Finally, the NNs model is constructed with the same variables used for LR model. The MLP model is performed with a network which has one hidden layer that consists of three neurons. The process is terminated after 38 iterations when the convergence criteria is satisfied and the objective function is found 0.4585. The examination of the values of independent variables' normalized importance shows that of "students confidence in math", "home educational resources", "age" and "students bullied at school" are statistically significant predictors. The most important predictors among these four variables is the scale of "students confidence in mathematics".

### 3.2. Model comparisons

While assessing the prediction and the classification accuracy of LR and NNs methods, the holdout method is used to partition the data into two independent sets: the training and the testing data set. 40% of the data is taken as the training set in order to build the initial model. The rest is split into two as the validation (30% of data) and the test data (30% of data). The validation data set is used to adjust the initial model to make it more general and less tied to the idiosyncrasies of the training data set. The test data is also named as a holdout sample and it is used for final assessment of the model accuracy (Linoff & Berry, 2011). In the SAS model comparison tool, misclassification rate is preferred as the model selection criteria.

Classification tables (confusion matrixes) which are used to evaluate the models' predictive abilities are shown in Table 5 and 6. Through these tables, the accuracy, the sensitivity (true positive rate) and the specificity (true negative rate) of each classifier method are also calculated. Calculation methods can be found in Han and Kamber (2006).

Table 5. Classification accuracy of the LR model

	Train data set				Validation data set		
	predicted		Percent Correct	Predicted		Percent Correct	
	y=0	y=1		y=0	y=1		
observed	y=0	1668	182	61.89%	1235	152	89.04%
	y=1	390	455	31.35%	289	345	45.58%
overall				78.78%	1524	497	78.18%

Table 6. Classification accuracy of the NN model

	Train data set				Validation data set		
	predicted		Percent Correct	Predicted		Percent Correct	
	y=0	y=1		y=0	y=1		
observed	y=0	1688	162	62,63%	1254	133	90,41%
	y=1	404	441	31,35%	314	320	49,53%
overall				79%	1524	497	77,88%

According to the tables, the overall percent corrects of train and validation data sets for both LR and NN methods are very close, that means that two methods give similar results for their predictive ability. While the classification accuracy of LR method is 78.5%, NN method has 78.6% accuracy rate. The sensitivities of models are calculated as 0.7 and 0.72, respectively. The specificity of LR is equal to 0.89 and the specificity of NN is equal to 0.91.

When other measures of model comparison such as misclassification rate, MSE, gain, gini coefficient and ROC index are taken into account, it is seen that both methods have similar classification and prediction ability. Table 7 indicates fitting statistics for the test data. It can be concluded that given statistics exhibit the same pattern across LR and NN models.

Table 7. Some fitting statistics for the comparisons of models

Method	Misclassification rate	MSE	Gain	Gini coeff.	ROC index
LR	0.21	0.15	181.2	0.62	0.81
NN	0.21	0.15	187.2	0.61	0.80

The classification similarities between two models are visualized in the ROC curves given below (Figure 2). ROC curves for the train, the validate and the test data look highly similar.

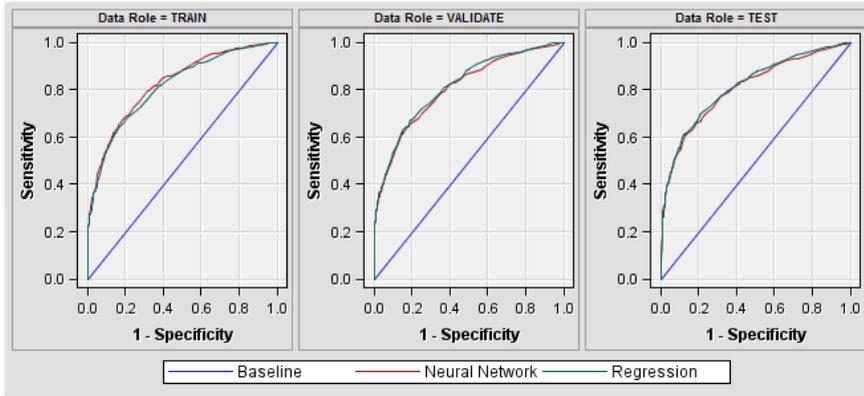

Fig. 2. ROC curves for LR and NN models

#### 4. Conclusion

In this study, 6736 Turkish 8th grade students' information from TIMSS 2011 database is used for two main purposes. Firstly, it is aimed to determine the significance of selected factors on mathematics achievement. Then, two popular data mining methods, namely binary LR and NNs are performed and the prediction and the classification effectiveness of these two methods based on different model fitting statistics are implemented.

Both LR and NN results show that “*students confidence in math*” scale is the most important predictor on mathematics achievement. Also a student who “almost never” or about monthly bullied at school” and who has “many educational resources” is included in successful group. On the other hand, when the prediction accuracy of models are compared, it is concluded that two methods give similar overall percent corrects. When some measures of model comparison such as misclassification rate, MSE, gain, gini coefficient and ROC index are examined, it is seen that predictive and the classification accuracy of LR versus NN has similar performance for the data used in this study. One reason of this similarity could be that nonlinearity does not exist between the dependent variable and the selected six independents. Because of the black box nature, unlike LR, NN cannot explain how it produces the model. LR enables researchers to calculate confidence intervals and to develop hypothesis tests in order to make decisions based on the statistical theory. Thus, LR appears to be the preferred model choice for this study.

## Abstract

Students to express themselves in social activities in order to realize their in their interests aptitude and ability to choose and implement activities. These activities in general and economic level of development of the school environment ,social facilities and students' interests are shaped for. In this study, Regional Primary Boarding Schools underwent the same training in the central primary schools are compared in terms of social events. Students away from their families due to the necessity of social activities are supported thanks to the continuously exist at the school and the school's physical and social opportunities to be reachable at any time other than due to primary schools on the idea that social activities will be investigated more. Regional Boarding Primary School in Malatya, the three county study was carried out. Research from District Directorates of Education are based on general data. In Hekimhan, Arguvan and Pötürge data of the academic year of 2010-2011 is interpreted. Applied to the result of reached by the study of the social activities, support to the expectations more is that the center of the county schools.

## 1. INTRODUCTION

Global society is now in an information century. In this century, people are witnessing communication Social activities are defined as the whole academical, social, cultural, artistic and athletic studies to develop sense of confidence and responsibility inside students, create new interest areas and bring new skills towards student clubs and community services along with the curriculums in primary, secondary, high schools and colleges (Ministry of National Education, 2005). With the help of social activities, students can own different abilities like giving respect to social and universal values, behaving in a democratical way, recognizing himself and the other people, adapting to the environment, developing positive identity and learning ability, being conscious of saving the environment, relying on himself and other people, getting used to study in a planned way, spending spare time in an effective and efficient way, being able to make decisions, giving tolerance to social environment, being creative and using time effectively. (Eccles, Barber, Stone, & Hunt, 2003; Perkins, Borden, & Villarruel, 2001; Scales & Leffert, 1999; Earls & Carlson, 2002).

E-mail address: arabacibaki@gmail.com

Regional Primary Boarding Schools are different from lots of public schools in terms of both their foundation aims and their conditions. Regional Primary Boarding Schools are boarding schools which are found in lands in which the population is little and scattered ( village, arable field, nomad camping side) with the aim of satisfy educational needs of poor and compulsory education aged students. ( Ministry of National Education, 2007) The first foundation of Regional Primary Boarding Schools equals to the first years of Republic. Atatürk indicated that there was a need for Regional Primary Boarding Schools for primary education in 1<sup>st</sup> of March, 1923 and according to that Regional Primary Boarding Schools are founded in 1923–1933 within cities with available budget, in 1933–1938 within township centers and finally in 1940 in central villages with day students and students in pension. ( Aralpcan, 1998).

Generally, Regional Primary Boarding Schools are tried to be effective education organizations in physical manners with gym centers, multipurpose halls, Information Technology halls, workshops, laboratories. According to these opportunities, it is expected that social activities in Regional Primary Boarding Schools are wide ranged in compliance with other schools.

This study aims to compare social activities in Regional Primary Boarding Schools and in the other schools.

## 2. Method

In the study, data analysis method is used as a qualitative research design. According to Fink (2005:3) data analysis is the process including analysing, identifying, arranging and evaluating data with experts, researchers and academicians. With this aim, the numbers of social activities organizations in 2010 and 2011 are found from sample schools, the data is compared and commented in tables.

The population of the research consists Regional Primary Boarding Schools and other primary schools near them in Malatya. The sample consists of Regional Primary Boarding Schools and other primary schools in Hekimhan, Arguvan and Pütürge. The information relevant of sample is shown in Table 1.

Table 1. The information relevant of sample

Schools	The town that the school is found			Toplam
	Hekimhan	Arguvan	Pütürge	
Number of Regional Primary Boarding Schools	1	1	2	4
Number of central primary schools	2	2	2	6
Total	3	3	4	10

As it is seen in Table 1, the research is carried out in 3 different towns. In Hekimhan, there is one Regional Primary Boarding School and 2 central primary schools and totally there are 3 schools. In Arguvan, there is one Regional Primary Boarding School and two central primary schools and totally there are 3 schools. In Pütürge, there are two Regional Primary Boarding Schools and two central schools and totally four schools. Because of geographical features, there are two Regional Primary Boarding Schools in Pütürge.

### 3. Findings

In 2010- 2011 academic year, there are 539 Regional Primary Boarding Schools in the country and the classroom, teacher and student conditions of these schools are shown in Table 2.

Table 2. 2010-2011 academic year, the numbers of classroom, teacher and student in Regional Primary Boarding Schools

Number of Student	Male	Female	Number of Teacher			Number of Classroom
247.563	131.874	115.689	12.990	10.428	2.562	9732

In 2010- 2011 academic year, 12.990 teachers and 247.563 students hold educational activities in 9732 classrooms in Regional Primary Boarding Schools. There is one classroom for per 25 students, and there are 19 students for per teacher. This condition reflect normal measures.

The social activities in 2010-2011 in sample Regional Primary Boarding Schools and central schools are listed below.

#### 3.1. The analysis of Social Activities in Hekimhan

Table 3. The analysis of Social Activities in Hekimhan in 2010-2011

Nr.	Schools/ Activities	f	%
1	Hekimhan 75. Year Regional Primary Boarding School	5	41,7
2	Sakarya Primary School	3	25,0
3	Atatürk Primary School	4	33,3

In Hekimhan town center, the most social activities are held in Hekimhan 75. Year Regional Primary Boarding School.

#### 3.2. The analysis of Social Activities in Arguvan

Table 4. The analysis of Social Activities in Arguvan in 2010-2011

Nr.	Social Activities in 2010-2011 Academic Year	F	%
1	Atatürk Primary School	8	42,1
2	Cumhuriyet Primary School	6	31,7
3	Tatlık Regional Primary Boarding School	5	26,2

It is seen that in 2010-2011 Academic Year, in three schools in Arguvan, Atatürk Primary school is the first with the range of 42% , Cumhuriyet Primary School is the second and Tatkinik Regional Primary Boarding School is the third in terms of social activity numbers.

### 3.3. The analysis of Social Activities in Pütürge

Table 5. The analysis of Social Activities in Pütürge in 2010-2011

Nr.	2010 – 2011 Eğitim Öğretim Yılında Yapılan Etkiniler	F	%
1	Pütürge Regional Primary Boarding School	9	28,1
2	Mehmet Akif Ersoy Primary School	8	25,0
3	Dumlupınar Primary School	6	18,8
4	Tepehan Regional Primary Boarding School	9	28,1

It is understood that in 2010-2011 Academic Year Pütürge Regional Primary Boarding School and Tepehan Regional Primary Boarding School organize more social activities than the two other central schools. Mehmet Akif Ersoy Primary School and Tepehan Regional Primary Boarding School are the third and fourth ones.

### 3.4. Comparison of Social Activities among Towns

Table 6. 2010- 2011 Data Among Towns

Nr.	Towns/ Activities		Nr. Of Activities	Average
	Towns	Nr. Of School		
1	Hekimhan	3	12	4,0
2	Arguvan	3	19	6,3
3	Pütürge	4	32	8,0

When we look at the data in 2010-2011 in Hekimhan there are 12 activities in 3 schools and there are 4 activities for per school and with these ranges, it is the last school in terms of social activities among towns. In Arguvan, there are 19 activities in 3 schools. Arguvan is the second among the towns. In Pütürge there are 32 activities in 4 schools and this means that there are 8 activities for per school and this range makes Pütürge as the first of the towns in terms of social activities.

### 3.5. Comparison of Social Activities in Regional Primary Boarding Schools

Table7. Comparison of Social Activities in Regional Primary Boarding Schools

Nr.	Regional Primary Boarding Schools/ Activities	F	%
1	Hekimhan 75. Year Regional Primary Boarding School	5	17,9
2	Tatlık Regional Primary Boarding School	5	17,9
3	Pütürge Regional Primary Boarding School	9	32,1
4	Tepehan Regional Primary Boarding School	9	32,1

,

When we assess the Regional Primary Boarding Schools regarding their social activity measures, we see that Pütürge Regional Primary Boarding School and Tepehan Regional Primary Boarding School in Pütürge are the mostly activity organized Regional Primary Boarding Schools.

## 4. Results and Suggestions

According to the data getting from District National Education Directorate the Regional Primary Boarding Schools in Pütürge are more effective in terms of social activities than the other Regional Primary Boarding Schools and central primary schools and it is seen that the Regional Primary Boarding School in Arguvan organizes less social activities. Tatlık Regional Primary Boarding School in Arguvan is poor in social activities and it can be affected by its being far away from the town. When it is considered generally, it is inferred that Regional Primary Boarding Schools are organizing social activities more actively than the central schools. When it is considered among towns, we can see that Pütürge is very active in terms of social activities. It can be derived from the managers and teachers in the town. Maybe the social activities can be important factors to refine the discarded image of Regional Primary Boarding Schools.

# Computer Aided Industrial Design Software Selection in Industrial Product Design Education at Turkey Using Expert Choice Program

Saliha Dönmez\*

---

*DoğuşUniversity, Faculty of Fine Arts and Design, Department of Industrial Product Design, İstanbul, Turkey*

---

## Abstract

Computer technologies have developed rapidly in the last half century and today have become one of the most useful tools for Industrial Designers. Using the power of the computer and the software is not an arbitrary choosing for Industrial Designers; instead it has been a professional requirement.

In this paper, selection of softwares taught at Computer Aided Industrial Design (CAID) courses in Industrial Product Design Undergraduate Programmes at Turkey examined through three staged surveys and obtained datas analyzed at decision making program, Expert Choice. The assessment and final results of the study points out the required qualifications of CAID education at Turkey.

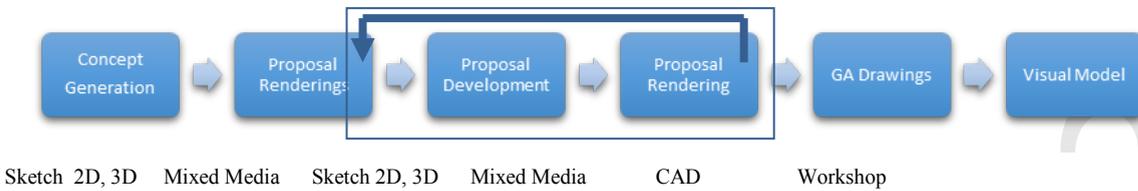

Keywords: CAID, Design Education, Decision Making

---

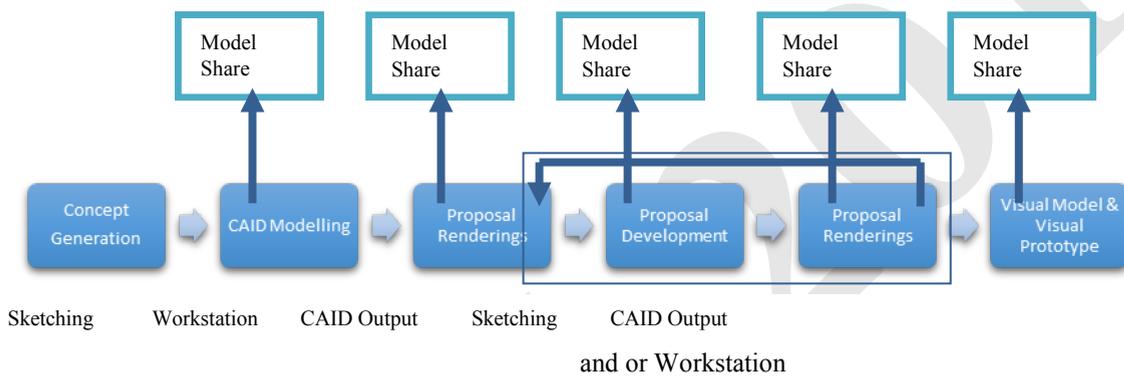

## 1. Introduction

By the development of computer technology, computer aided industrial design concept and softwares supporting the concept has been created. These softwares provide support to designers at gathering knowledge, sketch, 2D design, 3D design, prototyping and visualization stages of design process. Using CAID softwares is not an arbitrary choosing for Industrial Designers; instead it has been a professional requirement. Evans (1994) indicates that, CAID method accelerates design process, sharing knowledge with other designers and process can be managed more efficiently. He compares Archers' conventional industrial product design strategy with CAID method. In conventional method, possible design problems arise at the end of the process, whereby at CAID method possible problems can be controlled and prevented at every stages.

\* Corresponding author.  
Email address:

**Fig. 1.** 'Conventional' industrial design strategy

**Fig. 2.** Collaborative CAID methodology

Beside the effective usage at design process, CAID method has advantage on recruiting designers in industry. As a result of Süels' (2006) survey on "Effective criterias for hiring designer", the criteria of "using computer well" (%72.5) is the second most important criteria, after the criteria of "to be educated in design" (%90).

KINDI (2007) denotes at his study on 'job postings' that, postings has a very little emphasis on creativity, while most postings almost exclusively refers to the demand for computer skills.

CAID software knowledge has a positive impact on the process of recruiting, as well as advantages on design process. Thence CAID courses are given in Industrial Product Design Departments at Turkey to prepare students for Professional life; but the number and nature of the courses given varies upon university.

One of the reasons that CAID courses reveal differences in programs can be considered as diversity of universities vocational perspectives.

In this study, without regarding vocational perspectives of universities, a decision making strategy has been implemented on CAID software choices at Industrial Product Design, Undergraduate Programmes at Turkey.

## 2. Method

Selection of softwares taught at Computer Aided Industrial Design courses in Industrial Product Design

Undergraduate Programmes at Turkey will be examined through three staged surveys and obtained datas will be analyzed at decision making program, Expert Choice.

INTE 2013

## 2.1. Software Selection Criterias

Various amateur or professional CAID software exist in market. Selection of these softwares and usage at design process by designer depends on criterias. These criteria were determined as:

- Price
- Ease of Use
- Ease of Learning
- Sectoral Demand
- Modeling Method
- The aim of use

### 2.1.1. Price

Softwares, used at universities are mostly education versions and economic. Price appears as an important criteria at sector. Many companies prefer to work with cheap softwares instead of expensive ones.

### 2.1.2. Ease of Use

Ease of use criteria covers a wide range, so divided into three sub-criteria:

- Interface

Ease use of interfaces increase the efficiency. User, not experiencing barriers, establishes a harmonious relationship with the software.

- Ease of access to information

Easy access to information resources like sample model, sample scene, material, supports user to use software more effectively.

- Ease of information exchange between softwares

Programs that support the exchange of information makes the design process more effective and aid designers to create their own CAID techniques.

### 2.1.3. Ease of Learning

A software, learned without encountering obstacles, increases the user's motivation and confidence in the program.

### 2.1.4. Sectoral Demand

The usage of softwares varies upon the sector. In this study Stand Design, Interior Design, Consumer Electronics, Yacht Design and housewares industry have been researched.

### 2.1.5. Modelling Method

Different modeling methods can be used during design process. NURBS or Polygon / MESH methods are used in surface modeling, solid modeling techniques are preferred for production-oriented drawings and graphics, 2D/vectoral drawing softwares are used for visual presentation. For an effective design process, the methods can be used together.

- Surface Modelling
- Solid Modelling
- 2D/vectoral drawing

### 2.1.6. The Aim of Use

The purpose of the software usage, and effective features of softwares during design process, been used for determining the values of criteria.

- Presentation
  - Photo-Realistic Rendering
  - Technical Drawing
  - Preparing Presentation
- Design
  - 2D Drawing
  - 3D Drawing
  - Be Revised
- Production
  - Accuracy
  - Analysis
  - Dimensioning
  - Production Connectivity

## 2.2. Software Alternatives

Software preferences for use have regional reasons. For ex. softwares FormZ and Modo are widely used abroad but not recognized in Turkey. Due to the awareness and use of the softwares upon regions, study includes only Industrial Design Undergraduate Programs at Turkey. Alternative softwares chosen according to softwares frequently used at university education and companies.

Software alternatives are:

- 3dsMax
- Alias Wavefront
- Autocad
- Catia
- Cinema 4D
- CorelDraw
- FormZ
- Freehand
- Illustrator
- Maya
- Modo
- Photoshop
- ProEngineer
- Rhinoceros
- Solidworks
- Unigraphics

## 2.3. Survey Study

In order to determine the weights of the criterias, three layered survey study was done.

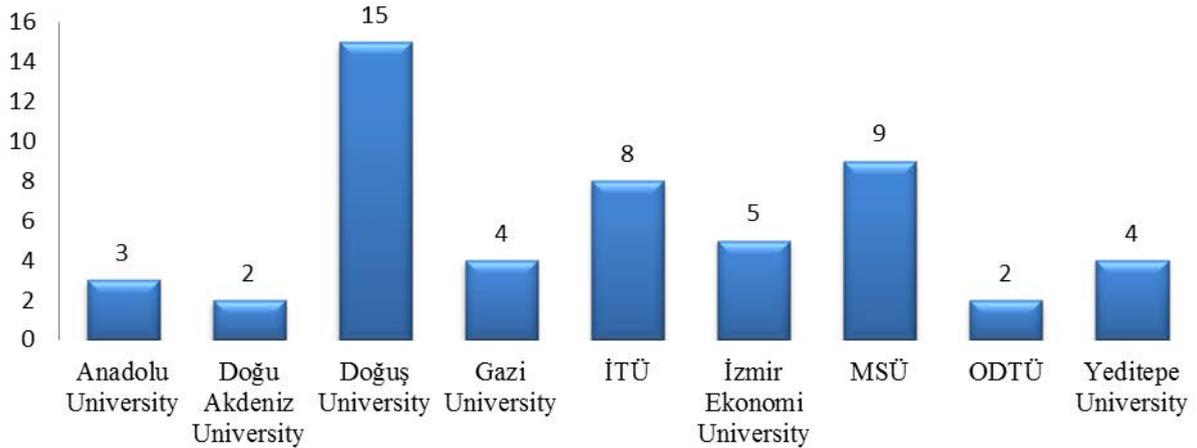

The first survey study was carried out between Industrial Product Design Department's Undergraduate Students at Turkey. Distribution of 52 students participated in survey upon university can be seen at Table 1.

The second survey was carried out with instructors of CAID courses. Instructor's selections were determined as twice of students at Expert Choice programs' decision tree. Contacted with instructors by phone or via e-mail. During this phase, realized that except 3 universities, all courses were given by part-time instructors.

Among all survey results, 5 instructors' survey results excluded from the analysis, because of part time instructors' lack of continuity, not taking place among the decision-making process at department, could affect the reliability of the survey results.

The third survey study performed by designers, working in the industry. Contacted with 3 firms from each Stand Design, Interior Design, Consumer Electronics, Yacht Design and housewares sector and the question of “Which softwares do you use at design process” was directed to them.

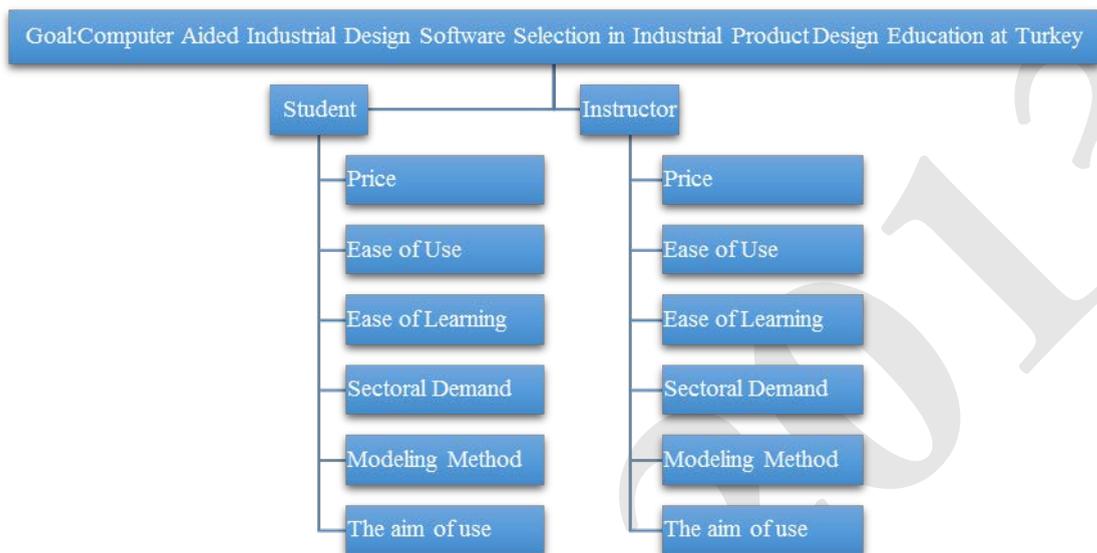

**Table 1.** Student participation to survey

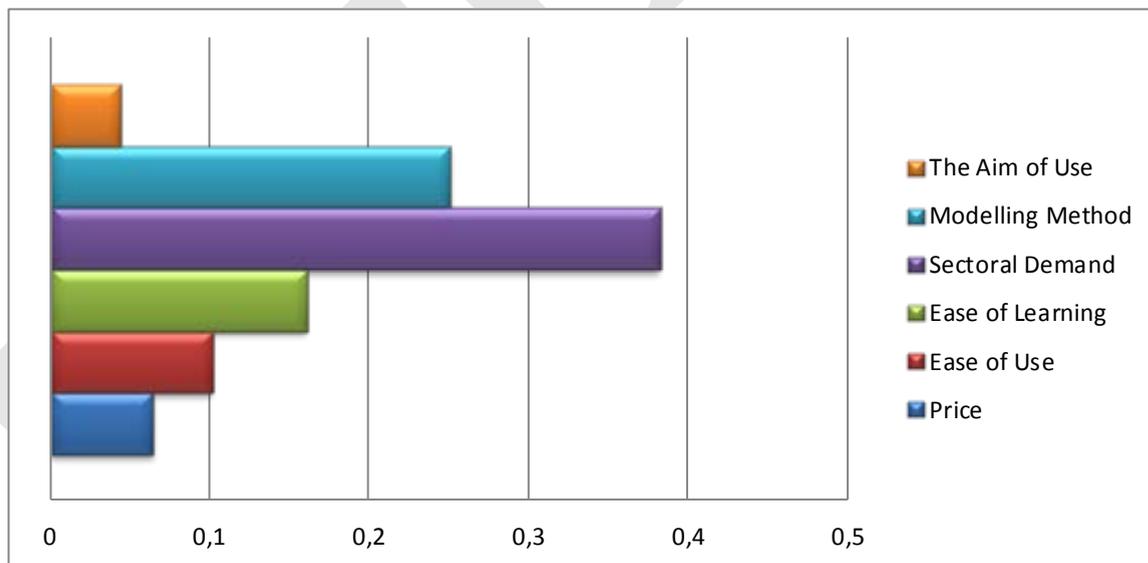

### 3. Expert Choice Study

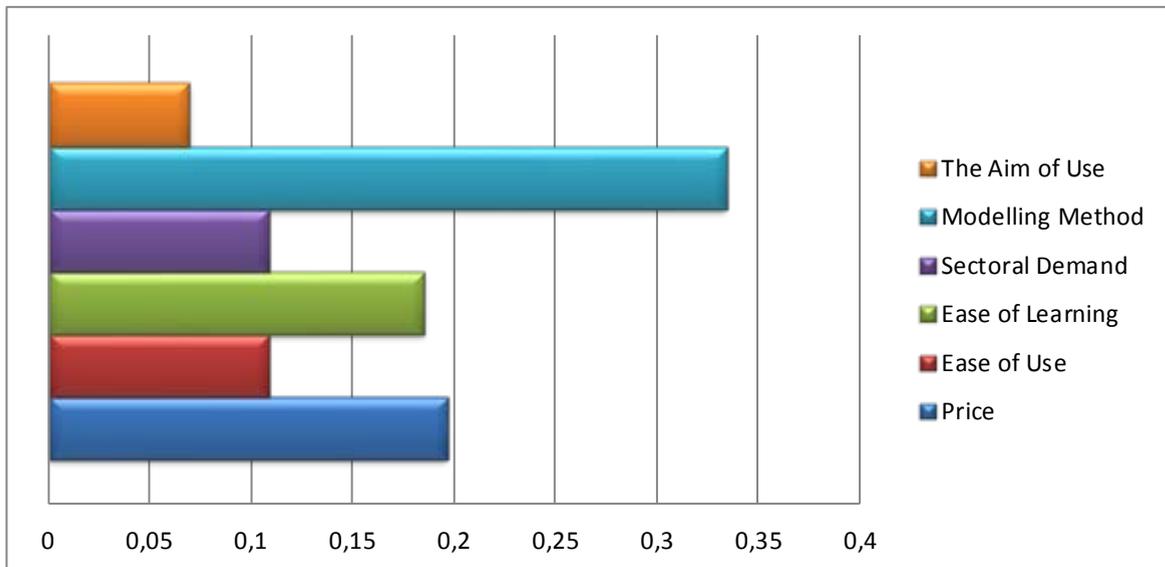

Datas obtained from the survey was entered to Expert Choice Decision Making program. The main criterias are evaluated under the two top criteria: Students and Instructors. Regardless of the value of survey datas, instructors' criterias were taken as twice of students' criterias (Table 2).

**Table 2.** Main Decision Tree

**Table 3.** Sub-criteria ranking for the student main criteria

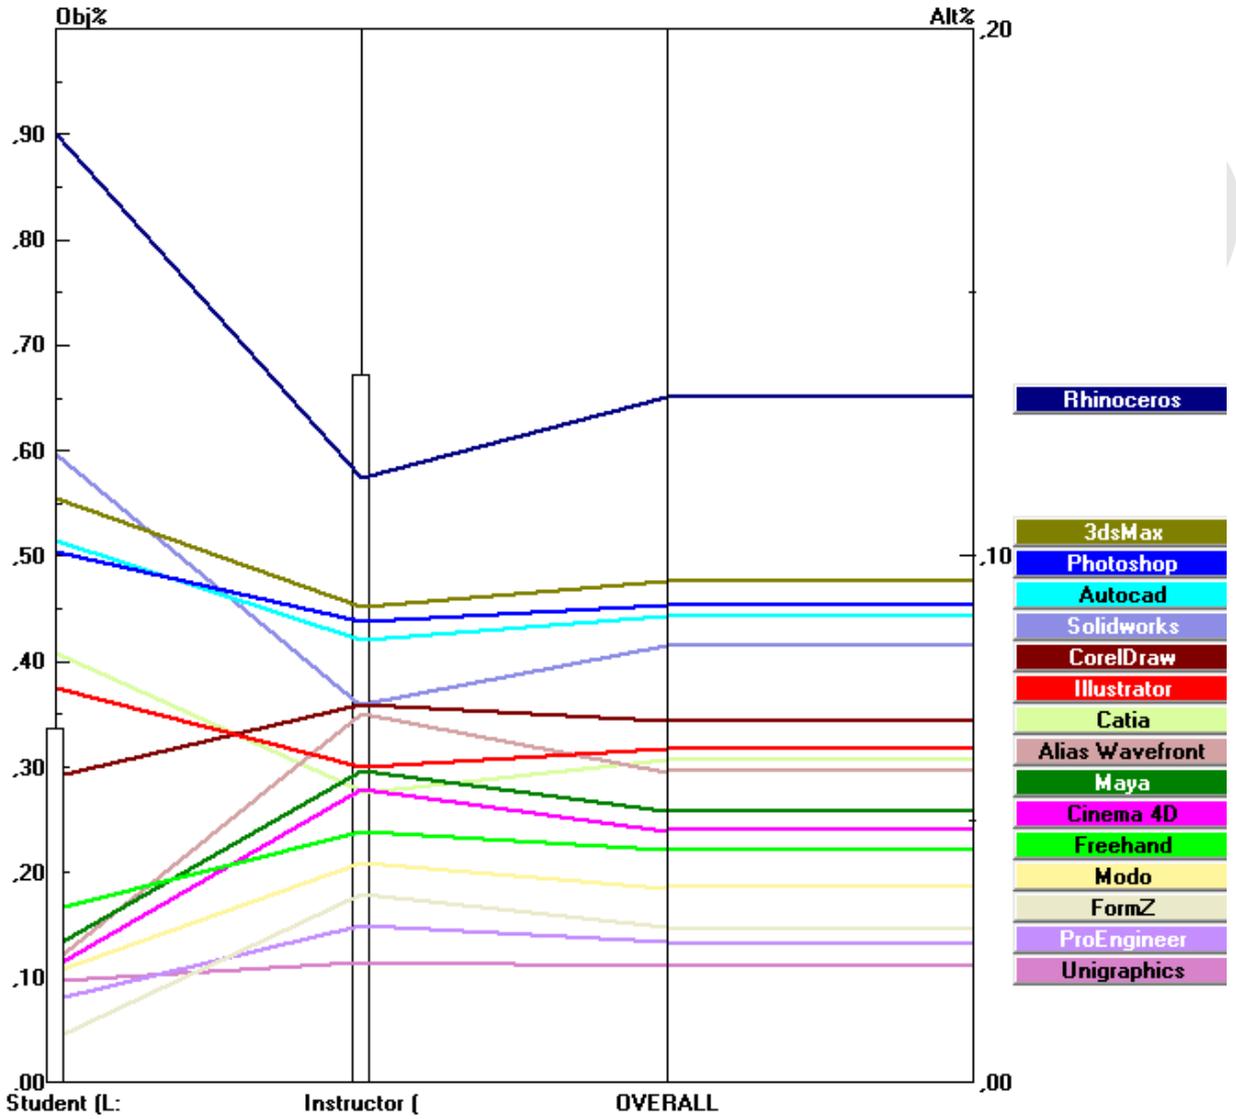

**Table 4.** Sub-criteria ranking for the instructor main criteria

Software alternatives were placed under the sub criterias price, ease of use, ease of learning, sectoral demand, modeling method and the aim of use. Sub criterias were analysed under the main criterias student and educators. In the sub-criteria rankings, 'sectoral demand' was chosen as the most important criteria among students (Table 3) and 'modelling method' was chosen as the most important criteria among instructors (Table 4).

All datas obtained from survey studies were processed to the decision tree and software performance graph was created. Results of the performance graph can be seen at Table 5:

Table 5. Software performance graph

#### 4. Conclusion

As a result of the surveys and Expert Choice criteria assessment, softwares Rhinoceros, 3ds Max, Photoshop, AutoCAD, Solidworks, CorelDraw was chosen as the first six software among all criterias. Three of these programs are surface modeling (Rhinoceros, 3ds Max, AutoCAD), one solid modeling (SolidWorks), and one 2D/vectoral drawing (CorelDraw) software. The most dominant criterias for determining software was chosen as “Modelling Method” and “Sectoral Demand”.

Under the ‘ease of use” criteria, both students and instructors chose *interface* as the most important property. Students and instructors also agreed in modeling types and ranked as; surface modeling, solid modeling and 2D/vectoral drawing.

Although the first six softwares selected as the result of research was surface modelling software, results should be viewed in terms of three modeling methods. Surface modeling, solid modeling, and vector modeling methods are all needed tools for design students and taking these educations at undergraduate education support student’s performance both in undergraduate and professional design life.

During the study, observed that the number and content of CAID courses given at universities differs from each other and mostly part-time instructors are giving courses. This can be considered as the indication of not giving importance on CAID education at Turkey.

This study was performed to examine the importance and software choice of CAID courses at Industrial Product Design Departments at Turkey. Advanced study can be made with more participants at two countries to examine the regional differences at software choice.

# Concept education by art education and an investigation on the opinions of teacher candidates about the "different" concept\*

Oya Abaci <sup>\*a</sup>

*<sup>a</sup>Marmara University, Ataturk Faculty of Education, Department of Elementary Education, Goztepe, 34722, Istanbul, Turkey*

## Abstract

Art education is the set of instructions on how to use the language of art. People understand the world and assign a meaning to it using art. In the modern education system the use of art education should be a tool to question the modern-day social values using a similar concept to understanding the phases of humanity by examining the works of art produced throughout the ages. The purpose of this research is to analyze and examine the evaluation of the "different" concept by pre-school teacher candidates who took art education in 2011-2012 academic year. The aim is to present how the "different" concept is handled by the teacher candidates, who will be in Turkish educational system in future, and which values they take note while concerning the "different" concept.

The research is carried out by application of art education to 196 pre-school teacher candidates thus evaluating the written opinions based on this application using qualitative research method.

*Keywords:* Art Education; Notion Education; Concept of Different

## 1.Introductions

Art is a speciality that defines a society and exposes that very society's differences from others. Every civilization that existed has expressed themselves through art. Relations of production, regime, philosophy, scientific and cultural thought, and senses, all in all the essence of society is formed in the art of that society. All properties of the society is concretized and become visible with the help of art. Because behind the subject of the art, there lies the human mind. The subject of art is fictionalized as a result of human thought and creative skill.

Thus, when we examine a work of art, we realize not only the form of the subject, but also the essence of the society that the work of art belongs to.

A work of art that is formed in a certain time period represents that period's thought, sensation and manner of life; however, at the same time it narrates something to the society. It has a message. This is yet another function that is imposed on the work of art: communicative function. In other words, the autonomous function of a work of art is formed by the material object, aesthetics object and relation with the society's cultural assets, but apart from these, the existence of a subject and content defines the communicative function of the work of art ( Tunalı, 1990 ). This communicative function lies not on the sensate of the work of art, namely the image, form, color or texture; it is hidden beneath the layers of meaning. According to Gombrich (1995), certain layers of meaning are at issue for almost all works of art. Layers of meaning are not tangible but abstract notions such as equality, love, power or freedom. With these notions and through the art object, social, historical, psychological and sociological

Corresponding author. Tel.: +90 216 336 36 86 /137

Email address: oabaci@marmara@edu.tr

questioning is performed. Art lets us feel the pleasure beyond the glory, but with our mind, consciousness and emotions. In order to understand and comprehend the layers of meaning, one has to have a sophisticated consciousness and conceptual thinking skill. Layers of meaning cannot be analysed with an everyday consciousness.

Teaching the fine meanings of the content, which are defined by abstract notions, is a time consuming process. It is needed to experience this process for humans to understand the life with all aspects, comprehend, to socialize and to situate themselves in their social surroundings. The relation between concept teaching and art education becomes important at this very point.

Art education encapsulates every field of the fine arts. However, the subject of this research is only the visual arts field of the art education. Visual arts education brings the individuals, who have gone through art education, the skill to approach their general surroundings and events with an aesthetical sensibility, critical thinking and convey their thoughts with a genuine language. It teaches the methods to present the emotions and thoughts, of the individual secludedly, and the society generally, by using different materials and behaviours (Abacı, 2006). It has a distinct side in education. Because this type of education is personal and the person does not learn the information about art, but create numerous authentic designs using the basic knowledge of art. The person learns to use the language of art, individualises and personalises it.

Visual arts education is definitely not the education of handicraft. It is an education type which should be applied on the individuals who are especially in the abstract thought stage and it examines the methods for individuals to bring out the externally stimulated impressions using experiential memory, richness of connotation and systematic thought. It is the process of the transformation of collective thought, which belongs to society, into personal expressive languages. It is education of learning the skill of comprehending via notions. In Turkish, the word "Kavram" which means "notion" is derived from the root of "kavramak" which means "capture, comprehend, encapsulate". It contains the general meaning of abstraction of the externally stimulated practical impressions and to "capture"; to comprehend. It is required to follow a very complex process in the human brain in order to create a notion from a sensorial reflection. During this process, quite a few operations are performed which are not limited to abstraction, comparison, analysis, combination, and generalisation are performed. These operations are specialities of creative thought, which leads us to the foundation of art education: education of creative thought skills. Only the ones who can think creatively, can analyse notions apart from their definitions.

Notion is usually confused with subject. Subject is the answer to the question that asks what is expressed via the art object, for example, the painting. Subjects can be varied. War, figure, portrait, nude, still life, religious, etc. More often than not, the subject can be the name of the art object. However, subject is different than content. Even though the subject is the same, every art object can have different contents. Subject, as it were, can be defined as the appearance of the art object. Hundreds of designs can be produced on the same subject with different content. As for content, it is the basic behaviour and attitude that is desired to be expressed. Notion is hidden behind content, and content is the internal structure of the art object. It is the hidden part that is inside. The hidden meaning is relayed through this form and is shaped according to the cultural and consciousness level of the observer. In other words, the important thing is what is presented within the subject, how and using which notions in the content.

This research is aimed at teacher candidates who are in their twenties and in abstract thought stage, with a purpose of them learning the design of an abstract notion using the art education method and techniques; question the abstract notions within their surroundings and develop social sensibility.

## **2. Methodology and Sampling**

This research done by using qualitative research methods on the analyses of the opinions on "different" concept according to pre-school teacher candidates who took visual arts education in 2011-2012 academic year in Marmara University, Atatürk Faculty of Education, Primary School Teaching major.

This research is carried out by participation 196 of pre-school teaching candidates. The three dimensional designs and through these designs narration of the evaluation of "different" who are done by teacher candidates are examined throughout the research.

### **3. Data Collection Instruments**

Data is formed based on three dimensional designs and literary descriptions, while the result report is produced after examining these qualitative research method.

