore sources of legal support of non-profit activities of educational institutions were not court precedents, but the Constitution of Russian Federation (Articles 43 and 44), Federal Laws "On education" and "On Higher and Postgraduate Professional Education", Presidential Decrees that were settled to solving urgent problems of the system ("On urgent measures of state support for undergraduate and graduate students of higher educational institutions", "On some measures to strengthen public support for science and higher educational institutions", "On some measures to strengthen state support of young candidates of sciences, and their supervisors", etc.), the RF Government Decrees (which approved such major acts as State educational standards for higher and professional education, Regulations on the licensing of educational activity, "Standard regulations on educational institution of higher professional education (on HEI) of Russian Federation"), Programs, Concepts and other documents of a conceptual nature (the

priority national project "Education", the Concept of modernization of Russian education until 2010, the Concept of State Youth Policy, etc.), departmental acts issued by the Ministry of Education and Science ("The procedure for admission to universities" and others), acts of regional authorities (the rules relating to higher education in the Law «On education» of the Republic of Adygea, Karelia, Tatarstan, Chuvashia, Stavropol region, Kurgan, Novgorod and Sverdlovsk regions, although the higher professional education in accordance with Article 24 of the Federal Law "On Higher and Postgraduate Professional Education" was related to the jurisdiction of the Federation, not of regions), administrative agreements (between the Federation and regions, between the federal executive authority and the education authorities of the regions, between founder and university), acts of non-governmental agencies of educational governing (All-Russia Union of Rectors, regional councils of rectors of universities, associations of universities, etc.), local acts taken by universities within the limits of their competences (statutes, regulations, orders of rectors, decisions of Academic Councils, etc.).

A case law might regulate the activities of universities only in one case, if it is processed as the act in the form of resolutions or decisions of the Supreme Court, Supreme Arbitration Court or the Constitutional Court of Russian Federation. Such case law, in particular, were the rule of maximum age of head of department of HEI was repealed (the Decision of the Constitutional Court of Russia №19-P dated 27 December 1999 in the case concerning the constitutionality of the provisions of part 3 of Article 20 of Federal Law "On Higher and Postgraduate Professional Education"), and allowance to enter the postgraduate and doctoral programs of some universities in case of having a diploma on higher education not acknowledged by the state (the Decision of the Supreme Court of Russian Federation №GKPI 99-563 dated 1 September 1999 on the application by S.A. Chernyshev on recognizing partially illegal parts 38 and 71 of the Regulations on the preparation of academic, pedagogical and scientific personnel in the system of postgraduate professional education in Russian Federation).

The next question was, which commercially attractive activities were performed by state funded HEIs.

There were three types of such activities: letting property on lease, supplementary educational services, and expertise.

ELA also asked whether liberalization of the education market meant that in the country universities and member states were losing their freedom to cooperate and to stimulate cooperation between institutions.

The competitiveness of universities in a liberalized market of educational services is substantially determined by the level of development of inter-university – especially international – contacts. Therefore, there are special sections devoted to international cooperation on the websites of most universities, which show how well universities are engaged in this type of activities. In addition, the lack of budget financing (which accompanied liberalization of the education market) encouraged universities to open up foreign markets, and this might also encourage cooperation with foreign universities. That is why there was no lack of incentives for cooperation.

However, the same could not be said about the cooperation of universities within the country. Indeed, the situation of competition for applicants was not conducive to cooperation of universities which provided educational services for the same national market. So news about examples of such cooperation were actively discussed in the academic community, and such news often became sensations. For example, news about the agreement on strategic partnership between Lomonosov Moscow State University and St. Petersburg State University was actively discussed in blogs by representatives of the university community in August 2009. As a rule, if such cooperation was carried out, it was based on international projects but not on bilateral agreements.

Cooperation of universities in Russia sometimes took the form of integration (as a result, a federal or a national research university was established on the basis of several universities). However, this was not due to market mechanisms, but rather to state control of education. The market did not motivate strong universities to integrate, particularly if they would lose their brand names in case of integration. In addition, the integration of HEIs could change the nature of the education market from competitive to oligopolistic one.

Further, ELA asked whether there was any case law on unfair clauses (clauses abusives) in school contracts by national Fair Trading agencies in state funded education and in private non-state funded education.

There were such precedents. Anti-monopoly authority repeatedly made judgments and determinations on the violation of the Law «On protection of the consumer rights» for universities, providing paid educational services. These judgments were based on unfair terms of the educational services agreements. The most famous precedents were related to the following three conditions. The first one concerns reasons for terminating the educational services agreement at the initiative of the university. These reasons were formulated without regard to the university statute and student's obligations contained therein and these reasons went beyond the educational process and can infringe on consumer legitimate rights. The second one was that student fee for the current school year or semester (paid as a deposit not refundable in case of termination of the agreement on the initiative of the student). The third one concerned the additional payment for the retaking of tests and examinations.

Such decisions and determinations of the Anti-monopoly Service were sometimes appealed by the universities, but judicial authorities usually left without changes the invalidation of the agreement terms, infringing the rights of consumers, and confirmed the prohibition of obtrusion of additional works and services that met parts 1 and 3 of Article 16 of the RF Law №2300-1 "On Protection of Consumer Rights" dated 7 February 1992.

Corresponding Decisions were made, mainly, in respect of private educational institutions. The most famous precedents were the Decision of the Federal Arbitration Court of the Northwest District, case № A56-21085/01 dated 21 January 2002 (for Private Educational Institution "St. Petersburg Humanitarian University of Trade Unions"), the Decision of the Federal Arbitration Court of the Northwest District case №A26-5499/03-27 dated 22 March 2004 (for Autonomous Non-commercial Association "International Slavic Institute"), the Decision of the Federal Arbitration Court of the Far Eastern District case № F03-A73/03-2/492 dated 26 March 2003 (for Private Educational Institution "Far Eastern Institute of Legislation and Jurisprudence"), the Decision of the Federal Arbitration Court of the East-Siberian District case № A33-20033/02-S6ao-F02-1921/03-S1 dated 2 July 2003 (for Private Educational Institution "Joint Institute for the Humanities").

It's hard to find such decisions of the Anti-monopoly Service in respect of state universities, as well as other precedents relating to unfair agreement terms with state universities.

The next question was following: is there any case-law on publicity and advertising by educational institutions, eventually by the national advertising standards authority?

There were such precedents. Among them the following cases are best-known. The decision of the Federal Arbitration Court of the Volga-Vyatka Region case № A29-3090/02A dated 9 September 2002, according to which, when promoting an educational institution, advertisement distributors must require submission of a license to educational activities to indicate its number and the authority which issued it. The Regulation of the Tatarstan Regional Office of the Federal Anti-monopoly Service of the Russian Federation dated 9 October 2008 on amercement of the Private Educational Institution "Profession Plus" for improper advertising (advertising goods for production and (or) realization of which a license or other special permits are required, in the absence of such permits). The Decision of the Omsk Regional Office of the Federal Anti-monopoly Service of the Russian Federation, case № 03-10.3/04-2007 dated 25 December 2007 concerning signs of violating the Law of Russian Federation "On Advertising" in the fact of distribution by the Ministry of Economy of Omsk Region advertisement of educational services of Private Educational Institute "Omsk House of Knowledge" on the official website of the Omsk region [www.omskzakaz.ru](http://www.omskzakaz.ru) (by advertising, the requirements of the legislation of Russian Federation on the placing of orders were violated).

ELA also put two following questions. Is there any case-law on publicity in educational institutions? Is there a special controlling organization?

The Federal Law "On education" prohibited political agitation and political organizations activity in educational institutions. However, such prohibition was not supported by sanctions. Therefore, the courts' decisions on such matters were reduced to prescriptions to stop violating the requirements of the legislation.

More common were cases of the application of the Law "On advertising" to the distribution of beer advertisements at a distance less than one hundred meters from educational institutions, their buildings and structures, which were contrary to parts 2 and 3 of Article 22 of the Federal Law № 38-FZ "On Advertising" dated 13 March 2006. Violators of these rules, under decisions of courts, were usually brought to administrative responsibility.

The duties of supervisory organization on the matters were performed by the Federal Anti-monopoly Service of Russian Federation.

Was there any case-law on commercial activities by educational institutions? Such was the next ELA's question.

There were a lot of such judgments. And they were pronounced by very different courts. During the first decade of the 21st century, the Constitutional Court pronounced judgments on cases related to taxation of educational institutions (the Ruling of the Constitutional Court of Russian Federation №366-O-P dated 4 June 2007 on the recognition of justified costs of the educational process, the Ruling of the Constitutional Court of Russian Federation №396-O dated 20 November 2003 on the exemption from Value Added Tax (VAT) any research and development activities by educational and academic institutions on the basis of commercial agreements). Judicial practice on disputes about providing of paid educational services to citizens was concerned in the application of the RF Law "On Protection of the Consumer Rights", making a mutual educational services agreement, providing paid educational services without a license, violations of cash discipline during providing paid educational services, during advertising paid educational services. Judicial practice in disputes related to taxes in education concerned responsibility for educational institutions to pay income tax, VAT, property tax, unified social tax, personal income tax, land tax, transport tax, regional peculiarities of taxation of educational institutions, the responsibly for providing tax returns, the consequence of the illegal use of the tax benefits, the provision of tax benefits for educational institutions (in particular, there were decisions concerning granting tax exemption to educational institutions in case of their non-commercial activities, granting tax exemptions to educational institutions which reinvest earned revenue in the educational process, granting tax exemptions to educational institutions which keep separately income accounting for principal activity income and business activity income). Judicial practice concerned in the disputes arising from leases in the area of education, the right of educational institution to serve the tenant and lessor of property, observing the procedure of letting transferred to operative management property on lease, observing the purpose of the property leased by the educational institutions, rental fee, lease agreement, rights of the owner to lease property assigned to the educational institution for operative management, especially the leasing of federal property, peculiarities of the leasing of land lots by educational institutions. Judicial practice on disputes related to real rights and rights of obligations in education concerning the property right and right of self-disposal of income from permitted activities, privatization of state and municipal property in the area of education, the right of operative management, limits of property disposition laid down for educational institution for operative management, property rights of the owner of an educational institution, vicarious liability for the obligations of the educational institutions, property accountability of educational institutions as the principal debtor.