### **4. Educational Program**

Following the training on art, the basic expression tools of art and what art education provides for an individual, it is asked from teacher candidates to design a three dimensional project on "different" notion. It is asked from teacher candidates to form a group of five people for the project. Every group is asked to think about an unknown planet, design the life and creatures living there. At this stage, photographs of previous designs are presented and discussed. The design process took two weeks and the groups produced their designs in 4 lecture hours.

Subsequently, the teacher candidates are individually asked to put themselves in the place of the being they designed and narrate when they think about the planet they are living on. They are asked to answer the question: "What is the difference of the planet that the being you designed is living on from ours?"

Educational Methods and Techniques: Debate, evaluation, design and essay writing. Three dimensional design.

Educational Tools: All kinds of materials and photographs that can express thought in three dimensional form.

Educational Goals: Developing abstract thinking skill. Designing notions via concrete objects.

### **5. Analysis of the Data**

In this study, the performance of the teacher candidates is evaluated by the three dimensional designs produced by the groups, individual essays on the subject in question and their opinions about it.

The examination and evaluation of three dimensional designs and essays are done using qualitative research method. Reading the narrative and interpreting the explanations are integral parts of qualitative research. Qualitative research tries to understand the actions, narrative and how they coincide (Glesne, 2012). Qualitative research is not only an operation in which the data is not degraded into numbers and analysed, but it also makes use of qualitative data. It is needed to use qualitative research tools in order to produce a definitive report because numbers would be insufficient for examining the perceptions of the people regarding the question, questioning, observing the designs, and evaluating the essays with interpretations while considering the relationship patterns between all of these.

As a result of the evaluation of 196 participant's essays, it is determined that 7 subject-notion groups are shaped as "different", these groups are shown in Table. 1.

Table 1: Subject-notion groups and related participant number use used these groups

Subject-Notion	Number	%
Physical Features of the Beings	137	70
Geography and Nature	91	46
Environment and Natural Life	36	18
Urbanisation	11	6
Emotions and Relationships Between People	59	30
Communal and Social Position	21	11
Human and Civil Rights	19	10

When we examine the classification of the subjects mentioned, subjects are noticed as to point to obvious differences that require sensibility to the world they live on, which are based on observation or human relations and can be emphasized by individuals from every age group or from every educational level, such as natural and urban life, environmental problems, social and communal differences, as well as subjects that can be realised by individuals who have the skill for abstract thinking, hence depend on educational level, developed consciousness, certain level of intellectuality such as human rights, equality, freedom and justice.

## 6. Results

When the designs produced by the groups which demonstrate the beings that live on different planets one by one, it is observed that they learnt the art education methods and techniques. They were successfully able to use the expression tools of art such as colour and composition on three dimensional designs which are known to be indicated by subject. In the process of designing new life forms, they preferred to make various changes on the human form such as three eyes, six arms etc. It is deduced that they are not very courageous concerning creative thinking. During the interviews, it is understood that they worked on designs appealing to children and they also liked these designs. The impression formed after the interview is that they exceedingly have the characteristics shown by the age group of the children they will be teaching.

The answers of the question asked for the essay "Two different worlds, and their differences" are grouped in seven categories.

After examining the essays of the 196 teacher candidates, it is seen that 137 of these candidates, which total to 70% of the study group, refer to the physical differences between the living beings. Number differences of the limbs such as three legs, blue skin, two heads and antenna are among the differences mentioned. 18 teacher candidates among the group were satisfied with portraying physical differences. The differences mentioned are differences that would be emphasized by individuals from every age groups.

We cannot portray a living being from its habitat. The habitat's geography, nature and climate differences are remarked by 91 (46%) teacher candidates. Mountains, rivers, oceans, seas, forests, plant and insect diversity are presented as our world's richness. Apart from these, earthquake subject is, historical quality and the smell of the sea are presented as differences exclusively by respectively, 1, 3 and 1 teacher candidates. We can see that

subject weights heavily here as well. Turkey is a country that lies on earthquake zone. During the last decade, not only in formal education but also using the media, people are encouraged to raise awareness concerning earthquake. Nevertheless, the case of only one teacher candidate has referred to earthquake needs to be concerned.

Out of 196 teacher candidates 36 ( 18% ) have stated the environment's and natural life's negative consequences as a difference between our world and other worlds. It is saddening fact that only this many teacher candidates had a subject on their agenda which reflects that people who live on Earth are destroying the nature in a manner to effect the natural balance, disrespectfully plunder the nature's right to live, and other causes that contribute to the weather, water and soil pollution such as cigarette smoke, garbage, chemical waste, factory smoke, global warming, and unplanned lumbering .

The problems brought by urbanization and unplanned urbanised cities are remarked by only 11 (%11) teacher candidates out of 196. There have been negative aspects that came to their minds while considering cities. They have imagined a world without traffic problem, noise, people and vehicle crowd, tall and box-shaped buildings crushing people, concretion, but with parks, sport arenas, and culture sites while remarking that all the problems mentioned have been solved and it is more pleasant to live in there.

Emotions of the beings and relationships between them are mentioned by 59 (30%) teacher candidates out of 196. Emotions of the humans such as love, lenience, happiness, and hope are referred by only 7 teacher candidates. 52 teacher candidates defined humane feelings as ambition, selfishness, lie, sadness, and self-interest. It is stated that humans are fighting, killing each other and not able to live any of the pleasant emotions. It is remarkable that despair is common in youth and they depict every relation in a negative manner. In spite of this implication teacher candidates depicting children purified from negative characteristics and not changing when they grow up indicates a criticism about the world they are living in. Only 4 teacher candidates have stated that there is no artistic relationship between humans. This can be interpreted as the lack of art education for it is only one term in their university life.

21 ( 11% ) teacher candidates among 196 characterised social status as difference. Wars, violence to women, educational problems, early marriages, hunger, health, and security are defined as differences by respectively 8, 3, 3, 3, 2, 1, and 1 teacher candidates

Only 19 (10%) teacher candidates have remarked about human rights. They have put emphasis on alienation notions such as earthlings to not accept, ridicule, ignore, not treat equally, be unconcerned and insensible about, and not even saying hi to the one that is different. They have separated children from other humans at this point as well and indicate children as affectionate and friendly by portraying children as treating themselves who come from a different world and has different physical features nice.

### 6.1. Conclusion and recommendation

Visuality is widely used in our age. Visual language has gone ahead of long, written expressions because of the fact that it is more effective and quick to convey narrations among the quick flow of life from society to individual and vice versa. This language has born because of a necessity.

Creating a visual language, using it or reading it differs between individuals of different ages. Pre-school children read via more concrete visuality. Pre-school child can puzzle out the differences between colours, dimensions, numerical differences; can figure out the relationships between these; can easily figure out the larger or numerically bigger. Pre-school child is interested in the real entity, which is the upmost stratum of visuality, the side that is visible. As the child gets older, it becomes to be able to evoke via symbolic entities that the visual side expresses. It knows that a lion stands for courage. Bird is always the symbol of freedom. As the life experiences and educational level increase, it begins to realise the layers of meaning behind the real entity, the visual part. Connotations increases with time and age. Individual can form systematic connotations via the novels read, movies watched, music listened or the painting observed at a museum visited; can puzzle out and interpret the narrations that are not told via a natural language or in a straight forward manner by using an original perspective. Becomes able to comprehend the metaphors, polysemy, irony or diversifications of notions. The individual has developed into thinking in an abstract manner rather than concrete.

As a conclusion of this research done after a visual art class given by me that lasted for one education term, it is seen that the teacher candidates, who are considered to be adults and at ages of concrete thinking, cannot see or make sense of the layers of meaning of visual language, the hidden meanings. Very few teacher candidates have emphasized abstract notions and the values that are expressed by these notions.

It appears to someone that, being examined periodically since the start of their lives and being not able to develop independent and free behaviours have negatively affected their intellectual sides. The fact that they are receiving education on pre-school teaching, and their success on preparing educational plans for the children they will be teaching has a risk of them shift their needs of their own ages backwards in time. Enjoying nursery rhymes, reading picture books, only being interested in children drawings makes teacher candidates go on a journey that they are not aware of. It would help them develop greatly if they read novels, go to museums and be interested in all disciplines of art during their educational period. It would make them into educated and cultured teachers who know how to use the knowledge.

4<sup>th</sup> International Conference on New Horizons in Education

# Conflicts between students as interculturally incompetent behavior

Michaela Jurtikova\*

*Tomas Bata University in Zlin, Faculty of humanities, Department of pedagogical sciences, Mostní 1279, Zlin 760 01, Czech republic*

## Abstract

The study focuses on intercultural conflicts, which constitute an important part of multicultural education. The author focuses on the definition of intercultural conflicts and their development. The focus is particularly intercultural conflicts at school to tertiary education. The study aims to give an overview of the issue of intercultural conflicts, perform their basic classification and present training theories associated with them.

Keywords: intercultural conflict; intercultural competence, intercultural conflict competence, intercultural communication training, internacionalization

## 1. Introduction

The theme of this essay is intercultural conflict between students. This topic was chosen for several reasons. In recent years, a strong research thrust focusing of the effect of culture on the performance of work teams has developed. For instance, research on „relational demography“ examines how individual differences (homogeneity and heterogeneity) in gender, age, tenure, culture and/or nationality affect performance in teams and organizations (e.g. Tsui & O'Reilly, 1989), but not in the school environment. Data shows that the way people interpret their environment, how they think, feel and act, are too often divergent and create barriers that hamper smooth cooperation. However, research on the interaction of people from different cultures and the impact of culture over time is still minimal. Thus, due to a lack of empirical research, we know very little about: a) the role of cognitive, communicative and affective consequences during the development of a shared understanding, and b) what is the role of culture and its impact on the dynamics of such social interactive behaviour (Vallaster, 2005). With globalization, the constant interaction between peoples, cultures and civilizations will increasingly become a source of tension and conflict, since mobility and migration will increase, creating multi-ethnic and multicultural societies. At the same time, peaceful co-existence in a multicultural context will be an ongoing challenge. Peoples will have to be brought up to respect, learn about and understand each other's cultures, and ethnic and religious values. To achieve these objectives, universities have a key role to play in promoting and developing education and intercultural dialogue.

A prosperous society, but one where the relationship with others is crucial, is formed by recognizing and mobilizing all resources and skills via areas of effective intercultural dialogue, which gives rise to fruitful cross-fertilisation.

Scientists, teachers, and students agree that the world around them changes both politically and economically, culturally, socially and technologically (Janebová, 2009). Universities are part of the wider society – of contemporary globalization process, and therefore can not be seen only tertiary education in the national context.

\* Michaela Jurtikova. Tel.: +420776867417  
E-mail address: jurtikova@fhs.utb.cz

It can not be seen also because of the efforts of tertiary education institutions and national policies to apply internationalization to the current agendas of the institutions and its development. Universities have great potential for innovation in each country, and they should try to respond to social and other changes or even anticipate them.

According to Council of Europe (2009, pg. 28) in period 2002 – 2005 the percentage of number of foreign students in the Czech Republic as the host country increased by 90% (plus 8769 students). Through internationalization of higher education universities becoming microcosm of society, they are “melting pot”. To achieve transparent and participatory democracy, which is a fundamental principle of good government, universities should be a forum for inclusive democracy, a place where students, on the basis of socio-cultural differences, will be able to deconstruct social stereotypes.

Universities are the places where people meet with different cultural backgrounds, values, personality, and therefore there are interpersonal conflicts, natural and inevitable (Turnuklu, Kacmaz, Turk, Kalender et al., 2009). Crawford and Bodine (1996) say that many conflicts in the school environment arising from differences - national, ethnic, gender, class, physical and mental. These differences lead to conflicts, which may take the form of prejudice, discrimination, harassment, and/or hate crime. However, these conflicts must be viewed comprehensively, because their nature is not only prejudice and discrimination, but also due to the structure and relationship of inequality and privilege. These intercultural misunderstandings are leading to intercultural conflicts.

This essay discusses three principal research questions: What is the nature of intercultural conflict? What is the process by which intercultural conflict develops? And how can individuals be taught, trained and/or mentored regarding the development of intercultural conflict competence?

## **2. Nature of intercultural conflict**

According to Ting-Toomey (2009) is intercultural conflict defined as the perceived or actual incompatibility of values, norms, face orientations, goals, scarce resources, processes, and/or outcomes in a face-to-face context. Intercultural conflict can be about substantive, relational, and/or identity conflict goal issues.

Intercultural conflicts arise because of misunderstanding of different cultural, ethnic and religious values, different social class, or gender inequality, and most of these conflicts are the result of intolerance and ignorance of these differences, so called the interculturally incompetent behavior. Janebová (2010) points to the fact that in the seemingly homogeneous „national culture“ there exists experiences of other people, subcultures, organizational culture, and other cultural level, which break down the idea of culture as „coherent“, and emphasize its internal differences.

Despite a significant amount of research on intercultural conflict, there are relatively few syntheses of this literature. Additionally, the diversity of literature on intercultural conflict is generally not integrated across contexts. In the Sage Handbook of Conflict Communication Oetzel, Ting-Toomey and Rinderle (2006) attempt to address this limitation by introducing a social ecological framework for the study of conflict. Social ecology is the study of the relationship between organisms and their environment (Brofenbrenner, 1979). The framework emphasizes that the environment has multiple levels or contexts and that the relationship of these contexts to the phenomenon of study is complex. An integrated framework of the levels is thus necessary to fully understand conflict communication in context. Oetzel, Ting-Toomey and Rinderle (2006) present the social ecological framework of conflict communication: interpersonal, organizational, community, and international. These levels correspond with Brofenbrenner’s (1979) social ecological framework, which divide environmental influences into four system levels: micro (face-to-face interactions in specific settings – interpersonal conflict), meso (interrelationships among various microsystems – organizational conflict), exo (forces within the larger social systems – community conflict) and macro (cultural beliefs and values – international conflict). In particular communication always come into play two individuals whose identity is woven of belonging to different groups,

from past experiences, the influence of environment on personal characteristics, etc. (Janebová, 2010). We are focusing just on the interpersonal level, respectively intercultural conflicts in interpersonal dimension (conflicts between two people) arising from the socio-cultural differences.

Culture is hence perceived as a group specific collective phenomenon within a social context and is partially shared among individuals through values and opinions, thought approaches and patterns of behavior. Culture is not perceived as a rigid or static entity, but is in constant flux across individuals within cultural groups, and over time within individuals (Maznevski & Peterson, 1997).

These groups include ethnic groups, religious groups, social classes, women or men, lesbians and gays, etc. (see above Gudykunst & Ting-Toomey, 1988). This definition we also know from the concept of intercultural education in the Czech Republic in the form of socio-cultural groups, but also according to Pope, Reynolds and Mueller (2004) in the form of inclusive definition of multiculturalism, that would include race, gender, sexual orientation, social class, religion and age. All of our social identities influence who we are and how we view the world and because of the complexity of diversity, authors aids that we all experience life from the perspective of those social identities whether we realize it or not.

Socio-cultural group is such a group of people that can be defined on the basis of race, ethnicity, belonging to socio-economic class, gender, language, national identity, sexual orientation, physical or mental handicap or subcultural affiliation.

According to Hofstede (2001) each group of people or category of people is equipped with a set of shared programs that make its culture. Because in each of us belongs simultaneously to many different social groups and categories, inevitably we carries several layers of mental programming, corresponding to different levels of culture.

Within intercultural competence development, it is important to consider cultural distance, which is a key contributor to intercultural conflict. The greater the cultural distance between the two conflict parties, the more likely the assessment of the conflict negotiation process would be misconstrued. The cultural membership distances can include deep-level differences such as historical grievances, cultural worldview, and beliefs. Individuals from contrasting cultural communities often bring with them different value patterns, verbal and nonverbal habits, and interaction scripts that influence the actual conflict interaction process. Intercultural conflict often starts off with diverse expectation concerning what constitute appropriate or inappropriate verbal and nonverbal behaviour in a conflict encounter scene (Ting-Toomey, 2009). Defining intercultural competence is the basis for understanding intercultural conflict and understanding the context of conflict and the development of professional competencies are the foundation for solving conflict situations.

Deardorff (2009, s. 14) defines intercultural competence as “ability to communicate effectively and appropriately in intercultural situations, based on intercultural knowledge, skills and attitudes”. Intercultural competence include three basic dimensions: affective, cognitive and behavioral and the authors approach to developing models of intercultural competence (i.e. Deardorff, 2009). Ting-Toomey (2009) point out that developing intercultural conflict competence within the larger intercultural competence setting is critical because conflict creates further perceptual distortions and emotional flooding in the cultural encountering process.

### **3. Intercultural competence as possibility to prevent conflicts**

Intercultural conflicts often arise because the intercultural competence wasn't developed. Intercultural competence in particular include: intercultural knowledge (awareness of their own cultural values, norms and traditions and their importance to our personality, learning from different cultures and prevent prejudice and stereotypes), intercultural sensitivity and adaptability (to be sensitive and empathetic to the foreign culture and interpret emotions in a culture of others) and the art of intercultural communication (ability to communicate without communication noise and confusion and the ability to deal with intercultural conflicts / problems). Communication skills in the intercultural situation, as subcompetence of intercultural competence (behavioral

competence), is critical for managing conflicts effectively. It includes authenticity, art of listening, be aware of and respect formal rules in foreign culture, correctly interpret nonverbal signals, to nuances as specificity of humor and irony of different cultures (Morgensternová & Šulová, 2009). The Council of Europe has responded to these challenges too. In May 2008, the Council of Europe adopted a White Paper on Intercultural Dialogue, which not only brings together and formalises the long-standing commitment of the Council of Europe in this area, but strengthens it (Council of Europe, 2009). For the purpose of this book is intercultural dialog understood as a process which consists of an open and respectful exchange of views between individuals and groups with different ethnic, cultural, religious and linguistic backgrounds and heritage on the basis of mutual understanding and respect. It requires the freedom and ability to express themselves and the willingness and ability to listen to the views of others. Intercultural dialogue contributes to the political, social, cultural and economic integration and cohesion of culturally diverse societies. Grown equality, human dignity and sense of common purpose. Its aim is to develop a deeper understanding of different worldviews and practices, increase collaboration and participation, enabling personal growth and transformation, and spread tolerance and respect for others. Among the stakeholders that should promote intercultural dialogue, include institutions of higher education.

Researches dealing with the relationship of national culture and social groups (as family, religion, social clubs, profession, work teams and universities etc.) found out that universities have an impact on the behaviour of individuals in case of that individuals currently studying at the university (Gudykunst & Ting-Toomey, 1988).

Higher education institutions play in fostering intercultural dialogue an important role through educational programs, as actors in broader society and as a place where intercultural dialogue is put into practice. According to Steering Committee on Higher Education and Research (CDESR) are universities are best defined by their universality – their duty is to give an unbiased and open attitude to the world, based on the values of the Enlightenment (Council of Europe, 2009). Universities have the potential to shape the intercultural intellectuals, who will play an active role in the public sphere. To reach this aim should help the scientific research on intercultural studies, dealing with aspects of attitudes "learning to live together" and cultural diversity in all educational activities.

#### **4. Intercultural conflict training**

Because is the behavioral competence, respectively intercultural communication competence critical for managing conflict effectively, we will focus in this part of essay on intercultural communication training.

Intercultural communication training is defined in this article as an interactive facilitation and coaching process in which learners are given the opportunity to acquire culturally relevant knowledge, increase self-awareness and other-awareness, manage emotional challenges, and/or practice competent intercultural communication skillsets (Bennett, 2003; Ting-Toomey, 2004). Through effective intercultural training, trainers can intentionally transform the mindsets, affective habits, and/or behaviors of the trainees in order for them to communicate competently and adaptively across cultures. More specifically, intercultural conflict training is conceptualized in this article as the competence-based training of individuals to manage emotional frustration and interaction struggles constructively due to cultural group membership differences. Such differences can stem from a perceived or actual incompatibility of cultural values, norms, face orientations, goals, scarce resources, processes, and/or outcomes in face-to-face context (Ting-Toomey & Oetzel, 2001).

According Ting-Toomey (2009) students have to develop intercultural conflict competence. Intercultural conflict competence refers to the mindful management of emotional frustrations and conflict interaction struggles due primarily to cultural or ethnic group membership differences.

The criteria of communication appropriateness, effectiveness, and adaptability can serve as evaluative yardstick of whether an intercultural conflict communication has been perceived as behaving competently or incompetently in an interaction episode (Ting-Toomey, 2009). Intercultural conflict competence can be

developed through intercultural conflict training. I would like to review major theory-practice approaches in intercultural conflict training. I'm using selection which Ting-Toomey used in 2007.

The criteria to guide selection of free conflict training approaches for a synoptic review:

- The approach covers either a strong conceptual or an applied angle to understanding culture-based conflict practice
- The conflict theory has either been systematically tested in a range of cross-cultural conflict settings or the applied model has been utilized successfully with a wide range of diverse cultural audience
- The theory or model has an heuristic function for bridging intercultural conflict theorizing processes with conflict application issues
- The conflict concepts and training ideas are readily accessible in published chapter or article format for further reading by curious intercultural researchers or practitioners

We will present the following free approaches: a) The conflict face-negotiation theory (Ting-Toomey, 1988, 2004), b) The S.A.F.E model (Hammer, 1997; Hammer, Rogan, 1997) and c) The A.E.I.O.U. collaborative negotiation model (Raider, Coleman, Gerson, 2006).

#### *The conflict face-negotiation theory*

Intercultural conflict often involves different face losing and face saving behaviors. Face refers to a claimed sense or desired social self-image in a relations or international setting (Ting-Toomey, 1997). Face loss occurs when we are being treated in such a way that our identity claims are either being directly or indirectly challenged or ignored. Face-loss can occur either on the individual level or the identity group level, or both. Repeated face-loss and face-threat often lead to escalatory conflict spirals or an impasse in the conflict negotiation process.

Ting-Toomey (1988) and Ting-Toomey and Kurogi (1998) developed an intercultural conflict theory, namely, the conflict face-negotiation theory. This theory assumes that:

- 1) People in all cultures try to maintain and negotiate face in all communication situations;
- 2) The concept of face is especially problematic in emotionally-threatening or identity vulnerable situations when the situated identities of the communicators are called into questions;
- 3) The cultural value spectrums of individualism-collectivism and small/large power distance (Hofstede, 2001) shape facework concerns and styles;
- 4) Individualism and collectivism value patterns shape members' preferences for self-oriented facework versus other-oriented facework;
- 5) Small large power distance value patterns shape members' preferences for horizontal-based facework

versus vertical-based facework;

- 6) The value dimensions, in conjunction with individual, relational, and situational factors influence the use of particular facework behaviours in particular cultural scenes;
- 7) Intercultural facework competence refers to the optimal integration of knowledge, mindfulness, and communication skills in managing vulnerable identity-based conflict situations appropriately, effectively, and adaptively (more Ting-Toomey, 2007).

#### *The S.A.F.E. Crisis Negotiation Conflict Model*

The S.A.F.E. model embodies four core motifs or triggers that are related to conflict escalation to de-escalation process (Hammer, 2001). The term „S.A.F.E.“ stands for the following four interactive frames:

- 1) **Substantive demands and interests in the conflict** (the substantive or content goals in the crisis negotiation situation between the subject and the negotiators)
- 2) **Attunement** (the degree of trust, power, control, and empathetic understanding that is being developed between the subject and the negotiators)
- 3) **Face** (the face needs or concerns of the subject as the crisis situation unfolds and the ability of the negotiators to effectively respond to the subject's face needs or desires)
- 4) **Emotional distress** (the ebbs and flows of the emotional state of the subject as reflected through the expression of positive versus negative emotions and, thus, increasing the degree of predictability to unpredictability of the crisis negotiation situation).

#### *The A.E.I.O.U. Collaborative Negotiation Training Model*

It is a comprehensive conflict training program that emphasizes a strong „collaborative negotiation“ perspective. Their cultural training philosophies are twofold: that all conflict resolution training programs should integrate a cross-cultural perspective, and that all training designs should also reflect a keen cross-cultural sensibility.

In their intercultural conflict resolution training (CRT) program, Coleman and Raider (2006) emphasize the following three objectives:

- 1) *Knowledge objectives*: for example, to become more aware of key ways in which worldviews differ and how that can manifest into conflict, and also to develop awareness that competition and collaboration are two main strategies for negotiation and for resolving conflict.
- 2) *Attitude objectives*: for example to shift trainees' attitude in ways that they will commit to the larger goal on increasing the use of collaborative conflict negotiation skills at all levels to create a more just

society, and also to develop an appreciation of cultural differences as a source of richness rather than liability.

- 3) *Skills objectives*: for example, to learn to listen when one's own identity group is under attack and be able to avoid ethnocentric or identity-based responses, and also to create a collaborative climate through the use of informing, opening, and uniting behaviors.

This collaborative conflict negotiation model – A.E.I.O.U. – stands for “*attack, evade, inform, open, unite, and with an added “Y” to symbolize yes*”.

Whole raft of studies take as their theme one essential aspect of practical intercultural communication> the knowledge, abilities and attitudes needed to make it work. When it comes to the requisite skills, what is important for intercultural dialogue. The findings of studies on this show clearly, that with all the good intentions in the world, simply wanting intercultural dialogue is not enough to make it happen. This naturally raises the question of training in the necessary competences and resources (Council of Europe, 2009).

Which main research question should be answered? In the area of competences: *Does institution offer courses teaching intercultural skills in specific areas? Does the institution offer training for specialist in the intercultural communication and/or dialogue?* And in the area of research: *Is the institution involved, through its research groups, in national or international research projects relating to multiculturalism? Does the institution encourage research in these areas, through international partnership and/or international network? Does the institution have advisors to manage international and multicultural research teams?*

## 5. Conclusion

In the present study, we briefly describe the topic of intercultural conflicts at school, focusing on tertiary education institutions. We tried to approach the reader a topic that is very current and is not yet given the attention it would deserve. Intercultural conflicts provide a large space for their theoretical treatment, empirical verification, but also for the application level, which we reflect in the environment of higher education. We consider it important to continue to discuss the issue and develop in the educational environment.

# Constraints and shortcomings in the development of marketing professionals in Romania

Dorian-Laurențiu Florea <sup>a</sup> \*, Silvia-Mihaela Pavel <sup>b</sup> , Alexandra-Elena Poștoacă <sup>a</sup>

<sup>a</sup> The Bucharest University of Economic Studies, 1 Romană Square, Bucharest, 010374, Romania

<sup>b</sup> University of Craiova, 13 Al Cuza, Craiova, 200585, Romania

## Abstract

Marketing is an emerging field in Romania, confronted with numerous challenges regarding professionals' development, despite the increasing interest of students for marketing profile faculties.

This paper regards 3 different perspectives – of employers, students, and professors – acquired through qualitative methods, on the topmost attributes and competencies required for a productive marketing professional and the main hindrances in career progress, which report several issues concerning major gaps between the 3 views, but also inside the employers' perspective. This research is a step forward for the macro system career management, but it also highlights some aspects of how human resources requirements shift in high emerging domains.

*Keywords:* professional development, marketing employee, competence;

## 1. Introduction

A major support for emerging fields consists of the specialized human resources that are able to provide highly qualitative work. This requirement is usually under-satisfied on one of its tales, by having either a fast-developed field confronted with penury of professionals, or numerous professionals in a former emerging field or a stationary one, but with a high latent potential.

Marketing field in Romania arised in the post-communist era immediately after 1990, but the lack of qualified professionals and organizational experience kept it away from a spectacular boom in the 90's. As more and more multinationals entered the Romanian market, marketing has become a field "on fashion" for both businesses and workforce. The university system has adapted to this trend by founding marketing faculties and developing marketing study programs inside the economic ones. Although no official statistics have been found, we can approximate the number of marketing professionals who graduate every year at about 1000-1500 individuals – professors' estimations from the qualitative research below are considered.

This paper aims to provide a diagnostic of the labour market on marketing field by identifying constraints and shortcomings in the development of marketing professionals, in their way from formal education to labour market and back if necessary, and proposes some solutions for repelling it.

## 2. Theoretical and practical background

Marketing is one of the most dynamic field in economics, with fast transformations in both theory and management practice. The transformations are even more alert in countries where the socialist system kept marketing away from being practiced. The external influence driven by the multinationals which entered the Romanian market represents a significant force in the becoming of market practice in Romania.

Unlike in the early 90's, when academic background was constantly overlooked when hiring someone on a marketing position – due to the lack of professionals on the field –, nowadays, the Romanian education system provide plenty of qualified workforce, which sets marketing on the top of the fields affected by academic inflation. Qualitatively, though, it appears as obvious the gap between formal education and employers' competence requirements, with deep implications at various levels, like:

- Career significance for the environment (Hoekstra, 2006), by minimizing the role of education in the development of a competent professional. The same idea can be stated in relationship to non-relevant professional background achieved during faculty, which has become from an encouraged practice, a dominant one;
- Career identity for the individual (Hoekstra, 2006), as the awareness of the gap makes students consider formal education useless for their professional development in marketing;
- The image of marketing itself as a science that can be completely learned in the workplace. This is a magnification of the “learning by doing” principle. It has to be said that this phenomena is common roughly for all the fields in economic sciences, as we will show later.

We have already put in the spotlight two approaches on career: internal career represented by identity and external career represented by significance. A third approach needs to be considered for a complete view of the construct – organizational career (Baruch, 2004) –, referring to the position and roles a professional undertakes in time. A very useful theoretical instrument here is Hoekstra's career role model (2010), consisting of the following 6 roles: maker, expert, presenter, guide, director, inspirator. A career role is defined as the “enduring aspects of the work roles that the person identifies with and is identified with” (Hoekstra, 2010). Although in the original model, marketing positions are placed in the presenter role, all of the 6 roles can be associated with different jobs inside marketing field. We will use this model later in order to interpret the results of our research.

From the employer perspective, the competencies needed for a marketing position are vitally important to be fulfilled by an employee, not just for efficiently completing every task allocated to him/ she, but also for the workability of certain strategic instruments, such as those used to define and delimit strategic business units. Thus, one criteria used when deciding the composition of a business unit is the overlap of employee's skills, needed for manifold products or markets (Căescu & Moise, 2011).

## 3. Methodology

We considered 3 perspectives which are relevant for identifying the constraints and shortcomings in career development of marketing professionals: employers, students, and professors. Usually, people who work in marketing and marketing-related fields are not eligible for a research, but in this case, they are the holders of the insights that we are looking for. A qualitative research is appropriate to meet our goals, and also taking into account the difficulties in forming a representative sample of every of the previous categories. Thus, we conducted 2 focus groups of students and 10 in-depth interviews with 5 professors of marketing and 5 managers or marketing managers. In-depth interviews were preferred for professors and managers in order to get “pure” perspectives of each of them, without influences from another subject of the research.

The selection questionnaire for students followed four inclusion criteria – to be a marketing student, to declare himself/herself decided to develop a career in marketing, to report at least an attempt to get a job or an internship, no matter the field, and to provide as many attributes as possible to portrait a competitive marketing professional –, and two exclusion criteria – to have been participated to a focus group in the 12 months and to have close relatives working on marketing or marketing-related fields. Concerning the managers, we selected 2 managers of SMEs, 2 marketing managers of multinationals and a representative of a media planning agency, primarily based on their willingness to participate. In the case of marketing professors, no selection method was used, as all 5 are peers of the authors from The Bucharest University of Economic Studies and University of Craiova. For the in-depth interviews, we avoided using projective techniques due to the high qualification of the participants, which would corrupt the results, so we mainly used direct questions. The group discussions and interview were conducted in Romanian, excepting one interview with a marketing manager, which was conducted in English. In the lists of verbatim below, we tried to keep exactly the same meaning in the translated transcript as in the original one. In order to overcome researchers' subjectivity, we discussed our interpretations with two other researchers specialized in qualitative research.

Six themes were approached during the group discussions and interviews:

- What does it takes to become a good marketing professional, generally? For a thorough portrait, the interviewer encourages the respondents through auxiliary questions to give as many attributes as possible, together with brief explanations of the most significant;
- The specific competencies required for some jobs/firms: marketing researcher, copywriter, client service responsible, marketing planner, media planner, marketing responsible. The last one refers only to the SMEs which do not have a marketing department, but just one or a few employees on marketing;
- How formal education contributes to the formation of these competencies? It's important here to ask the respondents to justify the extent to which competencies can be – or should be – developed in formal education versus at the job;
- Some successful career paths that are typical found among marketing professionals;
- The attitude of each category – students, professors, and employers' representatives – towards the other two, in terms of professional competence and degree of understanding marketing in the contemporary economy;
- Constraints and shortcomings at each level previously discussed, that encumber career development of young marketing professionals.

As it can be seen, the interview guide contains themes going from general to specific in a natural flow, finishing with a conclusive theme that sums up exactly what we are looking for. The comparative analysis of the 3 perspectives enable us to infer superior conclusions, although we need to have in mind that the results of qualitative research are not representative, and thus are not suitable for accurate comparisons.

#### **4. Results and discussions**

We will expose the meaningful results of the research together with some lists of verbatim that sustain our interpretations. In the nomenclature below, we explain the codifications used for the participants and their answers in the lists of verbatim.

## Nomenclature

FG1/ FG 2	focus group 1/ focus group 2
MP	marketing professor
ER	employer representative
M/ F	male/ female respondent
1, 2, 3...	distinguishing number – for the focus groups, the numbering was made from right to left, as they appear on the recording
<u>Word</u>	accented word
(0.5)	a 0.5 seconds pause in the speech
[word]	researchers' filling

### 4.1. *The portrait of a competitive marketing professional*

Highly defined portraits were obtained from every of the three categories. Despite being a general characterization, without a focus on any specific marketing position, we expected the recall of a large amount of basic knowledge as fundamental. Instead, general character traits – conversational, open-minded, fast-learner, resilient, unconventional, realistic – were commonly acknowledged as helpful for career development. Practically, this portrait has nothing specific for a marketer in order to be recognized as so. Indeed, students widely recalled theoretical knowledge as an important trait, but most of them were unable to explicit the trait. The ones who did, considered promotional knowledge the most important to know – lines 1-5. This can be explained by the numerous subjects they have in their academic program on this topic. Concerning the employers' representatives, they stressed on seriousness, hard worker and fast-learner, motivating that they have found many students and young professionals who are not ready for any sacrifice and don't have a vision on their professional future – lines 6-11. On the contrary, professor MPM2, the representatives of the media planning agency and one of the multinationals based their description on competencies attained through formal and informal education – lines 12-16.

LINE	RESP.	
1	FG1F1	I think that <u>promotional techniques</u> would be the most important to know (0.5), especially in the start of your
2		career.
3	FG1M2	[...] to know how to promote and sell anything, because (0.5) here's the hard job for any firm.
4		
5	FG2F5	It helps me a lot what I've learned in Promotional techniques class [in my current job]
6	ERM3	It's hard to find dedicated young marketers. [...] They are looking for big salaries, without willing to work hard.
7		
8	ERM1	We need serious graduates, who are able to integrate themselves very fast in our activity. We appreciate having
9		work experience during faculty.
10	ERM2	It's hard to believe how every 2 months I have to find a new marketing responsible. I have no idea what they are
11		expecting to give them.
12	MPM2	What has he done during faculty is decisive for every marketing professional. And I'm not talking just about going
13		to classes, but also about having diverse experiences, for example in the NGO's.
14		
15	ERF4	We look for the applicant to know how to make a marketing plan, how to plan a number of activities. It's important
16		to have experience in coordinating a team.

#### 4.2. Specific competencies required for some marketing positions

The participants of all three categories were asked to nominate the specific competences for 5 positions: marketing researcher, copywriter, client service responsible, marketing planner, media planner, marketing responsible. In order to examine the correctness of the answers, we used the expertise of two human resources managers from marketing industry.

Excepting copywriter, very poor descriptions were made for all the other positions, especially by students and SMEs' representatives. In the focus group, every job was introduced by asking who would like to get a job on that. Instructively, although every position was chosen at least once, the students weren't able to give details about the job description or competencies required for that job. Another significant observation refers to the understanding of SME's representatives on marketing responsible position. Both of them mentioned as the most important competence for this position to have good operation skills in some software, such as Photoshop, Corel and Microsoft Office. According to the two human resources managers, none of the marketing professors gave the right and complete list of competencies for all the six positions. We can conclude here that formal education isn't set on the competencies needed in the real economy, as not even awareness and minimum knowledge of it isn't formed. While SME's representatives show little understanding of the role of marketing itself in their firms, multinationals and media planning agency representatives give detailed lists of competencies and job description for most of the positions. Though, little marketing skills are expected to be achieved by the applicants for new-entry positions. Actually, they declared that most of these positions aren't available for new-enters, at least not with full responsibility. The fact that marketing students and graduates lack important marketing skills is a wide conclusion in the scientific literature (Arora & Stoner, 1992; Litchfield, 1993), which tries to find a solution as the regards professional and career skills in the marketing curriculum (Kelley & Bridges, 2005).

#### 4.3. The contribution of formal education to the competences development

Heterogeneous opinions were revealed about the contribution that format education has or should have to the general and position-specific marketing competences, inside every perspective. Most of the students consider the faculty useless for their career development – lines 17-18 –, while some of them appreciate that it's important just for the diploma and for the professional network development. However, other marketing students disagree with that, advocating that they really expect that the knowledge they get will prove useful in their professional

becoming – lines 19-20. They all agree though, after this dispute, that a job in marketing field – and for some participants also NGO activity – during formal education period provides more benefits in term of competences and success chances.

From professors' perspectives, two main logics can be drawn out. Some of them start by arguing that formal education is fundamental for career success, but are unable to give sustainable reasons – lines 21-22. In fact, their argumentation is believed by the multinationals and media planning agency representatives – lines 23-25. Other marketing professors declare themselves disappointed of the academic curriculum structure, which is not adapted to the contemporary marketing – lines 26-28.

Employers' representatives don't give too much credit to formal education when talking about competence development. Instead, they use the academic experiences of their applicants to visualize their professional mindset. Briefly, their answers go on two directions:

- Anything can be learned at the workplace, as long as the professional has the right mindset and motivation, which is generally the multinational representatives' opinion;
- The competences needed for the job must be previously gained, no matter from where, so experience is a sine qua non requirement. This is the SMEs' logic when talking about marketing responsible recruitment. Nonetheless, they also show some interest in the theoretical knowledge attained by the applicant from faculty, but the level of requirements is unwittingly low – lines 29-31.

LINE	RESP.	
17	FG1F4	What we learn here [in faculty] has nothing to do with what happens in the real world. They [professors] give us examples (1) from our grandparents' youth.
18		
19	FG2F2	I'm confident that what I learn today will prove important tomorrow. As (0,5) Steve Jobs said, "you <u>can't</u> connect the dots looking forward".
20		
21	MPM1	It's crucial for a good marketer to have the right academic background. [...] You just can't be good enough by just doing thing by heart.
22		
23	ERF4	We have great specialists on marketing department, who haven't attend a marketing class in their lives. [...] A structured mind like this one [an engineer's mind] helps a lot in marketing.
24		
25		
26	MPM4	Looking at what we're most doing in the classes, one can conclude that marketing is a fluffy thing. We are rigorous only where we (0.5) <u>shouldn't</u> be. [...] It's natural that we don't have credibility in front of employers.
27		
28		
29	ERM1	We don't have time to teach them everything they have to do. They know it, or they don't. [...] I usually ask the applicants at the interview: what's the marketing mix? How can you define a brand?
30		
31		

#### 4.4. Successful career paths

Here, professors are the ones who could give the numerous examples from their ex-students. Though, they consider these examples exceptions that cannot be multiplied because the number of students exceeds too much the demand for marketers – lines 32-35 – or because of limited penetration of marketing into the firms' activity – lines 36-37.

Students also prove they are able to identify good case practices in terms of career development in marketing, some of them declaring they have at least one role model in the industry, especially from the speakers they have met in different projects they were involved in. We notice that many of these role models are employed – or were at some point in their career – in a marketing service provider: marketing research company, advertising or PR agency, etc. Moreover, other students believe that career success usually depends on a well exploited lucky situation at a given moment, especially at the career beginning – line 38 – in line with previous research conclusion (Markaki, Sakas & Chadjipantelis, 2013).

Employers representatives show great gaps when approaching this topic. While SMEs managers weren't able to give more than one example from reality – it's true that they tried to reason some paths based on logics – the

other 3 representatives had plenty of examples to give. In the most examples, two obvious characteristics can be drawn: the relative high number of employers changed, and at least one major shift during their career, inside marketing field, or between another field and marketing – lines 39-44.

LINE	RESP.	
32	MPM1	We can't expect that these cases [successful careers] will become the rule (1), no matter how much we
33		[professors] would fight for. We make too many marketing professionals for our [Romanian] market's needs,
34		and not too many have gone to other countries yet and started doing marketing.
35		
36	MPM4	Many firms in Romania have <u>no idea</u> what marketing <u>is</u> , so our students have to aim only the big companies
37		(0.5) and the marketing service providers.
38	FG2M5	You can't become somebody without a little luck at the beginning.
39	ERM5	[Name] started in 2000 or 2001 at [agency name]. Few years later he moved to [agency name], where he
40		reached the position of Regional Communication Manager. He worked there until 2011, period during which
41		he change 3 or 4 positions. Then he took a few of month pause, being strategist for [company name], until he
42		decided to open his own agency. Eventually, this year he came back to [agency name]. (3) Oh, and he also had
43		a mobility in [country name] for a couple of months.
44		

#### 4.5. *The attitude of the three categories towards each other*

Interestingly, every category widely showed negative attitudes to the other two. Professors are accused by both students – lines 17-18 – and managers for delivering out of date information and for ignoring the practicality of their classes. Students are considered lazy, picky, unwilling to make sacrifices, and uninterested in learning – lines 6-11 – by the professors and SMEs managers and one of the multinational representative, but not by the other two managers. They admit to have found many exceptional young professionals and students through their internship and traineeship programs – line 45. In their turn, employers are seen as exploiters by most students – lines 46-48 - and unprofessional in the way they understand and apply marketing by the professors. Still, there are some exceptions who declare that they like their working environment and the opportunities they get.

LINE	RESP.	
45	ERF4	Many brilliant students have entered our cross-functional traineeship.
46	FG1M1	Employers don't take us seriously, they just want to exploit us on small tasks and pay us very poorly.
47		
48	FG2F2	I prefer a firm which doesn't pay me that much, but which develops me professionally.

#### 4.6. *Constraints and shortcomings in the career development of marketing professionals*

We distinguish between constraints and shortcomings on the following rule. We consider constrains those situations that make a marketing professional act inversely as his professional interest would dictate him, and shortcomings those contexts – usually marketing-related – which obstruct the desired behavior towards professional development. This theme sums up the constraints and shortcomings recalled in the previous five ones, and gives a holistic view on the barriers in the way towards professional success in marketing.

Firstly, students from the two focus groups were confronted with an internal guideline of recruitment team, made available by one consultant human resources manager, and differences with their portrait of a competitive marketing professional are discussed. Students ascribe the differences on the unrealistic image they have about marketing – lines 49-53. The same conclusion was drawn by most of the managers – lines 54-55, while some professors don't see a problem on that – lines 56-58. Moreover, students accepted that formal education doesn't develop their soft skills, such as teamwork – lines 59-62.

The required skills by the SMEs' managers is definitely a shortcoming with great impact on the development of marketing professionals, as this firms should cover most of the jobs on marketing, to the point where these jobs can barely be considered on marketing. The fact that many of these jobs still require experience is

counterintuitive, as it would be perfectly matched for new-entries. Actually, the lines 29-31 show that SMEs' managers have no idea of what they shall ask from a marketing employee.

On the other hand, the representatives of multinationals and marketing service providers declare that they don't expect to find too many hard skills on their applicants. The first derived constraint here is that any student or graduate can apply for a marketing position, as anything can be learned at the workplace, tightening thus the competition on the labor market, in line with Taylor's (2003) findings from United States. The second constraint here can be understood by employing Hoekstra's (2010) career role model. Although we agreed that any of these roles can be played in marketing jobs, refusing to award full responsibility to new-entry positions makes almost all these roles invalid. The sole role that we still consider operative is maker. Thus, we can explain why an attractive career can disappoint very fast a deluded pretender.

Interesting shortcomings can be found analyzing the successful career paths. If we take these paths into consideration, success depends on the possibility to work in an agency or research company, which is a pretty narrow pipe, but in fact, all the 3 categories acknowledged that the level of marketing professionalism is higher in this kind of companies. Then, considering luck a decisive component of success drives to demotivation and inaction inertia. Another shortcoming was observed by ERF4: the intricate paths of success, with manifold employers and field changes, don't yield to role models thinking. He argues that following your model means to close yourself many doors, and finally realize that you went on an inappropriate path for yourself or for the circumstances.

Finally, line 48 helps us infer a major constraint that was unmentioned by any group member. While some students or graduates – like FG2F2 – prefer the employers who develop them professionally, without paying a big salary, others need to choose the firms to offer them the highest amount of money. This illustrates the fight between exploration and exploitation, where in many cases, the long term objective – career development – is struck by the short term objective – economical subsistence. The choice between these two alternatives is hard to be avoided, because the employer brands are used to indemnify its employees, especially at entry-level and early stages of professional evolution.

LINE	RESP.	
49	FG1F4	Most of us think that marketing means advertising in the moment we apply to this faculty, and we need maybe more than (0.5) a year to understand that it's not that way. It is not enough to be creative in order to (0.5) be competitive.
50		
51		
52	FG1M1	I was always passionate of sales, and when I applied here [to Faculty of Marketing] I was convinced that marketing means sales.
53		
54	ERM3	When they come to our firm, they have no idea of how things work here on marketing.
55		
56	MPM1	On every field there's a gap between theory and practice, so nobody should be blamed.
57	MPM5	Any employee needs a time for adaptation at his new job. Take into account that every company has its own specific procedures. Experience isn't always helping.
58		
59	FG2F1	In faculty, we have many projects to do in team, but the truth is that we generally work independently.
60		
61	FG2F2	It's hard to work in team when you are competing for scholarships and accommodation with your teammates.
62		

## 5. Conclusions

Marketing is still a young industry in Romania, confronted with numerous challenges regarding career development of young professionals.

This paper regards 3 different perspectives – of employers, students, and professors – acquired through focus groups and in-depth interviews, on the most significant attributes and competencies required for a competitive marketing professional and the main barriers in career progress. Obvious gaps were detected between the 3

categories of participants, but also inside every category, especially in the employers' one. Though, all this gaps must be validated through quantitative research in order to prove meaningful.

This research is a step forward on both management practice and state of knowledge. On management practice, this paper gives valuable insight of the most impactful misbeliefs of employers and employees when talking about marketing professionals' recruitment. In addition, this research may result helpful for the elaboration of a more balanced labour policy at the macro level. On the state of knowledge, the current paper is an opportunity to consider a wide range of research that links human resources management on marketing to marketing efficiency in a small world of expertise, where professional quality is determinant.

### Abstract

This given article looks at the experience of national building on the post-Soviet territory conditions after dissolution of the Soviet empire. And it became in terms of experience of the Republic of Kazakhstan. Under imperial experience of national development of the former Soviet republics in article following phenomena are as follows:

First is the continuity of many elements of an ethnic course of Russian empire in the national policy of the Soviet Union.

Secondly, circumstance, which dissolved the Soviet Union, became possible in many aspects because of opposition of its non-Russian ethnic groups to imperial character of the Soviet national policy, to consciousness of Russian ethnic groups, its leadership in social structure of the Soviet society.

*Keywords:* Kazakhstan, Kazakh, Russian Diaspora,

The gaining of sovereignty and independence by the former Soviet republics initially caused euphoria amongst their populations. Coupled with this, the democratic way of national development and national values gained great popularity. This is hardly surprising, since the national self-determination of the republics of the Soviet Union was made possible, largely due, to the spreading of democratic values in the period of "perestroika." Perhaps that is why most of the newly independent Soviet republics have chosen the way of democratic states. The ruling elite of these countries saw the prevailing sentiment. However, that euphoria has not passed away only because a democratic transit of the bulk of former USSR republics has failed. It has taken place also because these countries have failed to construct a fully national state for all those years.

In addition, the transformation of economic systems in much of the former Soviet Union was not successful in improving the socio-economic conditions of their citizens. Over the past few years after independence, the social injustice, and the broad division of society into rich and poor, has become commonplace in many of these countries. In this connection, we will review socio-political moods of Russia's citizens since it is of interest for our research.

For 20 years after the collapse of the USSR, Russia has conducted sociological measurements of the socio-economic and socio-political mood of Russians. Findings of the review have showed that for instance compared to 2001 Russia's citizens very decently evaluate such their democratic values as 'self-expression in

\* Kuanyshbayeva Zh. Tel.: +87017765578;  
E-mail address: zhazira\_k.zh@hotmail.com

policy', 'freedom of speech', 'multi-party system', 'free elections.' In 2001 such successes of 1990s' reforms as freedom of speech ranked number 2 in evaluations of Russia's citizens, while in 2011 they ranked number 6 (Analytic report, 2011: 22-24).

This poll has also exposed that as the majority of interviewed opine negative social consequences of reforms exerted much influence not individually but on the whole community. It is quite obvious that these data are indicative of a high level of social ill-being in Russia (Analytic report, 2011: 28). This poll in 2011 also revealed a clear relationship between feeling of injustice of 'what was going on' with a sense of shame of respondents being Russia's citizens for condition of the country and realization that 'it is impossible to live like that any more (Analytic report, 2011: 67).

Researchers logically reach conclusion that such moods result from 'mismatch of reality and sociocultural norms which are widely spread in all layers of Russia's citizens which is also indicative of ongoing process of power delegitimization' (Analytic report, 2011: 68). In other words, activities of the authorities do not satisfy panhuman and national values of Russia's citizens any more. Moreover, researchers sum up: 'Social tension for the time being latently rotting in the community all of a sudden can be taken to the streets ... and it is attributed specifically to social-psychological condition of the population and not some of its personal material interests' (Analytic report, 2011: 73-74).

Moreover, according to the researchers, these violent acts can take shape also as "nationalist actions," because in this case the implications for such sentiments of Russians e.g. "people of my nationality have lost a lot in the last 15-20 years" and "all means are good when it comes to protecting the interests of my people" (Analytic report, 2011: 75).

According to sociological research in 1993, about 34% of Russian respondents believed that non-Russians were the main cause of all the social ills of Russia. Moreover, more than 54% of Russian respondents of all social classes believed that non-Russians in Russia had too many rights and too much influence (Gudkov, 2004: 206].

The above-stated data and conclusions about national moods of the title ethnos in Russia are confirmed by other social studies as well. In particular, according to the All-Russian Public Opinion Research Center, between 1998 and 2002 percentage of ethnic Russians crusading for 'Russia for ethnic Russians' idea surged from 45% to 55% (Sherbakova, 2009: 86). It is necessary to mention that people aged between 18 and 30 prevail among supporters of that idea. Moreover, respondents aged under 24 post the least index of ethnic tolerance which is 2.6-3 times lower compared to people above 40 (Sherbakova, 2009: 106). These data first of all indicate that consolidation and mobilization of the Russian community in Russia based on ethnophobias will continue in the future. It's no coincidence that as early as in 2007 closed polls of the All-Russian Public Opinion Research Center showed that 70% of interviewed ethnic Russians supported the 'Russia for ethnic Russians' motto (Sherbakova, 2009: 127).

In Russia ethnophobia among the Russian population is very widespread and it seems to have its roots in the past. For example, ethnophobia against Chechens, who are currently, actively circulating in Russian society, was there even before the first Chechen war of 1994-1996. (Sherbakova, 2009: 95). The Chechens belong to the group of people from the Caucasus, for which ethnophobia have similar features and are characterized in particular with such terms as "criminal, prone to terrorism", "getting rich at our expense," "despise people of other blood" etc. (Sherbakova, 2009: 104-105).

Such negative ethno-nationalist sentiment in Russia is gaining in strength each year. As noted by the Russian expert G. Zverev, Russian ethnic nationalism recently has shifted its focus from the periphery of public consciousness to become the ideological mainstream of the socio-political reality of Russia (Zvereva, 2005).

In Russia, the growth of negative ethnic nationalism became the foundation for the spread of violence against non-Russians. In 2005, some 435 people including people from the Caucasus and Central Asia, were the victims of skinheads. Additionally, all these actions began to turn into violent ethnic nationalism (Kozhevnikova,

2006: 9). Thus, negative ethnic nationalism remains one of the essential foundations of the consolidation, the mobilization in Russia of Russian society.

All this could not but affect the political process in Russia and its national policy. Xenophobia in Russia has become one of the most powerful electoral resources whereby candidates for various public authorities to actively display negative ethno-national ideas. Support for Russian negative ethnic nationalism by ruling elite of came into wide practice. Often, for example, members of the State Duma make various appeals, demands, aimed at suppressing the rights of non-titular ethnic groups in Russia. On 19 January 2005, 19 members of the State Duma were demanding the closure of Jewish organizations in Russia, accusing them of Zionism. It should be noted that this demand was condemned by President Vladimir Putin after only a week (Kozhevnikova, 2006: 23-33).

One can say that two orientations towards nation building are being implemented in Russia, i.e. ethnonational and citizenship-based. This means that Russia's ruling elite, wide ranges of the Russian ethnos simultaneously advocate nation building on the principle of co-citizenship and based on the Russian ethnos. At that, the Russian elite vigorously exaggerates an idea of priority of ethnocultural and other interests of the Russian ethnos in the nation building of Russia.

As Russian scholar Panov P. has demonstrated, currently the Cremlin carries out its discourse in the tideway of 'Russionism', when those who acknowledge Russian cultural values, special way, great historic mission of Russia are referred to the Russians. This scholar treats an appeal to co-citizenship in the Cremlin's policy as a desire to absorb other ethnoses capable of adopting the Russian culture (Panov, 2001: 85). Moreover, as Russian researcher Scherbakova D.I. opines while with Boris Yeltsin ethnic course of the state was a response to national movements, with Vladimir Putin policy of limiting rights of ethnic elites and supporting rights of the Russians became its cornerstone (Sherbakova, 2009: 86-87). At that, it is likely that Russia's leadership tries to mobilize ethnonational potential of the Russian ethnos for the purpose of implementing its geopolitical plans, including to restore its influence on the former USSR. In other words, Russia's ruling elite once again begins to play the card of restoring imperial Russia. In this context, anti-American demarches of Vladimir Putin and Dmitriy Medvedev for instance are quite understandable.

In such a manner the ruling elite of the Russian Federation has to a large extent facilitated consolidation of the Russians based on negative ethnonationalism. It is made subtly with respect to the Caucasians, natives from Central Asia as well as NATO countries. Signs of imperial syndrome reviving in Russia can be seen in that.

It should be noted that transformation of the Soviet socio-political system was mainly associated as attachment to socio-political values of the West. However, subsequently, at least starting from mid 1990s, moods of uniqueness of Russia's civilization development and distinctiveness became dominant in Russia. As opinion polls reveal since then in the bulk of Russia's citizens 'orientation towards civilized distinctiveness is coupled with traditionalistic philosophies' (Analytic report, 2011: 155-156).

Researchers have generally come to the conclusion that Russia's "revolution of values is a long time over," but the search continues for socio-political "new meanings and new ideas" (Analytic report, 2011: 158). One can in this sense, understand the appeal of the Russian ruling elite's need to revive the Russian identity, and the imperial values deeply rooted in Russian ethnicity. According to the Swiss scholar A. Kappeler, imperial identity and imperial patriotism were very important factors in consolidating the social classes in the Russian ethnic group (Kappeler, 1997: 179).

The above-described moods of the Russian ethnos in Russia cannot but cause feedback and discontent first of all among indigenous ethnoses of constituent territories of the Russian Federation. Thus, findings of focus groups in Tatarstan have revealed that the majority of their participants believe that ethnopolitics of Russia's authorities does not consider ethnocultural interests of the title ethnos of that republic (Shumilova, 2006: 140). Moods of national self-determination are widely spread in Tatarstan. At that, there discontent with the federal

center, i.e. Moscow, for the most part extend to the ethnic majority of Russia, i.e. ethnic Russians (Sagitova, 2006: 258).

Perception of the Russians as an imperial ethnos quite frequently is articulated in non-Russian information space of Russia. As Russian expert Kuznetsova A.B. says, in its time deportation of the Chechens and the Ingushes was also treated as a seizure of power by the imperial ethnos, i.e. ethnic Russians. This shows that the discrimination of the Chechen-Ingush people from the indigenous Russian population of Chechnya, is perceived more in the vein of Russian imperialist expansion. (Kuznetsova, 2005: 125).

As considered earlier, the facts suggest Russia's current historical practice is the mobilization of the Russian people by the xenophobic imperial values. In this context, it seems that the main characteristic, of self-determination and the development of the post-Soviet states, was the opposition to the imperial Russian ethno-nationalism, where the Russian community has or had a large volume.

National values are formed based on a model of nation, national ideology adopted in the society. In this case, two approaches dominated in the former USSR. In the first approach national values resulted from a model of nation building based on the principle of co-citizenship. In the second approach – based on nation building underlain by ethnic principle, i.e. based on an indigenous ethnos of a concerned state. Ruling elite of the major part of former USSR republics strives to implement the second model of nation building. The first model was and is being implemented inside countries that lack an absolute domination of an indigenous ethnos.

Although, there are some deviations, for instance like in Ukraine and Baltic states Latvia and Estonia. These countries do not have an absolute domination of an indigenous ethnos. However, ruling elite of these states also advocates a monoethnic principle of building their nation-states. Along with that, these countries also do not have clearly-cut and legislative orientation towards nation building based on a monoethnic principle. However, on the whole, elite of these states follows that principle and does its best to implement it in practice. In this approach national values are displayed mainly through some strategies of historic and cultural nature of indigenous ethnoses of those states.

Therefore, it's no coincidence that the so-called 'Russian question' buds from time to time in those countries. Its key basis is a fact that representatives of the Russian ethnos make a minority in those countries. According to 2011 census, indigenous ethnos in Lithuania accounted for 62.1%, while the Russians made 26.9%. In Estonia Estonians made 68.8% of the total population in 2010, and the Russians accounted for 25.5% (Kalabekov, 2010). Indigenous ethnos in Ukraine stands at 77.82% and the Russians ranking the second biggest ethnic community of Ukraine account for 17.28% (Pankov, 2005). Regular exploitation of the Russian question in those countries is also ensured by intricate relationships with Russia. Moreover, desire of these states to bolster their cooperation with NATO member states infringes on geopolitical rights of Russia. Finally, complex of these factors disables elites of those states from implementing to the full extent their plans of nation building based on monoethnic principles and probably forces them to pronounce thoughts about nation building underlain by co-citizenship principle.

The situation in the field of nation-building in the above countries applies to most post-Soviet countries. Typically, on the eve of Kazakhstan's independence in 1990 the population was 40.3% Kazakhs and 37.6% Russians. In 1992, it became 41.9% Kazakhs, and Russians down to 37%, with Russians prevailing in the northern and north-eastern regions of the country. (Zimovina, 2003).

Moreover, as researches show Kazakhstan is one of former USSR republics that most of all was exposed to Russification. In soviet times and also in composition of Russian empire socio-cultural space of Kazakhstan sustained a large-scale deconstruction when its core, nomadic housekeeping, was destroyed.

Meanwhile, Kazakh national movement as Azat, Zheltoksan, etc. was vigorous in Kazakhstan on the threshold of proclamation of sovereignty. In point of fact, these movements appealed to the need of nation building in Kazakhstan based on monoethnicity. These ideas caused a broad response of the Kazakh people. All those things have entailed suggestion of legislative execution of those ideas, the more so as they received support

of significant ranges of the ruling elite which for the most time already was composed of Kazakhs by then. Vigorous manifestation of ideas of Kazakh ethnonationalism designed to forcibly introduce the Kazakh language and Kazakh culture in public reality began in political process of the country.

In this period, due to the requirement to speak the national language, Kazakh, the recruitment to the civil service was mono ethnic in character. In January 1993, the first Constitution of the Republic of Kazakhstan was adopted, defining its statehood as a "self-determined state of the Kazakh nation." The Constitution however does not mention the status of the Russian language. Hence Kazakhstan was officially proclaimed as the "Kazakh" nation-state. This appears to have led to the sharp increase in the mass emigration of Russians from Kazakhstan, post independence. Overall, 2 million Russians have left Kazakhstan, leaving many strategic Kazakh refineries and factories without skilled workers and engineers.

Perhaps, due of the problem in 1995, another Constitution was adopted, which granted Russian the status of the official language of state and local government. This current Constitution deleted reference to state of Kazakhstan as the Kazakh state. It also introduced into the basic law of the land a paragraph on the Protection of ethnic, cultural, national and linguistic interests, and the rights of all ethnic groups in Kazakhstan. Also included is a ban on the creation of parties or organizations on ethnic or religious grounds. In the same year the Assembly of People of Kazakhstan, was established which operate under the auspices of the cultural and national centers of some of the ethnic groups in Kazakhstan, including Russian. In total, the Assembly of People of Kazakhstan has 22 national and regional, national-cultural centers of some of the ethnic groups of Kazakhstan, combining 470 regional, city and district organizations.

In general, at present, our country has more than 100 national schools and 126 middle schools, where the pupils of 15 ethnic groups learn their native languages, and 76 secondary schools have optional, study circles in students native languages. The national revival schools have 29 branches in 11 languages, for the study of ethnic groups in Kazakhstan. In addition, 170 similar Sunday language centers are operating. Each year, the state orders more than 30 books to be issued in the languages of ethnic minorities in Kazakhstan with a total circulation of about 100,000 copies.

However, the main innovation in interethnic field founded by the 1995 Constitution was an official proclamation of nation building in Kazakhstan based on co-citizenship. At that, the Kazakh language and Kazakh culture were declared to be a cementing core of Kazakhstan's nation. One of specific steps towards nation building in Kazakhstan was a Concept of formation of state identity of the Republic of Kazakhstan adopted on 23 May 1996. According to that concept national identification was to be built based on principle of co-citizenship and continuity with traditional Kazakh statehood. That concept also expressly maintains that statehood models of Russian Empire and Soviet Union were imperial in their own way [The concept of national identity formation of the Republic of Kazakhstan, according to the Order of the President of the Republic of Kazakhstan as of May 23, 1996, N 2995].

Quite recently, in 2010, Kazakhstan adopted National Unity Doctrine that proclaimed building Kazakhstan's nation based on co-citizenship, shared civic interests and values. Its underlying concepts 'One country – one destiny,' 'Different origin – equal opportunities' and 'promotion of national spirit' themselves suggest high level of democratic nature of that Doctrine (The doctrine of national unity of Kazakhstan, 2010).

Under the unifying role of the Kazakh language and culture, one can see Kazakhstan has created favorable conditions for the construction of the nation, "Kazakhstan". However the task has not been achieved as Kazakh society is lacking even a reasonable level of national consolidation.

In many ways, it happened due to such an objective reason, the low functionality state language of Kazakhstan, Kazakh. Numerous studies have shown that the level of use, scope and application of the Kazakh language in daily practice continues to yield to the Russian language and hence cannot become the national language of Kazakhstan (Aliyarov, 2011).

Another objective factor hindering the national unity of Kazakhstan's society, is a high level of ethnic tension, conflict within Kazakhstan. There is reason to believe that inter-ethnic relations contain underlying tension that can surface into open inter-ethnic clashes under certain circumstances. A number of studies by Kazakhstan's scholars argue in favor of that. In particular, it is demonstrated in a reasonably substantiated research of the Kazakhstan's Center of Humanitarian and Political Environment conducted in 2009 (Aliyarov, 2010: 119-131).

It should be pointed out that in Kazakhstan it is not customary to trace causes of interethnic conflicts, conflict situations to ethnopolitical disagreements, cultural confrontation and ethnophobias. Probably, behind it is a desire not to complicate relations with the authorities which present their interethnic policy as Kazakhstan's know how and boast the interethnic field of Kazakhstan as one of the most stable worldwide. Therefore, it is little wonder that an overwhelming majority of Kazakhstan's experts, analytical structures have put forward economic factors allegedly tangled with skirmish as a root cause of interethnic conflicts that took place in Kazakhstan.

However, we believe that the main factors of ethnic conflict, ethnic tensions in the country are the socio-cultural factors. These, in our opinion, are such phenomena as the conflict of social status and cultural values. Position in society, public respect and honor is highly valued among Kazakhs, even more so than material values. Kazakhs also appreciate the calm tone, relaxed manner of a speaking companion. (Krysko, 2002). So when someone starts to neglect those values, a Kazakh will take it as a challenge and an insult. An example, is the way in which conflict between ethnic Kazakh and Turkish workers unfolded in the oil and gas companies in Karabatan Atyrau region of Kazakhstan in 2006 where Kazakh officials have long received lower wages and social benefits than their Turkish counterparts. Whilst a factor, this pay differential was not the major cause of the conflict between them. The main cause of the conflict was that the Turkish workers were defiant, dismissive and disrespectful to the Kazakh colleagues. The result of which led to a massive confrontation.

In connection with the above-said it appears that attitude of the Russian Diaspora to the Kazakh statehood, culture and Kazakh language exerts much influence on exacerbation of tension, general level of attitude of non-indigenous ethnoses to the Kazakhs. It is quite justifiable to highlight this factor since the Russian language is the most functional one in Kazakhstan's community. Moreover, Kazakhstan's Russians from the outset of republic's independence as if appear as secret rivals of the Kazakhs in their original right to Kazakhstan's territory and statehood. It's no coincidence that as early as at the beginning of 1990s a lot of gossip was circulating in Russia's information space about transfer of a number of northern and north eastern territories of Kazakhstan with dominant Russian population to Russia. We think that the so-called post-imperial syndrome of Kazakhstan's Russians has been displayed in this particular factor. Existence of this syndrome negatively affects general status of not only the Kazakh language, Kazakh culture, Kazakh literature but statehood of the Kazakhs themselves. Let's quote some certain data that prove existence of that syndrome among a good deal of ethnic Russians in Kazakhstan.

In particular, for instance in 1991, 77% of ethnic Russians in Kazakhstan treated the USSR as their native land. Meanwhile, the figure was 50-60% for ethnic Russians in Baltic republics (Pope, 2002). Social study conducted by the Institute of Philosophy and Political Studies of the Ministry of Education and Science of the Republic of Kazakhstan in July – August 2007 has exposed that nearly 23% of interviewed ethnic Russians still treat the USSR as their native land.

Russian ethnopolitical organizations are quite pro-active in Kazakhstan as they find support of some representatives of the Russian ethnos in the republic. For instance, in spring 2010 website of Kazakhstan's ethnic Russians <http://www.russians.kz> that was active until late last year conducted an opinion poll of readiness of the Russians 'to live in 'the Kazakh Republic' and to live under hegemony of 'the Kazakh nation responsible for nation development.'" In the end of the 7453 who voted, 80% (5,972 people) were against it. Possibly due to pressure from the authorities, the results of this survey have been removed.

In addition, from the results of opinion polls in different years, it becomes clear that among all non-indigenous ethnic groups of Kazakhstan, the Russians have the lowest degree of readiness to integrate around the nucleus of the Kazakh culture (Kharitonova, 2008). It is also necessary to mention that Kazakh Russians exhibit the lowest knowledge of the Kazakh language or the desire to learn it. (Shaukenova).

In our opinion, in this case reluctance to learn the Kazakh language and to coalesce around the Kazakh culture is due to conflicts of social statuses of the Kazakhs and the Russians. The Russians have lost their previously high status when they were a top ethnos in the USSR. While the Kazakhs instead have gained a higher status in sovereign Kazakhstan. Thus, rivalry for status entails hostility to a rival, disregard of its culture and language, the more so as the Russians view themselves to be higher in cultural and civilization development than the Kazakhs. It is also necessary to pinpoint that growth of negative nationalism, imperial moods in Russia that we covered earlier also can exert significant influence on behavior and motivation of Kazakhstan's Russians.

Therefore, post-imperial syndrome of wide ranges of Kazakhstan's ethnic Russians is among key factors that prevent formation of Kazakhstan's ethnoses into a single nation and reduce scope of interethnic concord in Kazakhstan's community. Of course, there are other weighty causes that slow down nation building in Kazakhstan. For instance, it is a low level of democratization of Kazakhstan's socio-political system that hinders full-fledged exercise of different rights and interests of Kazakhstan's citizens, including ethnopolitical and ethnocultural. However, this subject is beyond the scope of our research.

# Continuity in educational supervision: a case study

Esen Altunay<sup>a\*</sup> Didem Arlı<sup>b</sup> Yakup Öz<sup>c</sup> Münevver Yalçinkaya<sup>d</sup><sup>a</sup> Faculty of Education, Ege University, 35040, İzmir, Turkey<sup>b</sup> Faculty of Education, Ege University 35040, İzmir, Turkey<sup>c</sup> Faculty of Education, Ege University, 35040, İzmir, Turkey<sup>d</sup> Faculty of Education, Ege University, 35040, İzmir, Turkey

---

## Abstract

The aim of this study is to examine the continuity of supervision and how it is done. It is thought that the study is important because it brings out the ideas of supervisors about the continuity of supervision. This study is a qualitative research and a semi structured interview is used. Participants are composed of education supervisors in İzmir. Purposive sampling method is used in the study. At the end, the importance of continuity in educational supervision is emphasized.

*Keywords:* supervision, continuity, education

---

## 1. Introduction

Today, education system that prepares individuals for change and keep face with the change with its whole elements is needed. Rapid changes in technology and production of knowledge forces organizations and employers to learn and because of that rearrangement of adopted objectives, content, appliances and tools used in education is required. To follow this change, sustainable renewal of teachers who are the basic elements of education increases id needed (Memduhoğlu & Zengin, 2012). So, teachers' need to develop and renew themselves not only increases the importance of their own efforts, but also increases the importance of efforts and supports of the people who is responsible for growing up teachers (Ergüneş & Ovalı, 2011). A way of providing that is to apply an effective supervision process by giving priority to guidance and professional development.

Inspection involves visits, observation of organizational services, programs and plans, evaluation of the quality made by the inspectors individually or in teams (Wilcox, 2000). From this point of view supervision can be assumed as a control mechanism. However, supervision as it has a developmental function is seen today as an essential tool emphasizing the necessity of supervision (Aydın, 2005; Demirtaş, 2010).

According to Başar (2000), principles of supervision are intentionality, planning, continuity, objectivity, integrity, contingency, openness, and democracy. Because of integrity and effectivity in the implementation of

\*Corresponding author. Tel.:+90 505 658 60 88

E-mail address: esenaltunay@yahoo.com

principles of supervision, there should be in an interaction among these principles. For example, contingency needs integrity, openness interacts with democracy, and continuity interacts with planning. Continuity is used for expression of continuing actions and cases never cut (Bıçak, 2004). It is seen both in problem and in solutions of that problem (Bıçak, 2004; Özen & Sağlam, 2010).

When there is no continuity in supervision, it is too late for changes and corrections. Also, continuing supervision provides the interaction of past and future (Başar,2000). In contemporary educational supervision there is an order and continuity. How teaching methods should be regulated to the student's development levels, methods of supervision also should be regulated in accordance with the teachers' professional development levels (Aydın, 2000). When the literature is examined, it is seen that researches investigating the continuity in supervision that it is limited. Hence, it is important to apply supervision services and to ensure continuity of them.

### *1.1.Aim of the study*

Purpose of the study is to examine the continuity of supervision and how it is done. It is thought that the study is important because it brings out the ideas of supervisors about the continuity of supervision.

## **2. Method**

This study is a qualitative research and a semi structured interview is used. Participants are composed of education supervisors in İzmir. Purposive sampling method is used in the study. Draft of the semi structured interview form gets the final form through with the expert opinions. In the study, internal validity is obtained by examining of experts, confirmation of participants and making the interviews in a long time interval. External validity is obtained by detailed description. Also, by consistency examining, internal reliability is obtained and by confirmation examination made by three experts, external reliability is obtained. For the data analysis, descriptive and content analysis methods are used.

## **2. Findings**

Opinions of the participants are gathered without their names, but coded because of the privacy reasons. So, supervisors' names are coded as 'D' and every participant gets code names as 'D1, D2, D3... D10'.

### *3.1. Opinions about continuity of supervision*

Through that sub problem the first question in the interview is "How do you describe the term continuity which is one of the principles of supervision?" As an answer to that question, education supervisors mentioned on teacher development, graduating student, frequency of inspection time/periodic inspection, inspection of the principal, clinical supervision, integration of school and inspection, continuous exchange of ideas, active

communication, continuity of observation, subsequence precedence relation, following the quality, control of problems and bureaucratic necessity.

One (D2) of the supervisors talked about continuity in supervision as: "Continuity of supervision is to carry out a guidance process and to evaluate in certain time intervals. Primary schools are inspected certainly in every two years. There is continuity. Every institution is inspected in every two years. Especially it is on the primary school level. But, there is not a certainty on the inspection of new primary, secondary and high schools. There will be change in the regulation, by the Ministry. The law makes us to get the responsibility of supervision of those schools. Government institutions are inspected in every two years and private institutions are inspected in each year." D1, D5 and D6 coded participants also said similar things and emphasized those inspections are made periodically. The one (D3) who specified continuity in education supervision can be provided if the school managers are given more authority on supervision tells: "Continuity of education supervision is to provide supervision by making school principals more sufficient on the education activities in school and to continue to remote supervision by the supervisors." D8 also says similar things with D3.

### *3.2. The perceptions on how to provide sustainability in inspection*

The question in the interview form according to the sub dimension is "How is the sustainability provided in inspection?." As response to this question, provincial education inspectors mentioned the reports, usage of different communication methods, the same inspectors' inspection, legal regulations, total assessment, raising awareness, preparing effective inspection plans.

The provincial education inspector D8, expressed his views about different communication methods and raising awareness as "The aim of inspection is to make teachers their self inspection., that's why inspectors have been trying to raise awareness, only by raising awareness inspections can be continued. ...I have been talking to teachers, trying to persuade the teacher to correct the false situations and also trying them to believe. If the teachers believe in me, he makes the change himself. If the teachers believe in the inspector that he guides the teacher then he can share his troubles with the inspector. If the teachers believe that the inspector will only criticize him there becomes a negative communication". D2 also mentioned his ideas as follows "After the inspection there becomes a bond between the teacher and the inspector. All the communication ways such as internet, phones are open to the teachers. We also give our mobile phone numbers to the teachers. They can call us whenever they want, it does not matter if it is day or night. Especially this year, due to the primary class first level, lots of people called me. School administrators, teachers all can call us." D1, D4, D5 and D6 expressed similar views as D8 and D2.

One of the provincial education administrators' D3 expressed his view as, " According to the legislation, schools are inspected biennially. This period causes fast inspection and decrease in quality. When you visit a school, you can see that at least 40 teachers work there, and you should do the inspections in two days , we write

our reports, and deliver it to the related chair.” And like D3, D2, D5, D6, D7 and D8 mentioned that reports are one of the most important factors for the sustainability of the inspection.

### *3.3. The perceptions on the significance of inspection's sustainability*

The question in the interview form according to this sub dimension is “ Why sustainability is important in inspection?”. As a result of the analysis five themes emerged out which are, the significance according to organization, student, society, teacher, inspector. The most important theme is the importance of inspection for the teachers' improvements (D2, D3, D5, D6, D7 and D8) secondly for the success of the students (D2, D3, D4 and D6).

One of the provincial school inspectors expressed his view about the improvement of teachers as follows, “The aim of the feedback after the observation of the teacher is for guiding them to improve themselves. For the guidance we tell both the positive and negative sides of them. For example during the lesson, if the teacher always tells the lesson himself we warn them and tell them that it is not appropriate to the programme. I suggest some resources related to the trouble.”. D3's idea on the success of the students is as “ I think that inspection remains unclaimed as it is done biennially. If head teachers and inspectors play more roles in the inspection system, schools will not remain unclaimed, and the sustainability of the inspection will remain. If the inspection is sustained, it will be effective in students' success.”

Four provincial education inspectors (D3, D6, D7, D8) expressed similar views about the continuity of inspections importance according to the inspectors . D3 said “ The continuity of inspection can be effective to the inspector for his own motivation. Inspector's motivation has been decreasing. You visit one or two schools in a year. Our mood also changes in time. When you go to a school, you should be prepared. For preparation you should have taken data about schools before. However none of them happens.”

### *3.4. The perceptions on the factors that affect the sustainability of inspection negatively*

The question in the interview form according to this sub dimension is “What are the factors that effect the continuity of inspection negatively?”. The most emphasized themes are the limited period of inspection, (D2, D3, D4 and D5), the improvement of working conditions of inspectors (D1, D2, D5 and D6), the change of growing up inspectors (D4, D6 and D7), the variety of inspection field (D3, D4 and D6), the change of some factors that are related to Ministry (D5, D6 and D7), the improvement of competencies of inspectors (D3, D4 and D8), the improvement of administrators competencies (D3, D8), multiple inspection systems (D3, D8).

D5 mentioned his thought as follows; “ We have been talking on our troubles about the improvement of our working conditions, we always face with the similar problems, we also are not informed about the change in education system for example about 4+4+4 although we do the inspections.” D3 expressed his thought as follows “ The inspections which is done for guidance is limited. Our working conditions is expanded through the

Ministry of Education decree so we can not catch up with those many works. We also have investigation responsibilities besides guidance and supervision. The variety of inspections prevents us from the time for guidance.” D4 said, “I visited a school and attended 80 hour lesson, I looked at the performance of the teacher, namely I observed his job performance. I examined his job planning and current situation for his success. At the end of the lesson, there becomes an identification for the current observed situation. What did the teacher do? He did this, he does not know this, at the end he gained improvement, this is not enough, ..but the time is not enough.”

About the negative effects D5 told the following statements, “ There has been a problem on the sustainability of the inspection. There is an educational planning problem. These plans are not done by educators or theorists or field experts. A lawyer became minister of education, engineer became minister of education, as they were not educators they assumed that they made an invention. That s the painful side.”

D8 said “ The inspection should be revised. Inspection has been done in three different levels, internal audit, ministry and primary school inspectors should be combined under one level. There becomes role challenge in inspection system.”

### *3. 3.5. The perceptions on the suggestions of providing the sustainability of inspection*

The question in the interview form according to this sub dimension is “ What are your suggestions to provide the sustainability of inspection?” The mostly emphasized themes are alternately inspection in specific schools (D1, D2, D3 and D5), the increase of knowledge technology (D3, D4, D6 and D7), the increase of decentralization (D5, D6, D7 and D8), the structural change of inspection system (D2, D4 and D8).

D5 expressed his idea as follows; “The inspectors’ working in specific fields or working in limited number of schools alternately gives him the opportunity to know the school more. The assessment of the inspection becomes more objective.” D3 said, “The increase in the usage of knowledge technology should be better, I formed up a group in internet during my visit to third class. I felt myself as if I visit the school more often, I was taking notes also, but the information had reached us before we visited the schools, we did more logical guidance.”

## **4. Discussion**

Supervisors thought the relationship with the concept of continuity which is one of the principles of supervision and teacher development, graduating of students, periodic supervision, supervision by school principal, clinical supervision, co-operation with school and supervisor, continuous exchange of ideas, active communication, continuity of observation, the relationship of priority and post, follow up of quality, control of problems and bureaucratic necessity. Supervisor provided continuity of supervision with methods of reporting, using of different communication techniques, the control by the same supervisor, compliance with laws and regulations, making collective assessment, raising awareness, preparation of effective supervision plan.

Supervisors said that continuity of supervision was important in terms of corporate, student, community, teachers and supervisors. Supervisors mentioned factors that adversely affect the continuity of the supervision such as limited supervision period, improving the working conditions of supervisors, change of supervisor training, diversity of supervision field, change of management structure of the Ministry, development of supervisors' competences, development of administrators' competences and structure of multi-control system. Supervisors reported that in order to ensure the continuity of supervision, supervisors should work in particular schools, use the information technologies, enhance decentralization and change the structure of supervision system.

According to the findings, supervisors tried to explain the continuity of supervision in terms of basic elements of the education system, supervisors whose the using methods indicated that they tried to realization of continuity partially however supervisors presented the solution suggestions due to institutional problems and individual problems of supervisors in education system. The suggestions of this research in line with these results are as follows:

1. The realization problems related with continuity of supervisors should be discussed by school administrators, supervisors, teachers and academics.
2. Supervisors are responsible for overseeing the institution and the number of teachers is very high. When it is added to investigations and inquiries, workloads of supervisors further increased. However the numbers of theirs are not sufficient. Therefore, the number of supervisors can be increased in schools.
3. Because period allocated for supervision is insufficiency for even identification and assessment the various aspects of teachers, supervisors can be started to in only a few number of schools.

# Corporate Social Responsibility Education in the Czech Republic

Pavel Adámek\*

*Silesian University in Opava, School of Business Administration in Karvina, Univerzitní nám. 1934/3, Karvina 733 40, the Czech Republic*

## Abstract

The corporate social responsibility (CSR) movement has gathered great momentum over the past number of years is now regarded as being at its most prevalent. However, there has been a lack of attention to, and discussion of, CSR in Czech and in relation to education. The paper reports findings from a survey of CSR education (teaching and research) in the Czech Republic. It analyses the extent of CSR education, the different ways in which it is defined and the levels of teaching. The paper provides an account of the efforts that are being made

to mainstream CSR teaching and of the teaching methods deployed. It considers drivers of CSR courses, particularly based on historical development and the anticipation of future success being dependent on more institutional drivers. Finally it considers main developments in CSR research both by business school faculty and students, tomorrow's researchers and the resources devoted to CSR research. The conclusion includes questions that detected further research directions.

*Keywords:* corporate social responsibility; the Czech Republic; survey of business schools; teaching and research

## 1. INTRODUCTION

This paper reports survey of corporate social responsibility (CSR) education in condition of the Czech Republic (CR). We mean teaching and research of CSR in this country with emphasis to the public role of the business school (private and state). The significance of this survey lies in the question as to whether business school are no more than brain washing institutions education their graduates but if appropriately develop CSR approaches in their teaching. Others have concluded that there is an "intellectual bias against business ethics" in business ethics and similarly oriented areas is systematically discouraged and seen as a "field of study... falling somewhere on the vector between ambivalence and disdain" (Hosmer, 1999, pp. 91, 102). Conversely other surveys have presented a more positive picture, notably the Beyond Grey Pinstripes report of the Aspen Institute conducted first in 2001 and repeated (Aspen/WRI, 2003). These findings contrast with some earlier studies (for an overview see Collins and Wartick, 1995) by depicting a growing interest and consolidation of business ethics and responsibility related topics in business schools' teaching and research agendas. In Czech there was an study in 2008 from the University of Economics, Prague, which was attended by 236 students. The research proposal was focused on determine the general knowledge of the CSR and how to get the original information on this concept. The research showed that the term CSR knows 73% of those surveyed students, mostly from newspapers of by studying at the school.

\* Corresponding author. Tel.: 00420739479938

E-mail address: adamek@opf.slu.cz

The general field of CSR in Europe is shaped somewhat differently and took longer to take off as an academic discipline. Certainly the most comprehensive initial overview over the situation in Europe has been provided by Mahoney (1990) in a comparative study of the teaching of business ethics in the U.S., U.K. and continental Europe. More recent information on the situation in European business schools has been case-study based work on business ethics practice in various European countries (Matten and Moon, 2004). In 1998, the European Business Network for Social Cohesion and The Copenhagen Centre provided information of a range of business schools' activity but did not aggregate or interrogate the findings. So far then, there has been little attention to assessing the overall state and shape of the contemporary CSR field in European business schools.

This paper reports on the findings of a survey that was designed to fill the gaps in relation to connection of the concept of CSR in terms of educational institutions in Czech. The first goal was to provide an overview of teaching and research in the broad field of CSR and describe the main institutions that are significant from this point of view. We assumed that CSR would mostly be understood as an umbrella term for a broad set of synonyms and different concepts reflecting both business and society relations and business ethics. The second goal was to capture the range of meanings of and activities in CSR reflecting Czech's different business and educational contexts. Thirdly, we were interested in finding out what role in terms of visibility, acceptance with students, resource provision for research and general expertise the area possesses at Czech universities.