The next ELA's question was as following. Have there been any rulings by national offices for fair trading?

National Authority, which regulates trade, is the Ministry of Industry and Trade. It does not concern education. And national body that regulates competition (including fair trading) is the Federal Anti-monopoly Service (FAS). It served as a supervisory organization in the sphere of providing educational services, too. The

FAS managed the Expert Council on Development of Competition in Education and Science. The Expert Council was composed of market participants, representatives of non-profit associations and regulatory authorities. This practice allowed the FAS to estimate the situation in respective markets objectively and increased the transparency of decisions made by FAS. FAS decisions on the issues related to education can be called rulings. In particular, in 2009, the Expert Council decided to begin developing recommendations for insurance (or provision of other forms of guarantee) of responsibility of educational institutions and organizations of secondary and higher vocational education in providing paid educational services. These recommendations could also be some kind of ruling.

One of the last ELA's questions regarding commercialization of education was as following. What legal and practical changes in the organization, governance and funding of universities have been introduced? ELA meant the context of European law.

Changes in the management of Russian higher education were not associated with the European directives, although society definitely associated them with the Europeanization of Russian education.

In November 2006, Federal Law № 174-FZ "On autonomous institutions" was adopted. Part 2 of Article 5 stated that autonomous institutions may be created by being established, or by changing the type of existing state or municipal institution.

In April 2007, Federal Law № 63-FZ amended the Budget Code of Russia. Paragraph 5 of Article 41 ("Types of budget revenues") indicated that the revenues from the use of property which is owned by the state or municipality, and fee-based services provided by budgetary institutions, as well as grant revenues and revenues from other income-generating activities must be included in the budget revenues after preparation, approval, budget performance and after a budget performance report.

These two laws placed budgetary and autonomous institutions in unequal conditions regarding the use of the non-budget funds they have earned. In accordance with Articles 3 and 6 of the Law "On autonomous institutions", an independent institution was entitled to deposit money and other property into the authorized capital stock of other entities, or otherwise transfer its property to other entities with the approval of their founder (by approbation of its own founder). Budgetary institutions were deprived of this right according to Paragraph 1 of Article 6 of the RF Law "On the budget for 2008-2010". Hence, they were prevented from establishing joint ventures with business structures and from connecting R&D personnel with production. The funds received from income-generating activities were not allowed to be used by federal budgetary institutions to establish other organizations, purchase securities nor should it be deposited in credit institutions.

According to Federal Law №18-FZ dated February 10, 2009 "On Amendments to Certain Legislative Acts of Russia on the activities of federal universities", HEIs of new type (federal universities) were established as autonomous institutions. And according to Law №217-FZ "On amendments to Certain Legislative Acts of Russia on business entities established by budgetary, research, and educational institutions with a view to practical application (implementation) of the results of their intellectual activities", universities got the right to independently set up small businesses for the practical implementation of the results of their intellectual activities. Previously, such companies were semi-legal.

ELA asked also which legal changes were brought to the core activities of research and teaching.

According to Federal Law №232-FZ dated October 24, 2007 "On Amendments to Certain Legislative Acts of the Russian Federation (with regards to the determination of higher vocational education levels)" a two-level system of higher professional education was introduced in Russia: a bachelor's degree was the first level and a master's degree or specialist's diploma was the second level.

Bachelor's degrees, master's degrees and specialist's diplomas were considered independent levels of higher education with different state education standards and independent final examinations, the results of which lead to awarding the qualification (degree) of "bachelor" or "master", or the qualification of "specialist". Admission to higher educational institutions for study according to curricula set forth by the RF Government, and to undergraduate programs was available for those who had completed secondary education or secondary vocational education, on a competitive basis, based on the unified state examination. Those who had successfully completed an undergraduate program were allowed to apply for admission (on a competitive basis) to a master's degree program. This law also regulated the terms for full time study in the main higher education programs. It took four years to obtain a bachelor's degree, and no less than five to obtain the qualification of "specialist". It took no less than two years to obtain a master's degree. Other term regulations were allowed to be established for some areas of learning and specialties. Access to PhD postgraduate study was available for those who had a master's degree or "specialist" qualification only: not for those with bachelor's degree.

According to Federal Law №18-FZ dated February 10, 2009 "On Amendments to Certain Legislative Acts of Russia on Federal universities' activities", programs of higher professional and postgraduate education might be based on educational standards and requirements which might be set by the federal universities themselves or by national research universities, as well as by other federal governmental educational institutions of higher professional education that should be listed in a presidential Decree.

Requirements for educational standards, for the conditions of realization and for the mastery of basic educational programs might not be lower than the corresponding federal governmental educational standards. Previously, all universities had implemented higher professional education programs based on a unified national standard.

The terms and conditions of the research activities of universities were not fully defined.

The very last question in the part of the questionnaire devoted to commercialization of education was as following. What is the legal framework for control of research and higher education?

To the end of the studied period of time, legislation considered licensing, state accreditation and quality control to be elements of state control. The Ministry of Education and Science set federal licensing requirements for the conditions of the educational process based on educational programs of various levels and directions, as well as minimum standards for learning and material base required for a candidate to obtain a license, and the educational qualifications of teaching staff, and staffing. However, recommendations for the order of interaction between federal and regional bodies in relation to audits of non-state universities and their affiliates in the subjects of the federation were not developed.

An important element of the functioning of higher educational institution is the compliance of its educational activities with the requirements and standards. It is determined by means of certification and state accreditation. State accreditation meant in Russia in the first decade of the 21st century a comprehensive evaluation of educational activities, including external expertise which determined the compliance of the content, as well as level and quality of educational activities with the requirements of state educational standards. It also included examination of the characteristics of separate educational institutions that were needed to determine their type according to part 18 of Article 33 of the RF Law "On Education". Accreditation of HEIs was conducted by the Federal Service for Supervision in Education and Science on the basis of an examination of the various components of the HEIs and the accreditation criteria for HEIs of various types which were approved by the accreditation body. Accreditation was both state and public, because it was entirely constructed on principles of transparency and openness. However, representatives of educational institutions, employers' associations and the public, as a rule, did not really take part on the accreditation process.

The functioning of higher educational institutions, in addition to the above mentioned elements, also included the necessity to fulfill the official requirements for learning and educational programs, which also determined the quality of education. The quality of the educational activities of an HEI was determined at the regulatory level by their compliance with educational standards. The standards served as indicators of the targeted and functional legal capacity of educational institutions and were defined as a socially recognized form when referring to specific educational content.

Legal regulation of university research activities and the control of such activities was effectively absent.

### 3. Conclusion

We can see that the legislation and court practice in Russia in the first decade of the 21st century enabled educational institutions to do some kinds of business activities. But the legislation and the corpus of case-law was too complicated. Some laws and decisions made by courts and authorities might contradict one another. Besides that, state-operated and private educational institutions had different rights and abilities. Thus, Russia needed to gather all the norms concerning commercial activities in educational sphere into one law. This law was adopted in 2012 and is coming into force in 2013.

4<sup>th</sup> International Conference on New Horizons in Education

# Communication of School and Family in Relation to the Form Teacher

Irena LOUDOVÁ<sup>a\*</sup><sup>a</sup>University of Hradec Králové, Institute of Social Work, 50003, Hradec Králové, Czech Republic

## Abstract

This paper sums up the results of one part of a research, which deals with the problems of the communication between school and parents. This partial topic contains the results of the questionnaire research, which was realized in February 2013 and there were ascertained the opinions of secondary school students aged 11-15 about their relations with their form teachers. The results show that students regard their teachers as providers of social support and trust them. Nevertheless, the area of social communication among students and between the student and the teacher is marked by a sort of awkwardness and lack of experience with effective self-assertion or adequate solution of conflicts.

Keywords: family, elementary school, form teacher, communication, social relations, student, subject matter

Motto: “ *I give you,*

*I get from you,*

*Together we share*

*And from that we live“*

*(Kubičková)*

## 1. Introduction

Social transformation must necessarily affect the area of education. It is important to preserve all that has been proved efficient by time and to accept new information concerning the curriculum and the extent and content of the subject matter of various courses. However, the transformations should have a far deeper impact on the sphere of education and social efficiency and the student's competences which make life in contemporary society easier.

A change of the teacher's role within the education process is expected. The student should move to the centre of an active education process and s/he should be led by the teacher, acting as a guide, to reach considerably greater independence in cognitive learning process, actively participating on the definition of objectives and effective methods. The success of such an education process requires friendly and relaxed relationships between schoolmates, between the students and the teacher and between the teacher and the students' parents (Swanson, Edwards, Spencer, 2010). It is the area of class and school climate which becomes the centre of interest and

E-mail address: jana.havigerova@uhk.cz

which has long been an object of research in the Czech Republic (Bosma, Jackson, 1990, Lašek, 2001). Social system climate is a long-term phenomenon, which Grecman (2003) describes as consisting of “*stable modes of perception, experience, assessment and reactions of all the people in a certain environment to the past, present and future events in the environment*”. It is the subjective dimension which is crucial because everyone’s subjective perception of a phenomenon is more important than the objective view. One of the aims of this research is to learn about the experience of the student’s role at school.