The choice of the terminology of CSR was determined by the action that key institutional players (such as the 2002 founded European Academy of Business in Society, key media and to a growing degree, corporate oriented publications) seems to have made this term an increasingly popular label (e.g., [www.csreurope.org](http://www.csreurope.org)). The new imperatives for CSR raise the challenge for corporations to acquire and develop appropriate skills and competencies. This raises the question of the role played by universities and business schools, the key provider of business education, in terms of:

- Provision of graduates with CSR skills,
- Supply of CSR education for practitioners,
- Specialist CSR education for industries,
- Research to advance knowledge in CSR.

The paper analyses these issues by addressing the following questions:

- At what levels and in what sorts of courses is CSR taught?
- Is CSR taught to business students, tomorrow's business leaders and managers?
- What meanings are attached to CSR education?
- Is CSR teaching conducted with business and community partners?
- What are the drivers for CSR teaching?

The paper continues, first the brief characteristic of literature review of CSR meaning and terminology. Secondly, we define the current approach of CSR in the Czech Republic - as the institutional background, as well as in the educational process. We define the key players in the field of CSR and the core institutions.

### *1.1. Literature review*

The Corporate Social Responsibility (CSR) movement is rapidly growing in significance as a strategic management instrument over the past number of years. Not only has the issue received academic attention but has quickly moved up the corporate agenda (Knox et al., 2005, Ogrizek, 2002). However, there has been a lack of attention to, and discussion of, CSR in the Czech Republic. The considerable emphasis placed nowadays on the societal role of business is in accordance with the spreading belief that measures of company success must go

beyond profit and should also relate to the needs of stakeholders and society at large (Natale and Sora, 2009). According to Carroll (2000) CSR is becoming the defining business issue of our time, affecting corporate profits and credibility, as well as personal security and sustainability of the global economy.

One of the factors contribution to the extension of CSR is the lack of consensus as to what the concept really means (Carroll, 1979; Panapanaan et al., 2003). Although the acronym CSR is now well rooted in the business lexicon (specifically in the European approach), a meaning of the term remains a subject of much debate (Roberts). Dahlsrud (2007) identified 37 of definitions that have variety of significance. It has been described as and subjective (Frederic, 1986), unclear (McWilliams, 2001), amorphous (Margolis and Walsh, 2001), highly intangible (Cramer et al., 2004), ambiguous (Fisher, 2004) or as and concept with unclear speculative boundaries. The majority of Czech authors (Trnková, Putnová, Čaník, Řezbová, Zavřel, Dyrtr, Petříková) used a positive approach to the definition based on subjective perspective. One of the most cited definitions could be seen from Carroll (1999) which is constantly being developed by many authors.

CSR has also been characterized as the concept in a variety of ways such as legally complying with the letter of the law, complying with the social and environmental codes of conduct engaging in corporate philanthropy, and the broader impact that business has on society among others (Jenkins, 2004; Khan et al., 2011; Prieto-Carron et al. 2006). According to the first authors (dealing with CSR issues) such as Berle, Means or Bowen, the emergence of the concept is due the increase in large companies. They already define the social responsibility of the businessman as a voluntary integration of social values in the management. A major idea is that CSR can be determined by the consequences of the company's activities on the stakeholders. CSR's issues are focused on a triple bottom line which includes: economical, social and environmental issues. The role of business in society is rapidly changing and the companies no longer operate in isolation but are a part of the business environment. The sustainability Performance management is also a new term in the field of entrepreneurship and corporate social responsibility (Kocmanová and Dočekalová, 2012). In relation to business and education, a variety of definitions have been proposed which focus on issues such as number of employees working in the enterprise, annual turnover, ownership types, and formal versus informal economy status (Jamali et al., 2009).

Additionally, well educated managers of e.g. SMEs plays a significant role in the local community with a high-degree of inter-reaction and acting as benefactor by support to the local economy by creating job opportunities. It has been argued that companies are constrained by the time and financial resources (Sarbutts, 2003 and Vives, 2006). On the other hand, it has been argued that being smaller and flatter; SMEs may be better placed than large firms to take advantage of the changing needs of society (Perez-Sanchez, 2003 and Sarbutts, 2003). Therefore, it is necessary to include in education, especially at universities the field of CSR. The acquired knowledge is then transferable by graduates (managers) into practice. Business ethics and community support play an important role in various business environments.

### *1.2. CSR approach in the Czech Republic*

In the CR at the beginning was the impulse of most companies involved to focus purely on philanthropic donations. Over the time, a number of companies have steadily been growing and companies are engaged in a remarkable range of activities. Today, Business Leaders' Forum's mission is promotion and enforcement of CSR in line with European methodology and best standards. The Forum closely cooperates with the European Commission and European Commission's Directorate-General for Employment, Social Affairs and Equal Opportunities (BLF, 2012).

The *harmonization* of Czech law with EU legislation, and the Czech Republic's accession to the European Union, contributed to major advances in the promotion of CSR. As long ago as 1998 the Czech Republic adopted, among other things, rules for the introduction of Eco-Management and Audit Scheme (hereinafter also EMAS), and prepared the first National EMAS Program. The program was updated in 2002 and is currently governed by EC Regulation no. 761/2001. In order to fully participate in this program, companies must, among other things, introduce an environmental management system which contributes to the continuous improvement of their environmental conduct. In 2007 there were 17 Czech organizations registered in the EMAS Registry, and another 1.500 in the EMS system (ISO 14001) from *Czech Environmental Information Agency*. The *milestone* in building foundations of CSR was August 2003, when the Sustainable Development Council of the Czech Government (hereinafter also SDCG) was established as a standing advisory body of the Government for sustainable development and strategic management. Increasing interest in CSR and a trend in implementation of CSR reflect also surveys of the Business Leaders' Forum. In 2004 in the survey 76 % of surveyed companies claimed to be involved at least in one CSR activity (the most frequently towards employees); in 2007 it was almost 90 %. CSR awareness has also been increasing thanks to international corporations operating in the country as they belong among main supporters of CSR and have brought essential know-how.

As CSR gaining its popularity among entrepreneurs, some non-governmental organizations have been focusing on building partnership between profit and non-profit organizations in the area of corporate philanthropy, corporate volunteerism, social marketing, environmental protection and others (e.g. HESTIA, AISIS, Czech Donors Forum, Environmental Law Service, Business Leaders' Forum, etc). In March 2007 the Ministry of Labour and Social Affairs created a new website on CSR, to inform users about the concept of CSR in the European Union. The website also provides references to different projects and activities concerning the promotion of CSR (Czech Ministry of Labour and Social Affairs, 2012).

According to surveys in the business sector, it appears that the main CSR related priorities are the environment, well-being and philanthropy. In each field is the most important to get into public awareness while the SMEs should implement this approach and gaining the competitive advantage in the futures market. For that purpose was founded the *key CSR actors* in the Czech Republic: Ministry of Human Rights and Minorities ([www.vlada.cz](http://www.vlada.cz)); Ministry of Labour and Social Affairs ([www.mpsv.cz](http://www.mpsv.cz)); Ministry of the Environment ([www.mzp.cz](http://www.mzp.cz)); Ministry of Industry and Trade ([www.mpo.cz](http://www.mpo.cz)); Business Leaders Forum ([www.blf.cz](http://www.blf.cz), [www.csr-online.cz](http://www.csr-online.cz)); Association of Fair Business ([www.korektnipodnikani.cz](http://www.korektnipodnikani.cz)); Czech Society for Quality.

Awareness is widespread, but information is lacking as to specific CSR topics. Many CSR-related activities are of common public knowledge but they are understood as concepts in and of themselves and not within the CSR context. However, the broader concept of CSR is slowly taking root in educational institutions such as universities. It is often covered in courses on Corporate Governance, Business ethics and in some cases it exists as a separate course as well. From *environment part* of situation in CR are related - *National action plan* - the current policy on climate change is in the process of modification (Ministry of the Environment of the Czech Republic, 2012). Environmental awareness is largely promoted through the *Czech Republic's National Cleaner Production Program*. In addition, there are a number of educational programs that reach out to the younger generations, introducing them to important personal practices such as sorting waste.

From the *cooperation between local communities and businesses* there we found that the business community involvement is generally not innovative. While normative projects and activities are carried out, ongoing dialogue and cooperation between businesses and communities is not common. *Sustainable Products and Services* are included into the Czech Republic's National Trademark on Quality is given to products that meet certain standards regarding quality/sustainability. The program consists of approximately 20 trademarks,

including several that focus solely on environmental impact of the product. It was mentioned that company best practices is implemented into the *Business Leaders' Forum*. Currently, has collected and disseminated practical CSR tools and guidelines via its web portal.

## 2. Methodology

Although our aim was to include institutions and types of CSR courses, a new issues arise in the study of CSR education in the methodological field. In this paper, we focus on the public high schools (universities in Czech) of economic type. In the CR, there is clear structure of universities. They are divided into four groups: 1. state universities, 2. public universities, 3. private universities, 4. universities with MBA program (see Table 1). We only targeted at the public sector, which is crucial because it allows education to all groups of potential students, there is no discrimination in terms of regular financial payments, this education is free for all students and it is financed by the state budget.

Our focus is institutional and research tool was expressly designed to elicit information about business schools and their broader attitudes, approaches and indeed their openness towards teaching and research activities in the chosen area. As the concept of CSR does not originate in Europe, we expected a range of terms to describe it and as we aimed to capture a culturally sensitive picture of CSR education, we have discovered a huge range of CSR synonyms: *Corporate Social Responsibility (CSR)*, *Business Ethics*, *Corporate Citizenship*, *Sustainability*, *Business and Society*, *Business and Governance*, *Business and Globalization*, *Stakeholder Management*, *Governance*, *Corporate Environmental Management*. The clarification of methodological issues which are used in research:

- What is a “university”? In condition of the CR we mean the name for institutions of higher education – finished with graduates in bachelor, magister, Ph.D. and MBA programs. They could be state-funded or private-funded universities.
- What is “CSR”? There is a variety of labels used in CSR educational courses. Literature overview of the meaning is included in following part of the paper.

Table 1. List of high schools of economic type in the Czech Republic

Type of university	State university	Public university	Private university	Universities with MBA programs
Number of universities	2	20	40	27

Source: Own primary research

As in the CR was not such a study performed and there is no single database that would be listed as individual statistics on objects or taught programs, so we came out a detailed analysis of the individual websites of all schools involved in the research and from the website of the Ministry of Education, Youth and Sports. We identified institutions with a facility for business education, whether in business schools or in university faculties or departments of management, economics, accounting, administration etc. This yielded 80 institutions but only 20 public universities became the subject of research.

## 3. Findings

We define the nature of CSR courses in terms both of individual *modules* (semester length courses) and full dedicated *programs* (multiple modules leading to a degree or other award). The variety in the conceptualization

of CSR education is illustrated by the fact that in the CR *we have no level and types of CSR programs* (there is no comprehensive program focused on the area of CSR). This was a surprising finding that we do not assumed. Positive findings are in the area of variety in the labels used for *CSR modules* titles (see Table 2). The percentage expresses of use of the selected terms used in the modules. It means that there are specific subjects taught at public universities.

Table 2. Generic labels of CSR modules

Business ethics 32%
Ecological/Environmental Management 28%
Corporate Social Responsibility 21%
Accounting 18%
Corporate Governance 17%
Business and Society 10%
Management/Business; Human Resource Management (all 7%)
Corporate Citizenship; Finance (all 5%)
Sustainable Development 3%
Leadership, Transnational, Geopolitics (all 1%)

Source: Own primary research

CSR itself is used only 21% of universities though is the third most common single title. The first place have “business ethics” 32%, which stems from the historical development of the country, where the term is most often used - according to old habits (does not have the same meaning as in Anglo-Saxon countries). Second position is occupied by a “environmental management” 28%. This aspect is given importance of the EMAS certification and relevant ISO standards 14000. The relative scarcity of modules labelled CSR itself or such close synonyms as corporate citizenship, sustainable development, finance, leadership, transnational – this values suggests that are unlike business ethics and we see as a recent development in Czech business education.

Therefore, it appear as a dynamic platform for teaching a number of current societal issues or management fashions. It is also stringing that there is proliferation of CSR labels generally considered of fringe status from a business school perspective. According to Moon and Matten (2004) from their perspective have to CSR education to make a difference in the future of business it should be in the form neither of a hived-off programme nor an optional module but embedded in the core of business education.

Many CSR teachers and practitioners share this view that CSR should be fully integrated into degree level teaching programmes. This is known as “mainstreaming” and would enable every business student to be made aware of the social and ethical dimensions of their future activities as a businessperson. We offered greater use of these tools in university education: formation of optional modules, embedding in other modules and courses, compulsory modules and other CSR teaching activities (seminars, conferences, special events, workshops, etc.)

We identify the most *teaching tools* used in CSR teaching (see Table 3). There is evidence widespread use of business speakers, NGOs speakers or CSR managers speakers as well as case studies from practical part of business environment (the key role are the large international companies). The tools related to the academic sphere are not so often use, such as e-learning, discussions or international student exchange. This suggests that the CSR teaching is influenced by practice.

INTE 2013

Table 3. Special tools used in CSR teaching

Teaching tool	Percentage of using the tool (%)
Business speakers	23
CSR based on case-studies	20
NGO speakers	15
CSR speakers (managers)	10
Communication (media) speakers	4
Other, the most popular:	6
- E-learning	
- Discussion forums	
- International student exchange	

Source: Own primary research

Other areas of research have been focused on the drivers of CSR education not only in universities but in all business schools. The survey invited perceptions of recent and future drivers of CSR business education. Specific drivers of CSR education were identified according to our findings in this order (the most important is in the first place, at least meanings driver is in the last place): individual faculty members; leadership of school/faculty/department; business organizations; students, university leadership; CSR networks and associations; governmental bodies; and society.

In comparison with the future success of CSR teaching is more important focused on the individual faculty members with a research interest or otherwise in CSR. The future drivers of success of CSR teaching in business school we define as business approval and support, required for program accreditation, inclusion in business school ranking, employment success of graduates, governmental incentives.

#### 4. Conclusions

The paper set out to address questions about the extent and the ways in which Czech business education addresses the broad topic of corporate social responsibility. The survey succeeded in gathering data from a wide range of public universities of economic type. There is a highly diverse understanding, contextualisation and packaging of CSR teaching. Although the term CSR, its current agenda items and other current business-society agenda items have gained currency, many modules are grounded in the longer term orientations of business ethics and environmental responsibility.

The variety in the conceptualization of CSR education is illustrated by the fact that in the CR *we have no level and types of CSR programs* (there is no comprehensive program focused on the area of CSR). Positive findings are in the area of variety in the labels used for *CSR modules* titles. Social responsibility reflects the values of the society in which we live and also will live future generation. CSR is not just a matter of business leaders, but concerns all of us. Educational institutions in the Czech Republic should, therefore, their subjects into the curriculum and to offer their training courses to include far more this issue. One possible approach is seen in the drivers of future success CSR teaching in business schools. Another factor is the support of educational institutions, students - support the work of professional business school students deal with this issue. The key role we see in national and international student's awards.

We can conclude that in the short post-revolutionary history of the country, we see positive development in the higher level of involvement in CSR training modules, but it is necessary to develop comprehensive programs in the bachelor's, master's and doctoral studies. Support from institutions, business sector and the government will be crucial for future success of CSR teaching.

This paper constitutes an important step in providing an overview over CSR education in Czech. It is intended that our findings focus the attention of business schools and their all stakeholders on their CSR education provision and that they provide benchmarks for further research in the area. Future goal of the survey is to intensify research on all four types of universities.

## Acknowledgements

The paper was supported by the Internal Grant of the Silesian University in Opava with the grant project title: “*Perception of Corporate Social Responsibility of Business in the Czech Republic*” with the registration number of the grant project: IGS/20/2013.

## Abstract

Creation of new study programmes follows introducing new products the perspective of which depends on the globalization growth and trends in economy, business activities and enterprises that is the assumption for the graduates to assert at the labour market. These activities are at the University of Zilina supported also by resources from the projects of the European Social Fund within the Operational Programme Education. The University of Zilina submitted and the employees are working at the project titled “Innovation and internationalization of education – tools of quality enhancement of the Zilina University in the European Education Area” that includes also the issues of study programmes creation and innovation at the selected faculties and departments. The aim is to enhance the quality of education at the Zilina University through development of innovative forms, attractive study materials and rationalization of study programmes. This paper is oriented on widening the offer of the university education at the Zilina University with emphasis on the needs of labour market and knowledge society.

*Keywords:* study programme, innovation, internationalization, graduates, education.

## 1. Importance of innovation and internalization of education

In the Strategy Europa 2020, in its principal initiatives and new integrated directions, knowledge is in the center of the EU effort for achieving smart, sustainable and inclusive growth. In the proposal of the financial framework for years 2014 – 2020, the European Commission supports this strategy through increasing the budget for investments in education, research and innovations. The reason is that education and especially higher education and its connection with research and innovations are essential important factor for advance of the individuals as well as the whole society. The result of education is high - qualified human capital and active inhabitants that are necessary for Europe to produce working positions, economic growth and prosperity. Thus the higher education institutions are important partners in realizing the objectives of the EU's growth strategy Europa 2020 for achieving the advance and sustaining the growth. For the purpose to contribute to the smart, sustainable and inclusive growth as much as possible on the part of the European systems of higher education, reforms in key fields are necessary with the aim to increase number of graduates in all three levels of higher education: bachelor, master and doctoral; to enforce quality and relevance of human capital development in higher education; to develop effective mechanisms for administration and financing in connection with support of excellence and to enforce knowledge triangle among education, research and business sphere (Strategy Europa 2020, 2011).

\* Corresponding author. Tel.: +421 41 513 6766; fax: +421 41 513 6620.

E-mail address: maria.luskova@fsi.uniza.sk

The strategic aim of the Slovak Republic innovation strategy for 2013 is that the Slovak Republic will develop, within years 2007-2013, national innovation framework that will include regional and innovative structures. The regional innovative structures (incubators, innovation centers, schemes, advisory centers and other elements) will establish a basic structure leading to permanent sustainability of the Slovak Republic on the base of knowledge. Based on these assumptions, the results achieved in 2013 should be as follows:

- positive trend of innovation processes development in economy and social sphere,
- number of successfully realized projects,
- innovations will take a share of 25% in increase of the gross domestic product in mentioned year (at present the share on the gross domestic product is 8%),
- more than 50% of enterprises in industry and services, especially small and middle sized enterprises (SMEs), will have innovative character (according to the European Commission information only 13% of SMEs placed new products on the market, whereby 32% of actual products were innovated in years 2002 – 2004),
- better competitiveness especially of SMEs,
- more than 5% of ideas for enterprise innovations will have a resource in higher-education research, resort research and Slovak Academy of Sciences (at present the share of ideas for innovations from university and academic environment is less than 1%).

The business sector, especially through SMEs, is considered to be the innovations bearer in general. To perform this task, professionally prepared, educated and creative human sources are necessary. Therefore education and obtaining experience and knowledge related to applied research and new innovative methods realized in business sphere have to be the priority field of innovative strategy. To meet the increasing demands on knowledge employees, the professional preparation of research workers within their higher education has to be better connected with needs of knowledge national labour market and especially with requirements of SMEs (Innovation Strategy SR for years 2007-2013, 2013).

The Government of the Slovak Republic in the Manifesto for years 2012-2016 declares that, within its priorities, it will support the higher education, research, innovations with special view to natural and technical sciences and with relation to all-society needs and economic development as well as the mobility of students, higher-education teachers and research workers (Manifesto of the Government of the Slovak Republic for years 2012-2016, 2013).

Innovation in education is usually understood as something new, modern, more interesting, more stimulating what is introduced into educational process to increase its attractiveness for students, to achieve better study results and better self-assertion of graduates at the labour market. The innovations in educational process are the most frequently connected with:

- use of information – communication technologies as cross-sectional tool (modern e-learning technologies and information systems, internet schools and on-line courses, electronic educational materials and modern electronic interactive teaching aids),
- activating, participating methods of work with students, (e.g. project method),
- innovations of educational content (curricula on new subjects),

- use of less usual organizing forms (e.g. block education, specialized laboratories, virtual laboratories and experiments for distance),
- introduction of elements of verified innovation programs (e.g. integrated thematic education),
- management of education, knowledge management, learning organization,
- use of results of scientific-research activity of educational institution in educational process.

## 2. Innovation and internalization of education at the University of Zilina in Zilina

The University of Zilina in Zilina (UNIZA) is a public higher education institution of university character. In its faculties and institutions UNIZA provides education in all three degrees of higher education and in many educational activities within continuing education. The UNIZA has seven faculties, see Fig. 1:

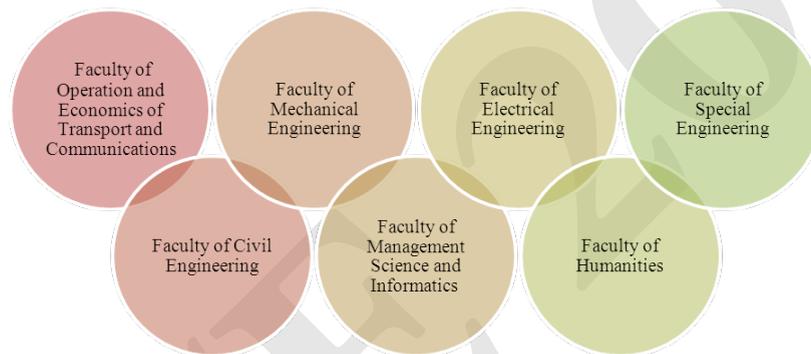

Fig. 1. Faculties of the University of Zilina in Zilina

The most important fields of the scientific-research activities are connected with profile of the university in the field of education and its results provide necessary preconditions for further education advance and improvement. They also contribute to form firm relations with social practice and enable the UNIZA to be a sought partner for home and foreign universities as well as other institutions and enterprises during solution of joint scientific-research and educational projects, participating in international programmes and academic mobility.

Development, innovation and precision of the study programmes offer and also creation of suitable structure of students' number in bachelor, engineering/master and doctoral study programmes are in accordance with the long-term intention of the university in the field of the higher education. The UNIZA proceeds from assumption that the tendency to specialization will deepen especially in the 2nd and 3rd degree of study, that the study offer in bachelor programmes will be balanced with interest and that engineering/master study programmes will be selective for applicants that will meet the more demanding requirements of this type of study. Likewise demanding selection will be precondition for study in doctoral study programmes and their development will

correspond with university orientation in scientific-research field (Long-term intention of the University of Zilina in Zilina, 2013).

Based on these facts, the UNIZA successfully implements also projects oriented on enhancing educational process within the European Social Fund in the Operation Programme Education. Within this program a lot of projects have been elaborated and implemented, e.g.:

- Flexible and attractive study at the University of Zilina for the needs of labour market and knowledge society 2010-2013.
- Development of quality culture at the University of Zilina on the base of the European standards for higher education 2011-2013.
- Innovation and internationalization of education – tools of quality enhancement of the University of Zilina in the European Education Area 2013-2015.

The above mentioned projects include all faculties of the UNIZA and support especially trend for development of joint study programmes of interdisciplinary character within the faculties. The important factor in development of education is also applying modern methods and forms of education and involving students also in out-of-school activities of the university. Through these joint projects the UNIZA tries to create an environment and other assumes especially for strengthening pedagogical activities oriented on motivation and support of independent work of students and work in teams, support of activities that lead to obtaining the skills and habits necessary for future professional life and especially for forming abilities necessary for permanent education, obtaining and classifying information and their creatively processing and application. Within evaluating and new formulating study programmes the UNIZA tries closely cooperate with representatives of the most frequent employers of the UNIZA graduates, scientific-research institutions and partners in abroad. The university will have a respect to opinions of current students and university graduates. The study programmes will be prepared in so way to be able to be realized in English language. Preparation of the UNIZA graduates in respective study programmes has to be concentrated on obtaining a good position at the labour market and trouble free assertion in practice. Likewise the results of scientific-research and art work (except basic research) have to be applicable and broadly usable in practice or in cultural and societal life. Therefore close connection with practice is condition of the university development.

### **3. Initiatives of the Crisis Management Department of the Faculty of Special Engineering in the field of innovation and enhancing educational process.**

Faculty of Special Engineering of University of Zilina in Zilina is technologically and managerially oriented faculty. It educates college-educated professionals for demand of public administration and business entities in field of crisis management with emphasis on protection of persons, economy and environment. Basic mission of faculty is to provide college education in accredited study programs of bachelor, master and doctoral studies, to expand knowledge by means of creative scientific research in field of crisis management, to provide lifelong learning related to its accredited study programs (Loveček, T. at all., 2012; Hudáková, M. - Veľas, A. 2011) :

- Crisis management.

- Security management.
- Rescue services.
- Transport in Crisis Situations.

Crisis Management Department's mission is to provide an academic education by the Civil Security study programme. Graduates are prepared to deal with the processes of risk assessment and emergency management in the public administration, municipalities, private sector and institutions dealing with living environment protection. Department of Crisis Management guarantees scientific education and organizational preparation of emergency management specialists educated through the Civil Security Programme. The Department provides the University education on 3 levels in compliance with Bologna process – Bc, Ing, PhD, and in accordance with Slovak law NR SR No.131/2002 about Universities and according further legal changes. The accreditation of 8.3.7. Civil Security study programme has been done recently in accordance with the law mentioned above.

Graduates are theoretically prepared for the professional life in the governmental sphere as well as in the private sector. The main sphere of the competence within the public sector is connected to the roles and tasks of risk and emergency management in governmental institutions, municipalities, and in the environmental institutions. Graduates have accurate knowledge on risk solution methods, they can provide risk analysis in various environment. They can deal with risk assessment and crisis elimination on management positions in public sphere or in (none)-industrial sector. There are several post-gradual courses provided for employees of Emergency management units of Ministry of Interior, Ministry of Defence, Ministry of Economy, Ministry of Transport, Posts and Telecommunication SR and for other governmental units and institutions dealing with emergency management. (Móricová, 2012; Sventeková at all. 2012; Crisis Management Department's mission, 2013)

Through its specific scope of activities Department of Crisis Management belongs to the smaller departments of the UNIZA and each year about 30-40 students successfully finish their full-time engineering study and 15-20 students finish their external engineering study. Similar number of graduates finishes also bachelor study.

**Department of Crisis Management of the Faculty of Special Engineering**, in accordance with long-term intention of the UNIZA, actively participates in activities focused on innovation and enhancing educational process. The aim is to provide education that will correspond with requirements of practice and current knowledge society. Pedagogical as well as research workers are part of teams participating in solution of university projects and actively work on specified tasks. Within these activities we can mention e.g. project *Flexible and attractive study at the University of Zilina for the needs of labour market and knowledge society* that included also preparation of new bachelor study programme Risk Management and preparation of accreditation documents of study programme *Civil Protection* in English language.

Within the activities of the Department of Crisis Management that are oriented on ascertaining the pedagogical process quality and prepared modification of existing study programmes, the department requested graduates who finished their study in years 2006 – 2010 to answer several questions aimed at:

- identification of strengths and weaknesses of pedagogical and scientific-research work,
- evaluation of graduates assertion,
- opinions on satisfaction/un-satisfaction with study (quality of study).

This survey was realized in year 2011 and for its needs anonymous questionnaire distributed through e-mail was prepared. 31% of total number of requested graduates (190) participated in this survey, from them 55% were women and 45% were men. 92% graduates were 25-30 years old.

From the total number of respondents, 73% were employed as assistants, specialized employees, and chiefs. 75% of graduates are satisfied with provided education and consider it to be qualitative. 43% of graduates use their knowledge in the practice. Because small numbers of graduates are employed in crisis management field it is apparent that they do not use their knowledge specifically oriented on crisis management but they use especially knowledge from general subjects what indicated also respondents' responses. Knowledge obtained within study of the subjects and fields - information technologies, logistics, management, economy, managerial statistics, foreign language, econometrics, marketing, crisis management, managerial psychology- are according to the graduates the most applied knowledge in their work. They would need further education in foreign languages, economy, management, marketing, managerial psychology, information technologies what results from various graduates professions. The majority of graduates (79 %) think that education realized by department should be more focused on practice, but 71 % of them said that students are lead to self-realization and 88 % graduates positively appreciate approach of pedagogues to students.

According to graduates, developing cooperation with practice, integration of lectures of professionals from practice to education, possibility to obtain certificates during study and many other activities focused on development of students' personalities, future crisis managers could contribute to enhancing the education and their subsequent assertion. With respect to very limited file extent, the results are not statistically important but they provide stimuli that can be used in the future (Móricová, V. – Klůčka, J., 2012).

Except this small survey, each year the Department of Crisis Management realizes a survey of students' satisfaction also in the form of anonymous questionnaire that is focused on ascertaining satisfaction with quality of education, organization of educational process, approach of teachers and study conditions. The students have also opportunity to express their stimuli for improvement of study organization.

At each faculty, evaluation of education quality is a part of the Report about faculty activities that is discussed at the collegium of dean and at the meeting of academic senate and once a year also at the meeting of the Scientific Board of the faculty.

In connection with these activities the Faculty of Special Engineering participates also in project Innovation and internationalization of education – tools of quality enhancement of the University of Zilina in the European Education Area.

Within preparing this project, focused on innovation and internationalization of education – tools of quality enhancement of the Zilina University in the European Education Area, two main objectives were defined (Švarcová, R, 2013):

### **1. Support of education quality at the University of Zilina through development of innovative forms, attractive study materials and rationalization of study programmes.**

The aim is proposal of conception of attractive study materials creation and elaboration of methodology for producing multimedia study materials as repeatedly usable objects, stored in digital library that will be used for creating study resources for on-line education. Introduction of new methods into study programmes (virtual laboratories) will be a part of conception. The activity includes also pilot verification of preparation and creation of new attractive study materials based on the uniform university system supporting their quality assurance and possibility of use by other departments of the UNIZA. For the purpose to achieve this objective, the faculties and departments of different orientation are selected so that the specifics could be identified and conditions for various needs of study programmes could be afforded. Within this activity new study programmes will be established and accreditation documentation of new study programmes for the 1<sup>st</sup>, 2<sup>nd</sup> and 3<sup>rd</sup> degree of higher education at selected faculties of the UNIZA. Primarily the analysis and comparison of existing study programmes with offer of the European universities will be elaborated. Modern content of study programmes in accordance with labour market needs and knowledge society will be proposed to improve the assertion of university graduates at the labour market in accordance with obtained qualification.

### **2. Increase of the University of Zilina participation in international cooperation through support of teachers and students mobility and introduction of joint study programmes.**

The aim of this activity is innovation of international teachers and students mobility process based on the identification of the weaknesses in actual teachers and students mobility, elaboration of internal legislation, recommendations and tools for mobility support and their increasing, enhancing teachers and students competences for effective participation in mobility, development of cooperation in common study programmes at international level, development of intentions dealing with preparation of new and adaptation of existing study programmes in cooperation with prestigious foreign universities and development of joint study programme.

In this project the Department of Crisis Management of the Faculty of Special Engineering is also dealing with preparation of new engineering study programme *Risk management* and accreditation documentation of bachelor and engineering study programme *Security and protection of critical infrastructure*. Except the Faculty of Special Engineering also the Faculty of Electrical Engineering, Faculty of Management Science and Informatics, Faculty of Humanities and Faculty of Civil Engineering are participating in implementation of this project within their professional orientation.

### **4. Conclusion**

One of the basic tools of country competitiveness increasing is orientation on quality human sources development. This is dependent on effective and enhanced educational process especially in higher schools that provide scientific knowledge and guarantee education that ensures high degree of knowledge, skills and abilities of the graduates to be able to find their job in rapidly changing labour market requirements. The only way for the higher schools is to adapt structure, organization, content and method of study to new conditions.

# Criteria for second foreign language preference

Orhan Kocaman<sup>a</sup>, Nurgül Kocaman<sup>b</sup>

<sup>a</sup>*Sakarya University, Faculty of Education, Turkey*

<sup>b</sup>*Sakarya University, Faculty of Education, Turkey*

## Abstract

The current study aims to find out what language other than English stands out as a second foreign language in a small scale of study at the faculty of education at Sakarya University. English is a widely spoken and accepted foreign language in Turkey. Families who send their children to state schools wish their children to study English and the case is not different for the families who send their children to private schools. In private schools, the language issue is somehow different because the students in these schools start learning a second foreign language at very early ages usually in well equipped classes and with high qualified teachers. The languages taught in these schools differ according to the school policy. German as a second foreign language seems to be the most popular language taught in these schools. French was the dominant language in Turkey in the 19th century. Language preferences inevitably change in accordance with the global changes. It is a clear fact that English is becoming prominent all over the world and the other languages can have only the second or third place in the order of most used foreign languages in many countries. The USA and The UK spend great effort and budget to spread English worldwide and try to keep English as a dominant foreign language in many countries. Today in many countries like Turkey, English is the dominant foreign language and it is regarded as lingua franca.

**Key words:** second foreign language, dominant, private schools, prominent.

## 1. Introduction

Throughout the history, some languages as French, Arabic and Persian became very popular in Turkey from time to time. For instance, from the 15th century to the early 20th century, Persian was popular. However, as scholars point out, the use of this language was limited to the elite. In other words, Persian had never diffused among masses. Arabic was the language of science and education in Ottoman Empire until the period of Reorganisation. With the advent of Reorganisation period, besides Arabic and Persian, French was also started to be taught in Enderun schools. The translation office founded in İstanbul was turned into Language School (Lisan Mektebi) in 1864. In addition to French, Romanian, Bulgarian, German, English and Russian were taught in Lisan Mektebi where foreign language teachers were also educated. With the reformation in Madrasas in 1914, foreign languages were integrated in the Madrasa curricula (Aslan, 2010). In the 19th century, French became popular and yet its use remained limited to intellectual and governing elite. (Yucel, 1982, 21)

English, on the other hand, enjoys a great popularity not only among Turkish elite, but also among ordinary Turks, especially among the Turkish youth, today. Even though there is no statistical data showing what percentage of Turkish people in general or the Turkish youth in specific use English, it is obvious that one can

see in the Turkish press, media and television that English has been increasingly used in Turkey. Reasons for the increasing popularity of English in Turkey are closely related to the integration of Turkey into globalization process. Beginning from the 1980s, Turkey has increasingly become influenced by globalization. (as cited in Acar, 2004, 2)

Turkey's economic integration with global economy also contributes to the increase in the use of English in Turkey. Employment pages in Turkish daily newspapers, such as *Hurriyet*, *Milliyet* and *Sabah* show that many companies with international connections require their employers to have knowledge of foreign languages (as cited in Acar, 2004, p2). Among these, the most required language appears to be English. German and French, and Russian are other required languages by the business sector.

In addition to the influence of global developments, such as internet, global economy, tourism, western movies and the emergence of multi-channels, educational policies of Turkish government are major factors in the rising popularity of English in Turkey.

In the past, the first school with foreign language education, Robert College, was opened in 1863 and Uskudar American College followed it in 1871. There was also Galatasaray Imperial Lycee that was opened in September 1869. The education was completely in French in this school (Shaw, 1977, p109). Darüşşafaka, which was the first non-governmental organization started education in 1873. It was nominated as a better school than many others in terms of teaching French and science courses (Demircan, 1988). The mission of Darüşşafaka Association was providing "equity in education." Bright and talented children who have lost one of their parents and who have limited financial resources become eligible to study at Darüşşafaka after passing a competitive exam when they are ten years old, and Darüşşafaka provides them access to quality education at international standards (retrieved from [http://en.wikipedia.org/wiki/Darüşşafaka\\_Association](http://en.wikipedia.org/wiki/Darüşşafaka_Association) on May 15th,2012).

In the same period, Italians, British and Germans founded their own schools too. After the end of the Ottoman Empire and the foundation of the Republic of Turkey in 1923, the new Turkish government declared a new law of education on March 3rd 1924. According to this law, Arabic and Persian were replaced by French, English and German as foreign languages in school programs. Until 1956, Galatasaray Lycee was the only school that gave education in a foreign language. In 1974-75, the number of schools giving education in foreign language, which are called Anatolian high school, was 12 and it reached to 23 in 1982-83 (as cited in Acar, 2004, p2). After this date, the number of Anatolian high school dramatically increased. In a world of competition, these schools felt obligated to raise their standards up to private schools and they added another foreign language to their curricula.

## **2. Methodology:**

### **2.1 Participants**

This study was conducted with 361 freshmen (212 female and 149 male) from different departments at the faculty of education at Sakarya University in 2009-2010 academic year. Convenience sampling method was used in this study.

### **2.2 Procedure**

A questionnaire comprising 20 items was prepared for this study and participants were required to put them in order from the most to the least important item which showed the reasons for their language preferences

(appendix). In addition to the questionnaire, a structured interview consisting of 5 questions was prepared by the researcher. The participants were given the questionnaire in order to collect data. After the data were collected by the researcher, it was saved on the computer and analyzed with Statistical Package for the Social Sciences (SPSS 16) and 17 structured interview questionnaires were randomly selected from 361 questionnaires and the participants' points of view were reflected to the study. The questionnaire and the interview responses were translated into English by the researcher.

The item analysis for each language was done only in terms of 3 most important items such as item 1 is the most important, item 2 is the 2<sup>nd</sup> most important and item 3 is the 3<sup>rd</sup> most important item in tables. The questionnaires were given numbers and participants were labelled with the same numbers given to the questionnaires. Thus, participant (21) means the questionnaire numbered 21. The responses based on mainly participants' views are listed as;

The participant (21) states that s/he does not find language planning and policies (LPP) inadequate and s/he thinks that education in Anatolian high schools and private schools are also inadequate. S/he states that the level of learning a foreign language depends on intelligence. S/he also argues for that language teachers are quite qualified but they cannot teach efficiently.

The participant (26) states that language education in schools is not adequate and s/he emphasizes that distant languages can be learned harder than the similar languages adding that teachers are equipped with sufficient language knowledge to teach a foreign language.

The participant (28) states that LPP in our country is wrong. It gives the impression that foreign language education is given because of obligation or formality and it is not taught for practical purposes. S/he also pinpoints that graduates of private schools are not capable of using the foreign language since the language education level is low in these schools.

The participant (33) states that students learn grammar well but they cannot communicate well. S/he also explains that speaking skill is not given enough importance and s/he highlights that classroom atmosphere, vocabulary knowledge, L1 level are the factors affecting language learning. S/he suggests that language teachers should consider language learning important and use correct methods. S/he claims that many teachers use wrong techniques.

The participant (34) states that people in Turkey have had English education for years but they cannot speak English properly. S/he points out that English is taught better in private schools and underlines the fact that learning English is somehow based on a person's linguistic intelligence. S/he thinks that a teacher can be considered to be qualified if s/he can teach what s/he knows.

The participant (36) states that the language education in primary and secondary schools is rather inadequate and inclined to rote learning and s/he claims that s/he could not benefit from this kind of education. S/he points out that language education in private schools are better than Anatolian high schools. As for the factors, s/he states that environment, friendship, school and level of English in primary school affect language learning. S/he says that although teachers are qualified in their field, they do not reflect this in their teaching. Thus, the number of the students who can speak English is not more than only a few.

The participant (37) states that s/he does not find language policies adequate adding that enough importance is not given to teaching a foreign language and s/he says that some private schools are really good at teaching a foreign language. Anatolian high schools used to give high standard foreign language education but after prep classes were abrogated the situation turned to worse in language education. S/he says that the most important factor is the academic success of the teachers. As for language teachers, they are successful at Anatolian high schools and universities and they can be more successful if they stay abroad.

The participant (39) states that language teaching is based on rote learning in schools but it should be based on practice. S/he asserts that private schools are better than Anatolian high schools due to the financial conditions. S/he also suggests that learners do not have a chance of communication in L2 and they lose their motivation because what they learn cannot be used in practice. S/he also adds that there are many language teachers who have high competence and teach efficiently.

The participant (41) states that language policies do not help students to learn a foreign language because students prefer having a passing grade instead of learning a foreign language. S/he adds that students are loaded with useless grammatical points which are no use in practice. S/he underlines that education at Anatolian high schools are adequate but it is not as adequate as at private schools. Factors affecting language learning can be listed as teacher's method, teacher's attitude towards to the students, how the students consider language and lesson. S/he claims that language teachers do not spend enough effort to improve themselves and suggests that language teachers should stay in the country where the language they teach is spoken.

The participant (44) points out that LPP in our country is not logical because authorities sometimes make explanations about the foreign language education whether it should be compulsory or elective. S/he adds that full language attainment is rather hard as long as learning is confined in the classroom because continuity is an essential factor in language learning. S/he claims that private schools provide better language education for their students than other schools. S/he suggests that teachers should have sufficient knowledge and motivate students and s/he also finds language teachers qualified at Anatolian high schools.

The participant (46) states that Turkey considers foreign language education important. The number of language teaching hours is high at Anatolian high schools and private schools and s/he suggests that foreign language teachers should have competence to teach the language and create an atmosphere students should enjoy learning. S/he points out that foreign language teachers our country high standards in teaching the language.

The participant (49) states that language policies in our country do not serve language teaching at all. Although students know grammar, they cannot learn how to communicate because of insufficient course hours at state schools. As for affecting factors, distance of the studied language, structure of the language and features of language teacher are important factors. S/he criticizes teachers explaining that teachers cannot teach whatever s/he knows.

The participant (81) has added one item to the item list saying that the selected language helps a person develop intellectually and s/he criticizes teaching method stating that it is mainly based on grammar teaching. S/he also underlines the fact that private schools and Anatolian high schools give better language education compared to other state schools. S/he suggest that listening to music, watching subtitled movies and people who speak the language affect language learning positively. As for teachers, they follow procedures and do not have much to do about this situation but some teachers make use of this and do not do anything to improve themselves.

The participant (70) states that English is taught as a foreign language in terms of foreign language policy. S/he thinks that teaching English as a foreign language is normal because in many parts of the world English is a universal language. S/he claims that It must be compulsory. In addition, adequate levels of English can be taught in different foreign languages. I think language education is not sufficient. It is rote learning. Only students who can get good grades are targeted. Even though I graduated from Anatolian high school I do not believe an elaborate foreign language education is being given there. S/he pinpoints that teacher's attitudes and techniques affect language learning in a class. Willingness of students and student awareness are also very important. As for teachers, I think teachers are qualified in terms of pedagogical and language skills.

The participant (57) suggests that necessary measures should be taken because foreign language education in private schools and Anatolian high schools is extremely inadequate. English lessons in Anatolian

high schools are reduced to ten hours, preparatory year is abrogated which causes the problem to get bigger and bigger. Students are trying to learn English rule by rule and this does not help them in daily life or in business to talk to a foreigner. Factors affecting language learning can be listed as a teacher factor, the interest in the country of the language spoken. As for teachers, pedagogical and language competence of foreign language teachers in our country are high but many students cannot make use of this situation. This is due to the rote learning.

The participant (86) states that education policy in general is poor adding that a language should be learned by practicing. S/he claims that the foreign language education is mainly based on theory. S/he claims that language is learned according to today's conditions and needs. S/he also suggests that foreign language education should be spread to the four years and should not be limited with one year in schools. S/he thinks that teachers are generally qualified.

The participant (53) states that English and German are taught since they are the most important languages but there is a demand for teachers of English in schools. The government should invest a little more on English teachers and provide good conditions for them. English and German are taught in Anatolian high schools. Students at Anatolian High Schools speak this language better than other students at state schools. s/he also states that s/he cannot judge teachers' qualifications.

### 3. Findings and Interpretations

**Table 1: Percentages of selected languages**

		Frequency	Percent
Valid	German	86	23,8
	Arabic	48	13,3
	Chinese	27	7,5
	French	62	17,2
	Spanish	35	9,7
	Italian	24	6,6
	Japanese	49	13,6
	Russian	24	6,6
	Other	6	1,7
	Total	361	100,0

When we look at table 1 and its bar chart, we can see that, German is the most preferred second foreign language selected by 86 participants with 23%. French is the 2<sup>nd</sup> most preferred second foreign language selected by 62 participants with 17%. Japanese is the 3<sup>rd</sup> most preferred second foreign language selected by 49 participants with 13.6%. Arabic is the 4<sup>th</sup> most preferred second foreign language selected by 48 participants with 13,3%. Spanish is the 5<sup>th</sup> most preferred second foreign language selected by 37 participants with 9.7%. Chinese is the 6<sup>th</sup> most preferred second foreign language selected by 27 participants with 7.5%. Italian and

Russian are the 7<sup>th</sup> and 8<sup>th</sup> most preferred second foreign language selected by 24 participants with 6.6%. 6 participants preferred Korean, Norwegian, Portuguese, Greek, Bulgarian and Flemish as a second foreign language to learn.

**Table 2: The items that indicate why participants learn a foreign language.**

**(1 most important, 20 least important)**

Items	N	Minimum	Maximum	Mean	Std. Deviation
s1	361	1,00	20,00	8,37	6,05
s2	361	1,00	20,00	10,57	5,33
s3	361	1,00	20,00	10,21	5,24
s4	361	1,00	20,00	10,73	5,54
s5	361	1,00	20,00	9,25	5,40
s6	361	1,00	20,00	9,47	4,91
s7	361	1,00	20,00	11,90	5,68
s8	361	1,00	20,00	15,63	6,72
s9	361	1,00	20,00	6,56	4,71
s10	361	1,00	20,00	10,27	5,70
s11	361	1,00	20,00	12,33	5,17
s12	361	1,00	20,00	9,76	4,87
s13	361	1,00	20,00	9,09	5,68
s14	361	1,00	20,00	9,73	4,72
s15	361	1,00	20,00	14,60	4,81
s16	361	1,00	20,00	13,49	4,47
s17	361	1,00	20,00	10,20	5,35
s18	361	1,00	20,00	7,86	5,15
s19	361	1,00	20,00	9,03	5,92
s20	361	1,00	20,00	10,94	5,20

Table 2 shows the most preferred items from the most to the least in languages preferred. Item 9 (*I would like to communicate with people who speak this language*) is the most preferred item as a mean of all languages (Mean=6.56). Item 18 (*I think this language will help me to gain prestige*) is the 2<sup>nd</sup> most preferred item as a mean of all languages (Mean=7.86). Item 1 (*I need this language to promote myself academically*) is the 3<sup>rd</sup> most preferred item as a mean of all languages (Mean=8.37).

As for the least preferred items according to participants, item 8 (*I find this language closer to me in the sense religion*) is the least preferred item as a mean of all languages (Mean=15.63). Item 15 (*I think this language will help me better understand my mother tongue*) is the 2<sup>nd</sup> least preferred item as a mean of all

languages (Mean=14.60). Item 16 (*I think I could express my feelings better in this language*) is the 3<sup>rd</sup> least preferred item as a mean of all languages (Mean=13.49).

**Table 3: The distribution of languages according to the gender**

Gender * Language Crosstabulation												
			Language									
			German	Arabic	Chinese	French	Spanish	Italian	Japanese	Russian	Other	Total
Gender	1,00	Count	44	26	11	48	16	19	38	6	4	212
		% within Gender	20,8%	12,3%	5,2%	22,6%	7,5%	9,0%	17,9%	2,8%	1,9%	100,0%
		% within Language	51,2%	54,2%	40,7%	77,4%	45,7%	79,2%	77,6%	25,0%	66,7%	58,7%
		% of Total	12,2%	7,2%	3,0%	13,3%	4,4%	5,3%	10,5%	1,7%	1,1%	58,7%
	2,00	Count	42	22	16	14	19	5	11	18	2	149
		% within Gender	28,2%	14,8%	10,7%	9,4%	12,8%	3,4%	7,4%	12,1%	1,3%	100,0%
		% within Language	48,8%	45,8%	59,3%	22,6%	54,3%	20,8%	22,4%	75,0%	33,3%	41,3%
		% of Total	11,6%	6,1%	4,4%	3,9%	5,3%	1,4%	3,0%	5,0%	,6%	41,3%
	Total	Count	86	48	27	62	35	24	49	24	6	361
		% within Gender	23,8%	13,3%	7,5%	17,2%	9,7%	6,6%	13,6%	6,6%	1,7%	100,0%
		% within Language	100,0%	100,0%	100,0%	100,0%	100,0%	100,0%	100,0%	100,0%	100,0%	100,0%
		% of Total	23,8%	13,3%	7,5%	17,2%	9,7%	6,6%	13,6%	6,6%	1,7%	100,0%

It can be easily observed from the table 3 that language preferences in terms of gender show significant difference. While the female participants most prefer French (22,6%) and least prefer Russian (2,8%), male participants most prefer German (28,2%) and least prefer Italian (3,4%). Calculations were done according to  $p < 0.01$ .

**Table 4. Item analysis according to German. 1= the most important 2=the 2<sup>nd</sup> most important 3= the 3<sup>rd</sup> most important**

Language		N	Minimum	Maximum	Mean	Std. Deviation
German	s1	86	1,00	19,00	5,9186	5,29865
	s2	86	1,00	20,00	11,9302	4,91287
	s3	86	1,00	20,00	9,7326	4,73143
	s4	86	1,00	20,00	12,7907	4,81203

6 participants preferred Korean, Norwegian, Flemish, Bulgarian, Greek and Portuguese. Table 12 show that they preferred these languages for the for the purpose of item 9 (*I would like to communicate with people who speak this language* Mean=4,1667) item 10 (*I think that the pronunciation of this language sounds beautiful* Mean=6,3333) item 6 (*By learning this language I can appreciate this country's points of view on my own country in their language* Mean=7,0000)

#### **Conclusion:**

After analyzing interview responses, we can conclude that the participants in this study criticize language planning and policies and find them inadequate. They find foreign language education in Anatolian high schools poor because of lack of motivation, lack of equipment and teacher quality. They think that teachers use wrong techniques and base their teaching only on grammar. They are also criticized to lead their students to the rote learning

They also point out that English is taught better in private schools and suggest that everyone should have the right to choose a language to learn and teachers should use the correct accent.

They also pinpoint that students are not willing to learn and they lack of motivation. Thus, it is impossible to teach a foreign language to someone that is not ready to learn.

As a final point of the research, it can be concluded that findings from this small scale study reflect the current situation in the second foreign language education and may be used as a basis of further researches.

# Cultural differences of international students in Turkey and problems they experience

•Yaser Snoubar<sup>\*</sup>, Gizem Celik<sup>b</sup>

<sup>a</sup>Hacettepe University, Institute of Social Science, Department of Social Work, 06230, "Ankara", Turkey

<sup>b</sup>Baskent University, Faculty of Health Science, Department of Social Work, 06810, "Ankara", Turkey

## Abstract

The number of students who come to Turkey for the purpose of education from different countries and different cultures is increasing. Often these students come from the countries in Balkan, Middle Eastern, Africa and Turkish Republics. These students experience various problems in adapting Turkish culture as a new way of life and this has negative impact on the educational success of the international students in Turkey.

In this paper, adjustment problems experienced by undergraduate international students in Turkey and the application of social work to solve these problems will be discussed.

*Keywords:* International students, adjustment problems, social work applications.

## 1. General information about the students who come to Turkey for Bachelor's Degree

Students, worldwide, who want to have higher education usually, choose USA, Canada, Australia and European countries. The leading causes of these countries to be chosen are better condition of the education level when compared to student's homeland, cultural diversity, and wide range of opportunities for students. In addition to this, according to a report of Roslyn Kunin and Associates, Inc. (2009), it is known that students who go abroad for education contribute to the economy (Ozer, 2012). In this way, both the students and the countries that give education have mutual advantages.

When the international student move is investigated for Turkey, the rise in the number of students to be registered is observed. For example, according to 2009 data, as the number of students to come to Turkey for education was 2713, in 2010 it became 7273. (Ozoğlu & at all, 2012) It is seen that Students who come to Turkey for education purpose are usually from Africa, Middle East, Turkic Countries, and Balkan Countries. One of the reasons for these students to choose Turkey is the "Islam Phobia" which was scattered around the west countries after 9/11 attacks in USA that led to a restraint on students' acceptance to west countries. Another reason can be shown as the cultural and language root which dates back to Ottoman Empire era. On the other hand, rise in the education opportunities in Turkey caused to rise in the number of International Students. Although it is seen to have rise in the number of international students, it is very low when compared to other countries. According to Özoğlu & at all (2012), the main reason is Turkey's undeveloped International Student policy.

According to Student Selection and Placement Centre's gender distribution data, number of male students is higher than female students. For example during 2010-2011 education periods, when the number of female students was around 10 thousand, the number of male students was around 17 thousand. This condition which

\* Corresponding author. Tel.: +90 506 887 50 44; fax: +90 312 246 66 74.

*E-mail address:* yasersnober@hotmail.com

can be considered as gender discrimination, gives information about the cultural background of international Students who come to Turkey for education purpose.

When the homeland of the students which choose Turkey is analyzed, higher number of students come from Azerbaijan, Republic of Northern Turkish Cyprus, Turkmenistan, Iran, Bulgaria, Germany, Greece, Mongolia, Afghanistan, Kazakhstan, Bosnia and Herzegovina, Kyrgyzstan, Russia, Albania, and Syria.

## **2. *Education Services For International Students in Turkey***

There are other services to be distributed by Youth and Sports Ministry, Prime Ministry Abroad Turks and Relative Society Chairmanship (ATRSC), in addition to services which are given to Turkish Students. For Example, when the social and cultural activities and missions given by ATRSC's International Students Chairmanship are observed, the main topics are;

- To ensure the success of students during their education period in Turkey,
- To do different workshops in Turkey and abroad in order to maintain relationships during and after the education period,
- To develop programs in order to provide better life quality, facilitation and opportunities for the International Students in Turkey,
- To improve scholarship opportunities in order to attract successful international students. (<http://www.ytb.gov.tr/index.php/uodb-menu-sol/uodb-gorevler-sol.html>, 5<sup>th</sup> June 2013).

The missions of Youth and Sport Ministry are to develop policies which support personal and social development of youth for both Turkish and International Students, to ensure the coordination between governmental structures, to determine the procedure and principal causes of services and project related to youth, to develop projects and supervise the results of projects. Higher Education Credit and Hostels Institution, youth centers, facilities, federations, and youth camps which are under the Ministry provide services for International Students. These services can be held under the topics of accommodation and recreation.

Scholarships, which can be determined as the most important service to be distributed to international students, are distributed as scholarship under the Greater Student Project which is to empower relationships after the break of soviet union in 1992, scholarship of The Scientific and Technological Research Council of Turkey (TUBITAK), Government Scholarships which are provided by ministries and institutions, scholarships of some private foundations and associations.

International Students in Turkey, whose number is over 30 thousand, are educated under 24% State Scholarship, 13% Government (including structures connected to government) Scholarship. There are no registry data about foundation and association scholarships. In the context of these scholarships, health, language education, university tuitions expenditures, and monthly allowance which are considered yearly. For the non-scholarship students, there are health centers which are called "Medico" where they can get free health service.

## **3. *Difficulties for Students to adapt Turkish Culture and its Influence on Education Success***

Even though international students pay attention, during the selection process, to the cultural harmony and countries' closeness, it is possible for them to have compliance issues. Leading causes of compliance issues which lead to cultural shock and stress are language inadequacy, psychological problems, exposure to discrimination, and economical difficulties. These problems may get denser with the addition of bigger difference between students social environment at their homeland and host country. According to a research which is done by Thomson & at all (2006) with the attendance of international students at University of Australia, it is founded

that bigger difference between culture of students' homeland and host country causes cultural stress and has a negative effect on the welfare of international students. Staying away from family, friends and cultural values, have negative effects on students to cope with stress. When discriminatory attitudes and security issues are added to this situation which can be considered under lack of social support, increases stress and decreases success (Thomson & at all, 2006).

Wang (2009) 's study on Chinese international students' cross-cultural adjustment in the United States, in which he investigated the effects of some factors on adaptation of international students in the intercultural, such as the roles of acculturation strategies, self-construals, perceived cultural distance, and English self-confidence. As a result of the research, it was determined that positive correlation between the above-mentioned factors and lengthy period of residence in the U.S., participation in the host society, direct communication, English self-confidence, marital status, perceived cultural distance, help in psychological adjustment and sociocultural adjustment.

Bastien (2011) in his study found psychological adjustment also significantly associated with acculturation strategy and cultural distance. This also suggests the need for targeted support interventions to facilitate the psychological and socio-cultural adjustment of international students in the academic field.

Özçetin (2013) researched the problems faced by international students in higher education in Turkey and the factors that influence these problems. In this research he investigated the adaptation problems of international students and search age, gender, economic situation, shelter, the host city, friend relationship, participation in social- cultural and sports activities and the nature of their training that affects social adaptation. As a result of this research, dormitory life, Turkish speaking, loneliness and the problems caused by cultural differences are the most important things that affect the international students in the education process in Turkey. According to the results there is a relationship between social adaptations and the genders of students, levels of income, and social relationships.

Pirliyev (2010) conducted an analysis about the level of adaptation of international students coming from Middle Asia by using "structural equation model". The finding of his research indicates that the difficulties relating to cultural adaptation of these students have adverse outcomes on the general adaptation process while language development has no significant contribution to the process; there is no correlation between the educational and cultural adaptation, and between the language development and cultural adaptation whereas there is a connection between the language development and educational adaptation.

In another study conducted by Özoğlu et all (2012) it revealed that cultural differences was one of the most important factors affecting social adjustment of international students in Turkey. The challenges faced by the students in adapting the Turkish culture are complicating their adaptation to daily life and time to time get the students closed to distractive level. The research also revealed that students from different cultures are uncomfortable from some of the behaviours of Turkish students who tend to ridicule when they see them in such traditional clothes. Some students misunderstood because of the clothing styles and accordingly express feelings of discomfort.

To sum up, major problems of international students in adaptation process stem from the difficulties of cultural differences and language barrier. These socio-cultural differences cause international students to have a fear of failure and feel ashamed when talking to Turkish students, and become a discouraging factor in classroom participation and social inclusion. It means that the cultural adaptation problems have negative impact on the educational success rate of international students. Therefore, it is necessary to attach importance to structure and implement initiatives towards tackling the adaptation problems of international students along with the opportunities of accommodation and scholarship. In this regard, social work profession might take significant roles in responding the problems of international students and in improving their educational success through efforts developed in cooperation with agencies in micro, mezzo and macro level. The general overview of social work practice regarding the subject matter can be found in the next section.

#### 4. *Social Work Applications for Solving International Students' Problems*

International students consider many reasons in selecting different countries to continue their education. Some of the factors are the quality of education, opportunities offered to international students, cultural affinity and the possibility of securing jobs after education. Though the decisions taken by international students are being done willingly and expressed as steps to creating a better career, students end up encountering various problems as a result of change of country. As mentioned earlier, the adaptation problems that are experienced due to cultural differences can be described as complex and stormy period in the life cycle of such students and this consequently worsens the conditions for international students.

On the one hand, international student a young person is struggling with the challenges posed by the physical changes; on the other hand, he is trying to answer question of "who am I", as well as trying to find meaning in his life and studying in an environment that is very different from their own cultural values, perhaps away from the support of family and friends. In addition, people coming from war and conflict prone environment find it even more difficult to adjust to such problems encountered by international students. In this sense, important professional support should be increased as well as the physical opportunities provided to students such as housing, scholarships, health and so on.

A multi-dimensional approaches and studies must be performed again for solution of these problems in different sizes. Individual, family, group, community, and resolving the problems of society and meeting the needs of preventive, performing studies covering the developer-converter functions, social work profession and discipline located in size of the service and policy-making, determined to remove the needs of international students and the solving of their problems remain significant. Most often, Social work practices that can categorize micro, mezzo and macro levels, basically, the provision of states of well-being of international students and aims to increase educational success.

Micro-level applications are referred to as individually-based social work practice which includes verbatim dialogues with international students. Acting by the "Within the surroundings of the individual" concept made in consideration of the international student's family, friends, school, dormitory environment, and so on, identification of systems that interact with students also refers to the study of these systems as well. Owning an active role in the solution of the problem with the value of self-determination personally experiencing the problem ensures the participation of international students, uncovering the strengths of the framework as well as support the empowerment approach reflects other aspects of the application.

Cover international students who are experiencing a similar problem or have a similar need to create the group, group-oriented method of social work, in other words, the mezzo-level applications. Interaction of groups that can indicate open or closed group features could be the nature of socialization and education groups. Given the importance of international students in the age characteristics and interaction we can say group will be more focused on the effectiveness of social work practices. Different topics or problems each week, depending on the nature of the group could be addressed in a group, such as the groups where different members of the group can participate (open group), groups where member can't be changed (closed group) can be made. Among the group there has to be members with similar problem or members who have experienced this problem before, the capacity of problem-solving of international students participating in the study will increase, through role-play performed in a group will help you know how to deal with similar difficulties faced in the society. Different institutions and organizations working within the field of social work carried out by experts.

Social work practices are forming a macro community, service, and policy elements. Youth in a society, are the most dynamic element of the socio-cultural structure. Future professionals' information managers and decision-makers in terms of the candidates are young people in higher education, social investments are important in these components. This will give many additives to international students' own country as well as the country they are educated in this sense. Therefore, the spread of higher education in the country next to the creation of successful

policies to attract international students to the country is necessary to expand the services offered to students. In this sense, youth, international students, knowing of the problems faced by the students and social workers participation in the policy-making process is very important.

## CONCLUSION

In subject of the international students, Turkey, like other developed countries, show development about becoming preferred and attractive country. In order to solve the problems of international students, and to ensure their participation in socio-cultural activities in Turkey and help them succeed in their education, it requires the monitoring of strategic policies to enable them to live in Turkey.

Cultural differences, whether in Turkey or in other countries, is one of the most critical factors affecting the success and adaptation of international students during their education. Therefore, Turkey, in order to have an effective strategy for international students, is expected to develop strategies in order to reduce or remove cultural differences and the negative effects of this problem. Within the framework of social work practices, in order to solve cultural difference problems of international students, various practices can be performed with individuals, groups, and at the community level. For example, create opportunities for international students to show their cultural activities. This may create attributes that reduce feelings of strangeness and enhancing self-confidence of international students as well as provide cultural awareness for the Turkish students. Doing those cultural activities and programs that will enable Turkish students to develop and communicate with international students on a regular basis, will reinforce cultural diversity and versatility as well as increased international student success.

More broadly, can be improved depth and importance of the topic with discusses it by conferences and symposia held in cultural diversity and multiculturalism themes. The problems targeted have to do with concepts of discrimination, exclusion, alienation and can be addressed as multi-dimensional, by different professions and disciplines, in addition to planning practical activities by producing the policy and services; could be considered. For example, small arrangements, may be possible in order to do discounts for international students in theatre, cinema and entertainment places, organize promotional theatre activities a week or once a month in the Turkish culture by the institutions of higher education, providing themselves to present introductory information in country foods, clothing styles, music issues.

Another dimension of the subject is that a portion of international students different from other students are likely to experience psycho-social problems and may have serious difficulties in adjustment as they come from the civil war in African countries, endless war and conflict environments in the Far East and the Middle East. Negative experiences in the war environment leads to serious problems in people's lives and it becomes difficult to adapt to a new society and hence to a new culture. There should be helping of international students who come from war environment for the purpose of education in Turkey through the provision of services that facilitate their adaptation such as psycho-social support programs, counselling services, job opportunities or scholarships. Orientation of international students to the culture of Turkey helps increasing their educational success and psycho-social well-being. For this purpose, policies that will be established and services that will be configured is thought to be important in terms of student mobility between the countries and the quality of education.

# Cultural safety in university teaching and learning

Elena Hunt, PhD\*

*Laurentian University, Sudbury, Ontario, P3E 2C6, Canada*

---

## Abstract

World population mobility as well as distance learning has led to increased multiculturalism on campuses and virtual classrooms. Immigration and travel calls for more accurate knowledge of cultural health and safety. This paper explores cultural safety, stereotyping and possible actions in the direction of raising awareness in a multicultural teaching and learning environment. The example of Nursing Education is used.

**Keywords:** Multiculturalism; stereotyping; cultural safety; nursing; health; intervention; indigenous people.

---

Motto: We are like all other people, like some other people and like no other person (Kluckhohn & Murray, 1948).

## 1. Introduction

World population mobility as well as distance learning has led to increasing multiculturalism on campuses and virtual classrooms. Due to globalization, nearly all universities list students with different cultural backgrounds. Concurrently with the education phenomena, immigration of all kinds and purposes, along with travel, be it for business or pleasure, call for deeper understanding and more accurate knowledge of cultural health and safety. Cultural diversity has been on the agenda of numerous governments, while Canada, Australia and the United States remain traditional leaders in multiculturalism policy. One may ask why it is important to understand other cultures. Leininger (2002) argued that without critical awareness, researchers and service providers tend to impose their beliefs, values and patterns of behaviour upon cultures other than their own, making it harder to recruit and sustain the participation of minorities.

The level of comfort for all cultures on campus need to improve, in order to insure safety and well being if we are to live and study together. A safe environment is necessary for scientific inquiry, exchange and dialogue to take place. Therefore, efforts are being put forth by universities around the world to build awareness of cultural diversity for the professionals of tomorrow, considering multiple initiatives to accept and celebrate cultural diversity. One university that has taken these types of initiatives is the University of Botswana. Botswana is a multi-cultural society, with several different languages spoken throughout the country. The student body at University of Botswana is a reflection of this society. As Lubinda (2010) reports, the University organizes an

\* Corresponding author. Tel.: 01-705-675-1151

E-mail address: ehunt@laurentian.ca

annual Cultural Diversity Day to celebrate their community. Students and faculty carry out research in the languages and cultures of various tribes. University of Botswana has taken a leadership role in compiling dictionaries and developing language codification (Lubinda, 2010).

In most universities of North America, there is some form of cultural diversity (Bennett & Salonen, 2010). Cuyjet, Howard-Hamilton and Cooper (2011), emphasize the importance of student organizations for cultural safety, competence, and diversity. They stress the importance of both curriculum activities and co-curricular life on campus. Additionally, these authors underline the importance of creating a positive relationship between the university administrators and the student organizations in order to improve, promote and celebrate cultural diversity in the campus setting.

Brustein (2007) emphasizes the importance of including international studies in more university programs. He suggests that while most universities prepare students for one specific field, they must also learn to work and live in a global society. He suggests that if some form of international studies were included in the mandatory course lists, students would have better job prospects when they graduate. For example, the University of Pittsburgh established a Certificate in Global Studies and philosophy degree in international and area studies, which are complimentary to other programs. Also, several universities in the United States, notably Michigan State University, encourage research to be done with international contributions. These are but simple beginnings of the measures that some American universities are taking to help build culturally aware professionals.

In Canada, similar but more specific efforts to raise cultural competence are being made by universities. Indigenous Peoples of Canada are seeking to create health care professionals that will improve the quality of their health care. Case in point, the University of Saskatchewan, the First Nations University of Canada and the Saskatchewan Institute of Applied Science and Technology have created a nursing program specifically geared towards Northern Saskatchewan's demographic map and culture (Anonson et al., 2008). This program gives the opportunity to several Aboriginal students to prosper in school and later on in their professional careers.

## **2. History of Concepts - Cultural Competence, Cultural Safety, Cultural Humility**

### **2.1. Cultural competence**

Cultural competence can be viewed and interpreted from many perspectives. The basic concept of cultural competence is simply knowledge of culture. Researchers have developed models to more specifically determine what cultural competence is. The conceptual framework of cultural competence includes a spectrum of three components: cultural awareness and beliefs, cultural knowledge, and cultural skills (Sue, 2006). The level of proficiency in a combination of these three elements illustrates how culturally competent an individual or organization is.

More complex models exist as well. One model used globally is the Purnell model for cultural competence (Purnell, 2002). It is composed of 12 domains that demonstrate many dimensions of culture: overview/heritage, communication, family roles and organization, workforce issues, biocultural ecology, high-risk behaviors, nutrition, pregnancy and childbearing practices, death rituals, spirituality, health care practice, and health care practitioner. This model, when compared to Sue's model, shows contrasting views of cultural competence. No one single model will ever be complete, but it is important to be aware of the many different models and their particular strengths.

Nursing is one specific profession where concepts of service learning and providing are used. A recent study of graduates from six different nursing programs by Kardon-Edgren et al. (2010) evaluates their cultural competency using Campinha-Bacote (2010) Inventory for Assessing the Process of Cultural Competency among Healthcare Professionals-R (IAPCC-R) as a measurement tool. The authors found that, on average, nurses were

culturally aware. Most programs differed in terms of cultural diversity of the students and faculty, however all programs included some type of service-education in the community. Although many factors contribute to cultural competency, the results prove that these programs are producing culturally aware nurses.

## **2.2. Cultural safety**

The concept of cultural safety was first explained by Maori nurses working in New Zealand. Their goal was to demonstrate their perspective on nursing programs. Cultural safety is a way of describing the ethics involved during trans-cultural interactions. It emphasizes that in a multiculturalist relationship, each individual has his or her own beliefs and morals, partially based on their culture. The practice of cultural safety “involves recognizing negative attitudes and stereotyping of individuals because of the ethnic group to which they belong” (Polaschek, 1998).

The literature surrounding cultural safety expands over different contexts. No matter the specific topic that a study reflects on, one key component that is almost always mentioned is cultural education. To develop culturally sensitive professionals, there must be culturally sensitive education (Wilson, Sanner & McAllister, 2010; Bennett & Salonen, 2010).

Cultural safety is important especially in the healthcare setting, both for the professional and the healthcare receiver. When entering into a healthcare relationship, all parties involved have their own ethnicity, culture and background (Capell, Veenstra & Dean, 2007). In order to maximize the results of healthcare, there is a necessity to educate future and existing professionals about cultural competence. Elsegood and Papadopoulos (2011) took the initiative to offer an online culture competence course to practitioners at Child and Adolescent Mental Health Services (CAMHS) in the United Kingdom, to then evaluate their potential progress in this domain. After the 8-week course, many practitioners reported that what they had learned will contribute to better care for their patients. However, the self-evaluation was done subjectively and the researchers only collected qualitative results. Thus, the challenge of evaluating culture competency persists.

## **2.3. Cultural humility**

Cultural humility can be best described as a state of mind. According to Tervalon and Murray-Garcia (1998) cultural humility is a commitment to self-evaluation and critique and to build a mutually beneficial relationship. Most of the research on cultural humility is done in the field of medicine, so the mutually beneficial relationship they describe is addressing the patient-physician relationship. The general attitude in this relationship is that the health caregiver is the expert. Cultural humility occurs when the caregiver takes time to learn from the patient about his or her cultural identity (spirituality, gender, race, ethnicity, family role, etc.), thus improving the care being delivered. The caregiver-patient relationship can be loosely related to the teacher-student relationship. Cultural humility in the classroom would occur when the teacher or instructor recognizes the cultural identity of the students as individuals, with the goal of improving teaching and learning.

These concepts (cultural competence, cultural safety and cultural humility) complement one another. In fact, cultural humility encompasses cultural safety, which cannot be achieved without cultural competence. Desouza (2008) differentiates cultural competence from cultural safety. She defines cultural competence as the process of learning about other cultures, whereas cultural safety is recognizing an individual's identity, partially based on the individual's culture. Furthermore, cultural humility can only occur when the person who is viewed as a higher authority is culturally competent. For cultural humility to be effective, the individual must be

culturally competent and safe, generally when in contact with a large group, or specifically when in contact with an individual. Essentially, cultural competence is the base, with cultural safety and cultural humility being stepping stones toward creating better professional relationships.

### **3. Insuring cultural safety on campus**

Decades ago, Geertz (1973) characterized culture as dynamic, all encompassing and made meaningful by understanding the interpretations of human behaviours and actions. Supporters of this view understand culture as complex, rather than static, and related to the processes of ‘meaning-making’ (Vandenberg (2010). Complexity only grows when a variety of cultures come into play. Multiculturalism becomes then a multifaceted compound phenomenon. The resulting interpretation of multiculturalism is so diverse, that chances of successfully integrating all of the different races and cultures into some type of harmonious gathering prove to be slim. Some organisations have tapped into the issue, trying to rationalize multiculturalism in their country or workplace. The outcome isn’t always positive, as many traditional college campuses and their surrounding communities continue to be perceived as unwelcoming, or at best, neutral to the presence of diverse students (Cuyjet, Howard-Hamilton & Cooper, 2011).

A number of scholars caution about strengthening rather than reducing stereotypes about people who are different in students during their learning years. If cultural engagement is not organized and delivered with careful planning, it can easily reinforce oppressive outcomes (Hess, Lanig & Vaughan (2007).

### **4. Culture clash? What causes conflict, racism and discrimination?**

When individuals from differing cultural backgrounds interact, there can be miscommunication, misunderstanding, and frustration. These obstacles can be overcome by making all parties more culturally sensitive. It is important for people to recognize how cultural backgrounds affect individual perceptions and actions; and how cultural awareness can improve the relationship between people from differing cultural backgrounds.

Is this a realistic achievement in today’s world of diverse cultures and ethnic groups?

Different approaches have been used by universities across the globe. When teaching cultural awareness, a series of concepts specific to different cultures are used. This approach may lead to categorizing, even stereotyping and a way of thinking detrimental to bridging the gap between cultures. Stereotyping and generalizing a person’s characteristics to an ethnic group or population, such as distrusting Chinese people because they are perceived as communist or fear Muslims as they are judged as terrorists can be disastrous for the person and the group he or she belongs to.

A whole new different issue is brought by the Indigenous Peoples of Canada. The problem with grouping indigenous peoples and other marginalized groups under the premise of “multiculturalism” or a wider theme of “diversity” is that it fails to explore the ways in which the ongoing colonization of aboriginal peoples shapes contemporary modes of race and racism in settler nations (Carleton University, 2011). Aboriginals believe that the white people and all other peoples from other countries are living on their land as interlopers and should be accepting of them. Non-Indigenous look at the aboriginals as a drain on society’s funds and hold misconceptions about them as a burden on Canada. Therefore, Indigenous people are still subjected to racism, discrimination and inequality. Oftentimes, discussions of Aboriginal issues in the class elicit strong emotions, including anger and frustration. Lately, cross-cultural competency and educational equity are receiving greater interest and consideration. Yet, the challenges and barriers that are currently being faced at the classroom level

have yet to receive sufficient attention. Comments of students after having participated in workshops or presentations about aboriginal people include 1- This makes me feel bad about being white. 2 – This infringes on academic freedom. 3 – I am not aboriginal, so this does not affect me. 4 – I don't know enough about aboriginal peoples to answer or speak to issues that might come up. Unfortunately, the Aboriginal people's resentment of the white population does not help improve the situation of cultural safety in the classroom (Carleton University, 2011).

## 5. The concept of stereotyping

Among various programs offered in Higher Education, most programs in the Health domain include some curriculum content related to transcultural or multicultural health care. In fact, the Nursing discipline pioneered the transcultural Health movement through the work of Madeleine Leininger in the United States. Her model was rapidly adopted by Nursing Programs around the world. In parallel, Nursing theory on cultural diversity began in Australia, addressing the needs of Maori and other Indigenous people.

Nursing in North America has considered cultural diversity and Transcultural health care since the 1960, and several theorists have dedicated their career to framing practice by a variety of theoretical models applicable to an increasingly culturally diverse population. Europe has followed recently, in the context of the European Union and of their recent immigration policies and practices, as well as following the free exchange of workers within the Union. Nursing has a privileged role within the Health Care system of any country, therefore, it bears the responsibility to care for the needs of a progressively more diverse population. Other professions benefiting of Higher Education like Medicine or Psychology have joined the efforts of adapting their curriculum to multiculturalism among their students or their clients.

Lack of cultural competence in Health care may lead to overlooking a statement, not verifying information or a fact. Dominant opinions become stereotypes with a potential to influence interventions in Health care. Nevertheless, refraining from using preconceived ideas about the client is paramount in Health care. Stereotyping chokes scientific criteria used for deductive thinking or generalizing. A stereotype is a preconceived idea applied to all individuals of a group, disregarding uniqueness. Positive or negative, this idea shapes the image perceived as projected by the person judged. Does the image reflect factual reality, or is it the result of the observer's belief (stereotype)? This dangerous generalization of one's preconceived idea may very well be at the root of creating the human hierarchy between societies and cultures, and explain ethnocentrism. More and more people and militant groups claim their identity in light of differences between humans and between cultures. In spite of all differences, humans have a lot in common. Many characteristics are universal, many other are common to groups of people, while some traits are individual, a signature of each one being unique. To neglect specific individualities may lead to unforeseen consequences. Generalizing to every individual what is known of a group of people is equally dangerous.

Generalizing through the process of induction may be abusive and lead to false conclusions. Yet, generalizing follows an intelligent process of acquiring, organizing and sorting out information. It is a tenet of the learning process. Concluding through the process of deduction constitutes another tenet of the learning process. In the process of learning, the student may focus on acquiring and organizing information, disregarding the source and missing the distinction between a fact and an opinion, perception or impression. This presents with a danger of abusive generalizations and stereotype building. The information stored becomes subjective and, in the case of Health care professionals, influences clinical judgment and may induce professional misconduct.

Although extensive use of subjective generalizations is not advisable, it is important to understand that learners, especially undergraduate students, need to use this process to organize received information, to incorporate new concepts and definitions. The first few university years represent a time of acquiring and

integrating basic professional knowledge, principles and practical experience into a coherent ensemble based on logic, common sense, sound judgment, critical thinking and intuition. For instance, students are shown a clinical picture made of a set of symptoms generally describing a particular diagnosis (a concept or construct); main characteristics of a people are regrouped to describe a certain culture. These are but stereotypes we are using to teach our students. Then, they are asked to step away from the generalization process, from what they have just acquired, use critical thinking and not blindly apply the cultural picture to all individuals included as part of a specific ethnic group, or they may be wrong assuming an individual will respond as all other people from his group. The human being is a complex holistic system, having a lot in common with all other humans, some commonalities with a group, and most importantly, some individual particularities that absolutely call for consideration and respect. How is then the student to distinguish between sound generalization and individual particularities, without prejudice? How can the student find the balance? Limits are ambiguous and difficult either to comprehend or perceive.

## **6. Transcultural stereotyping**

The perception of the observer is always tainted by his own culture. It's like seeing the world through one's glasses. In spite of one's conscious effort to look beyond limitations imposed by their own language, logic and values system, only an incomplete perspective of the other's culture can be achieved. All elements of the other culture are defined and referred to in comparison with what is known a priori by the observer. As Stewart and Bennett (1991) explain, transcultural interactions run the risk of distortion, given each culture's different ways of perceiving, organizing and prioritizing elements of reality.

Usually, a culture is studied through questioning, using tools specific to the observer's culture. This process may in itself include bias, hence significant information may be missed. Unique perspectives may be ignored or misinterpreted. For instance, race, ethnicity, sex or sexual orientation are classified according to taxonomic definitions, often dichotomous (ex. black or white, heterosexual or homosexual). Nonetheless, some cultures have distinct understanding about specific subtle nuances of phenomena (ex. white, black, mulator or métis), placed on a conceptual continuum. Canadians and Native Indigenous Peoples of Canadian territory retain a richer and more diversified vocabulary for defining and describing snow than Italians or Brazilians. Their winter experience modelled their language and helped them develop a very particularly perceptive acumen toward their environment. New concepts have been generated; consequently, their reality can be very different from the one experienced by the observer (Machado, 2001).

Creating stereotypes may be risky. As an example, in general, nodding by Asians is being taught as not always signifying that something heard is understood. In fact, many Asian people mean that they understood by nodding. Furthermore, having Asian heritage doesn't always mean that the person was born and raised in Asia, therefore cultured in Asia. Many people of Asian descent were born in North America or immigrated as children. Others have been living in North America for generations. Acculturation has occurred depending on the time spent in the adoptive country and on many other factors. No inference should be made based on stereotypes.

## **7. Should stereotyping be abolished?**

Transcultural Health should only describe a very general image of a particular culture. Professionals should keep an open mind and remember that their own perception is influenced by their own culture. A wise professional uses and manipulates generalizations with care. Preconceived ideas about different cultures have limitations; consequently, every individual should be understood within the context of his own culture, with respect given to uniqueness under a holistic and personalized lens. People should be able to define themselves

individually as a representative of a certain culture, sharing common characteristics, adding some group traits and some personal ones that can tell them apart from every other human being.

### **8. Teaching Cultural Competence in Health Care : the example of Nursing**

Teaching cultural competency in Nursing does not benefit from the same approach in all Nursing Programs. Even after a few decades of teaching Transcultural Health, courses are a challenge in terms of format, delivery, method and evaluation, and learning outcomes. Results are often less than desirable, many graduates feeling helpless before their patients from different cultures. They encounter difficulties in communicating, evaluating and performing nursing interventions on them.

Underwood (2006) proposes a strategy meant to bring students to reflect on cultural diversity by asking them at the beginning of the course, to write some questions related to 3-5 different cultures in their environment. Students need to be reassured that no question is shameful or awkward. Questions are compiled and sorted according to cultural domains used by valid transcultural models such as Leininger and McFarland (2002), Giger and Davidhizar (2004) or Purnell and Paulanka (2003). This process will identify recurrent themes, as well as perceptions, beliefs, experiences and preconceived ideas of students. As well, it will highlight learning needs and objectives, and direct course content and possible interactive class or virtual discussions.

Another valuable strategy for teaching transcultural health remains the direct immersion into another culture, by means of international practicum. Nursing Programs increasingly use out-of-country field, clinical or community placements to increase cultural awareness and appreciation. A newly acquired perspective allows students to discover universal human characteristics and to understand the differences in values, beliefs, attitudes and customs. When the language of the host is different than the one of the student, new ways of communicating are learned, specifically non-verbal skills like presence, touch or facial expressions. Additionally, students uncover the influence of the socio-political system on health care and see a better picture of the advantages and disadvantages of the health care system in their own country.

Learning outcomes depend on the cultural competence of the educator, whose culture of origin, passed experiences and values become a great influence on their teachings. Nurses of a diverse cultural background are particularly suitable to teach transcultural health. They also make great teaching aids or invited guests. Some studies show that educators having had more intercultural contacts are the most open to other cultures (Kardong-Edgren et al., 2010). Cultural competence develops positively while direct care is performed on patients of a different culture or on vulnerable populations. Getting to know people in their own shared environment stimulates learning more than class teaching, textbooks or travels.

In a recent study, Wilson et al. (2010) conducted focus groups to evaluate the perceptions of both faculty and students in the mentoring program to become a nurse. What they found important in the overview of cultural competence is that the cultural diversity of the nursing workforce is related to the personality and cultural competency of the faculty.

In spite of a definite utility for obtaining and organizing knowledge, concepts of transcultural teaching may lead to stereotyping and prejudice. A conscientious health care provider takes group characteristics, societal and human nature complexities into consideration, while balancing and prudently using generalizations and individual beliefs and values. The need for ethical care across health systems warrants the inclusion of transcultural teaching in all health care disciplines by direct contact with a culturally diverse population. Health care practices should be based on rigorously acquired scientific evidence, the only way to distinguish between knowledge and belief, thus avoiding unfavorable stereotyping and promoting ethical care.

## 9. A Canadian University initiative on cultural safety

One mid-size Canadian University is progressively implementing actions toward raising awareness and cultural safety in a multicultural teaching and learning environment, since the number of International students has grown importantly in the last few years.

Canada is already home to many immigrants of first generation. Many more have parents or grandparents who immigrated. Newcomers to the University may be International students or even immigrants and not aware of the issues related to multiculturalism or that Indigenous people may still be victims of discrimination and inequality. In an effort to raise awareness, several initiatives have been implemented or are the object of discussion for future completion.

- A few Committees were formed with the purpose of consulting on future actions and manifestations; and to provide a forum for exposing all forms of racism and discrimination towards different cultures, minorities, religions, sexual orientation or preference or towards vulnerable groups.
- Workshops and presentations on cultural safety are given throughout the campus, some of them being mandatory for different students or programs.
- Aboriginal peoples issues, interests and culture are promoted by means such as Aboriginal Awareness Week or Exhibit of Residential Schools.
- Aboriginal content in different courses and in each academic program is becoming the norm.
- A number of seats in several programs are designated for Aboriginal candidates in order to insure opportunity for developing a critical mass of indigenous professionals who would better understand and serve their communities.
- The Educator hiring policy is favorable to Indigenous peoples and other minorities.
- An Indigenous Sharing and Learning Centre is being built on campus.