We focused on the figure of **form teacher**, mainly on his/her students’ view of him. The actions of form teacher represent an important part of the student’s school life as form teacher can exert a considerable influence over his/her students’ well-being, health and their mental, physical and social development. The role of form teacher is very demanding and it raises many expectations. Form teacher is an important factor influencing the individual students as well as the whole class.

## 2. Method

### 2.1. Research objective

The objective was to learn about the **secondary school students’ perception of their form teacher and of their own role at school**.

We examined the students’ emotional attitude to school environment: the quality of the atmosphere between the students and teachers, mainly the relationship of students with their form teacher. We intended to find out whether teachers spare some time for their students’ problems, whether they help them, to what extent they respect the students’ feelings, whether they talk to them enough, think about their wishes, and look after them and have the individual approach to the student.

The second area of our interest was the teaching. We focused on the motivation, activation and didactic skills of form teachers. We asked the students about the following: their understanding of the teacher’s instructions, the sufficiency of his/her explanations, his/her help with students’ difficulties, the diversity of teaching, the clarity of explanations and instructions, use of good examples, the effort to find a good explanation and organize the subject matter well. We mapped the teacher’s effort to help the students with study matters.

### 2.2. Method

We opted for the quantitative approach, using a non-standardized **questionnaire** comprising 31 items. We worked with Licker’s six point scale (1. strongly disagree – 6. strongly agree). Every respondent also answered basic personal questions concerning his/her age and sex.

### 2.3. Research sample

We focused on the students of secondary schools in the Czech Republic. We addressed 883 students (440 boys and 443 girls) aged 11-15.

## 3. Results

The obtained data was transformed into numeric form (data matrix coding) and analysed statistically using the software STATISTICA 9.0, NCSS. The next section gives some of the questions which were subject to **factor analysis**, which showed the following common variables and denominators of the statements. We give examples of some of the questionnaire items under each factor.

**Factor 1 – TEACHER'S CARE FOR THE PUPIL:**

Sparing some time for the student, the willingness to talk to him/her, to be his/her friend, care for his/her problems, respect his/her feelings and wishes, give help.

Form teacher cares for his students' problems.

The answers suggest that 20,48 % of respondents think that their form teacher does not care much for their problems, while 54,22 % claims the opposite. More than one half of the respondents perceive the care for their problems on the part of their form teachers.

Form teacher helps us as a friend.

34,94 % of respondents have a positive perception of their form teacher's help, which means that s/he can provide social support. A slightly lower number of respondents (31,33 %) think that their form teacher does not help them.

Our teacher usually spares some time to talk to us if we do not like something.

Almost one half the children (48,20 %) believe that their form teacher is willing to talk about their disagreement with the situation in the class. 10,48 % of them think that the teacher spares no time to deal with their problems.

If students want to talk about something with their form teacher, s/he spares time to do it.

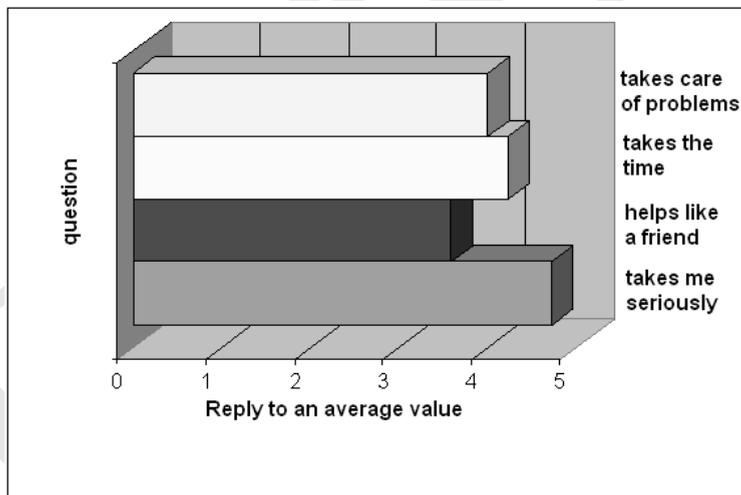

The answers suggest that 62,65 % of respondents agree with this statement. Merely 6,02 % expressed disagreement, so more than a half of the respondents claim that their form teacher has time for them if they want to deal with something.

I feel that my form teacher takes me seriously.

42,38 % of children agree with this statement and feel as partners of their form teachers, while a considerably lesser part of the respondents think that their form teachers do not take them seriously.

Form teacher does not show enough respect for the feelings of his/her students.

Almost one half (45,78 %) of the students think that their form teacher notices their feelings, while 12,05 % think that s/he has no regard for them.

**Factor 2 – THE ABILITY OF COMMUNICATING WITH THE TEACHER**

The child's ability to speak with the teacher outside school, not to give up communication because of a

momentary misunderstanding.

- If there is a misunderstanding between me and my form teacher, I give up soon.

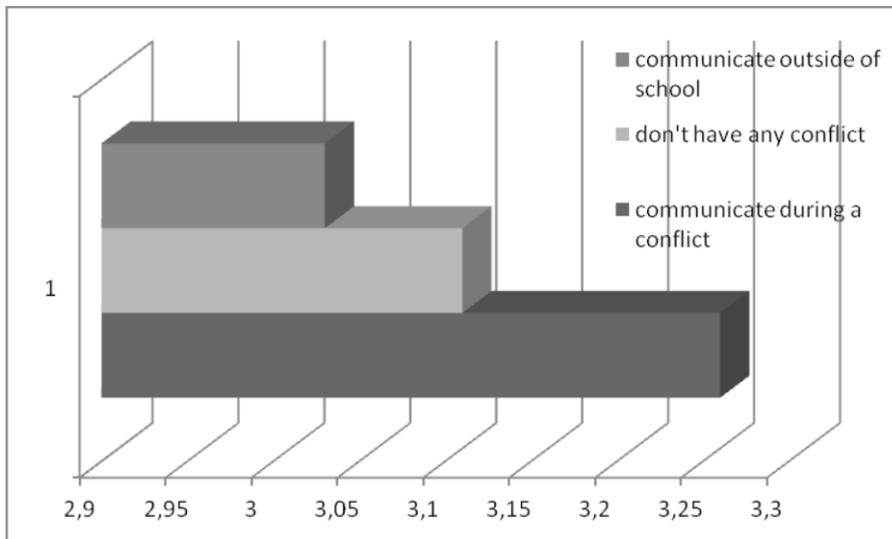

20,48 % of respondents agree with this statement, however, more than a half of the children (51,81 %) are not afraid to make contact with their form teacher despite the misunderstanding.

- If I am in a conflict with my form teacher I quickly lose confidence.

14,45 % of the respondents experience disagreeable feelings and fear because of a conflict with teachers, nevertheless, 32,53 % of them feel no loss of confidence.

- If I accidentally meet my form teacher outside school I do not know what to speak about with him/her.

The percentage of respondents who think that they have something to talk about with their teacher outside school and those who claim the opposite is the same (27,71 %). This means that almost one third of the children manifest a kind of awkwardness in communication with teachers.

### Factor 3 – PERSONAL FEELINGS ABOUT THE RELATIONSHIP WITH THE TEACHER – THE STUDENT, CONTACT WITH THE TEACHER

The student's perception of criticism on the part of the teacher, discussion of personal questions, the ability to be in contact with the teacher.

- I have a disagreeable feeling that my form teacher judges me critically.

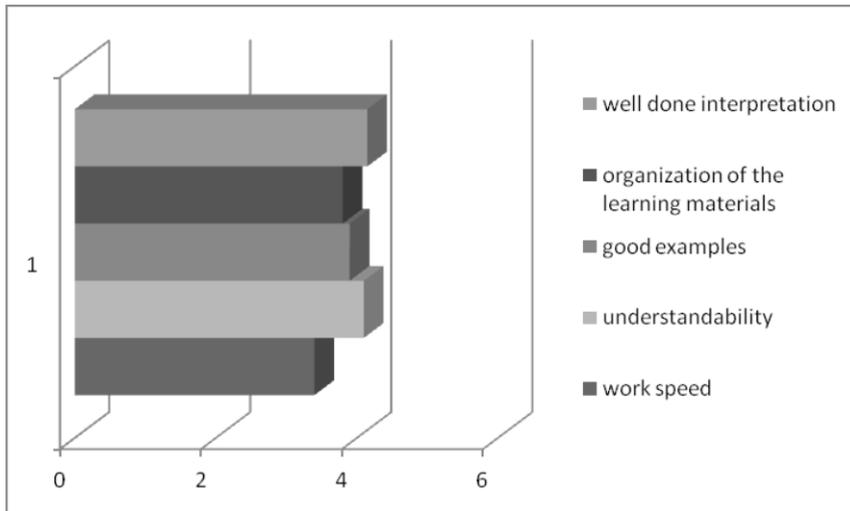

Mere 10,82 % of children believe themselves to be judged critically by their teachers, a far greater part of the respondents (49,40 %) think the opposite and do not share the feeling.

- We often talk about questions which touch us personally during the lessons.

More than one half (55,42%) of the respondents think that personal questions are not discussed often. 21,69 % of children claim that they talk about such questions.

### Factor 4 – THE PUPIL AND THE TEACHING

The ability to give understandable explanations, precise instructions, good examples, the ways of presenting the subject matter, the pace of work, the effort to give good explanations.

- We can manage difficult tasks in the lessons of our form teacher, if we try.  
43,38 % of respondents expressed their agreement with this statement and 19,27 % their disagreement. This means that almost one half of the students believe in the success of their work conditioned by the guidance of their form teacher and their own effort.
- Our teacher can organize the subject matter very well to make it understandable.  
The answers suggest that 44,58 % of children think the subject matter to be well organized, while 18,07 % believe that it is not so. The lessons are difficult for them.
- Form teacher tries hard to explain everything very well.  
More than one half (50,60 %) of the respondents believe that their teacher tries hard to give quality explanations. 14,45 % of children think that their teacher does not exert much effort to do so. The answers suggest that the majority of students are satisfied with the presentation of the subject matter.
- Students are given precise instructions for their work.  
This statement is thought to be true by 27,71 % of respondents, while 20,48 % disagree with it. The majority of them (more than a half) claim the guidance and instructions to be of average quality.
- Good examples enabling better understanding are given often.  
40,97 % of children are satisfied with the examples, while 15,66 % feel a lack of good examples.
- We do not start to go over a new topic before everyone has understood the current one.  
The pace of work seems satisfactory to 33,73 % of students. The percentage of those who are not satisfied is almost the same (34,94 %). They feel that the teacher moves on although not everyone has understood the topic yet.
- The explanations are intelligible enough to make me understand even a difficult topic.  
Presentation of the topics does not seem understandable to 39,76 % of respondents. A much lesser part (18,07 %) of the students understand the explanations.
- Our former teacher cares for everyone to understand the subject matter.  
The greater part (56,63 %) of the respondents think that the teacher cares for his students to understand, while 22,89 % think the opposite.

Variation variables: age and sex

The results concerning the item – I get along well with my form teacher – revealed that boys get along with their teachers much better than girls ( $F = 4,90 / p < 0,05$ ).

The differences in other items were statistically insignificant.

We were also interested in the differences in the students' perception of their form teacher depending on their age. The research showed that the younger the students are the more they agree with the following statements:

Our form teacher:

- cares for everyone to understand:  $r = - 0,32$  ( $p < 0,05$ );
- takes me seriously:  $r = - 0,32$  ( $p < 0,01$ );
- I can speak with him/her outside school:  $r = - 0,23$  ( $p < 0,05$ );
- I get along well with him/her:  $r = -0,43$  ( $p < 0,01$ ).

#### 4. Conclusion

The research demonstrated that Czech students believe that their form teachers usually spare some time for them if it is needed. Approximately one third of the respondents regard their form teacher as a friend and the majority of respondents think that s/he cares for their problems. The students realize that their teacher is aware of their feelings and one half of them are not afraid to make contact with him/her. Personal matters are not discussed much in our schools. Approximately one half of the children believe that they get along well with their teachers, who take them seriously and do not judge them with too much criticism. Almost one third of the children are able to talk to their teachers outside school, however, they find communication at school easier. Many are able to deal with a conflict with their teacher on their own. The feeling of getting along well with the teacher was expressed more by boys than by girls in our research. The younger the students are, the more they perceive their teachers as providers of support and help. On the other hand, higher level of criticism of the communication between the teacher and his students expressed by older children might suggest that teachers are less skilled in individual work with older students, since the one-way communication (from teacher to students) that the older pupils have violated.

Students are aware of the teacher's effort to present clear explanations and most of them are satisfied with them. Still, a mere third of the students find the teaching completely intelligible. The greater part of students are not satisfied with the pace of work, which they think to be too quick, thinking that the teacher makes them move on before everyone has understood the current topic. Although the children believe that teachers care for them to understand the subject matter and try to help them, a great part of the respondents have the impression that the pace is too quick for them, they do not completely understand the assignments and tasks and do not have a good command of the subject matter. One of the causes of this could be the lack of questions asked by the teacher (Havigerová, Haviger, 2012). More than one third of the respondents appreciate the quality of examples.

We think that according to the students' view, the current situation is quite positive. The relationships of students and their form teachers seem to be relatively good. Students regard their teachers as providers of social support and trust them. Nevertheless, it is necessary to pursue the improvement of work with the student all the time, as it is an essential part of the lifelong professional development of every teacher.

Finally, we may say that students' experience of their role in its form required by the school is positive; the school does not err much in this area. Nevertheless, the area of social communication among students and between the student and the teacher is marked by a sort of awkwardness and lack of experience with effective self-assertion or adequate solution of conflicts.

Czech children focus on their school performance and they are able to subject much to it even despite a lack of support of their parents (parents often regard school results as a standard which is naturally required). However, students have little will to excel and show that they are the best.

They often lack the skills of social behaviour, they are unable to formulate and defend their own opinion before their teacher or schoolmates, they cannot deal with conflicts in an adequate manner, the presence of the teacher makes them lose self-confidence and they fear to express themselves. This can have only slight negative

effects at school, however, once the student leaves school, his/her low level of social skills may become one of the many negative factors affecting interpersonal behaviour for the rest of his/her life.

Květenská, Truhlářová and Levická (2010) suppose that this factor may also put the child in the danger of being harmed by his/her environment. Therefore, we may state that the acquisition and improvement of social skills in children is something to be definitely taken into account in the education process. Social skills can be divided into several categories. The first category of the so-called interactive skills (Smékal, 2004) enables the individual to form, maintain and deepen meaningful relationships with other people. The sphere of quality communication and its development in students is a challenge for all educators. Symmetric and intensive communication with the parents is of no less importance.

## Abstract

Among currently popular education reform ideas are school-community partnerships that link the educational mission of the school with the needs of the whole child, their families, and the broader community. However, a review of the research reveals diverse partnership models. To develop clarity and advance research on this reform agenda, we have developed a typology of four categories organized from the least to the most comprehensive: Family and Interagency Collaboration, Full-Service Schools, Full-Service Community Schools, and a Community Development Model. In this paper, we explain the four partnership models and the empirical evidence of successes and challenges for each.

Keywords: school-community partnerships; community schools; full-service schools; community development

## 1. INTRODUCTION

School-community partnerships are currently in the forefront of educational reform efforts. But the literature on these partnerships indicates a variety of models, strategies, and purposes that require different commitments and resources. After reviewing hundreds of articles by using a range of key words and search approaches, we narrowed our review to 37 conceptual, empirical, and research synthesis sources that met high standards of research and reporting rigor (AERA 2006, 2008). The empirical research included a broad range of qualitative, quantitative, and mixed methods research, including case studies of single-site partnerships, survey research, longitudinal evaluations, and quasi-experimental comparative designs. Most studies included more than one data source: test scores, attendance records, satisfaction surveys, interviews, and observations. From this literature, we developed a typology consisting of four categories organized from the least to the most comprehensive in purpose and design: Family and Interagency Collaboration, Full-Service Schools, Full-Service Community Schools, and a Community Development Model. We argue that such a typology is a necessary tool to guide systemic educational reform, especially those that go beyond traditional school dimensions (Valli, Stefanski, & Jacobson, 2013). The four categories provided the framework necessary to analyze the theories of action implicit in the partnerships and enabled us to comparatively examine the processes necessary to establish and sustain various types of partnerships, their purported outcomes, and reasons for implementation successes and challenges. (See Table 1 for a summary of sources in each category).

### 1.1. Family and Interagency Collaboration

We name this first institutional partnership “*Family and Interagency Collaboration*” because its primary purpose is to increase family and community involvement in schools by coordinating delivery of services. Partnerships within this category make “family and community involvement an expected part of district and school life” (Epstein, 2010, p. 21) and require an organizational commitment on the part of the school and parents and/or participating agencies. One criticism of this model, however, is that even with the intent of “two-way” communication and reciprocity, families and community agencies tend to serve the more limiting role of merely supporting rather than helping to shape the mission and goals of the school (Schutz, 2006).

We reviewed one descriptive, seven empirical, and five research synthesis sources in this category. The common theory of action within this partnership model is that coordinating the delivery of educational, health, and social services is key to strengthening families and meeting the learning and developmental needs of students. To be successful, these partnership models required attention to relationship building; human, fiscal, and material resources; school leadership that valued this extended role of the school; and an evaluation system that was implemented early in the partnership. As Blank, Melaville, and Shah (2003) argue from their evaluative review, successful partnerships are built on more than good intentions; they are characterized by effective leadership and resources beyond those typically found in traditional schools. Of the studies reviewed for this model, Community in Schools (CIS) exemplified the best evaluation practices. CIS was able to assess not only a broad range of outcomes, but how and why the model worked, and in what situations it worked. The five-year, national evaluation design included a data inventory, a quasi-experimental study, a natural variation study and case studies, a comparative study, and an experimental study (CIS, 2010).

While there was some empirical evidence that these partnerships improved students’ attitudes toward school and that teachers and parents found them beneficial, the evidence was stronger for improvements in student achievement indicators such as standardized test scores, grade point averages, attendance, and graduation rates. One of the strongest examples of an effective family and interagency collaboration was found in the Communities in Schools (CIS) model. CIS works within the public school system, establishing relationships with local businesses, social service agencies, health care providers, and parent and volunteer organizations to provide needed resources based on student needs. Researchers found that CIS schools, especially high-implementing CIS schools, consistently outperformed comparison schools on state achievement tests (CIS, 2010).