## 10. What remains to be done?

Many initiatives and actions have taken place on campuses across Canada in the last two decades. As populations mobility has increased and technology has improved at high rates, many more initiatives need to come alive, in order to advance student success and insure cultural safety. Old initiatives that produced some expected outcome must be updated and improved. New initiatives need to be carefully tailored around research results and take into account the rise in people's movement for equal rights and ethical treatment, respect, and abolishing discrimination of all kinds.

These are some ideas that could be integrated into new initiatives:

- There should be a raised awareness of the ethnic and cultural variety among students. What do they bring and what are the advantages of diversity that we seek as a nation?
- The realities and legal aspect of immigration should be known to all students, as well as the civil rights of immigrants according to the Canadian constitution.
- Educators should take the lead in instructing their students about cultural diversity and should become knowledgeable themselves; one way to do so is through reflection on diversimilarity (Ofori-Dankwa & Lane, 2000).
- Teaching basic and universal communication skills, civility and respect for people of all kind.
- Aboriginal (indigenous) issues are distinct among all multiculturalism issues. They should be addressed separately. A distinction should be made between indigenous peoples and immigrants. When presentations, workshops or other forms of teaching are used pertaining to indigenous peoples, the following should be taken into account:
  - Presenting only history of native people and colonialism will only raise awareness;
  - Adding the presentation of discrimination, inequities and inequalities, goals and needed interventions, will raise cultural competence;
  - A variety of feelings are stirred into descendents of colons, while they become aware of the effects of colonialism on Indigenous peoples. It is important to learn how to address and cope with these feelings (ex. white people's feelings of guilt), in order to avoid a new rise of antipathy toward Aboriginal peoples;
  - Adding communications skills susceptible to help relations between Indigenous peoples and other cultures including colonialists raises cultural competence to the level of cultural safety.
- Among immigrants, first generation, versus second and third, refugees and temporary workers face different issues and levels of acculturation.
- A myriad of aspects of what culture represents make addressing multiculturalism excessively complex and intricate. For instance, the issue of religion may hinder efforts towards multiculturalism. Faced with a legal obligation to tolerate if not accept newcomer's religious beliefs, the host culture may feel overwhelmed and threatened.
- Maintain the North-American Higher Education present trend of naming a senior academic administrator like a vice-president, for student diversity. This allows some power to implement initiatives and bylaws on campuses. Relying solely on governance and volunteer work may not bring on the desired effect of cultural respect and safety for all.
- Student organizations should be involved in the cultural safety movement on campus, as they can play an important role in the success of the unresolved issue of multiculturalism.

## 11. Conclusion

Cultural safety in Higher Education represents an ongoing challenge. In time, through world mobility and inter-cultural marriages, initiatives and interventions toward a culture of respect for one another and for the value of every individual, the multiculturalism goal may be achieved on and off campus.

# Decentralization in –and of- education

Aygül Oktay\*

*Abant İzzet Baysal University, Faculty of Education 14280, “Bolu”, Turkey*

## Abstract

Decentralization and centralization of Education both seem to be related to “democracy” which is understood as a way of life. Yet, it is also related to some other factors and forces: such as the level of literacy, economic conditions, traditions and types of government. These and some other factors and forces also seem very affectfull in democratization, as well as decentralization ideas, and practices. For instance, various studies illustrate that first of all administrators at different levels are not willing to give up their existing, institutionalized authorities and powers, towards more democratic practices. But, instead, they seem to approve and willing the other administrators to be changed, and give up some of their authorities and powers, towards more democratic decentralized practices. In addition, for instance, with the existing world-wide trends towards globalization, they may also expect, with different scope and speeds again, having some significant changes towards democratization of their educational systems.

Keywords: decentralization, centralization, education

## 1. INTRODUCTION

### On Democracy and Education

As it is most often pointed out that, since there is not a “better” one on the seen, democracy is the best way of dealing with human affairs, in terms of “governing” the people, under the state umbrella. In this sense, the government is then understood as an establishment “for” and “by” the people. In addition, a fundamental object of a democracy is accepted as promoting the happiness and well-being of the people, namely the population. In this case, democratic school then, will try to teach children and utilize the means of happiness and it must also teach them “what the democratic nobility is”. But, since the fundamental object of democratic education is to try to lift the whole population to a higher level of intelligence, living conditions and happiness, it is a must to give all the children the necessary habits, understanding and skills before they leave the school ( Elliot in Krug, 1965.pp.115).

An obvious question is then to be answered at this points; would be that, is it possible to have the “desired” or “necessary” outcomes; firstly, if you do not have an “enlightened” population who are not and will not be in schools, and secondly, if -for their existing conditions-you do not trust them in using and practicing their democratic rights and fulfilling their duties, as the citizens of democracy.

\* Corresponding author. Tel.: +90 374 254 10 00  
E-mail address: ayguloktay@hotmail.com

There seems, somewhat a dilemma at this point. On one hand, democratic institutions can not be considered as “safe”, if a great majority of the population is not trusted in terms of their activities as the main “actors” and “subjects” of the democratic state and government. On the other hand, it is very clear that democracy must also be learned. This is the case in terms governmental affairs, it doesn’t matter if it is in municipal, state, provincial or in national levels. Of course as it is similar to the other “learning” conditions, learning the “democracy” require some of the “basics”, such as willingness, guidance and practice.

Then the democratic citizenship may come into the picture with the necessary skills in order to be able to meet the responsibilities, and to seek and use the “rights” of citizenship. For this reason, then education in this picture is not and must not be a process and service which is carried out within the school buildings for specific age groups, but it must be for all, and both a service -including in teaching and practicing democracy- and investment.

As it is often stated that democracy is to be dealt with simply as a question of political morality and economic abundance which would be a route to political democracy. So, it is also mostly pointed out that the democracy as being more “appropriate” for countries where those necessary conditions are existed (Potter,1954.pp.112). Yet, a free men must set their goals and nobody should tell them what to do, and they must do it for themselves (Gardrier,1962.pp.161).

What then, are we going to wait for the “suitable conditions” to arrive, or is there any other way to create the “appropriate” situation? First, we observe that some of the most conservative – which means not democratic in many ways – regimes accomplished great things, both by tearing down the old orders, but at the same time by establishing the new ones, even democratic ones. But, of course, the rationalization of any political order is closely related to somewhat, creating, or “making” new citizens for, and in, that “new” society. Literacy and the necessary skills, including technical ones, for the mass of people are also the other vital skills in that matter (Moore,1967.pp.440).

In any democratic society, it is necessary to have a consensus on objectives and goals of education. Education then is considered a process for: (1) Individual excellence, (2) A society of equals, (3) A government of free man, (4) An economy of security and plenty, (5) A civilization of beauty and grandeur, (6) An enduring civilization, (7) A world community (Casterter,1981.pp.4).

Yet, since school systems in a democracy is to be responsible somewhat for preparing students, as products with certain qualities, and socialize them for a complex adult roles. But, this process requires some specialization, and as a result, some autonomy on the side of schools and their teachers, which may be another concern with peoples’ interests and decisions on education, and all types of educational matters, within the system. At this point, it is known that school systems are consisted of client-serving organizations, and they are at least semi-bureaucratic ones in which their role structures are quite different; but, still operate according to specific rules, and regulations of the procedure (March,1970.pp.973-975).

### On Decentralization of Education

It is mostly stated and well accepted that one of the obvious and clear evidences for an educational system to be considered as a “democratic” one is that of its being, at least to some extend, “decentralized”. People mostly come into close contact with are mostly schools, hospitals, highways, and people of fire departments which all are basically the matters of local or provincial governments.

The first concern at this point is that the question of who runs our city, province or state. Secondly, if we have any sayings in all of those activities in our close environment and region. This obviously becomes quite a

clear sign and evidence of existence of a democracy. Of course, having different and/or special interests, ethnic groups and so on, and if their differences and interests are taken into consideration functionally, these are also some other positive signs of democratization. All of these are also related to the question of what are the

basic and irreversible sources of power; social, economic, political and philosophical. Along this, in order to be considered as a democratic one, any decision and/or practice in education must be depended upon the main philosophy that every child to be treated both equally and efficiently. But, we also have to remember that, first, some of the significant changes most often come from industry, not from the government; especially not from the local or regional government. Secondly, during the recent years capitalist enterprises have changed their organizational forms, shapes and practices, and they become more and more “multi-national” (Ehlers, 1981, pp. 55 and 88). So, this also requires some kind of re-adjustment of the idea and practices of decentralized education. Yet, as it is the case in terms of the “industrialization” and “information age”, these and other concerns and practices can not be dealt with in the same way, in all cases for different countries, with their different levels of educational and overall development.

But, as a part of general process and practice within the overall system of government, decentralization of education still has some merits which are mostly originated from and it is more suited to democratic principles. In addition, it seems better and more sufficient in understanding local needs, problems and potentials and establishing and carrying out educational plans and practices in more flexible ways. Besides, decentralization of education gives people of different groups more and better chances for cooperation having a voice in educational matters. It would also be a way to create a better understanding of the central government and its activities in education, and utilize educational investments properly at the local and/or regional levels. Yet, people in decentralized system of education may not be interested enough, or knowledgeable, or accustomed to in making decisions on educational matters. It is also difficult to have the necessary manpower, economic resources, to carry out educational activities objectively and to control the financial matters. Especially to deal with the economical inequalities, either within the area or state and/or nation-wide, may sometimes become a serious burden. Overcoming local and/or regional prejudices and to deal with the old habits, stressing on short-term benefits and interest of people; providing a nation-wide equality and working in harmony with the national objectives seems some other shortcomings of decentralization of education.

But, as it was pointed out before, democratic institutions, including educational ones, will be safer if a great majority of population are trusted, and if they share common understandings as well as democratic practices.

Yet, giving parents greater choices of school and reorganizing the system through open enrollments and more emphasis on choice and diversity, as it was the case in Great Britain recently, did not seem to be creating the expected results. For instance, less popular schools lost funding as their numbers of students declined. The needs of some future parents, or at least some parts of society are seemed forgotten. Because, the idea that providing greater choice leads to higher academic standards did not worked out and instead of academic excellence, “popularity” of schools seemed having more preferences, and priority for parents (Scott, 1994, pp. 73 and 79).

### The Place of Centralization in Education

In some cases the state may act as a teacher, but the important thing is that what and how she intends to teach. In a society, aiming to arrive in a democratic way of life and establishing a real democratic state, the content and methods of teaching will be different from a totalitarian oriented approach. In this case, and especially for the “emerging” democracies, and especially during the “learning” and “adjustment” periods, to

have a more centralized settings and fulfilling most of the state duties by the central government may be more appropriate and beneficial. But, if we call this as a transition period towards having a “workable”, and “real” democracy, it is better and desirable that this “transition” will not be “permenant”.

This also implies having a continious effort towards -even at different levels and types- decentralization, including in education, which is a very difficult, tiredsome job to be accomplished.

Yet, especially for those countries in which the differences between and among the regions, in terms of economical wealth, level of education, ethnicity and some other characteristics of people are significant, and if it does not seem possible to create a balance, or eliminate these differences, by using the local and/or regional institutions and resources, then the central government comes into the picture, which means, centralization maybe the key at this point.

This way administring the related duties centrally, and distributing and using available resources more effectively and efficiently for the peoples’ benefit as a whole, would be much easier and faster.

In this case, legal and financial powers and responsibilities are mostly accumulated at the center, and a significant portion of state work carried out by the central government. This way, unity within the country and in state administration may be established much easier. In addition, to carry out governmental responsibilities in a more economical, rational way, and to eliminate various types of inequalities, including educational ones, having a better chance to use more and better skilled and specialized personel, methods and technology seem among the other advantages of centralization of education. Of course, two questions then seem to be asked: The one is that “How much centralization is to be considered as appropriate, and permissible, in terms of democracy and democratic education?”. The second one is that “How long do these centralized settings, ideas and practices should be lasted or permitted?”

Actually, to answer these two questions in an affirmative or in a negative way mostly depends upon the levels of “progress” of any respected society, in terms of her their accomplishments in establishing sound, workable institutions of democracy, and getting accustomed to democracy as the “way of living”. Otherwise, it is not very diffcult to have a symbolic re-organization work based on “decentralization” in education. But, if some of the habits, understandings of “old times” are not changed and improved and if understandings of rights, responsibilities of democratic citizenship are not created, you may very well be in a position to re-create some new power groups and a new hierarchy dominating the people in different ways, re-establishing, even informally, the former system, as a new type of “oligarshy” under the name of “decentralization”.

Yet it doesn’t seem to be right in almost all cases “to be too different”. When we think of another fact that, in general, lower-income groups and minorities do not seem to show much interest in school board elections and the policies of school boards, in general, reflect the thinking of the upper socio-economic levels in the community.

It seems quite clear that if the conditions are not suitable enough, sometimes, while we are trying to facilitate greater choices, in order to build a more democratic and fair system of education, we are possibly creating a more differentiated system, by providing better chances in education for the children of “better to do” families, in which we are helping with a new type of social reproduction (Scott,1984.pp.85).

Of course, besides some of its advantages, centralization also has some limitations as well. For instance, it may limit the chances of people trying to be citizens of democracy and it encourages red-tape which slow-down all governmental activities. In addition, it is very difficult and time-consuming to find out solutions to the local needs in education.

## The chance for decentralization

The fundamental object of democracy is to promote the happiness and well-being of the people, regardless of their differences. The democratic school then has given the responsibility for teaching children the means of happiness and providing the necessary skills to be able to live accordingly.

As Madison pointed out, the accumulation of all powers in the same hand or hands may be defined as “tyranny” (Griswold, 1960, pp.102).

In order to have a democracy in a country, there seems quite clear that there are some “prerequisites”, such as a suitable economic condition; believing in, and willing to live with and, according to democratic principles and philosophy, which are involved in some “learning” and behavioral patterns, related to “democratic citizenship”.

One of the signs of an “existence” of democracy in a country is decentralization of education. Of course, decentralization is one of the dependable evidences in this respect, even though, under some circumstances, it has some advantages, as well as limitations.

In some cases, centralized settings and practices too, in education may be both democratic and beneficial to be carried out.

For instance, working on modernization process on one hand, along the democratization efforts, and wide disparity between manpower needs and real demands, and rapid population-growth on the other hand, make almost impossible to deal with their educational problems as well as democratizing their educational systems in developing countries. For instance, individuals mostly look on education as a means of getting a job in these countries. Under this condition, even if they give priority to democratizing their education, they may not have much chance. In addition, since they do not have enough experience and facilities to be used as citizens of democracy, their educational systems have a much heavier job and more and complex responsibilities for carrying out. In this case, especially before or after arriving at their “take-off” points, these countries may get more benefits, and go faster in development and democratization process, by using centralized procedures and practices.

Yet, countries with their well-established democracies and democratic practices in their educational systems are still trying to have better educational systems and practices of education by creating “much better” democracies especially by providing more and voluntary choices for their children.

In any reform or change the question of “Where does it come from?” is another point which is important to be considered by the people (Evans, 1996, pp.197).

It seems understood quite clearly that creating more choices is not automatically leading to higher standards and it is not proved as a dependable tool to build a more democratic and fair educational system, especially in terms of providing better education for the children of the low-income groups and minorities.

In addition, when we stress more and more on decentralized organizations and practices, we observe that first, the lower-income individuals again, and then the common citizens do not show enough interest, both in school-board elections and school affairs. The differences of opinions, concerning the proper functions of the schools, and using pressures by some interest groups for their own benefits within the community seem making difficult to carry out decentralized policies and practices in education.

Yet, it is still vital that democratic education is to be shared, questioned, helped and sacrificed by the citizens of democracy. If we are willing to live in a democracy and if we like it to be “democratic” in education also, we have to be aware of the fact that it is obviously difficult, and these are the democratic, unescapable tasks to be carried out.

One of the last thought may be related to those various differences again, in dealing with democratization of educational systems of our own, in terms of existing issues, problems and prospects.

It should be remembered that the “climates” in different lands and/or countries are also different .

## Abstract

For the definition of training needs of staff working in the public service-oriented solutions in the area of transport infrastructure is needed to define the scope of competencies at different administrative levels. The strategy of development of human resources in public administration based on the strategy of human resources, this strategy is based on the strategy of public administration, specifically its long-term goals.

The paper shows the specific programs increase professional competence and their use in the Moravian Silesian region and the Czech Republic

*Keywords:* public administration, specific programs, professional competence, Moravian Silesian region

## 1. INTRODUCTION

Transport infrastructure is an integral part of the strategic documents of the Czech Republic (CR) and its territorial units. The quality of transport infrastructure depends not only on the financial, technical implementation, but also the quality of human resources working in this field, their knowledge and skills. In public administration should be that increasing education and deepening the skills of staff should be one of the tools for improving the quality of services. Current information age places considerable demands on the knowledge and skills of employees, gone is the time when the employee was a carrier of physical labor. Today there is a tendency for workers bringing intellect, innovation and accepting responsibility. The paper shows the specific programs increase professional competence and their use in the Region and the Czech Republic<sup>†</sup>.

## 2. PERFORMANCE OF PUBLIC ADMINISTRATION

Central authority active in this field is the Ministry of Transport (see the organizational structure of the Ministry of Transport and Communications and the Regional Authority viz. Annex 1) at the Moravian-Silesian Region (the MSR) mode of transport MSR and subject him departments at various administrative units. The scope of news articles in the area of transport infrastructure is defined by law: Law No. 13/1997 Coll. on the road, as amended, (2013) defines the scope of management of transport infrastructure and duties of administrative authorities to the relevant communications (see Figure 1). Performance of the transport department is generally subject to the rules and laws applicable to public administration, so we will continue to talk about

† This paper is created based on the Silesian University research grant SGS 5/2013

Transport Department MSR generally as a public service and analyze the training of employees in this sector from the viewpoint of the general rules of public administration training at the regional level<sup>‡</sup>.

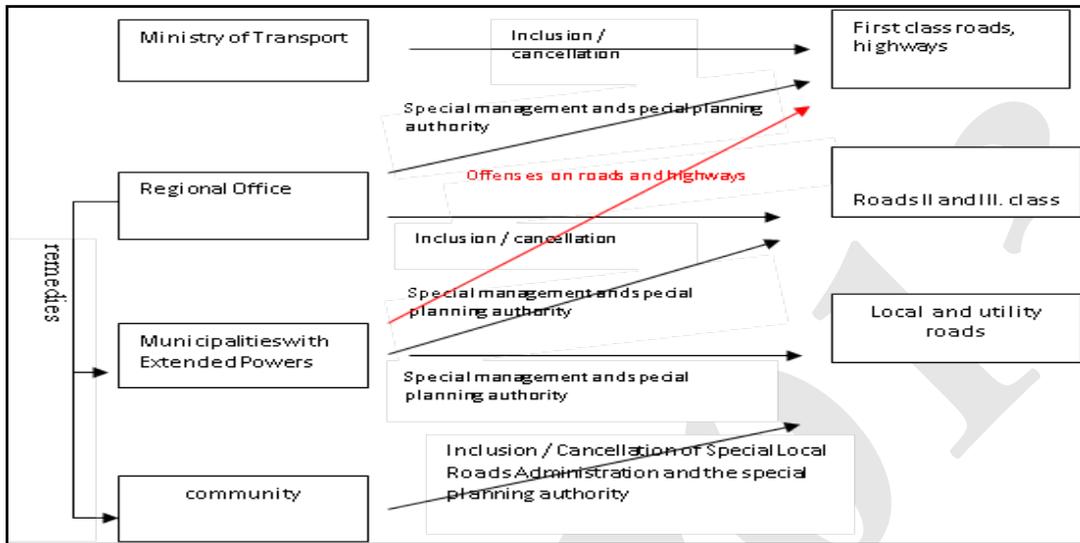

Figure 9 Generalized performance of the various authorities in matters of road infrastructure

If we were to rely on the definition of education by Koubek (2002), the concept of education workers in time and space convertible. It depends on the social environment, the organization in which they operate, the culture and the education level of the population, the nature of work and the technologies used, training of personnel defines the activity as an activity involving activities:

1. Adjustment of the labor skills of the staff changing needs of the position ie deepening work skills.
2. Increasing the usability of workers, ie the development of knowledge and skills to perform, other work practices, expanding their ability to work (increasing flexibility).
3. Activities associated with retraining processes, retraining for occupations that organization needs. Caring for retraining is part of an organized training.
4. Adaptation of new employees by the new specific requirements, techniques and technologies used, the style of work in the organization.

The formation of work skills in the modern HR work that goes beyond just professional capacity to work of the employee, including the formation of personality worker (his behavior, work behavior), consciousness (needs, accepted values, interests, attitudes, norms) and motivations that influence individual and collective performance.

### 2.1. Training of staff in public administration

The strategic objective of government is to increase citizen satisfaction with government performance and quality of communication. As mentioned above, public administration extends into the area of transport infrastructure and thus affects citizens' satisfaction with the quality of transport infrastructure. The basic precondition for quality and flexible use of staff is shaping capabilities, increasing their knowledge and skills. Development and education of employees in the public administration is left to the employee's decision is

<sup>‡</sup> The issue is aimed at employees of local governments in terms of civil servants training, subject to Resolution No. 1542 "Regulations for the training of employees in administrative offices" and is different from the law 312/2002 Sb. on officials of local governments.

exhaustively defined by the Act on education officials of local government units pursuant to Act 312/2002 Coll. (2013). If we wanted to define increasing knowledge and working skills can be derived from Koubek (2002) on the basis of and in accordance with the law.

### 2.1.1. *The area of general education*

It includes the employment firm anchoring of ethics and values in the personality of employees in public administration. Public officials is governed by a set of rules, regulations and obligations under the law. Every employee should be a system of government to be loyal, the problem can be overcome certain contradictions which are against the beliefs and principles of the employees. By Pomahač and Vidláková (2002) it is possible to maintain and improve the ethical behavior of public officials upon receipt of written rules and in particular codes of ethics for civil servants, the necessary education and further training of employees and the influence of role models superiors at work. The values professed in public administration should be based on the expectation that the employee is here to serve the public, not for its own benefit and profit.

### 2.1.2. *Furthermore, increasing knowledge includes vocational education, which falls into*

1. Here is the activity of public administration required secondary education. In the last few years to improve the performance of public administration is a necessity in higher education program in the group fields of law, law and public administration, in some menus work is also featured in the university majoring in economics and management. Orientation allows in public administration with creating the requirements for the jobs correctly defining the needs for simple work to shorten and streamline adaptation employees. Currently, creating so-called competence models. Generally this activity according to the definitions included in the following program, ie input regarding the education of employees at all levels.
2. Receive refresher training courses - deepening qualification concerns<sup>§</sup>
  - *Input education relating to the head office of a senior official and officer involves getting:*
    - ◆ Knowledge of the fundamentals of public administration, in particular the general principles of organization and activities of public administration and urban planning, fundamentals of European administrative law, principles of finance, ethics rules.
    - ◆ Basic skills and habits necessary for the performance of administrative activities, basic knowledge of the use of information technology.
    - ◆ Basics of communication and organizational skills needed for the job in their work
    - ◆ Fundamentals of management control for managers.
  - *Continual education that applies to officers and includes:*
    - ◆ Deepening, update and specialized education officials focused on the execution of administrative activities. Thus defined education we could include seminars, conferences, training cycles).
    - ◆ The deepening of language skills (language skills for the right terminology in the appropriate language).
  - *Verification of special professional competence of head office, a senior official and officer includes:*
    - ◆ Getting general and specific knowledge to perform the job (the list of competencies and their abbreviations see Annex 1) - There is a necessity to know the staff of the Transport Department issues concerning laws, regulations and ordinances relating to land-use planning, road, knowledge maps, environmental education, legislation, etc.
    - ◆ Training of senior officials including the general and special part. The first one concerns the knowledge and skills in management officials. A special section includes an overview of the activities set out in an implementing regulation exercised by subordinate officials. For more

<sup>§</sup> official who has special competence, may pass under the Act

information on executive education can be obtained at the website of the Ministry of Interior\*\*.

### 3. Retraining – requalification

It can be defined as the activity of acquiring knowledge, which in the case of the transfer of employees to a total or partial retraining the full extent of the law 312/2002 Sb. An example may be a shift worker from the Department of cadastral management to the Department of Transport. The employee meets the conditions for the exercise of new job part. For their employment must pass a special examination of professional competence in the field of road transport and decisions on supervisory activities in road management.

### 4. Vocational rehabilitation is likely to be in the public administration as a means of increasing knowledge is not used or used in such a small extent that this form of literature knowledge fails.

#### 2.1.3. Area of development

By Koubek (2002) to include the acquisition of a wider range of knowledge and skills than those required for employment, development-oriented are more than the work as a career, which will allow the individual to develop adaptive labor supply. It allows to create, shape the personality of an individual and to contribute to the achievement of organizational goals and improving interpersonal relationships. In the case of improvement of qualification (hard skills), which includes knowledge of the Administrative Code, laws on communications, construction law and in the case of personality formation including improving communication skills, assertiveness, stress levels, etc., occurs in public administration based on legal obligations to employees set a 18 day lift plan training for three years when the annual evaluation, each employee is required to develop a plan to further improve their knowledge and skills (which identifies its shortcomings), such a development plan is then mandatory for employees. Specific group in planning education are elected representatives, increasing their knowledge and skills is not defined by the Act 312/2002 Coll. However, the public administration is the target group addressed and she offered several educational events throughout the year. The above defined education being touched training organization conducting the training on the acquisition of knowledge and skills through courses, seminars, etc., gaining expertise and knowledge of the subsequent verification of eligibility by examination or mentoring and through workshops. In recent years, however, focuses on education by increasing the knowledge and skills through learning organization. By Bielczyk (2005) is a learning organization is defined as a comprehensive model of human resource development, in which all workers continuously learning from everyday experience. The necessity of this form of knowledge is increasing the need for learning is individual, based on his natural need of learning, learning new things, and curiosity and use of this potential for the benefit of companies - public administration and at the same time learning team, which is part of the individual. Employees in the learning organization are able to gradually analyze what needs to be done to improve the overall situation in the organization, finding solutions to aggressively acquire new knowledge and experience and be willing to share their knowledge with each other. The introduction of a learning organization can be strengthened able to motivate managers to initiatives in the transfer of information and knowledge, and identification of targets employees of the organization.

#### 2.2. Forms and evaluation staff training

Individual courses are displayed on the website of the Ministry of Interior. These courses are structured according to a hierarchy of management - organizational structures - government, local government, according to the roles - employment status - clerk, head clerk, an elected representative. Courses can be analogous to forms of study in higher education (individual educational institutions and the number of programs are listed in Table 4). Full-time study takes place at the training center (Benesov - overnight, Prague - day), combined studies is then a

\*\* <http://www.mvcr.cz/clanek/vzdelavani-vedoucich-uredniku-uznani-rovnocennosti-vzdelani.aspx> (20. 5. 2011)

combination of teaching through electronic mediums in elevation and meetings with tutors. Distance learning is mediated by self where the substance is submitted to the batch with tutoring. In order not training employees only isolated process in public administration, it is necessary to evaluate the effectiveness of the investment into education and assess any additional learning needs. Nowadays, not only for self-assessment, but also the implementation of evaluation tools BSC (Balanced Scorecard) in public administration.

### 3. DEVELOPMENT OF THE DEVELOPMENT AND EDUCATION OF EMPLOYEES IN PUBLIC ADMINISTRATION

Table 2 Summary of accredited educational institutions by region and accredited educational programs Source: Annual report on the state of training of local government officials in the area of special professional skills for 2009

University of West Bohemia, Department of Lifelong Learning	Plzen Region	1
Total accredited programs SPC		63

The professional development of employees is the obligation for the performance of activities in the Public Administration to obtain a qualification. Increasing the special professional competence (SPC) in the Czech Republic carried out through teaching full-time and elearning courses. These programs are focused on issues of public administration institutions. The broader issue of the training and education of employees in more than one program in the training centers, which are mostly accredited academic institutions (see table 1<sup>††</sup>). Each of these programs is the completion of the test and getting the certificate of SPC to the employee within a specified period from the acquisition of competence in public administration successfully completed. <sup>‡‡</sup> MSR has a stake in the education of employees in public administration, participates in mediation of four educational programs accredited SPC on its territory, civil servants must complete the required courses specific expertise six months of starting employment.

#### 3.1. Development of SPC in the Czech Republic

With regard development of obtaining a certificate of special professional qualifications (somewhere SPC) during the years 2009-2011 there was an annual decrease of applications submitted for testing proficiency in

<sup>††</sup> *Institut Praha*. [online] 2013 Available from: <http://www.institutpraha.cz/>

<sup>‡‡</sup> Civil servants must complete the required courses specific expertise six months of starting employment.

public administration. During each quarter of 2009 -2011 there is a decrease in the number of registered employees in the development of skills upgrading, the 3rd and 4 quarter of 2011 is associated with an increase in applications filed from 2010, but does not meet the quotas from 2009. Only in the first quarter of 2012 there is an increase in the number of new applications filed compared to 2009-2011 (see Table 2)

Table 3 Development applications for the SPC quarterly

	2009	2010	% ratio 2010/2009	2011	% ratio 2011/2010	% ratio 2011/2009	2012	% ratio 2012/2011	% ratio 2012/2010	% ratio 2012/2009
1.Q	813	604	74,29	369	61,09	45,39	920	249,32	152,32	113,16
2.Q	686	450	65,60	407	90,44	59,33				
3.Q	454	334	73,57	422	126,35	92,95				
4.Q	544	380	69,85	498	131,05	91,54				
Year % ratio	2497	1768	70,80	1696	95,93	67,92	x	x	x	x

Most are in the first quarter of 2012 required counties in educational programs related to skills upgrading in the vehicle registration (REG), these education requirements appear already in year 4 quarter of 2011 (64 entries) and the result is likely to be the introduction of a new information system registry vehicles.

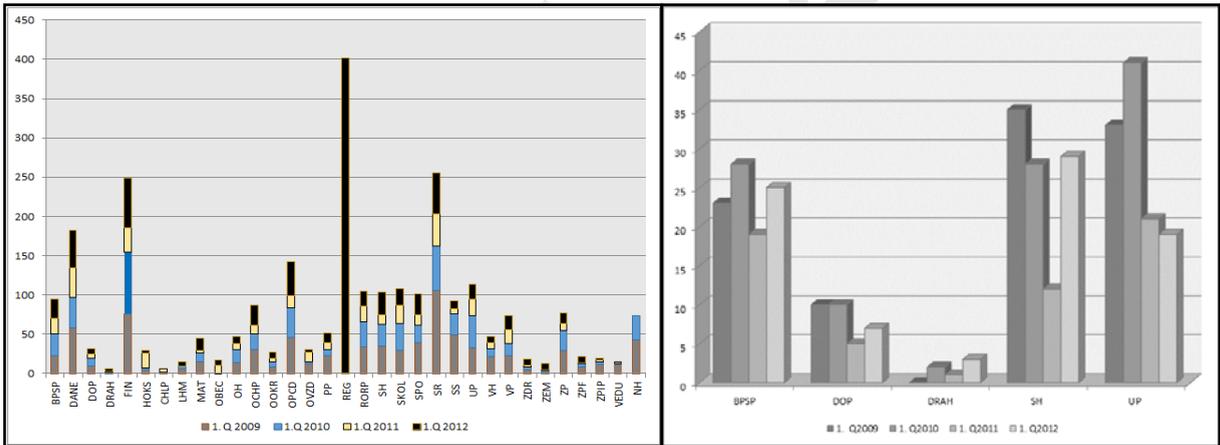

Figure 10 Development of applications SPC first quarter of 2009 - 1 quarter of 2012 (left), of applications in selected SPC (right)

It is largely used in training and education in the field of taxation, finance, population records and the land-use decision-making and decision-making in the field of construction law and expropriation (see figure 2).

In the case of evaluation of training activities, transport workers union can be considered as the flagship educational programs for obtaining SPC programs focused on the issues:

- BZPS It applies in misdemeanor proceedings in matters of safety and traffic flow in the area of transport and road management and administrative proceedings related
- DOP in road transport
- DRAH Valid for administrative decision-making and oversight activities in the operation of railways and railway transport
- SH Valid for administrative decision-making and oversight activities in road management
- UP in land use planning

In the quarterly comparison, most graduation requirements SPC for employees in the Department of Transport of the Czech Republic passed in the first quarter of 2010, at least in the quarterly comparison in the first quarter of 2011. This trend turned up in the first quarter of 2012, where there is again an increase in applications for completion SPC. Most were filed applications for capacity building programs for UP (spatial planning) and in administrative decision-making and oversight activities in road management. Overall, in 2011 the use of these programs in the Czech Republic ranked BSPS at 9 position on 20 DOP to 29 expensive for SH 6 and 10 position UP, total was the education offered 31 programs SPC. Most of the certificates of special qualification in 2009 was recorded in MSR. In 2010 it was granted the most certificates in the Central Region and in 2011 in Prague.

### 3.2. MSR position in obtaining a certificate SPC.

Most certificate showing increasing special expertise in MSR was issued in 2009, then joined the downward trend in the number of issued certificates of competence. (see Table 3, public service employees MSK). In 2011, used in MSR public officials to obtain a certificate of special professional competence in the field of spatial decision-making and decision-making in the field of construction law and expropriation.

Zlin Region	124	98	81
summary	2438	1895	1321

Overall MSR in obtaining a certificate SPC reported in 17 of the 31 above-average values (17 values is larger than modus). As one of the counties use the opportunity to gain expertise in the management of civil registration, taxes and finances to a greater extent than other regions. Also, the number of certificates issued in the capacity of road holding, BPSP DOP shows efforts to develop knowledge for the creation of transport infrastructure. Overall more about MSR, see Table 3, Table 5 (reight) 1, figure 3).

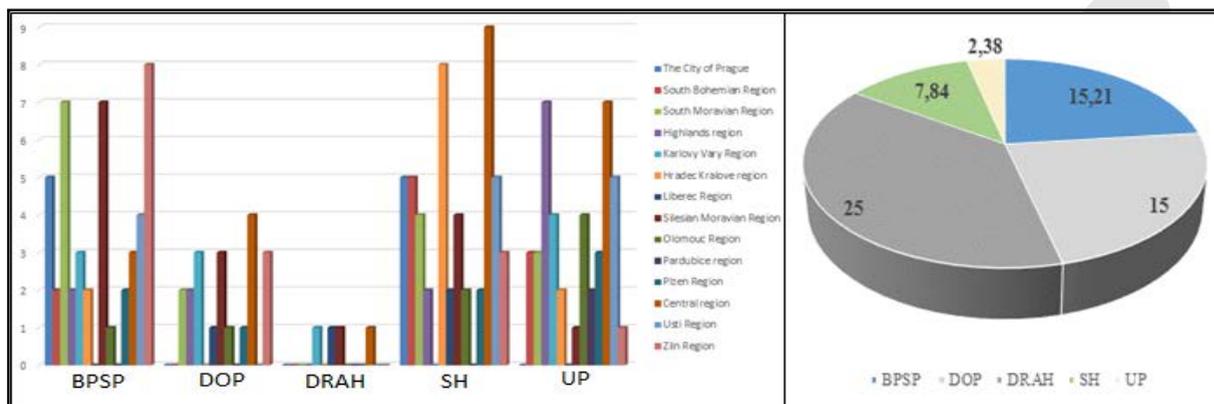

Figure 3 Share of the use of programs for the departments of transport in the Region to use the individual program in the Czech Republic

MSR is slightly below average in the success obtained certification for the first proper time relative to the total number of registered SPC is, when the county ranked at 7 instead of the 14 counties. (average 81.91% success rate). Problems in the organization of programs and subsequent tests were caused by canceling applications. A high percentage of applications were canceled in 2010 due to the equivalence of education (36% of the total number of canceled), which created a problem when planning for (lectures SPC) and tests. According to the survey, internal documents of the Ministry, it was found that there is a systemic change in the recognition of qualifications in the case of equivalence of education.

Table 5 Sum of achievement for proper testing specific expertise by region (left), sum of cancellations in SPC% per year 2010 - 2011 (right)

Region	Pass the examination in due course

Sumary	608	350

The next most common application is the abolition of termination of employment (25%). In 2010, in the Public Administration reported 608 cancellations applications for SPC (see Tables 4, 5), the most common reason

corresponds to the current state of public administration, which is characterized by organizational changes and staff reductions. However, it is necessary to minimize cancellations to avoid variations in educational planning, staff development and inefficient funds expended in the development of civil servants. Also, success of public administration in the proper term is slightly below the national average, so it should be considered whether the conditions for the implementation of tests and preparation is sufficient.

# Depression levels of the elementary school teachers

Mücahit Dilekmen<sup>a\*</sup>, Buket Erdem<sup>b</sup>

<sup>a</sup>Atatürk University, Faculty of Education 25240, "Erzurum", Turkey

<sup>b</sup>Atatürk University, Faculty of Education 25240, "Erzurum", Turkey

## Abstract

The aim of this research is to examine depression levels of the elementary school teachers in terms of the following variables: gender, age, marital status, occupational seniority, contractual-tenured-paid working, working in combined or independent classrooms, number of students in the classroom, place of duty, occupational acceptance, occupational satisfaction and finding the occupation appropriate to one's personality.

Universe of the study is composed of all teachers who are working in 186 city center elementary schools and village schools managed under city administration in Erzurum province of Turkey. Sample of the study is composed of 194 classroom teachers who are working in 40 elementary schools that were randomly selected among the schools in the universe of the study. Personal Information Form and the "Beck Depression Inventory" were used as data collection instruments in the research. In view of these findings, no significant difference was observed among the depression levels of the elementary school teachers in terms of gender, age, occupational seniority, marital status, types of classrooms where they teach, their place of duty and type of employment. It was observed that there was a significant difference among the depression levels of the elementary school teachers in terms of number of students in the classrooms, occupational acceptance, occupational satisfaction and finding the occupation appropriate to one's personality.

**Keywords:** Elementary school teacher, depression

## 1. INTRODUCTION

Education can be defined as knowing the story of the universe, Earth, life systems and consciousness as well as recognizing the role of humanity in this story. The primary objective of education is to enable people to fulfill these roles (Langford, 1999). Teachers take on sacred duties of raising individuals for every occupation that the society needs, fulfilling the information need of the society and shaping the future of the nations (Kuran, 2002). Elementary school years constitute an important period in children's physical, psychological and social development. Elementary school teachers are experts who are responsible for education during this period. Teachers are the primary models that students look up to in their socialization process. The teachers, who are taken as models, contribute positive or negative effect to the personality development of the students. A teacher's role and his/her behaviors hold great importance in the classroom. Therefore, teachers have to pay attention to their behaviors. Teachers' support, attention, compassion and love for their students encourage them at the same level as the negative effects that occur when teachers unfairly criticize, punish and humiliate their students. If the teachers experience psychological problems, this devastation increases more in terms of quantity. Depression is one of the most significant psychological problems. Depression is a serious and well-defined psychological

\* Corresponding author. Tel.: +90 536 3591320; Fax: +90 0442 2360955

E-mail address: dilekmen@atauni.edu.tr

problem that has distinctive symptoms and that must be taken seriously. Everyone may experience emotions such as sadness, grief and unhappiness in a period of his/her life. These emotional stages, which are generally temporary and related with the experienced situations, can be occasionally experienced at extreme levels and for a longer time although no clear reason is observed to cause it. Such types of emotions may disrupt individuals' relationship with themselves and the people around them.

Depression manifests itself in some emotional, mental, behavioral and physical symptoms. A depressive mood is the most noticeable symptom of depression. Depressed people are generally unhappy, pessimistic and hopeless. They feel sad and lonely. They may lose interest towards themselves and their surroundings. At times, this depressed mood can be accompanied by symptoms such as tension, uneasiness and extreme skepticism. These people can be ill-tempered from time to time. They occasionally feel apathy; they cannot cry, laugh or feel closeness to anybody (Tuğrul and Sayılğan, 1997).

Researches conducted on the prevalence of depression in Turkey and other countries showed that 20-30% of the general population have one or several of depressive symptoms whereas 10-15% of the general population have symptoms that can be diagnosed as depression and that have to be treated (Köknel, 1989). World Health Organization (WHO) reports that 3-5% of world population (approximately 150-200 million people) have depression symptoms at various levels (Baltaş and Baltaş, 1999). In his research, Dilekmen (2011) found that teachers in Turkey experience some psychological problems and reflect this condition on their students as negative behaviors in six different categories. Yıldırım (2007) found that teacher support reduces stress and depression levels of students. Reynolds, Wallace, Hill & et al. (2001) found that there is a positive relationship between depression and negative self.

Kashani and Sherman (1988) stated the importance of social skills, lack of self-efficacy and mother-father child relationships in depression experiences of children. They stated that depressed people have insufficiencies in self-rewarding, self-assessment and self-monitoring. In his study, Tennant (1988) stated that negative experiences of children in preschool period are influential in depression, and sources of stress, especially divorce of parents, are significant in explaining the depression in adults. In his study entitled "memoirs of teachers", Bakır (2005) observed that the depression levels of teachers who work in cities are higher than those of the teachers who work in villages; the depression levels of teachers who work as substitute are higher than those of other teachers; and the depression levels of female teachers are higher than those of male teachers. In their study, Humensky, Kuwabara, Fogel and et al. (2010) concluded that the educational environments, in which there are individuals with depression symptoms, negatively affect the school performance causing negative mood, interaction problems with peers, failure to concentrate on courses and reducing success. Gold, Smith, Hopper and et al. (2010) concluded that creating cognitive awareness can be effective in reducing anxiety, depression and stress of the elementary school teachers.

Many different studies have been conducted on the subject of depression. However, there is not enough number of studies found in terms of these variables in this study that is related with elementary school teachers. This study tested how depression levels of the elementary school teachers differed in terms of the following variables: gender, age, marital status, occupational seniority, contractual-tenured-paidH working, working in combined or independent classrooms, number of students in the classroom, place of duty, occupational acceptance, occupational satisfaction and finding the occupation appropriate to one's personality.