### 1.2. Full-service schools

Similar to the collaborative model described above, “*Full-Service Schools*” seek fruitful partnerships with community agencies to serve the needs of the whole child and families. Sometimes referred to as a “wrap-around” school, this model expands the school day and sets aside space within the school building, literally wrapping social, family, and health services around the educational time and space dimensions of the school. The difference between this model and the previous one is that the school attempts to offer full-services. It is a comprehensive, school-based, integrated approach to service delivery, requiring both organization commitment and organizational change. Its theory of action is that such on-site, integrated services will strengthen the support network essential to meeting the needs of children and families.

In this category, we reviewed two sets of conceptual and nine sets of empirical sources, suggesting the prominence of this model in the field. To be successful, these partnerships had to find ways to institutionalize change, to engage in processes that coordinated resources and communication. Numerous challenges had to be overcome in this regard and most studies found that some elements of the Full-Service model were only partially implemented. Cook, Murphy, and Hunt’s (2000) study of 10 Comer elementary schools in Chicago, for instance, indicated considerable variation in implementation of the model, with no school “faithfully following all the program guidelines, although some were rated as close” (p. 564). Implementation and sustainability problems fell into four general areas: organization, communication, resources, and leadership. Surveys and interviews unearthed a host of problems including lack of central decision making, ad hoc role specifications, redundancy of data requests, absence of Memoranda of Understanding, high turnover of key staff, disconnect between teachers and full-service staff, and inadequate funding and fiscal autonomy. A common element across studies that helped implement and sustain the full-service model was typically the presence of a site-based coordinator (Dryfoos, 2000; Leone, Lane, Arlen, & Peter, 1996; LFA, 2005a, 2005b, 2006).

If the myriad implementation and sustainability challenges were met in these partnerships, positive outcomes occurred for schools, families, and students. Most of these outcomes were found in improved academic performance (Cook et al., 2000; Impact of City Connects, 2010; Fox, Leone, Rubin, Oppenheim, Miller, & Friedman, 1999; LFA, 2005a, 2005b). But there were also indications of improvements in students’ behavior and attitudes (Impact of City Connects, 2010), teacher and parent satisfaction (Cook et al., 2000; LFA 2005a, 2005b, 2006), and the school climate (Impact of City Connects, 2010). Although reported outcomes did not consistently indicate increased achievement as a result of the Full-Service School model and effect sizes were often small, the accumulated evidence suggests that Full-Service Schools generally have a positive impact. This impact increases the longer students participate in the Full-Service School’s services and the more the reform model is faithfully implemented (Impact of City Connects, 2010). One study in this category raises an important cautionary note: that school conditions associated with improved achievement are not necessarily the same conditions that improve students’ social outcomes (e.g., improved attitudes toward school, better relations with peers and parents). In this study of James Comer’s School Development Program, researchers found that without a strong academic climate in the school, academic performance was unlikely to increase even if the social climate improves (Cook, Habib, Phillips, Settersten, Shangle, & Degirmencioglu, 1999).

### 1.3. Full-service community schools

Differing from Full-Service Schools, “*Full-Service Community Schools (FSCSs)*” seek to democratize schools by opening them, not only to greater involvement, but to greater decision making, on the part of the neighborhood community. As such, community schools require greater attention to changing the culture of the school. Although the model also emphasizes partnerships with community agencies to expand the resources available through the school, and thus require some organizational change, democratic decision-making is what differentiates it most from a full-service school and what requires a cultural shift in the way schools are operated. No longer are families simply clients to be served, but essential partners in the operation of the school. As its

category name implies, “*Full-Service Community Schools*” have the ambitious goal of changing both the structure and the culture of the school. Their theory of action is that incorporating community and family voice in partnership decision making will further strengthen the full-service school model. Although it is possible, in theory, to have community schools that do not also aspire to be full-service schools, in practice, these types of school-community partnerships seem to be an anomaly. The examples we found had the dual goals of being Full-Service and Community Schools: places that offered a full range of services to students, families and communities, as well as places that incorporated a full range of voices in decision-making. In this model, not only are schools charged with the task of providing comprehensive services, but the community is charged with the proper course of action in the community school ideal (Rogers, 1998).

We analyzed three conceptual and four empirical sources in this model. To be successful, partnerships had to find ways to democratize school structures, school practices, and school leadership. This was not an easy task, as evidenced by the limited number of exemplars. For FSCSs, the process elements are reflective of both its organizational and cultural purposes. So in addition to many of the organizational themes found in the other models, such as ensuring adequate resources and building a sound evaluation system from the start, considerable emphasis is placed on the cultural theme of relationship building, especially building trust and democratizing the school with community input. To that end, a variety of forums and committees are used to develop and sustain a partnership model of shared decision making. Using a successful example of a Children’s Aid Society partnership, Keith (1999) similarly highlights the importance of the professional educator’s role shifting from simply “bringing specific skills and knowledge to the table” to “recognizing that others at the table also have contributions to make” (p. 231). This shift is needed to cultivate reciprocity and trust but also requires difficult work: “building alternative mediating institutions that are truly democratic; intensive personal interaction, including one-on-one meetings; a strategy of social action that understands the importance of conflict properly addressed; and a long-term commitment to broad-based community empowerment” (p. 232). Implications for leadership also become a major theme. Based on his evaluation of the three schools in the Polk Bros. initiative, Whalen (2002) recommends assistance for principals in developing more collaborative leadership styles.

When successful FSCS partnerships were in place, there was evidence of improved student academic performance, attendance, and attitudes. These partnerships also positively changed the school’s climate and increased its capacity. The strongest indication of the FSCS potential to impact academic achievement comes from a comparative study of 18 FSCS to 18 matched “regular” schools (Adams, 2010). Although the initial comparison of the schools revealed no significant math and reading achievement differences, when the researchers controlled for level of diffusion (i.e., bringing the FSCS model to scale; fidelity of implementation), students in the FSCSs significantly outperformed students in comparison schools. Important intervening variables for academic achievement were levels of model diffusion (Adams, 2010), family engagement (Castrechini, 2011), and trust in the schools (Adams, 2010). These trusting relations were, in fact, stronger predictors of math and reading achievement than the schools’ SES. The authors caution, however, against rushing to causal claims. Although this body of research often accounts for student attitudes from previous surveys and reports of classroom experiences, student positive attitudes could be the result of factors not in their model such as parental attitudes toward school.

In their descriptions of exemplary FSCSs, Melville (2004) and Williams (2010) also note the increased capacity of participating schools to address a variety of health and adult education needs such as dental, hearing, and vision screenings; health fairs; and GED, literacy, cooking, and nutrition classes.

#### 1.4. *Community development*

The last and most comprehensive model described in our typology is that of “*Community Development*.” As evident in our choice of title, this model goes well beyond the other three in its goals and vision. Not content to serve the individual needs of students and their families, the aim of initiatives in this category is to push beyond the school walls to transform whole neighborhoods and communities, using schools as a primary base. The

theory of action underlying this reform model is that strengthening the community infrastructure is an essential component in child and family development and school improvement. Evoking Dewey's (1902) century-old conception of the school as a social center, schools become not only places of continuous intellectual growth for both children *and* adults, not only sites for extended agencies and social services, but also points of contact for community members to deal with pressing political, economic, and cultural matters. According to the Coalition for Community Schools, community development means that participants work together to strengthen social networks, the physical infrastructure, and the community's economic viability (Samberg & Sheeran, 2000).

We reviewed two conceptual and four empirical sources on this model. Echoing some of the findings from previous models, to be successful these partnerships required committed leadership that could facilitate a shared vision of community development and the school's role in that vision. They also needed a comprehensive evaluation system, put in place during the planning process, as well as a long-range sustainability plan. What is most striking is the convergence of themes across the articles and how closely they echoed recurrent themes in other models. As in previous models, the elements of leadership, vision, evaluation, and sustainability are not treated as discrete or linear, but rather as interconnected webs of supports. Authors see the need for someone to be both a seasoned school-based leader and a "catalytic" partnership leader who can anticipate opposition and build consensus around viable, research-based theories of change (Proscio, 2004). They discuss the importance of developing leadership within the community (Gold, Simon, Mundell, & Brown, 2004; Warren, Hong, Rubin, & Uy, 2009) and helping communities become more self-reliant through this leadership development (Oppenheim, 1999). In their theory of change, Gold and colleagues (2002, 2004) view leadership development, community power, and social capital as the essential components of a community's capacity to effect school reform. Consistent with this model's theory of action, Proscio (2004) finds that place-based community development drives school reform, not necessarily the other way around.

At this point in time, outcome findings for this model are relatively weak, with some promise of sustained improvements in housing, health, employment, and transportation in the community as well as the more typical school-level improvements such as increased attendance and higher academic achievement. As indicated above, the Community Development sources focused broadly on strengthening the community partnership, institutions, and infrastructure by renovating schools and improving housing options; creating safer neighborhoods, improving traffic patterns, and making public transportation more accessible (Gold et al., 2002; McKoy et al., 2011; Proscio, 2004). These partnerships have trained teachers to use new and presumably better curricula (Proscio, 2004), have taught parents how to help their children with homework (Warren et al., 2009), and offer wrap-around programs, including bi-lingual services, health clinics, counseling, mentors, and advocates (Gold et al., 2002; McKoy et al., 2011; Oppenheim, 1999; Proscio, 2004; Warren et al., 2009). But what have these changes in institutions and services meant for children, families, and community members? Once again, the strongest evidence is on academic achievement, with positive findings (Oppenheim, 1999; Proscio, 2004; Warren et al., 2009).

The most carefully designed study is the analysis of those selected to participate in the Harlem Children's Zone (HCZ) by lottery compared to those not selected. Researchers examined the differences between HCZ lottery winners and losers and found improved academic achievement in elementary and middle school English language arts (ELA) and in middle school mathematics in the lottery winners (Dobbie & Fryer, 2011). According to the authors, the magnitude of the gains in both reading and mathematics is greater than that of reforms found to be most effective in improving achievement among poor children: smaller class sizes, improving teacher quality, and Head Start. And although the researchers claim that the achievement gains are attributable to the high-quality Promise Academies the students attend, and not the broader network of community services, these academies were, in fact, full service community schools, providing free medical, dental and mental-health services, nutritional meals, incentives for achievement, and food and transportation support for parents. Even for the Harlem Children's Zone, which is often held up as the Community Development model to be emulated, outcome

data beyond test scores are surprisingly hard to find, and even the academic achievement outcomes are, at times, highly contested.

## 2. Discussion

Evident in these four school-community partnership model descriptions is the fact that as their purposes expand, so, too, do the requirements for success. The more comprehensive models (e.g., full-service community schools and the community development model) require significantly greater inter-organizational work and commitment than do the models with more limited scope. (See Table 2). Our analysis of the research within each of these categories provides evidence that approaches such as full-service or community schools can promote academic success and meet targeted family and community needs. However, there is not yet compelling evidence of sustainable models with enough power to transform whole communities. One reason might be that these models have not yet had enough time to both implement and document their success.

Table 2: Summary of Model Purposes and Requirements

Model	Purpose	Requirements
Family and Interagency Collaboration	Coordinate service delivery	Organizational commitment
Full-Service Schools	Deliver school-based, coordinated services	Organizational commitment and change
Full-Service Community Schools	Deliver school-based, coordinated services and democratize the school with community input	Organizational and cultural change
Community Development Model	Transform the community	Inter-organizational and cultural change

In addition to strength of evidence for findings, structuring the review as we have helped us determine similarities and differences in the models. Most evident to us was the outcome focus on achievement scores. This is not surprising given the current emphasis in the US on improved student achievement scores on standardized tests in mathematics and reading. But the broader interests in improving student and family health, for example, so often seen as critical to student learning, often went unexamined. The lack of outcome data in these areas is particularly surprising given the subtitle of Dryfoos's (1994) early book on the Full-Service School model: *A Revolution in Health and Social Services for Children, Youth, and Families*. Few partnerships seem to have created the type of integrated databases that enable comprehensive, systematic, and rigorous evaluation such as the School-Based Youth Services Program developed in Iowa almost two decades ago (Walker & Hackmann, 1999).

The other obvious commonality was the focus of all four models on the process of developing and maintaining partnerships. This preoccupation suggests both the importance—and the continuing difficulty—of partnership work. This is apparent even in *Family and Interagency Collaborations*, which require the least change. While scholars and activists have learned a great deal about the mechanisms necessary to put these partnerships in place, acting upon this knowledge requires great capacity and commitment. So although the review we have conducted generally supports prior research and provides justification for embarking on school-

community partnerships, it does not necessarily mean that any particular partnership will be able to accomplish those outcomes. The institutional, resource, and relational contexts of partnerships are simply too varied, even those within prescribed models such as NNPS or CIS, to assume replicability.

In addition, the external evaluators of the Comer SDP schools point to two types of implementation problems relevant to each of these partnership models: site conditions and model specification. While not totally absolving the schools and school district for insufficient model implementation, Cook and colleagues (1999) point out the responsibilities of the reformer to provide a clear guide for action, saying that a practical theory of reform must contain enough specificity for schools to implement well. The authors talk about failure to differentiate the SDP model from other reform efforts underway in the school district as well as role conflicts the model created for the principal, who was the person officially accountable to the school district for both overall school management and for implementing a shared decision-making model.

Another obstacle to model implementation is site conditions. From their study of SDP schools in Detroit, Millsap and colleagues (2000) argue that, in addition to developing a shared understanding, three other conditions facilitated efforts of the schools that were full implementers: (a) small school size—under 600, (b) the principal's facilitative leadership and positive working relations with team members, and (c) staff members who want and believe in the reform effort. Of the two types of problems, the latter seems even more difficult to address. How are positive team relations and facilitative leadership developed? What prompts school staff to welcome reforms? And how does one reform large schools, or break large schools into smaller schools? Although research on organizational change and school improvement begins to offer some answers, these remain daunting challenges for school-community partnerships.

### 3. Conclusion

Advocates of school-community partnerships have reviewed the lessons of the past 100 years and argue that the involvement of all stakeholders and broad-based, comprehensive services are essential for the development and education of school-aged children, especially those growing up in poverty. They claim that removing barriers for learning and providing supports for target populations will generate the conditions for learning that will lead to improved outcomes. We believe that these reform efforts are assisted by a clearer understanding of the various types of partnerships, such as we have provided, and an analysis of the requirements for their success. The literature still lacks empirical studies of sustained partnerships. This shortcoming is not surprising. These efforts are often led by community activists and educators who spend their time doing the work and have little time or expertise to engage in systematic data collection and analysis. But the well-funded, large-scale efforts that have been studied (e.g., CIS, SDP) show the difficulty in faithfully implementing these models. The more complex and multi-layered the reform effort, the greater the likelihood of weak links. Models that appear to be worth replicating, such as Communities in Schools and Harlem Children's Zone, require carefully designed, sustained evaluation.

# Comparing the predictive and classification performances of logistic regression and neural networks: a case study on timss 2011

Oykum Esra Askin<sup>a\*</sup>, Fulya Gokalp<sup>b</sup><sup>a</sup>*Yildiz Technical University, Faculty of Arts and Science 34220, "Istanbul", Turkey*<sup>b</sup>*Yildiz Technical University, Faculty of Arts and Science 34220, "Istanbul", Turkey*

## Abstract

Investigating effective factors on students' achievement has wide application area in educational studies. Specially, Trends in International Mathematics and Science Study (TIMSS) allows researchers to determine correlates of mathematics and science achievement for different countries. In this study, the predictive and classification performances of logistic regression and neural networks are compared to identify the impact levels of variables on students' mathematics achievement in Turkey. Age, gender and scales created by TIMSS team for 8<sup>th</sup> grade students (students like learning, value learning, confident in math, engaged in math, bullied at school, home educational resources), are selected as predictive variables. Model fitting statistics show that two methods give similar results in prediction and classification. In addition to model results, students' confidence is found as the most effective factor to improve mathematics achievement.

Keywords: TIMSS 2011, neural networks, logistic regression

## 1. INTRODUCTION

Education policy makers desire to get reliable information about main factors effecting students' achievement. In this sense, obtained information could be used for monitoring current problems and identifying effective solutions to improve the quality of education system. One of the common ways to acquire the mentioned information is using a reliable database such as Trends in International Mathematics and Science Study (TIMSS). TIMSS is the largest international comparative study which provides useful information about educational achievement and learning contexts for policy makers, educators, researchers, and practitioners (Martin, Mullis, Beaton, Gonzalez, Smith, & Kelly, 1997). There is an extensive literature uses TIMSS data to determine factors impact on students' achievement. While some studies investigate whether school characteristics such as class/school size, resources and the curriculum are significant determinants of achievement (Papanastasiou, (2000); Pong and Pallas (2001); Schreiber (2002); Webster and Fisher (2003); Woessmann (2003)), some studies focus on teachers' characteristics such as education level, teaching experience, qualification and hours spent on planning lessons ((Akiba, LeTendre and Scribner (2007); Dodeen, Abdelfattah, Shumrani and Hilal (2012); Hanushek and Luque (2003); Jürges and Schneider (2004); Mills and Holloway (2013); Woessmann (2003)). Student characteristics such as age, gender, family background (e.g., parental education level, income, SES), number of books at home, and attitudes are another important factors concerned with achievement (Aypay, Erdoğan and Sözer (2007); Neuschmidt, Barth and Hastedt (2008); Woessmann (2004; 2005); Yayan and Berberoğlu (2004)).

\* Corresponding author. Tel.: +90 507 956 77 29; fax: +90 212 383 44 21  
E-mail address: oykumesra@gmail.com

Several statistical methods have been applied in order to find significant relationship between factors mentioned above and students' achievement. With the rapid development of information technologies, a great number of techniques within data mining are attracting educational researchers (see. Romero and Ventura (2007)). However, still there is a lack of studies used data mining tools for TIMSS data. In this paper, two well-known data mining methods; logistic regression (LR) and neural networks (NNs), are used. In addition to the usage of LR and NNs to identify the impact levels of several factors on students' achievement, this study also attempts to fill another gap by evaluating the prediction and classification performance of LR against to NNs. In this vein, motivations of this paper can be described as followings: (i) to determine the significance of factors on achievement by using TIMSS 2011 survey data of Turkish 8<sup>th</sup> grade students (ii) to compare the prediction and classification effectiveness of two methods based on different model fitting statistics.

## 2. Methodology

### 2.1. Study methods

LR and NNs which are two popular data mining methods aim to describe variable(s) in relation to the other(s) by looking for rules of classification or prediction based on the data (Giudici & Figini, 2009) and they have been applied in many fields such as health, finance, agriculture and engineering. In addition to LR and NNs methods, several different methodologies such as decision trees, cluster analysis and ensemble models are performed on the relevant data and the results of outcomes are compared according to their predictive/classifier accuracy. In this way, the question of which approach is outperformed by another(s) can be reported. In recent years, such studies are rapidly increasing in educational studies. To give an example for Turkish literature, the predictive powers of four different data mining methods on secondary education placement test results are investigated and the ranked-importance of factors on prediction models are determined by Şen, Uçar and Delen (2012). As it mentioned before, this study deals with TIMSS 2011 Turkey data and two popular methods, namely LR and NNs are used. A short brief of these methods is given in the following sections.