## 2. METHOD

### 2.1. Research Design

The research is a descriptive study conducted in compliance with survey model in terms of variables.

### 2.2. Universe and Sample

The universe of the study is composed of all teachers who are working in 186 city center elementary schools and village schools managed under city administration in Erzurum province of Turkey. The sample of the study is composed of 194 classroom teachers who are working in 40 elementary schools that were randomly selected among the schools in the universe of the study.

### 2.3. Data Collection Instrument

Personal Information Form that was prepared by the researcher and the “Beck Depression Inventory” that was developed by Beck, Ward, Mendelson, Mock & Erbaugh were used as data collection instruments in the research. The Beck Depression Inventory was first formed by Beck, Ward, Mendelson, Mock & Erbaugh in 1961. It was revised in 1971 reproduced in 1978 (Groth-Marnat, 1990). It is one of the most common studies that are used in clinically determining the symptoms of depression. It was developed in English in 1961. It was used in more than 2000 studies and translated into many languages. It exhibited intercultural reliability and validity at high levels. Two independent adaptation studies were conducted in Turkey for the Beck Depression Inventory. One of them is the adaptation study entitled “Beck Depression Scale” that was conducted by Buket Tegin (Erkal) (1980). The other is the study entitled “Beck Depression Inventory” that was conducted by Nesrin Şahin (Hisli) (1988-1989). Internal consistency coefficient and item-total score correlations of the scale were examined for reliability studies. In view of the obtained results, internal consistency coefficient of the scale was found to be 0.93 while its item-total score correlations were observed to range from .45 to .72. Criterion-related validity and structural validity were examined for the validity studies of the scale.

The Beck Depression Inventory is an instrument commonly used in measuring the phase and intensity of depression. It is a scale that is of 4-point Likert type. The inventory, which is composed of 21 questions, measures characteristic behaviors and symptoms of depression. Its implementation takes approximately 10-15 minutes (Groth-Marnat, 1990). This condition increases the practicability of the scale. Reliability: It was obtained in different times with tests that the average internal reliability of the Beck Depression Inventory is 0.86 whereas its internal reliability ranged from 0.73 to 0.92. Similar reliabilities were also obtained for the 13-item short form. Cronbach’s Alpha values of the Beck Depression Inventory exhibit high internal consistency ranging from 0.86 to 0.81.

### 2. Procedures

The Beck Depression Inventory and the Personal Information Form, which were data collection instruments, were implemented by the researcher in the schools that were identified as the sample of the study. The researcher introduced himself and gave some information about the aim of the research for each implementation. Moreover, teachers were informed on how to answer the inventories, and their questions were answered during the implementation session. The implementation took approximately 10-15 minutes to complete for each teacher. The participants’ answers were checked after the implementation session was over. Measuring instruments, which were answered outside the standards of measuring instruments or left blank, were not included in the evaluation. Upon completion of implementations, all inventories were checked by the researcher. The number of teachers that completed the implementations was observed to be 194. SPSS 17.0 software program was used for the statistical analyses. T-test, Kruskal-Wallis Test, Mann-Whitney U Test, one-way ANOVA, LSD and Dunnett’s T3 tests were used in the analyses.

### 3. Findings

The data obtained in the research were subjected to statistical processes and the results were given below.

Table 1

Means, Standard Deviations and T Values Regarding the Depression Scores of the Elementary School Teachers in Terms of Gender

Dependent Variable	Gender	N	$\bar{X}$	Sd	t	p
Depression	Female	118	8.57	6.78	-.181	.856
	Male	76	8.75	6.08		

No significant difference was found among the mean depression scores of the elementary school teachers in terms of gender ( $t_{192} = -.181$   $p=.856$ ). In view of this result, no significant difference was found among the depression levels of the elementary school teachers in terms of gender.

Table 2

Mean Ranks and Kruskal-Wallis Test Values Regarding the Depression Scores of the Elementary School Teachers in Terms of Age Groups

Dependent Variable	Age Group	N	Mean Rank	$\chi^2$	p
Depression	20-29	173	16.40	4.374	.224
	30-39	88	15.62		
	40-49	66	16.20		
	50-59	222	14.58		
	Total	559	15.85		

No significant difference was found among mean ranks of the depression scores of the elementary school teachers in terms of age groups ( $\chi^2_{(3)} = 4.374$ ,  $p=.224$ ).

Table 3

Mean Ranks and Kruskal-Wallis Test Values Regarding the Depression Scores of the Elementary School Teachers in Terms of Occupational Seniority

Dependent Variable	Occupational Seniority	N	Mean Rank	$\chi^2$	p
Depression	1-5 years	33	101.08	7.	.198
	6-10 years	60	110.74		
	11-15 years	45	87.69		
	16-20 years	33	95.27		
	21-25 years	12	85.46		
	26 years or more	11	74.50		
	Total	194			

No significant difference was found among mean ranks of the depression scores of the elementary school teachers in terms of occupational seniority ( $\chi^2_{(5)} = 7.320$ ,  $p = .198$ ).

Table 4

Means, Standard Deviations and T Values Regarding the Depression Scores of the Elementary School Teachers in Terms of Marital Status

Dependent Variable	Marital Status	N	$\bar{X}$	Sd	t	p
Depression	Single	41	9.00	6.63	.393	.694
	Married	153	8.54	6.48		

No significant difference was observed among the depression scores of the elementary school teachers in terms of marital status ( $t_{192} = .393$ ,  $p = .694$ ).

Table 5

Mean Ranks and Mann-Whitney U Test Values Regarding the Depression Scores of the Elementary School Teachers in Terms of the Types of Classrooms Where They Teach

Dependent Variable	Type of Classroom	N	Mean Rank	U	p
Depression	Combined	18	107.17	1410.000	.442
	Individual	176	96.51		
	Total	194			

No significant difference was observed among mean ranks of the depression scores of the elementary school teachers in terms of the types of classrooms where they teach ( $U_{192} = 1410.000$ ,  $p = .442$ ).

Table 6

Mean Student Number Groups and Standard Deviation of the Classrooms Where Elementary School Teachers Teach

Student Number Group	N	$\bar{X}$	Sd
20 or fewer	52	9.21	6.89
21-30	100	9.50	6.25
31-40	42	5.76	5.88
Total	194	8.64	6.50

One-Way ANOVA was conducted in order to find whether or not there was a significant difference among mean depression scores of the elementary school teachers in terms of student number groups of the classrooms where they teach, and the results of this analysis were given in Table 7.

Table 7

ANOVA Regarding the Difference Among the Depression Scores of the Elementary School Teachers in Terms of Student Number Groups of the Classrooms Where They Teach

	Sum of Squares	Sd	Mean Square	F	p
Intergroup	449.527	2	224.763	5.566	.004
Intragroup	7712.932	191	40.382		
Total	8162.459	193			

It was observed that there was a significant difference among mean depression scores of the elementary school teachers in terms of student number groups of the classrooms where they teach ( $F(2-193)= 5.566, p=.004$ ).

In view of the Post-Hoc analysis (LSD) that was conducted in order to detect from which groups that the difference resulted, the depression scores of the elementary school teachers who teach 20 and fewer ( $p=.010$ ) and 21-30 ( $p=.001$ ) student number groups were found significantly higher than the depression scores of the elementary school teachers who teach 31-40 student number group.

Table 8

Mean Ranks and Mann-Whitney U Test Values Regarding the Depression Scores of the Elementary School Teachers in Terms of Place of Duty

Dependent Variable	Place of Duty	N	Mean Rank	U	p
Depression	Village	26	103.92	2017.000	.530
	City Center	168	96.51		
	Total	194			

No significant difference was observed among the depression levels of the elementary school teachers in terms of place of duty.

Table 9

Mean Ranks and Mann-Whitney U Test Values Regarding the Depression Scores of the Elementary School Teachers in Terms of Types of Employment

Dependent Variable	Type of Employment	N	Mean Rank	U	p
Depression	Contractual	9	88.39	750.500	.618
	Tenured	185	97.94		
	Total	194			

No significant difference was found among mean ranks of the depression scores the elementary school teachers in terms of types of employment ( $U_{(192)}=750.500$ ,  $p=.618$ ).

Table 10

Mean Ranks and Kruskal-Wallis Test Values Regarding the Depression Scores of the Elementary School Teachers in Terms of Their Acceptance of Teaching Occupation

Dependent Variable	Occupational Acceptance	N	Mean Rank	$\chi^2$	p
Depression	Low Level of Acceptance	16	140.53	15.243	.000
	Acceptance	87	103.21		
	High Level of Acceptance	91	84.48		
	Total	194			

A significant difference was found among mean ranks of the depression scores of the elementary school teachers in terms of accepting teaching occupation ( $\chi^2_{(2)}=15.243$ ,  $p=.000$ ).

In view of the conducted Dunnett's T3 analysis, the depression scores of the elementary school teachers who had low level of occupational acceptance were found significantly higher than the depression scores of the elementary school teachers who had high level of occupational acceptance ( $p=.000$ ).

Table 11

Mean Ranks and Kruskal-Wallis Test Values Regarding the Depression Scores of the Elementary School Teachers in Terms of Their Satisfaction with Teaching Occupation

Dependent Variable	State of Satisfaction	N	Mean Rank	$\chi^2$	p
Depression	No Satisfaction	11	152.27	28.842	.000
	Low Level of Satisfaction	26	134.73		
	Satisfaction	97	92.30		
	High Level of Satisfaction	60	79.73		
	Total	194			

A significant difference was found among mean ranks of the depression scores of the elementary school teachers in terms of satisfaction with teaching occupation ( $\chi^2_{(3)} = 28.842, p = .000$ ).

In view of the conducted Dunnett's T3 analysis, the depression scores of the elementary school teachers who were not satisfied with teaching occupation were found significantly higher than the depression scores of the elementary school teachers who were satisfied with teaching occupation ( $p = .021$ ) and the elementary school teachers who had high level of satisfaction with teaching occupation ( $p = .007$ ). Furthermore, it was observed that the depression scores of the elementary school teachers who had low level of satisfaction with teaching occupation were found significantly higher than the depression scores of the elementary school teachers who were satisfied with teaching occupation ( $p = .005$ ) and the elementary school teachers who had high level of satisfaction with teaching occupation ( $p = .000$ ).

Table 12

Mean Ranks and Kruskal-Wallis Test Values Regarding the Depression Scores of the Elementary School Teachers in Terms of Finding the Teaching Occupation Appropriate to Their Personalities

Dependent Variable	Appropriateness to Personality	N	Mean Rank	$\chi^2$	p
Depression	Low Level of Appropriateness	29	130.36	14.494	.001
	Appropriateness	101	97.51		
	High Level of Appropriateness	64	82.59		
	Total	194			

A significant difference was found among mean ranks of the depression scores of the elementary school teachers in terms of finding the teaching occupation appropriate to their personalities ( $\chi^2_{(2)}= 14.494$ ,  $p=.001$ ).

In view of the conducted Dunnett's T3 analysis, the depression scores of the elementary school teachers who found the teaching occupation slightly appropriate to their personalities were found significantly higher than the depression scores of the elementary school teachers who found the teaching occupation appropriate to their personalities ( $p=.024$ ) and the elementary school teachers who found the teaching occupation very appropriate to their personalities ( $p=.002$ ).

#### 4. Discussion

No significant difference was found among the depression levels of the elementary school teachers in terms of gender, age, occupational seniority, marital status, types of classrooms where they teach, place of duty and types of employment. This condition showed that the stated variables did not diversify the depression of the elementary school teachers. This also showed that the stated variables affected the depression levels of the teachers similarly. Furthermore, the fact that the responsibilities and working conditions of the teachers were the same in terms of the stated variables might have been influential on this result.

It was observed that compared to other elementary school teachers, there was a positive significant difference in the depression levels of the teachers who accepted their occupation; who were satisfied with their occupation; who found this occupation appropriate for their personalities; and who had a low number of students in the classrooms where they teach. Reynolds, Wallace, Hill & et al. (2001) found a positive relationship between depression and negative self. In their study, Humensky, Kuwabara, Fogel and et al. (2010) concluded that the individuals with depression symptoms negatively affect educational environments while causing negative mood, experiencing interaction problems with their peers, failure to concentrate on courses and reducing success. When these results are taken into consideration, it can be stated that the teachers, who work in crowded classrooms,

who perform their occupation unwillingly, who are not satisfied with their occupation and who do not find this occupation appropriate for their personalities, will experience more depressive symptoms, may hurt students more and may have negative self-perceptions. Making occupational improvements by paying attention to the results regarding the stated variables can positively affect the related disadvantaged groups. Gold, Smith, Hopper and et al. (2010) concluded that creating cognitive awareness can be effective in reducing anxiety, depression and stress of the elementary school teachers. When this research result is taken into consideration, studies must be conducted, which will increase cognitive awareness in reducing depression states of the teachers who work in crowded classrooms; who perform their occupation unwillingly; who are not satisfied with their occupation; and who do not find this occupation appropriate to their personalities.

## Abstract

In the processes of design, development and selection of software needed for the individuals in need of special education, the characteristics of these individuals should be observed. Software might be used as the support material for the education of the individuals in need of special education. In many researches done, it has been concluded that computer supported programs provided long term orientation by increasing the motivation of the individuals with a disability and that they enjoyed working at the computer.

With the introduction of developing technology which surrounds all aspects of life as well as education, it should be provided that children with mental disabilities apart from regular students should also make use of from these technologies. In this research done in this context, it was aimed "concept teaching" based on simulation and animation by using mobile tools in the education of children with mental disabilities. Visual programs supported by technology made very significant contributions to the students of concept teaching in the schools and rehabilitation centers offering these resources.

Application of this study was made with 21 students from four different school and rehabilitation center located in the Sakarya province of Turkey. In the result of the evaluation of the data obtained from the application, use of visual programs supported by technology proved positive contributions in concept teaching.

Keywords: Mentally disabled students, concept teaching and technology.

## 1. Introduction

With the increasing use of information and communication technologies, educators state that trend towards global education is inevitable and global education practices should be given importance and be started. Rapid advances in communication technologies have influence on the structure and format of the education and forces educators to develop new training programs and models of teaching and learning (İşman, 2005). As İşman stated, with the use of technology actively have made radical changes in their education systems by developing different methods in education and training to raise contemporary individuals.

Individuals with mental disabilities is often defined as the “state of being significantly in retard of normal students in the process of development and showing inability in adaptive behaviors”. (Özsoy, Özyürek, Eripek, 1988). In spite of the existence of the individuals in this definition throughout the history, their training does not go back that far.

“Individuals in need of special education due to their communication-related mental, sensory, emotional, social, physical properties are individuals in need of more special services in their normal training process. Different educational efforts are needed for the training of these individuals. Special curriculum development, the use of special material, use of special education experts, special physical arrangements in training places and the like are the properties which should take place in the training of individuals with special educational needs.” (Güven, 2003). With developing technology, education systems and teaching methods also vary. Technology used in every field of education and training has also started to be used in the education of individuals with special educational needs. This makes them learn many things in a short time, as well as reinforce what they learnt by reiterating in different times to ensure permanence.

In the studies on special education, different teaching methods were developed but technological studies in these methods have been started to be used in the last few years. However, children with intellectual disabilities also live in the developing and changing age like other people and they are curious about tablets, mobile phones and computers. Here is the point where information technologies provide great use to educators in teaching them concepts that they are going to use in daily life by using their curiosity. A lot of factors that are difficult to be implemented by classical education can be put into reality by information technologies. “According to many studies which includes comparisons between the traditional teaching / training programs and computer-aided education show that computer supported software have positive effects on the learning of on children with disabilities.”(Pişkin, 1995; Heimann et all, 1995; Moore, McGrath ve Thorpe, 2000; Bosseler ve Massaro, 2003; Hetzroni ve Tanous, 2004; Özdener ve Erkoç, 2006).

“Studies done in this context show that computer-assisted programs increase the motivation of children with disabilities and make them gather their attention and they enjoy very much studying at a computer” (Bayram, 2008, s.3).

### 1.1. Objectives of the research

In this research, animation and simulation-based concept training in the training of mentally retarded children by using mobile devices is aimed. Objectives expected with the software developed as a result of this research are;

- To gain these individuals to the society again,
- To create awareness in the community
- To present the concepts regarded as the first step in their development,
- To make them use of the technology,
- To put training in every moment of their life not only in only rehabilitation centers.

### *1.2. Research universe*

The universe of this research includes students with intellectual disabilities studying in the special education and rehabilitation centers in the province of Sakarya. Concepts were thought to these students by using Mobile Teaching Software.

### *1.3. Sampling process*

Research application was conducted in three parts. In the first phase, readiness of the student was determined by applying pretest. Thus, it was determined which concept would be the starting point in the training. Second phase is the training / education phase. In this phase, the desired concept was thought and whether it had been understood or not was determined by applying an interim test. In the last phase, it was checked whether the concept thought was learned permanently or not by applying the final test.

### *1.4. Limitations*

The limitations of the software developed for mobile devices are listed as follows:

- Each student's socio-economic status may not be suitable to possess a tablet computer.
- Use of tablets might be seen costly and for this reason, schools and rehabilitation centers might prefer using traditional education models.
- Teachers for the education might oppose using technology.

### *1.5. Research model*

Pre-test and posttest control group experimental model was used as the research model. Post test results of experiment and control group were analyzed by using Paired Samples t-Test in the end of the implementation.

### *1.6. Data collection*

Data used in this research were collected by applying the software, developed for the mobile gadgets, in the education of the children. This software was used in four different schools for twenty one students in the province of Sakarya. It was aimed that the mentally disabled students were thought "concept teaching" by using pre-installed developed software on the tablet computers.

## 2. Software Developed for the Mobile Computers

Sections of the software used in “Concept Teaching” in the education of the mentally disabled students are as follows;

### 2.1. Main Menu

Main sections of the software are seen in the figure-1. User is directed to other sections of the software by clicking the links on this screen.

- Registration
- Pre-test
- Education
- Report
- About

Figure 11. Main Page

These menus, sub-menus will be explained one by one.

### 2.2. Registration

As it is seen in the figure-2, school name and student's name is input to the system to use in the process of education. To turn back to main page, Main Page button is used below the screen.

### 2.3.

Figure 12. Registration

### 2.3 Pre-test and Post-test

These tests are the tests used to determine the readiness of the students and how much they learned in the end of the education. As seen in the figure-3, there are double test, triple test and drag tests. Which test is to be used is determined according to the student's learning ability level.

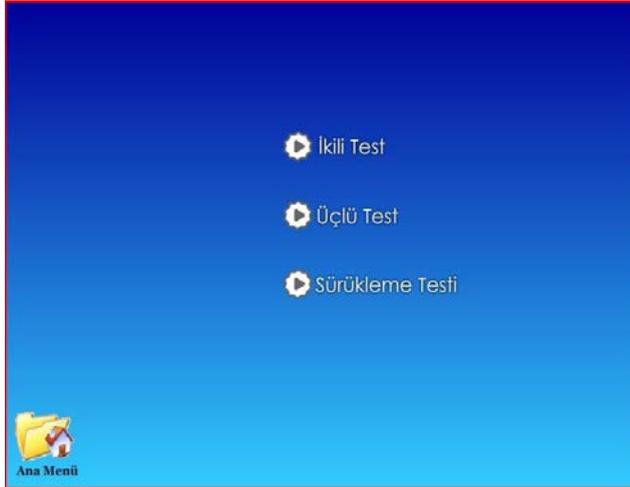

Figure 13. Pre-test

After selecting the test, you will see the sub-menu “Concept Subjects”. From this screen, concept to be thought to the student is selected.

Figure 14. Pre Test Concepts

When “Transportation Vehicles” link is clicked (Figure-5), pre-test – Double Test screen is seen. Software asks the student in voice “which one is the train?”

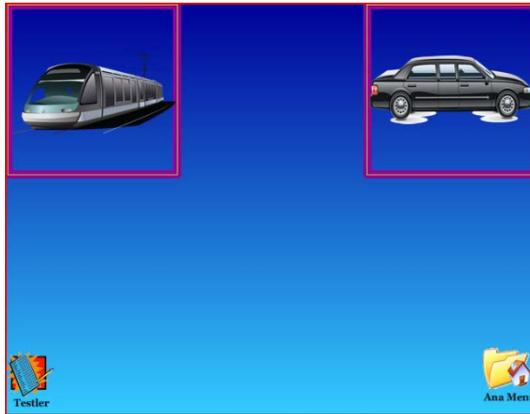

Figure 15. Pre Test Double Test. "Transportation Vehicles"

If the answer is correct, the software says to the student "Correct, Congratulations" and applauding sound comes and another question comes.

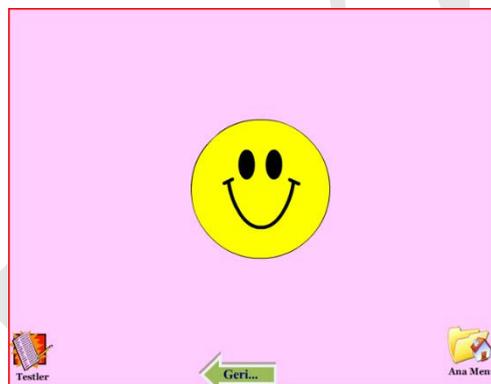

Figure 16. Pre test Double Test Correct

If the answer is not correct Figure-7: Pre-test, Double Test Transportation Vehicles- Incorrect screen appears and says to the student "Try again!"

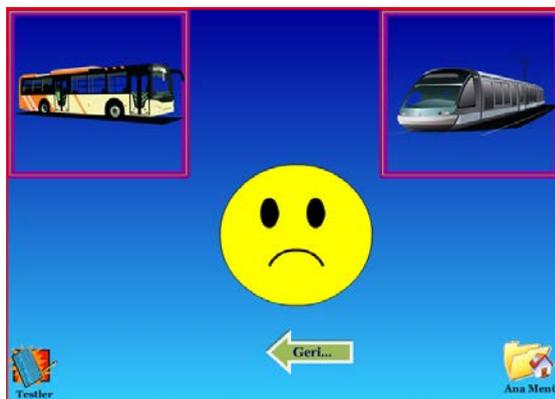

Figure 17. Pre test Double Test Incorrect

#### 2.4. Education

After applying the pre-test, the subjects to be thought are determined and then students passes to the second phase. The subject to be thought is selected from the figure-8 screen.

INTE 2013

Then, Education – Transportation Vehicles screen appears (Figure-9)

From this screen, Transportation Vehicle to be taught is selected. The view of the selected vehicle (figure-10) appears on the screen and the size of the vehicle grows in the screen and tells the type of the vehicle five times repeatedly. To make the student repeat, the screen doesn't change until the next command.

### 3. Analysis of the data

During research made in Sakarya Center and Hendek District upon 3 different groups, the data have been collected from 5 students from each group whose learning levels are the same. Before teaching concepts by enhanced program preliminary made test results of each group are shown on table below by giving 1 to known concepts and 0 to unknown concepts and by taking averages of group data. Second test data were obtained by using the same methodology after giving education. Last test data were obtained 2 months after the education by the same methodology mentioned above. The significance of relationship between preliminary test and second test has been tested by paired samples t-test. To test permanence of taught concepts to students' relationship between preliminary test and last test has been tested by using the same method and the results have been shown on table below. The names of schools and students from whom the data have been obtained were not given because it was thought that it would not be ethical.

#### 3.1. Data of first group

Rehabilitation Centre: A

Name of the Student: X

Table 1.

VEHICLES	Pre-test	Interim-test	Post-test
Bicycle	1	1	1
Motor Cycle	0	1	0
Automobile	1	1	1
Train	0	1	1
Airplane	0	1	1
Bus	0	1	1

By looking at data on Table-1, it was observed that; as a result of preliminary test students in that group did not know the majority of concepts; in interim test made after getting education through the program used in enhanced mobile devices concepts have been learnt; and in last test after some time passed they learnt majority of concepts and their learning is permanent.

Table 2.

MEASURE	N	$\bar{X}$	S	Sd	t	p
PRE-TEST	6	0,33	0,516	5	-3,12	0,025
INTERIM TEST	6	1,00	000			

By running paired samples t-test in SPSS for pre-test and second test data in Table 1, results in Table-2 have been obtained. Because the t value is minus it has been observed that there had been significant change between preliminary test and interim test data and that the program had a contribution in teaching concepts. Because P value is  $0,025 < .05$  this contribution is statistically significant.

Table 3.

MEASURE	N	$\bar{X}$	S	Sd	t	p
PRE-TEST	6	0,33	0,516	5	-1,12	0,045
LAST TEST	6	0,83	0,408			

By running paired samples t-test in SPSS for pre-test and last test data in Table 1, results in Table-3 have been obtained. Because the t value is minus it has been observed that there had been significant change between preliminary test and last test data and that the program had a contribution in permanency of concepts. Because P value is  $0,045 < .05$  this contribution is statistically significant.

## 3.2. Data of second group

Rehabilitation Centre: B

Name of the Student: Y

Table 4.

VEHICLES	Pre-test	Interim-test	Post-test
Bicycle	1	1	1
Motor Cycle	0	1	1
Automobile	0	1	1
Train	0	1	1
Airplane	0	1	1
Bus	0	1	0

By looking at data on Table-4, as a result of preliminary test, students in this group did not know the concepts compared with group X and after being educated through the program enhanced in mobile devices in interim test it has been observed that they had learnt majority of concepts and in last test after some time passed this learning is permanent.

Table 5.

MEASURE	N	$\bar{X}$	S	Sd	t	p
PRE-TEST	6	0,17	0,408	5	-5	0,04
INTERIM TEST	6	1	000			

By running paired samples t-test in SPSS for pre-test and second test data in Table 4, results in Table-5 have been obtained. Because the t value is minus it has been observed that there had been significant change between preliminary test and interim test data and that the program had a contribution in teaching concepts. Because P value is  $0,004 < 0,05$  this contribution is statistically significant.

Table 6.

MEASURE	N	$\bar{X}$	S	Sd	t	p
PRE-TEST	6	0,17	0,408	5	-3,162	0,025
LAST TEST	6	0,83	0,408			

By running paired samples t-test in SPSS for pre-test and last test data in Table 4, results in Table-6 have been obtained. Because the t value is minus it has been observed that there had been significant change between preliminary test and last test data and that the program had a contribution in permanency of concepts. Because P value is  $0,012 < 0,05$  this contribution is statistically significant.

### 3.3. Data of third group

Rehabilitation Centre: C

Name of Student: Z

Table 7.

VEHICLES	Pre-test	Interim-test	Post-test
Bicycle	0	1	1
Motor Cycle	0	1	1
Automobile	0	0	0
Train	0	0	0
Airplane	0	1	1
Bus	0	1	0

By looking at data on Table-7, as a result of preliminary test, students in this group did not know the concepts at all and after being educated through the program enhanced in mobile devices in interim test it has been observed that they had learnt majority of concepts and in last test after some time passed this learning is permanent.

Table 8.

MEASURE	N	$\bar{X}$	S	Sd	t	p
PRE-TEST	6	0,00	0,000	5	-1,12	0,025
INTERIM TEST	6	0,67	0,516			

By running paired samples t-test in SPSS for pre-test and second test data in Table 7, results in Table-8 have been obtained. Because the t value is minus it has been observed that there had been significant change between preliminary test and interim test data and that the program had a contribution in teaching concepts. Because P value is  $0,025 < .05$  this contribution is statistically significant.

Table 9.

MEASURE	N	$\bar{X}$	S	Sd	t	p
PRE-TEST	6	0,00	0,000	5	-2,236	0,076
LAST TEST	6	0,50	0,548			

By running paired samples t-test in SPSS for pre-test and last test data in Table 7, results in Table-9 have been obtained. Because the t value is minus it has been observed that there had been significant change between preliminary test and last test data and that the program had a contribution in permanency of concepts. Because P value is  $0,076 < .05$  this contribution is statistically significant.

## 4. Conclusion

The use of mobile device application that was developed in this study showed that computer aided education facilitates mentally disabled children's learning. Using animations and simulations in conceptual teaching helped retaining of the learning. Results of the students' tests and teachers' opinions showed that mobile devices helped the education of mentally disabled students. Animation and simulation-based mobile devices used in this study with the classical concept teaching materials, teaching materials, the difference between the cross-testing may be a subject of further studies.

# Design within the historic environment: A survey on admiration preferences

Assist.Prof.Dr. Süheyla Birlik\*

*Karabük University, Faculty of Safranbolu Fethi Toker Fine Arts and Design, Department of Architecture, Karabük 78600, Turkey*

## Abstract

Today, the new designs applied within historic environments are realized with approaches that vary between two extremes. A permanent doctrine related to such examples, which are sometimes criticised positively and sometimes negatively in terms of their effects on the existing texture, has not yet been put forth.

This paper is on the works created with similar and/or opposite approaches for new incompatible-looking buildings within the historical environment and the admiration preferences of these works. The potential designs formed on a street of Safranbolu, which is a world heritage site, have been evaluated by the students who attend the elective course named 'New Buildings in Historical Environments-Studio' given at the Department of Architecture in the Karabük University. This rehabilitation work aiming at conservation-development, which is rebuilt based on current allowed building heights, is aiming to search for means of solution on behalf of compatibility of old and new.

*Keywords:* design within the historic environment; Safranbolu-Baysal Street; Karabük University Department of Architecture

## 1. Introduction

MIM448 New Buildings in Historical Environments-Studio is carried out as one of the elective courses in the eighth semester at the Department of Architecture of the Faculty of Safranbolu Fethi Toker Fine Arts and Design in the Karabük University (Table 1).

Table 1. European Credit Transfer System (ECTS) form of the course named 'New Buildings in Historical Environments-Studio'

### GENERAL INFORMATION

<b>Code</b>	MIM448	<b>Title</b>	New Buildings in Historical Environments-Studio				<b>Semester</b>	8	
<b>Lecture</b>	1	<b>Practice</b>	2	<b>Laboratory</b>	0	<b>Credit</b>	2	<b>ECTS</b>	5
<b>Level</b>	Bachelor's Degree	<b>Language</b>	Turkish	<b>Type</b>	Elective	<b>Education System</b>	Formal Education	<b>Prerequisites</b>	None
<b>Objective</b>	To introduce the design approaches in historical environments, to discuss the topic on the examples.								
<b>Content</b>	Explanation of the historical environment concept, introduction of the design approaches that can be applied for infill buildings in historical environments together with their examples, examination and assessment of the topic on a featured environment.

*e-mail address:* suheylabirlik@karabuk.edu.tr

**Learning Outcomes**

Upon successful completion of this course, students will be able to:

- Get sensitive to historical environments.
- Explain the design approaches in historical environments.
- Analyze historical environments.
- Design new buildings in historical environments.
- Survey admiration preferences of designs in historical environments.
- Criticize the new designs applied within historic environments.

### CONTRIBUTION TO PROGRAM

Program Qualifications	Contribution Level				
	1	2	3	4	5
To be able to express intellectual thoughts verbally and in written			X		
To have information on topics related to environment, art, history of architecture, to follow current developments					X
To be able to use different means in concrete expressions of abstract thoughts				X	
To protect historical environments and to be able to apply architectural restoration techniques					X
To be able to show the physical environment control data in their works					
To be able to create original designs taking advantage from traditional and new concepts related to architecture					X
To be able to adapt into their own designs information acquired from building scale to urban environment					X
To be able to reflect on their own designs innovations in construction technology and material fields				X	
To think critically on the subject of design, to be able to generate alternatives to changing conditions					X
To know the scientific research process very well, to report information and findings obtained and to be able to present them in required places					X
To be able to perform intradisciplinary and interdisciplinary works on an appointed subject			X		
To be possessed of social sensitivity and occupational ethics					

### ASSESSMENT METHODS AND CRITERIA

Mid-term Exam	%20
Quizzes	
Homework	%20
Project	%30
Term Paper	%20
Laboratory Work	
Other	
Final Exam	%10

	Total Workload / 25.5 (h)		5.02
	ECTS Credit		5

## 2. Design within the Historic Environment

When the current developments are considered -in terms of contextual compatibility-, the approaches that can be adopted in the new building designs in historical environments can be collected under the following headings:

- similar approach
- opposite approach
- harmonic contrast approach

### 2.1. Similar Approach

#### *imitation*

to rebuild by copying the characteristics of the past (Figure 1)

Figure 1. Safranbolu; Turkish Retired Workers Association Safranbolu Branch Presidency / Karabük (photos: Süheyla Birlik)

#### *version*

to rebuild by addressing the characteristics of the past from a different viewpoint (Figure 2)

Figure 2. Göreme; Ataman Hotel / Nevşehir (photos: Süheyla Birlik)

### 2.2. *Opposite Approach*

to build by reflecting the characteristics of the own era (Figure 3)

Figure 3. St. Stephen's Cathedral; Haas House / Vienna (photos: Süheyla Birlik)

### 2.3. *Harmonic Contrast Approach*

to build by using the characteristics of both the past and the own era (Figure 4).

Figure 4. Matthias Church; Hilton Budapest Hotel / Budapest (photos: Süheyla Birlik)

### 3. Safranbolu-Baysal Street

Baysal Street (Figure 5), which has possession of both old and -incompatible with the texture- new buildings, is the preferred model application area in this study.

Figure 5. Baysal Street (south silhouette) / current situation

*conservation-development aimed rehabilitation study*

Potential designs (Table 2) has been developed in the manner of:

- restoring of the old buildings
- rebuilding of the new buildings incompatible with the texture based on current allowed building heights

Table 2. Baysal Street (south silhouette) / potential designs

*subjective evaluation*

The current situation and potential designs have been evaluated by the students (twenty seven persons; fifteen girls, twelve boys) who study at the fourth-grade at the Department of Architecture in the Karabük University in the 2012-2013 Academic Year and attend the course named 'New Buildings in Historical Environments-Studio'.

The subjects were asked to answer the questionnaire forms prepared by the Semantic Differentiation Scale for the street silhouettes for which the sequence of display is specified by drawing of lots.

Table 3. Semantic Differential Scale / frequency distribution

	strongly agree	agree	partially agree	neutral	partially agree	agree	strongly agree	
	+3	+2	+1	0	-1	-2	-3	
impressive					2	0		unimpressive
orderly			1 0					unorderly
well-balanced				1		0		poorly-balanced
spectacular					0 1	3		unspectacular
original						1		ordinary

a=current      b=imitation      c=version      d=opposite      e=harmonic contrast

#### 4. Conclusion

According to the statistical data obtained as a result of the evaluation by the architect candidate students of the current situation and potential designs of Baysal Street, which is located within the historical texture of the city of Safranbolu, the 'admiration preferences' have been listed as:

imitation	→	version	→	harmonic contrast	→	opposite	→	current
- 0.296		-0.4148		- 0.5851		- 0.7185		- 0.8370

What is desired to be accomplished with the conscious that may change according to settlements and designers of the potential designs and subject groups of the admiration preferences, is to contribute to the formation of new buildings that will blend in with the historical environments.

#### Acknowledgment

Thanks the 4<sup>th</sup> grade students who studied at the Department of Architecture in the Karabük University in the 2012-2013 Academic Year and participated in the survey by taking the elective course named 'New Buildings in Historical Environments-Studio'.

# Determination of the Mental Cutting Ability of Prospective Mathematics Teachers

Nazan Sezen Yüksel<sup>a\*</sup>, Ali Bülbül<sup>b</sup><sup>a</sup>*Hacettepe University, Faculty of Education, 06800, "Ankara", Turkey*<sup>b</sup>*Hacettepe University, Faculty of Education, 06800, "Ankara", Turkey*

---

## Abstract

The aim of this study is to determine the mental cutting ability of prospective mathematics teachers. For that purpose, mental cutting test is applied to prospective mathematics teachers to determine the ability in current situation. At the start of study, the test is applied to 232 students and after the validity and reliability analyses took its final form. The questions in the test take two parts such as "pattern problems" and "quantity problems". According to obtained data, accomplished a result that; prospective mathematics teachers' mental cutting level is low and they are more successfully at pattern problems than quantity problems.

Keywords: Mental Cutting, Pattern Problems, Quantity Problems

---

## 1. Main text

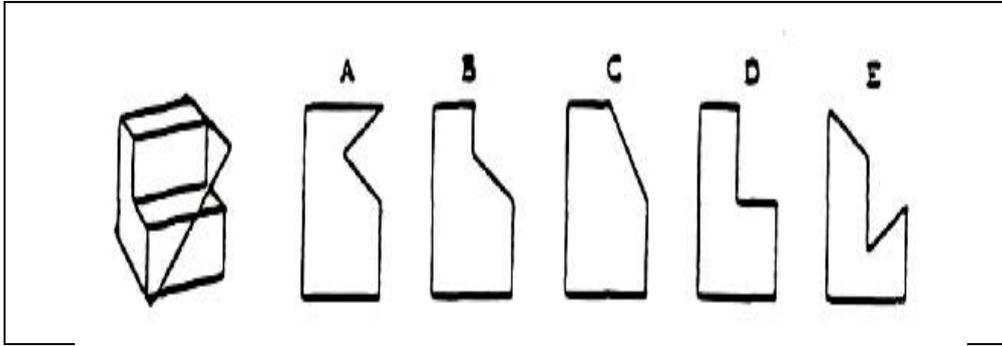

The spatial ability is a common concept that we met in both scientific and all part of daily life, and also the studies for determining and mensuration of the components of this ability is gradually increase day by day. The mental cutting ability which is postulated a component of the spatial ability is overemphasized. The mental cutting test is defined by (Sorby, 2011) as; it is an ability to draw the different point of view of a given object which is cut by a plane.

Although there are many tests in the literature about determining of the other components of spatial ability (spatial visualization, mental rotation etc.), there are only two test known to determine the mental cutting ability. The one of this is; Mental Cutting Test (CEBB,1939) which is used in this study to obtain data, the other one is "The Mental Cutting Test- Schnitte" which is developed by Fay and Quasier-Pohl in 1999 (Quasier- Pohl, 2003).

The Mental Cutting Test (MCT) was first developed for a university entrance exam in the USA and than in Japan and Austrila. This test is consists of 25 items and developed by CEBB (Collage Entrance Examination Board) in 1939. For each problem on the exam, students are shown a criterion figure which is to be cut with an assumed plane (Gorska et al, 1998).

\* Corresponding author. Tel.: +90-312-297-8601; fax: +90-312-297-8600.

E-mail address: nsezen@hacettepe.edu.tr

It is asked for establishing the obtained cross section when a given 3 dimension shape cut by a plane as in the figure above.

The other Mental Cutting Test-“Schnitte” is developed by Fay and Quasier-Pohl in 1999 and accepted a new assessment method for extraordinary high spatial ability (Quasier-Pohl, 2003). Here, the 3 dimension geometric shapes (pyramid, cone, etc.) that cut mentally are hollow. These shapes are cut with aid of a plane or any other geometric shape.

In the literature, the mental cutting test is applied by different application to different students group. For example, Saito et al (1996) evaluated the spatial ability by mental cutting test in their study. After evaluation, they indicated that, mental cutting test reflected the ability of manipulate of 3-dimension mental image and ability of generalization the 2-dimension images to 3-dimension images. According to this, mental cutting test reflects analytical thinking ability besides spatial ability.

Makino et al (1992) examined the students’ problem solving process on the mental cutting test by use eye tracking monitor and verbal protocols as data obtain method in their study. According to analysis results, mental cutting test reflects visualization ability. Hereunder, the students get high grade from mental cutting test, more successfully to visualize mental picture. Suzuki et al (1992), get result in their study that, mental cutting test grades shows significant difference for the benefit of male students.

Sometimes, mental cutting test is used for detection of spatial ability of students one times before graphic education. Nevertheless, usually same students are applied the test twice, beginning and the final of the lesson as pretest and posttest (Tsutsumi et al, 2005). Suzuki et al (1992), applied mental cutting test to students before and after graphic lesson at more than 10 universities in their studies. As a result of application, after graphic lesson activities, mental cutting test grades have shown increase.

Adanez G.P. and Velasco A.D. (2002), in their study, they prepared the mental cutting test’s computer environment version, got a result that, there is a positive and significantly relationship between engineering student’s mental cutting ability and technical drawing performs. Sorby, S., Hamlin, A. and Veurink, N. (2008), pointed 3 dimension spatial abilities’ importance on engineering education, and expresses that in Michigan University has opened a lecture for developing 3-dimension spatial ability for engineering since 1993. Within the context of this lecture; at first, the number of student has shown developing is a few, but as time progresses, the aim was successful in parallel with the studies.

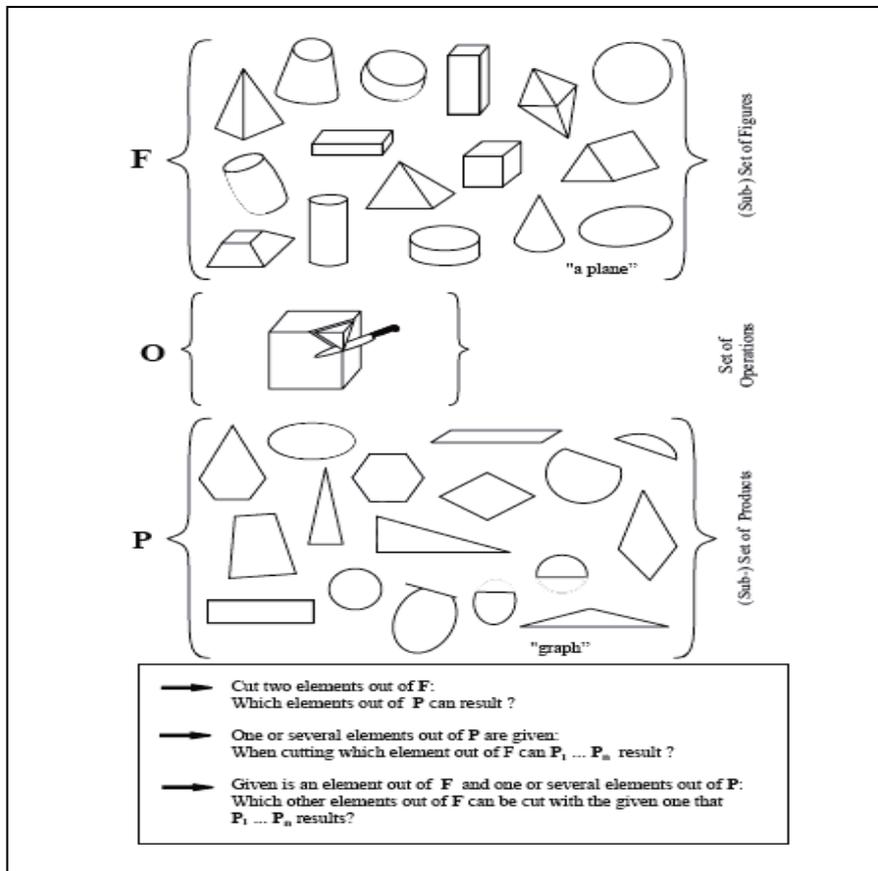

Fig 2: A Sample Question for Mental Cutting Test- "Schnitte"

In mathematics, especially geometry, the level of having mental cutting ability of the students effects the success rate on these lectures and the ability of envisaging the different manipulation of 3-dimension shapes. Therefore, in this study, it is aimed to determine the prospective mathematics teachers' mental cutting ability level and contribute to literature by various bringing forward a proposal in accordance with the obtained results.