#### 2.1.1. Logistic regression

Logistic regression is a variation of the ordinary least squares (OLS) regression, but unlike OLS, this method allows to use two or more categorical variables as a dependent variable. This study focus on binary LR method when the dependent variable is dichotomous.

$\pi(x)$  is the probability of outcome of interest and it represents the conditional mean of  $Y$  given  $X$  ( $\pi(x) = E[Y|X = x]$ ). The residuals do not follow a normal distribution because  $Y$  gets only two possible values. The conditional mean falls within the [0,1] interval. The change in the conditional mean per unit with the change in  $X$  becomes progressively smaller as the conditional mean gets closer to 0 or 1. Therefore, the shape of the fitted regression line is likely to be S-shaped. Despite different distribution functions are proposed by researchers, the most common used in the literature is logistic distribution function. The form of the simplest logistic regression model is as follows (Hosmer & Lemeshow, 2000);

$$\pi(x) = \frac{e^{x\beta}}{1 + e^{x\beta}} = \frac{e^{x\beta} / e^{x\beta}}{(1 + e^{x\beta}) / e^{x\beta}} = \frac{1}{1 + e^{-x\beta}} \quad (1)$$

where  $\beta' = (\beta_0, \beta_1, \dots, \beta_k)$  denotes the vector of parameters and  $k$  is the number of independent variables used in the model. In order to convert the model from nonlinear to linear form, a logit transformation of  $\pi(x)$  is applied.

$$\log\left(\frac{\pi(x)}{1-\pi(x)}\right) = x' \beta \quad (2)$$

The left side of Equation (2) is also named as a logit and it can be expressed by **logit (Y)** or **logit  $\pi(x)$** . The logit is the natural logarithm of odds which is derived by taking the ratio of probability of success to probability of failure of an event. As it can be seen clearly, the odds ratio of an event take values in the interval  $[0, +\infty]$  whereas the logit take the values in the interval  $[-\infty, +\infty]$ . The logit may be continuous and it is linear in its parameters (Hosmer & Lemeshow (2000); Alpar (2011)).

In LR, the goal is to predict the logit of dichotomous outcome **Y** from the categorical or the continuous independent variable **X**. The unknown regression coefficients are estimated by using maximum likelihood estimation (MLE) method which maximises the likelihood function. The log likelihood function is given below (Hosmer & Lemeshow, 2000);

$$L(\beta) = \ln[l(\beta)] = \sum_{i=1}^n \{y_i \ln[\pi(x_i)] + (1 - y_i) \ln[1 - \pi(x_i)]\} \quad (3)$$

where  **$l(\beta)$**  denotes the likelihood function of the parameters. By taking first derivatives of  **$L(\beta)$**  with respect to  **$\beta$**  and then equalizing the likelihood function to zero, we obtain the maximum likelihood estimator of  **$\beta$ 's**. The value of maximum likelihood estimate, denoted as  **$\hat{\beta}$** , shows how much logit changes with one unit change in **X**. From the Equation (2), it can be easily interpreted that the odds ratio is equal to  **$\exp(\beta)$**  and for the value of 1, no relationship between **X** and **logit (Y)** is interpreted.

Three different tests based on the likelihood function are used in order to test the significance of estimated  **$\beta$**  coefficients. To test the significance of overall LR model, the likelihood ratio test is performed. The test statistic (**G**) is the difference between two deviance values: deviance for the model with only constant (the null model) and the deviance for the model with constant and variable(s). It follows a Chi Square distribution and the formula of the test statistics can be expressed as  **$G = D(\text{null model}) - D(\text{model with variables})$**  or  **$G = -2 \ln\{\text{likelihood (the null model)} / \text{likelihood (model with variables)}\}$** . If the null hypothesis:  **$h_0: \beta_0 = \beta_1 = \dots = \beta_k$**  is rejected at chosen significance level (usually at  **$\alpha = 0.05$**  significance level), it is concluded that variable(s) added to model increase(s) the model fit. The Wald Test is performed in order to test whether any individual parameter (slope coefficient) equals to zero or not. Let  **$\hat{\beta}$**  denotes the maximum likelihood estimate of unknown parameter  **$\beta$**  and  **$SE(\hat{\beta})$**  denotes the standard error of  **$\hat{\beta}$** . The Wald statistics follows a Chi Square distribution with one degrees of freedom and can be obtained as follows:  **$W = \hat{\beta}^2 / SE(\hat{\beta})^2$** . The last one is Lagrange Multiplier (Score) test which is based on the distribution theory of the derivatives of the log likelihood and limited software packages includes this test due to complicated matrix calculations (Hosmer & Lemeshow, 2000).

### 2.1.2. Neural networks

Neural networks are widely used computational models and the main idea is to mimic the process of human brain. Algorithms of NNs are used as an alternative of standard statistical techniques in prediction and classification due to having following benefits: (1) Like human brain, NNs have the ability of learning and generalizing from past experience. According to Sivanandam, Sumathi and Deepa (2006), the ability of learning allows NNs to adjust themselves to the dynamic and changing environment. (2) NNs are easily overcome with complex non-linear relationship between inputs (independent variables) and outputs (dependent variables), and there is no need to make priori assumptions about the mathematical forms between inputs and outputs. (3) NNs are robust to noisy, missing and incomplete data. (4) Possible interactions among inputs can be easily determined by NNs. However, Linoff and Berry (2011) mentioned about some weakness of NNs versus other statistical techniques. Because of black box nature, NNs can produce well established model but cannot explain how to do it. For example unlike logistic regression, there is no way to get an accurate set of rules from NNs. Also LR enables to make confidence intervals and to develop hypothesis tests in order to make decisions through statistical theory. Non availability of such statistical procedures is the other drawback of NNs. Lastly, when training sets are inaccurate for the large amounts and chaotic data, an over fitting problem may occur (Sivanandam, Sumathi, & Deepa, 2006).

As it mentioned before, NNs have the ability of learning and learning can be done by training. The back propagation algorithm is the most popular supervised training method and it performs learning on a multilayer perceptron (Han & Kamber, 2006).

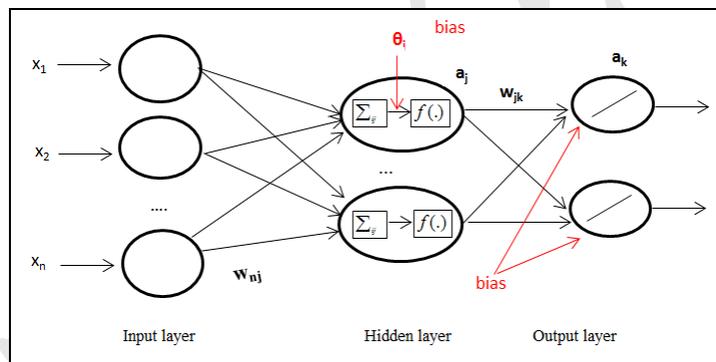

Fig. 1. An architecture of a simple MLP with one hidden layers

The Multilayer Perceptron (MLP) consists of three components: an input layer, one or more hidden layers and an output layer. Figure 1 shows architecture of two layers MLP. Neurons which are the smallest unit of a NN are represented by circles. The weight value carries information from one neuron to another. Steps of backpropagation algorithm used in training of MLP are described below (Han & Kamber, 2006);

- **Step 1:** (Initialize the network weights) Weights are randomly assigned as small numbers.
- **Step 2:** (Propagate the inputs forward) Each input layer unit  $j$  carries its information to all hidden units. For an input  $j$ , its output  $a_j$  is equal to its input value  $I_j$ . Then the net input of unit  $j$  according to the previous layer  $i$  is computed as  $I_j = \sum_i w_{ij} a_i + \theta_j$  where  $I_j$  is the linear combination of inputs  $x_i; i = 1, \dots, n$ ;  $w_{ij}$  is the weight value,  $a_i$  is the output of unit  $i$  from the previous layer and  $\theta_j$  is the bias of the unit  $j$  (sometimes bias takes the value 1). Next, each hidden unit  $j$  computes the output value  $a_j$  with respect to the type of activation function which is shown as  $f(\cdot)$ . The most popular activation function used in the hidden layer is the sigmoid or

logistics which is a continuous and differentiable nonlinear function. With the help of the sigmoidal activation function, the output of unit  $j$  can be calculated as  $a_j = 1/(1 + e^{-I_j})$ .

- **Step 3:** (Backpropagate errors) The error is propagated backward by updating the weights and biases to reflect the error of the network's prediction. The output layer error is obtained by  $Err_j = a_j(1 - a_j)(T_j - a_j)$  where  $T_j$  is the known desired value of the output. Then, error of the hidden layer  $j$  is calculated as  $Err_j = a_j(1 - a_j) \sum_k Err_k w_{jk}$  where  $Err_k$  is the error of unit  $k$ .
- **Step 4:** (Updated the weights and biases) For each  $w_{ij}$ , weight increment is calculated by  $\Delta w_{ij} = \eta Err_j a_i$  where  $\eta$  is the learning rate which takes value between 0 and 1. Then each weight is updated for each bias  $\theta_i$  in the network with the formulation:  $w_{ij} = w_{ij} + \Delta w_{ij}$ . Similarly, each bias  $\theta_i$  is updated by  $\Delta \theta_i = \eta Err_i$  and then the new value of bias is calculated as  $\theta_i = \theta_i + \Delta \theta_i$ . Training stops until a pre-specified number of epochs have expired and the sufficiently small overall error is satisfied (repeat steps 2-4). Training in network generally continues until it reaches a certain error rate such as 95%. Too much training may cause any over fitting problem. Additionally, before applying step 2, input variables are usually normalized to 0-1 scale. Thus, changing the scale helps speed up the learning phase.

## 2.2. Data and variables

TIMSS is an international assessment of mathematics and science at the 4<sup>th</sup> and 8<sup>th</sup> grade students from different nations and it is conducted every four years by the International Association for the Evaluation of Educational Achievement (IEA) since 1995. In 2011, more than 600,000 students from 63 countries participated to this international study and 45 of them administered the eighth grade assessment (Mullis, Martin, Foy, & Arora, 2012). Data used in this study includes 6928 Turkish students' information from student questionnaire and some missing or inaccurate values exist. To handle this problem, 192 students' data are excluded from the analysis.

Table 1. Independent variables used in study

Variable name	Type of data	Codes of the statements
Age	Ratio	ITBIRTHD
Gender	Nominal	ITSEX
Students like learning math	3 point likert scale	BSBM14A- BSBM14B, BSBM14C, BSBM14D, BSBM14E.
Students confident in math	3 point likert scale	BSBM16A, BSBM16B, BSBM16C, BSBM16D, BSBM16E, BSBM16F, BSBM16G, BSBM16H, BSBM16I
Students value math	3 point likert scale	BSBM16J, BSBM16K, BSBM16L, BSBM16M, BSBM16N, BSBM14F
Students engaged in math	3 point likert scale	BSBM15A, BSBM15B, BSBM15C, BSBM15D, BSBM15E
Students bullied at school	3 point likert scale	BSBG13A, BSBG13B, BSBG13C, BSBG13D, BSBG13E, BSBG13F
Home educational resources	3 point likert scale	BSBG04, BSDGEDUP, DSDG055

Before applying LR and NNs methods to determine the significance of variables on students' mathematics achievement and to compare the prediction/classification performances, dependent and independent variables are determined. In this study, first plausible value of the mathematics test is chosen as a dependent variable and scores for each student are encoded as binary values of 1 or 0 (if the score is over the average 500,  $y=1$ ; otherwise,  $y=0$ ). In order to find factors affecting mathematics achievement, the results of eight student survey questions are selected as potentially influencing variables. These independent variables are given in Table 1. According to Table 1, six of them except age and gender are created based on the students' responses to different statements by TIMSS team. Statements used to create the relevant scale are given in the last column of the table with their codes. For example, "*Students like learning mathematics*" is a 3 point likert scale (1=like learning

math: 2=somewhat like learning math: 3=don't like learning math) and it measures students' feeling about mathematics based on the following 4 point likert statements: "I enjoy learning mathematics" (BSBM14A), "I wish I did not have to study mathematics" (BSBM14B), "Mathematics is boring" (BSBM14C), "I learn many interesting things in mathematics" (BSBM14D) and "I like mathematics" (BSBM14E). "*Students confident in mathematics*" scale aims to investigate students' beliefs about their abilities in mathematics and it is a 3 point likert scale (1=confident: 2=somewhat confident: 3=not confident). "I usually do well in mathematics", "I learn things quickly in mathematics" and "My teacher tells me I am good at mathematics" and six more statements are used in order to formed this scale (for further details, see Martin and Mullis (2012)).

### 3. RESULTS

#### 3.1. Descriptive statistics

Purified data set from missing and inaccurate values consists of 6,736 Turkish 8<sup>th</sup> grade students' information. SAS enterprise miner 5.2 software is used to find descriptive statistics, construct models and compare models accuracy. Table 2 shows some descriptive statistics for independent variables (except age) with respect to dependent. It is seen that 2112 students get the mathematics score above 500, whereas 4624 students get the score below 500. When examining the created scales, "*home educational resources*" has the highest mean for both groups. Also, while the mean of "*students confident in math*" scale is equal to 1.879 for students whose scores are above 500, the mean of this scale is 2.584 for students belongs to other group. The mean which is close to 3 refers that many students replied the frequency of their feelings about confident as "not confident". Hence, it can be said that scale of "*student confident in math*" may be an effective factor describing the achievement.

Table 2. Descriptive statistics of independent variables

Independent variable	Above 500			Below 500		
	Min-Max	Mean	Std.dev	Min-Max	Mean	Std.dev
Age	12-16	14.085	0.421	12-16	14.0205	0.595

#### 3.2. LR and NN results

The binary LR analysis is performed in order to find which variables are significantly differentiated in two groups of students. Variable selection procedure is determined through forward stepwise selection. The Newton-Raphson Ridge Optimization algorithm, which is default in SAS, is used to calculate maximum likelihood parameter estimates. After 4 iterations, the process is terminated. Table 3 shows the likelihood ratio test results which is used as the measure of goodness of fit of the model. According to the test results, estimated model fits the data well and the set of predictors have a significant effect on the logarithm of odds of a dependent variable at 95% confidence level (p-value<0.05). Another chi-square goodness of fit tests is Hosmer and Lemeshow and the

p-value of test statistic is equal to 0.203. The null hypothesis of "no significant difference between observed values and predicted values" is rejected at 5% significance level, so the model fits the data well.

Table 3. Likelihood ratio test statistics

-2 Log Likelihood		Likelihood ratio		
The null model	Model with variables	Chi-Square	DF	p-value
3352.077	2525.401	826.6757	14	0.0001

Table 4 shows the results of maximum likelihood estimation and analysis of variable effect (in the last column). The last ordered category is chosen as the reference category for each six created scale. According to the analysis of variable effects, four predictors including "age", "home educational resources", "students bullied at school" and "students confident in math" are statistically significant at 95% confidence level. In addition to these four predictors, "the students value mathematics" scale statistically effects the mathematics achievement if the confidence level is taken as 90%. The parameter estimate of  $\hat{\beta}_1$  and  $\hat{\beta}_6$  is negative and the p-values of Wald statistics with one degrees of freedom are statistically significant ( $p < 0.05$ ). Thus, it is said that these variables are statistically significant and make negative contribution to the model. On the other hand,  $\hat{\beta}_5$ ,  $\hat{\beta}_{11}$ ,  $\hat{\beta}_{12}$  and  $\hat{\beta}_{13}$  significantly increase the model fit, positively. In other words, "confidence in math", "almost never bullied at school", "about monthly bullied at school" and "many educational resources" help to be in successful group for a student.

Table 4. LR results

Scale	Variable name	$\hat{\beta}$	SE( $\hat{\beta}$ )	Wald ChiSq	p-value ChiSq	Odds	p-value (effect)
	constant ( $\hat{\beta}_0$ )	5.556	1.3794	16.23	0.0001	258.951	---
Age	age ( $\hat{\beta}_1$ )	-0.395	0.0974	16.5	0.0001	0.673	0.0001
Gender	gender ( $\hat{\beta}_2$ )	-0.022	0.0504	0.2	0.6515	(1 vs 2) 0.955	0.6515
Students like learning math	like learning ( $\hat{\beta}_3$ )	0.218	0.0892	6.00	0.0143	(1 vs 3) 1.347	0.018
	somewhat like learning ( $\hat{\beta}_4$ )	-0.139	0.0693	4.05	0.0441	(2 vs 3) 0.941	
Students confident in math	confident ( $\hat{\beta}_5$ )	1.652	0.112	217.9	0.000	(1 vs 3) 21.32	0.0001
	somewhat confident ( $\hat{\beta}_6$ )	-0.246	0.0731	11.34	0.0008	(2 vs 3) 3.191	
Students value math	value ( $\hat{\beta}_7$ )	-0.213	0.0835	6.53	0.0106	(1 vs 3) 0.754	0.008
	somewhat value ( $\hat{\beta}_8$ )	0.1444	0.074	3.81	0.051	(2 vs 3)	

						1.078	
Students engaged in math	engaged ( $\tilde{\beta}_9$ )	-0.008	0.0931	0.01	0.9237	(1 vs 3)	1.048
	somewhat engaged ( $\tilde{\beta}_{10}$ )	0.064	0.0731	0.78	0.3762	(2 vs 3)	1.128
Students bullied at school	almost never ( $\tilde{\beta}_{11}$ )	0.243	0.0721	11.39	0.0007	(1 vs 3)	2.028
	about monthly ( $\tilde{\beta}_{12}$ )	0.221	0.0781	7.99	0.0047	(2 vs 3)	1.983
Home educational resources	many resources ( $\tilde{\beta}_{13}$ )	0.939	0.1733	29.34	0.0001	(1 vs 3)	7.462
	some resources ( $\tilde{\beta}_{14}$ )	0.132	0.0999	1.75	0.1862	(2 vs 3)	3.330

Additionally, the value of odds ratio should be greater than 1 in order to mention about significant relationship between the relevant predictor and the dependent variable. For example, the odds ratio estimate for  $\tilde{\beta}_5$  versus  $\tilde{\beta}_0$  (or 1 vs. 3) is equal to 21.32. It can be interpreted as the odds of being in successful group are 21.32 times higher for a student who has confidence in math than a student who has not confidence in math. Furthermore, this parameter estimate has the highest value of odds ratio and it can be said that students' confidence in math is the most effective factor in being the successful group. The other predictors can be interpreted as the same way.