## 2. Method

In this section includes some information about study group, data collection and analysis of data.

### 2.1. Study Group

The study group consists of 232 prospective mathematics teachers at two state universities in Ankara which have mathematics education programme.

### 2.2. Data Collection Tool

In this study the mental cutting test which is developed by CEBB (1939) is used as data collection tool. According to this test, it is expected from a student to

- Envisaging the cutting of a three dimension shape by a plane
- Determine the cut part and remain part shapes of three dimension shape cut by a plane after cutting.

The test contains 25 items and consists of two parts. The first part is called “pattern problems” and in this part the right answer is found only by determining of plane patterns. And the second part is called “quantity problems”. As for in this part, the right answer is identified by determining the plane not only by pattern but also quantity (edge length or the degree of the angle between two edge).

The following figure is an example; the one of the question of the test to have opinion about “pattern problems”.

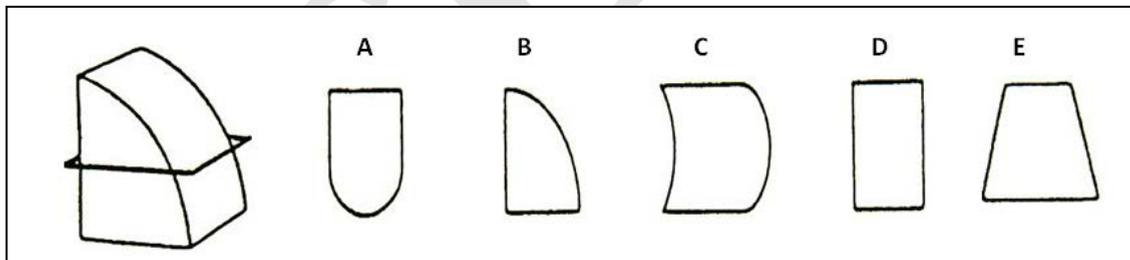

Fig 3: The sample question for mental cutting test (pattern problems)

As the following is a sample problem for “quantity problems”, the other category in the test.

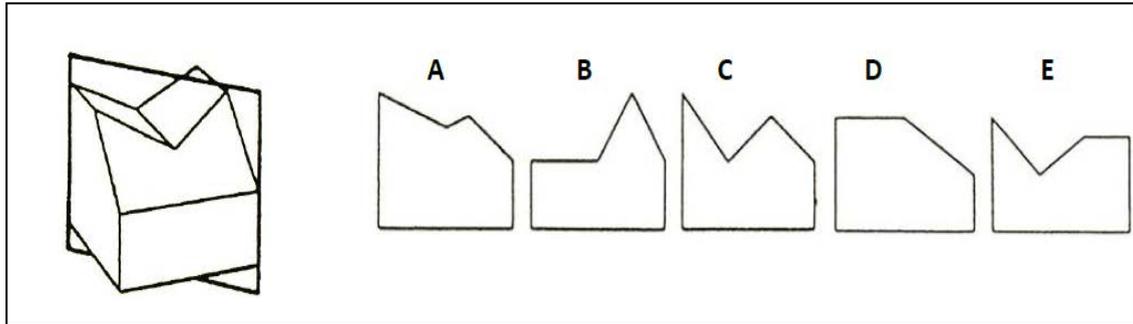

Fig 4: The sample question for mental cutting test (quantity problems)

## 2.2. Data Analysis

The analysis consists of; item analysis, validity and reliability studies and descriptive statistics analysis of the data get from application of the test. The analysis of data is made by IteMan 5.0 program. For validity study; confirmatory factor analysis is calculated by Lisrel 8.7 software and for validity study; Cronbach's Alpha internal consistency is calculated by SPSS 17.0 statistics software.

## 3. Findings

In this part; the item analysis belongs to mental cutting test, validity –reliability analysis and descriptive statistics findings are given.

### 3.1. Findings for Item Analysis

As a result of item analysis, the discrimination index and proportion correct of each item is calculated. According to this; the lowest discrimination index is 0.26, the highest discrimination index is 0.71. The value of proportion correct is the lowest item has 0.20, the highest item has 0.57 parameter. The other items show an alteration between 0.29 and 0.56.

Table 1: Results of Item Analysis of Mental Cutting Test

Number of Items	25
Number of Examinees	232
Mean	11.06
Standart Deviation	4.234
Skewness	0.500
Kurtosis	0.362
Mean P	0.35
Mean Item- Tot.	0.45

### 3.2. Findings for Reliability Study

The items in the data collection tool are graded as dichotomously according to given answers. The reliability study of data collection tool, the Cronbach's Alpha internal consistency is considered. In literature, mentioned that, using KR-20 technic in the dichotomously grading is imperative, but also when each item graded as 1-0, is known, KR-20 and Cronbach's Alpha internal consistency do not give same result (Cronbach, 1951).

According to the results of the analysis, Cronbach's Alpha internal consistency coefficient of mind cutting test was found to be .69.

### 3.3. Findings for Validity Study

To provide evidence for validity of obtained data from mental cutting test, confirmatory factor analysis (CFA) is applied to data. In application of confirmatory factor analysis, the Maximum Likelihood Factor Analysis is used as a technic of factorization.

Before application of confirmatory factor analysis to obtained data from the test, it is investigated that, the data weather counterpoises the normality premise, which a premise of confirmatory factor analysis, or not.

Table 2: Table of One Sample Kolmogorov- Smirnov Analysis

		Mental Cutting
N		231
Normal Parameters <sup>a,b</sup>	Mean	13.64
	Std. Deviation	4.083
Most Extreme Differences	Absolute	.087
	Positive	.047
	Negative	-.087
Kolmogorov- Smirnov Z		1.322
Asymp. Sig. (2- tailed)		.061

When analyzed the result of One Sample Kolmogorov-Smirnov analysis in Table-2, the p value get for mental cutting test is  $>0.05$ . According to this, the data counterpoise the normality premise.

The goodness of fit indexes obtained from confirmatory factor analysis done for mental cutting test are;  $X^2/sd= 1.36$ ,  $GFI= 0.88$ ,  $CFI= 0.83$ ,  $NNFI= 0.82$ ,  $RMR= 0.066$  and  $RMSEA= 0.040$ . In the line with suggested modifications; the 24<sup>th</sup> item is deleted, 11<sup>th</sup> and 13<sup>th</sup> item and 20<sup>th</sup> and 22<sup>th</sup> item are connected. And the Table 3 below shows obtained goodness fit index;

Table 3: Confirmatory Factor Analysis for Mental Cutting Test

Mental Cutting	Goodness of Fit Indices
$X^2/ sd$	1.17
Comparative Fit Index (CFI)	0.91
Root Mean Square Residual (RMR)	0.014
Goodness of Fit Index (GFI)	0.90
Non-Normed Fit Index (NNFI)	0.90
Root Mean Square Error of Approximation (RMSEA)	0.028

According to goodness fit index values; according to  $GFI= 0.90$ ,  $CFI=0.91$  and  $NNFI= 0.90$  index, model is good fit; according to;  $X^2/sd= 1.17$ ,  $RMR=0.014$  and  $RMSEA= 0.028$  index, model shows perfect fit.

In accordance with the first level confirmatory factor analysis, the path diagram obtained for mental cutting test is shown in Fig 5.

After the final situation of reliability and validity studies of the mental cutting test, which is used as data collecting tool in study, the descriptive statistics is applied to data that obtained by this test.

Table 4: Descriptive Statistics for Final Situation of Test

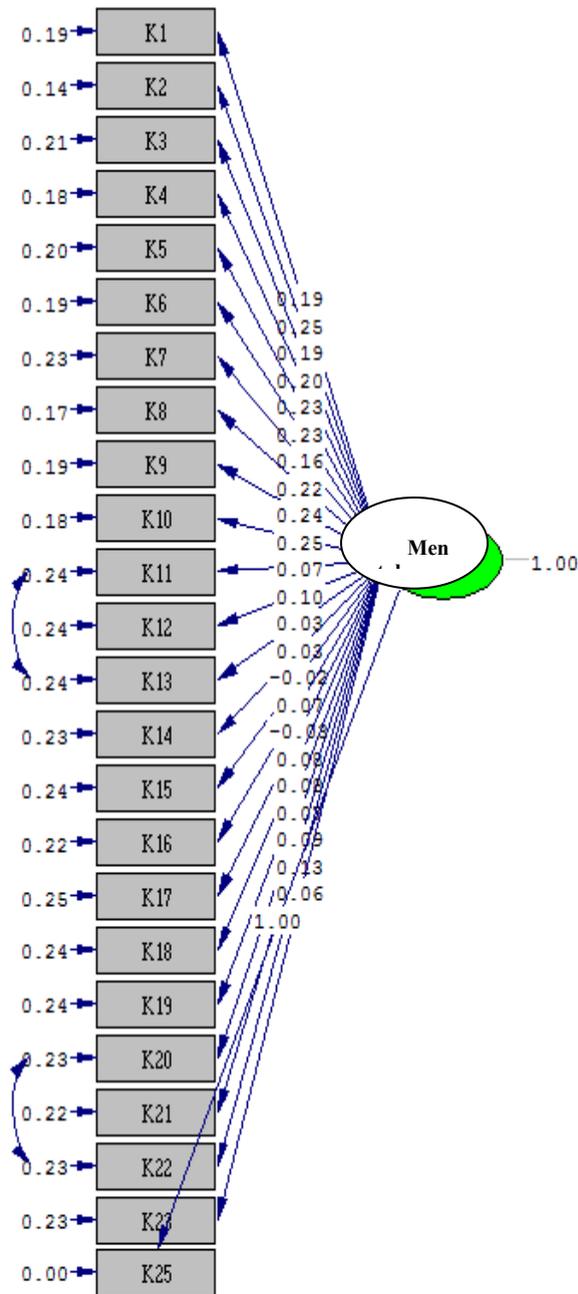

Mental Cutting	
Mean	10.07
Standard Deviation	4.108

The one sample t –test table which is applied for the “pattern problems” and “quantity problems” in the test mean difference is whether significant or not is shown as;

Table 5: One Sample t-Test of Mental Cutting Tests Groups

	Mean	t	df	Sig (2- tailed)	Mean Difference	% 95 Confidence Interval of the Difference	
						Minimum	Maximum
Pattern Problems	6.68	26.438	76	.000	6.688	6.18	7.19
Quantity Problems	2.63	16.817	76	.000	2.636	2.32	2.94

If view Table 5, according to the grades gets from pattern problems and quantity problems of study group, there is a significant difference in favour of pattern problems.

Chi-Square=294.32, df=250, P-value=0.02839, RMSEA=0.028

#### 4. Results and Conclusions

This is an incontestable fact, that spatial ability played a very important role in mathematical thinking. Studies for the development of spatial ability are considered as an important part of mathematics education.

The mental cutting test is determined a sub-dimension of spatial ability and is used often in mathematical process. According to findings obtained from in consist of this study, it is pointed out that the mental cutting ability level of mathematics prospective teachers is low. In addition, if look out the average of different question types in the test, the mathematics prospective teachers are more successful at pattern problems than quantity problems. Consequently, the ability of determining the plane pattern of mathematics prospective teachers is more developed, in other words, it is concluded that, mathematics prospective teachers prefer to focus on general lines of shapes instead of take edges and the angle between the ages.

On the purpose of to improve the mental cutting ability of mathematics prospective teachers; application of the test special to this ability meticulously and enlarge the application area by different type tests will make a proposal to future studies. Also, preparing substantial materials and designs made in computer environment contribute to develop this ability.

By the examination of the mental cutting test relation with the other sub dimension of spatial ability, can be observed which situations this ability steps in and can support developing the ability by intervention in needed situations. By investigation of high level cognitive ability such as problem solving, problem posing or mathematical thinking, with mental cutting ability by future studies, it can be contributed of spatial ability to mathematical area.

# Determination of university students' metacognitive beliefs (Gazi University sample)

Pınar Bilasa<sup>a\*</sup>*"Gazi University, Gazi Education Faculty 06500, "Ankara", Turkey*

---

## Abstract

The objective of this study is to define metacognitive beliefs of university students at Faculty of Education on Industrial Arts in Gazi University. Owing to the fact that the aim in the study is to determine an existing situation, 'descriptive survey model' is used. Therefore, "Short Form of Meta-Cognitions Questionnaire (MCQ-30)" developed by Cartwright-Hatton and Wells is used. The scale consists of 30 articles made with 4-point Likert scaling. Adaptation of the scale to Turkey and its validity and reliability has been made by Tosun and Irak. Study population consists of all the university students available at the university during 2012-2013 Spring Academic Years (647 students). The study group consists of 220 students who take part in the research on volunteering basis. As a result of the study, whether there is statistically difference in 'cognitive reliance, recalcitrance and danger, need to control opinions and cognitive awareness' metacognitive beliefs according to gender and department is revealed. Accordingly, it has been seen that female students have belief to control their feelings much more than male students. In addition, it has been revealed that Departments of Management and Computer Teaching has more positive believes.

Keywords: Gazi University, metacognition, education program

---

## 1. INTRODUCTION

Instead of "Metacognition", generally terms such as self-arrangement, directive control, supra-cognition, executive cognition, and beyond-cognition' may be used. It is considered that frequent use of these terms interchangeably in literature makes the concept complicated and conflicting. Therefore, for the purposes of making it easy to understand, the term of 'metacognition' is used. Although it is difficult to know the root of the word of metacognition, this concept is indicated to be considered by some philosophers and scientists in the past. For example, the statement of Spinoza (1632-1677), '... if one knows anything, then he knows that he knows it', is accepted to be the first statement which mentions metacognition. Besides, the first person to emphasize that metacognition means being aware of is Platon. At the same time, Aristo also suggests that there is another independent force which gives awareness to actions other than hearing and seeing. It is seen that many definitions have been made for metacognition in historical background. Some of these definitions are as the following:

\* Corresponding author. Tel.: +90 535 391 52 52; fax: +90 312 485 31 23.  
E-mail address: pinarbilasa@gmail.com, pinarbilasa@gazi.edu.tr

'This is the awareness and arrangement of thinking processed used by students for planned learning and problem solving'	<i>Brown, 1978</i>
'Cognition refers to actual acts and strategies used by the readers, whereas metacognition is a structure which expresses firstly what individuals know about their cognitions and secondly their skills to control their cognitions'	<i>Forrest-Pressley and Waller, 1984, p.6</i>
'This is the knowledge of individuals about several aspects of thinking processes' and 'It is the skills of individuals to arrange their cognitive activities to learn more efficiently'	<i>Gavelek and Raphael, 1985, p.2</i>
'This is dynamic interaction period which should be evaluated immediately'	<i>Meichenbaum and others, 1985</i>
'Secondary level cognitions Opinions about opinions, information about information and thinking about actions'	<i>Weinert, 1987, p.8</i>
'This is the self-follow-up of learning strategies and cognition about their usage'	<i>Borkowski and others, 1987, p.4</i>
'It is to be aware of our thinking while performing some certain tasks and to use this awareness for controlling what we should do in the later stage'	<i>Marzano and others, 1988, p.9</i>
'This is the output of cognitive thinking and consciousness'	<i>McCormick and others, 1989</i>
'This is the skills of any person to have information, awareness and control about his learning'	<i>Baird, 1990</i>
'This is the knowledge of an active student who puts control over learning process about his cognitive processes, which are functions of feedbacks received via learning outputs and the ability of this student to control and follow such processes'	<i>Metcalfe and Shimamura, 1994</i>
'This is the knowledge of an individual about his knowledge, processes and cognitive and emotional situations and the skills of this individual to follow and arrange on the basis of purposes'	<i>Hacker, 1998. p.11</i>
'This is the awareness of an individual about his own thinking and assessing and the capacity to arrange his own thinking'	<i>Wilson, 1999, p.3</i>

Fig.1. Metacognition definitions

Based on these definitions, it is possible to define metacognition as the ability of an individual to think about his learning consciously, to plan, follow and arrange his own cognitions. From this perspective, particularly the skills of students to determine their beliefs about their own learning are significantly important in terms of increasing their levels of metacognitive awareness. On the other hand, the students' capacity to determine their metacognitive beliefs will make them more aware of their own mental processes. On this basis, determining whether metacognitive beliefs of university students are differentiated according to gender and department has

become the subject matter of this study. Therefore, metacognitive belief profiles of these students who are prospective teachers will be revealed.

### *1.1. Objective of Study*

The objective of this study is to define metacognitive beliefs of university students at Faculty of Education on Industrial Arts in Gazi University. Therefore, the dimensions of metacognitive beliefs of students are examined under the levels of 'positive beliefs, recalcitrance and danger, cognitive reliance, need to control opinions and cognitive awareness' according to variables of gender and department.

### *1.2. Method*

Scanning method is used in the study. The descriptive survey model is an approach which aims at describing a situation which previously or still exists in the way how it exists (Karasar, 2012: 77). The study is limited to 220 persons who are students at faculty of Education on Industrial Arts in Ankara Gazi University during 2012-2013 Spring Academic Year and 4 departments available in the faculty. All the students in the faculty are senior students because of non-admission of new students to the department upon the Cabinet Decree No 2009/15546 issued in Official Gazette dated 13.11.2009 and numbered 27405. Distribution of students to take part in the study is as the following: 55,% of 220 students (123 persons) are female, whereas 44,1% of them are males (97 persons). The distribution according to the departments is as the following: 25,5% of 220 students (56 persons) are from Department of Management Education, 24,1% (53 persons) are from Department of Computer Teaching, 21,4% (47 persons) are from Department of Industrial Technology Teaching and 29,1 (64 persons) are from Department of Family and Consumer Sciences Teaching. 'Metacognitive Scale (ÜBÖ-30) whose original name is "Meta-Cognitions Questionnaire (MCQ)" developed by Cartwright-Hatton and Wells in 1997 and created in the form of 30 items again by Wells, Cartwright-Hatton in 2004 (Tosun ve Irak, 2008: 68) is used in the study. Each item in the scale is rated over four-point Likert scaling scale which has the scales of "(1) I strongly disagree" and "(4) I strongly agree". Kaiser-Meyer-Olkins (KMO) value of the scale developed by Wells and Cartwright-Hatton (2004) is 0.90, whereas its Cronbach Alpha value is .93. Its KMO value is found to be 0.89 and its Cronbach Alpha reliability coefficient is found to be .86 by Tosun and Irak upon their works made on a group consisting of 850 (282 males, 565 females) university students during 2005-2006 academic year after its adaptation to Turkish (Tosun and Irak, 2008: 69-70). Items in ÜBÖ-30 are distributed according to five functions contained in the metacognitive beliefs. These are as the following:

1) Positive beliefs (Items 1, 7, 10, 20, 23 and 28): These include the idea that anxiety helps making plan or solving problems and there are positive beliefs about anxiety. At the same time, according to this factor, anxiety is a desirable personal characteristic.

2) Recalcitrance and danger (Items 6, 13, 15, 21, 25 and 27.): This consists of two dimensions. One of them is the belief that 'Anxiety should be controlled so that individuals can perform their functions and they can stay reliably'. The other dimension is the belief that anxiety cannot be controlled.

3) Cognitive reliance (Items 8, 14, 18, 24, 26 and 29): This is related to self-reliance of an individual on his own memory and attention capacities.

4) Need to control opinions (Items 2, 4, 9, 11, 16 and 22): This includes the need to take negative beliefs under control about superstitions, being-punished and being responsible for. This is related to the idea that these beliefs will occur when an individual cannot control them and the person will be responsible and punished for its harmful results.

5) Cognitive awareness (This includes items 3, 5, 12, 17, 19 and 30): This expresses an individual to continuously deal with his own thinking processes (Tosun and Irak, 2008: 69).

### 1.3. Data Collecting and Analysis

Instruments used for data collecting are distributed to the voluntary students by the researcher by obtaining permission from the lecturers who are responsible for course hours determined according to weekly course schedule, necessary explanations are made and after practice of approximately 20 minutes, these are controlled one by one and collected. Data collecting has lasted for approximately 2 weeks by collecting data in this way. Firstly, during the analysis of study data, whether data is normally distributed and whether variances are homogenous is determined and then t-test is employed for comparisons made according to gender and univariate directional variance analysis (ANOVA) is employed for comparisons made according to department.

### 1.4. Findings

Comparisons are made according to variances of gender and department in the research. Variance analysis results are provided below in comparison of sub-dimensions of metacognitive beliefs according to gender variable.

Table1. T-test results of Metacognitive Sub-Dimensions According to Gender

Metacognitive beliefs	Gender	N	Mean	Std. Deviation	t	p
Positive beliefs	Female	123	2,1098	,67610	-1,316	,190
	Male	97	2,2337	,71511		
Recalcitrance and danger	Female	123	2,4431	,58121	-1,138	,257
	Male	97	2,5275	,49866		
Cognitive reliance	Female	123	2,1247	,67299	1,391	,166
	Male	97	1,9931	,72525		
Need to control opinions	Female	123	2,5596	,70618	2,443	,015*
	Male	97	2,3351	,63760		
Cognitive awareness	Female	123	2,9932	,47783	1,203	,230
	Male	97	2,9175	,44431		

\*p<0.05

When Table 1 is examined, there is significant difference according to variance analysis results of positive belief dimensions on the basis of gender variable. This difference is for the female on the basis of dimension of need to control ideas. In the study made by Semerci and Elaldı in 2011 on Determining Metacognitive Beliefs of Students at Faculty of Medicine in Cumhuriyet University, according to t-test results made according to gender, there is statistically significant difference for male students in terms of metacognitive beliefs about the need to control the ideas. This finding indicates parallelism with the finding of study in terms of metacognitive belief dimension.

Table2. Variance Analysis Results of Dimensions according to Variable of Department

Metacognitive beliefs	Sum of Squares	df	Mean Square	F	p	Mean Difference
<b>Positive beliefs</b>						
<i>Between Groups</i>	5,494	3	1,831	3,948	<b>,009*</b>	IŞL-BIL
<i>Within Groups</i>	100,199	216	,464			
<i>Total</i>	105,693	219				
<b>Recalcitrance and danger</b>						
<i>Between Groups</i>	,945	3	,315	1,055	,369	
<i>Within Groups</i>	64,525	216	,299			
<i>Total</i>	65,470	219				
<b>Cognitive reliance</b>						
<i>Between Groups</i>	,625	3	,208	,424	,736	
<i>Within Groups</i>	106,064	216	,491			
<i>Total</i>	106,689	219				
<b>Need to control opinions</b>						
<i>Between Groups</i>	,748	3	,249	,528	,663	
<i>Within Groups</i>	101,856	216	,472	,663		
<i>Total</i>	102,603	219				
<b>Cognitive awareness</b>						
<i>Between Groups</i>	1,106	3	,369	1,731	,162	
<i>Within Groups</i>	46,011	216	,213			
<i>Total</i>	47,118	219				

\*p&lt;0.05

When Table 2 is examined, there is statistically significant difference in the variance analysis results of dimension of recalcitrance and danger according to variable of department. This difference is between the departments of Management Teaching and Computer Teaching. In this case, it can be said that students at the departments of Industrial Technology Training and Family and Consumer Sciences Teaching consider that the anxiety cannot be controlled.

### 1.5. Discussion and Conclusion

There is statistically significant difference for females among the students included in the population in terms of dimension of control need metacognition belief according to gender variable ( $t=2.443$ ,  $p<0.05$ ). This situation indicates that, when compared to male students, female students are afraid of an extremely responsible for results and possible caused by their own behaviours. This finding indicates parallelism with the findings in study of Semerci and Elaldın (2011). That is, significant difference is found in terms of recalcitrance and danger according to gender variables made on 408 students of faculty of medicine (49% as female and 51% male) at Cumhuriyet University. This situation supports the finding. This situation supports the finding.

According to department variance, there is statistically difference between the departments of Management Teaching and Computer Teaching in terms of positive beliefs ( $F=3,948$ ;  $p<0.05$ ). This situation indicated that positive beliefs about anxiety for helping individuals to make plans or solve problems occur in both these departments. In addition, this also reveals that the students at departments of Industrial Technology education and Family and Consumer Sciences think that anxiety cannot be controlled.

When these findings and the related departments are considered, it has been concluded that it is necessary to arrange the education provided for pre-service teachers in a way to increase their self-reliance in improving their metacognitive beliefs. The education provided should be guiding in terms of helping students make plans or solve problems, control their anxiety to perform their functions and to stay under reliance, enable them to be self-reliant on their own memory and attention capacities, to take negative beliefs under control and to deal with their own thinking processes continuously. In this line, the need for re-assessing and revising the training programs provided especially in departments of Management Teaching and Computer Teaching has occurred. Thus, students will become aware of their own positive and negative hesitations and can increase their self-reliance. This positive improvement will make great contributions to pre-service teachers to educate new generations. In this line, it may be suggested that education programs of particularly faculty of educations which aim at educating teachers should be dealt with again in terms of providing students with the opportunities for identifying their learning needs and determining how they learn.

# Developing an Intelligent Tutoring System for Vehicle Dynamics

Carlos Huertas\*, Reyes Juárez-Ramírez

*Autonomous University of Baja California, Calzada Universidad 14418, Tijuana 22390, Mexico.*

---

**Abstract**

Intelligent Tutoring Systems (ITS) represent a substantial portion of knowledge from human tutors, therefore they are able to provide a better learning guidance than Computer Assisted Instructions (CAI). One of the most important goals of an ITS is to provide feedback tailored to the learner unique needs. There are several educational activities that are supported by these systems such as: problem solving, example review, educational games, etc. This research focus on interactive simulation to improve the learning curve of vehicle dynamics topics as it has been shown that engineer students usually find math and physics too boring and hard to understand when they are unable to map a topic to a real life problem, therefore a most interactive approach seeks to catch student attention while providing a sandbox to experiment and learn. In this paper we present our first prototype, discuss its design and provide test results based on a two year evaluation process.

## 1. Introduction

The Computer Assisted Instruction (CAI) were introduced by Patrick Suppes at Stanford University since early 1960, these systems have evolved as learning tools providing students with encoded set of exercises and associated solutions. CAI system usually provides problems with a single correct answer, hence here is where the problem arises as more complex scenarios cannot be completely evaluated, as is the case of Vehicle dynamics topics where a single problem may have a lot of potential correct answers, and since we talk about nonlinear problems, it is usually required to perform the whole process to find out if the answer is correct or not. From several researches (Alexander, 1999; Leung, 2003; Jain & Getis, 2003) it has been revealed that there is indeed a difference in students achievements between a CAI assisted group and a conventional group, these differences are mostly positive as shown by Owens and Waxman (1994), Teh and Fraser (1995), Yalcinalp, Geban and Ozkan (1995) and Leung (2003). Even when it has been show the effectiveness of CAI systems, there is still a gap to be filled for more complex topics, and there is where the Intelligent Tutor Systems (ITS) have proved to match and even surpass CAI system performance as reviewed by Glickman and Dixon (2002).

Main goals in ITS research are, how to create computer based tutors more flexible, autonomous and adaptive for particular student needs. There are three types of knowledge that any tutor, being human or artificial needs to have in order to aid student learning (Conati, 2009):

- About the target instructional domain
- About the student
- About the relevant pedagogical strategies

Besides, an ITS needs to have communication knowledge in order to present the required useful information via the computer and the available channels. These different types of knowledge contribute to define the body of an ITS that is integrated basically by four main models according to a general consensus research (Nwana, 1990; Freedman, 2000; Nkambou et al., 2010):

- Domain model
- Student model
- Tutor model
- User interface model

The *domain model*, also called expert model, it is usually built on a theory developed by John Robert Anderson from Carnegie Mellon University that is called Adaptive Control of Thought—Rational (ACT-R), this theory tries to take into account all the possible steps required to solve a problem, this model has the knowledge to evaluate student performance and detect errors. The *student model* can be seen as overlay on the domain model, and it is usually considered a core element in a ITS, this model is responsible of tracking the student progress and raise flags or warnings if the student deviates from the domain model. The *tutor model* is the glue that holds the domain and student models together and is responsible of making decisions about adequate strategies and actions for better learning process. It is required to take actions when the student models set deviated flags (Anderson, H. & Koedinger, M). The *user interface model* finally integrates the required information for a successful communication, such as: knowledge about patterns of interpretation, domain knowledge needed for communicating content and knowledge needed for communicating intent (Padayachee, 2002).

Intelligent Tutoring Systems (ITS) may have discrepancies in their architectures, however, they are still much the same as any other instructional design process, Corbett et al., summarizes ITS design and development in four iterative stages:

- Needs assessment
- Cognitive task analysis
- Initial tutor implementation
- Evaluation

The *needs assessment*, is a common stage of an instructional design process, this analyses the learner based on experts and teacher experience, therefore this is the first step to develop the domain model (Corbett et al., 1997). The *cognitive task analysis* involves the detailed approach for developing a computational model for problem solving, observation of human tutor interaction with students provides invaluable information to develop this stage (Farhana et al., 2002). The *initial tutor implementation* involves setting up a problem solving environment following for a series of evaluation activities, which according to Corbett et al. (1997) are very similar to any other software development. The fourth and final stage called *evaluation* perform studies to find out the usability and impact of the ITS, finding learning rates and achievements level (Corbett et al., 1997).

Our current research focus on the domain model, in this paper we present the framework that is being developed to support the first model and that will serve as the expert system for problems solving and will determine the correctness of student results, this is a very important and vital part of the system, because as we can learn from Conati (2009) researches, one main key difference between a CAI and ITS is that the latter, needs to be able to generate real-time solutions not previously defined by a human tutor. The remaining of this paper goes as follows: In section 2, we provide details for the domain model design. In section 3, the current work status of development is discussed. In section 4, an evaluation of domain model accuracy is compared with real life vehicle dynamics scenarios. In section 5, we provide statistical data about current prototype usage. In section 6, we present our conclusions and future work.

## 2. Domain Model Design

A physics engine is a computer software that provides an approximate simulation of certain physical systems, such as rigid body dynamics and it is the core element in our domain model as our ITS will focus on vehicle dynamics, specifically evaluating vehicle parameters to output performance characteristics under testing conditions, theoretically an endless amount of problem generation can be provided for students as long as the system is capable of process real-time unassisted results by its own.

The model is constructed mainly by three modules:

- Engine Model
- Driveline Model
- Dynamics Model

The specific details of each module are discussed below.

### 2.1. Engine Model

In order to be able to estimate vehicle performance, it is important to determine how this behavior can be computed. The maximum achievable acceleration of a given vehicle is limited by two main factors, (1) Maximum torque at driving wheels, and (2) Maximum traction force at wheels.

The common vehicle engine to be modeled in this research are internal combustion, and its maximum attainable power  $P_e$  is a function of engine angular velocity  $W_e$ , this needs to be determined experimentally by the

student or, the system can provide an expected torque curve for all operative Revolutions per Minute (RPM) using a third order polynomial function, as can be seen in (1):

$$P_e = \sum_{i=1}^3 P_i W_e^i \quad (1)$$

With this approach the students can develop their own formula for determining engine torque curve or simplify the problems using the provided polynomial approach.

The output of this computation is then feed into the driveline module for further analysis as explained below.

## 2.2. Driveline Model

We use the driveline term to represent the whole system responsible to transfer the torque being generated by the engine(1) to the tires(7), among the components being modeled we have: clutch(2), gearbox(3), differential(5), axles(6) and shaft (4), since the power needs to be transferred from system to system, the power at wheels is always less than the power at engine, this is called driveline efficiency and opens a lot of possibilities for problem solving. The overview of the vehicle power transfer can be seen in Fig 1.

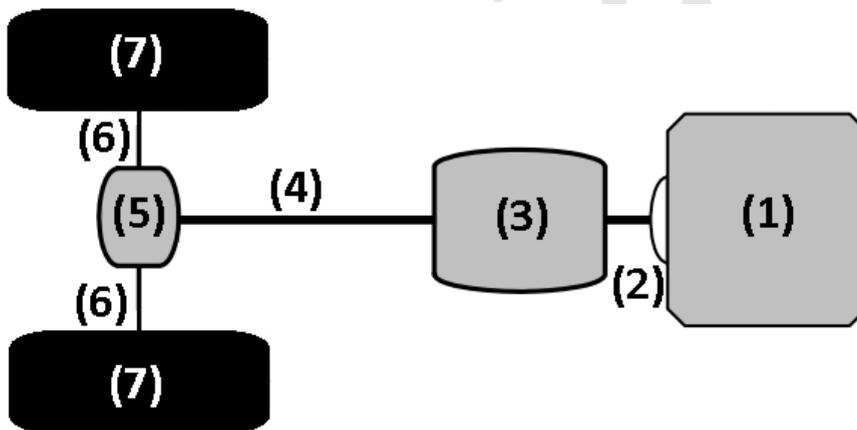

Fig. 1. Vehicle power transfer overview

To find the power at wheels student can develop their own model based on the power laws or run experimental tests varying the whole driveline losses to match specific vehicle characteristics, then the torque finally reaching the wheels can be calculated as in (2):

$$T_w = \eta T_e \quad (2)$$

Where the Greek letter Eta represents the overall system efficiency applied to the engine torque  $T_e$  to get the resultant torque at wheels  $T_w$ . Once we find out the force moving the tires we feed the dynamics model for final analysis.

### 2.3. Dynamics Model

This module is responsible for integrating all the vehicle modeling to find out the maximum possible acceleration that can be reached, the limits of this acceleration can be defined by power limitations, i.e. the engine cannot provide enough power to keep accelerating, or traction limited, i.e., the tires are unable to transfer the power to ground and spins, therefore wasting energy instead of moving the car. To evaluate the required time to reach a desired speed it is necessary to find the traction force  $F_x$  and integrate. This is being done based on the Newton equation of motion and the resultant integral is presented in (3).

$$m \int_0^s \frac{1}{F_x - F_R} dv_x \quad (3)$$

With this motion integral with limits from a standstill 0 up to the goal speed  $s$ , we consider the vehicle mass  $m$ , and the traction force  $F_x$  minus the total resistance force  $F_r$  which is caused by several sources but being the main source the air drag force and inertia, these forces are evaluated considering different parameters of vehicle body structure that students can design on their own. The dynamics model is far more complex however, more in deep analysis would fall out of the scope of this paper, all these models were developed as part of the ITS first stage, in the following section more details about development are provided.

## 3. ITS Development Status

The first challenge in ITS development was to determine what could be the most adequate development framework to use, since vehicle dynamics modeling requires intensive calculations, framework performance was a major decision point and, since a server controlled internet application would give us much more control and feedback about the ITS usage, we decided to develop a Rich Internet Application (RIA), to determine which framework would provide enough performance a series of frameworks were evaluated with a Bubble render animation benchmark developed by Alexey Gavrilov (2009). In the following Table 1. we provide our test results.

Table 1. Frameworks Benchmark Results

Framework Name	FPS
DHTML JavaScript	115
Silverlight 3.0	199
Flash Flex	55
Java Swing	144
Adobe Air	56

Based on benchmarking results, it was decided to use Silverlight as the development framework as it proves to be up to 38% faster than the second fastest evaluation, even after considering the Silverlight inability to run on Linux machines, the Windows and Mac market share is over 92% as reported by W3C (2013), these results coupled to the fact that it is a Freeware framework made the decision easier. By the time of this paper, the newest prototype ITS version is being developed in the most recent version of Silverlight 5.1.20125.0, which provides numerous new features such as: increased isolated storage, improved HTTP stack latency, improved graphics stack with 3D support, real time audio and 64bit architecture support that open possibilities for improving student learning curve by taking advantage of this features.

The first public prototype was released on June 2011, followed by a refresh in early 2012 after extensive user feedback and usability analysis, the Graphical User Interface (GUI) was redesigned to improve the *user interface model*, in the following Fig. 2 we can see two main screens where the student can interact with the ITS, on top it is shown the vehicle management screen, on bottom the real-time vehicle simulation test.

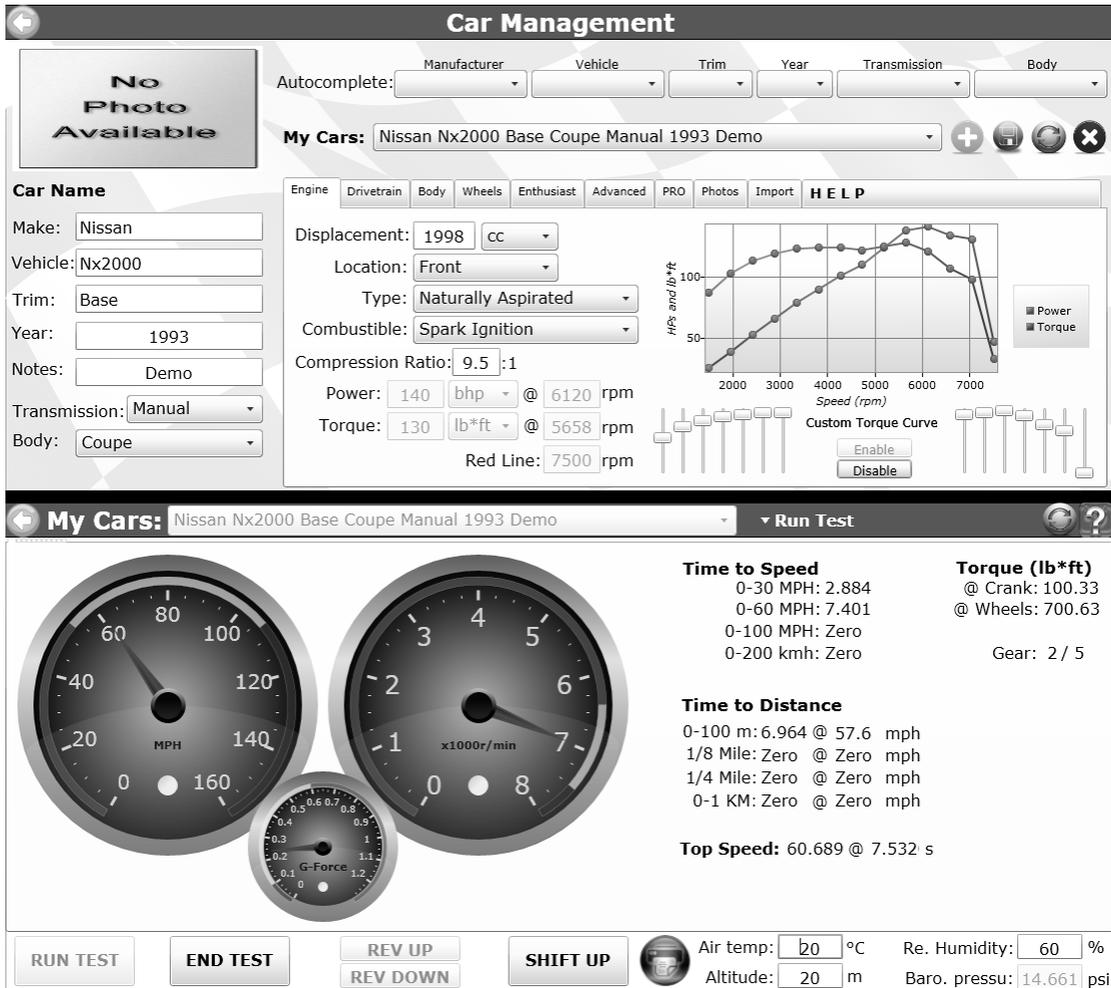

Fig. 2. Main ITS screens for student interaction

On car management screen (Fig. 2, top), the student can design their own vehicle modeling, characteristics are organized in 7 different tabs that provides the student a total of 91 different parameters and configurations to model the vehicle as the problem to be solve demands, while in the real-time test (Fig. 2, bottom), the student can see the effect of different vehicle properties in a non-linear physics problem and therefore confirm or deny his/her proposed solution for a given problem.

In the following section we show our current experimentation of the physics engine and its accuracy to support the domain model.

#### 4. Domain model accuracy evaluation

As reviewed in introduction, it is important that the tutor, in this case an ITS to have different knowledge, in particular in this section we test the domain knowledge, since an ITS must be able to solve problems in real-time, and these problems do not necessary comes from a pre-defined source or defined by a human tutor as in CAI systems, we need to perform exhaustive testing to prove the ITS capability to solve non-linear problems regarding vehicle dynamics domain. To perform the accuracy comparison, a series of experiments with real cars were taken as the gold benchmark, the source of these experiments were provided by the Road&Track Magazine, the parameters to evaluate were the vehicle capacity to achieve a speed of 60 mph (96.5 km/h) and 100 mph (160.9 km/h) from a standstill, and find out how much time is required to travel a distance of a quarter mile (402.3 meters). The main idea is to see how the physics engine works and how close is to real-life experiments, in Table 2, we provide our accuracy results for a partial list of evaluated cars.

Table 2. Domain Model (Physics engine) accuracy benchmark

Tested Vehicle (Year, Brand, Line, Trim)	Real 0-60	Sim 0-60	Real 0-100	Sim 0-100	Real 1/4	Sim 1/4	Res. Acc
2013 Hyundai Genesis Coupe 2.0T	6.3	5.7	14.8	14.3	14.5	14.4	95%
2012 Mazda Mx5 Miata GT	6.6	6.8	17.8	17.7	15.0	15.2	98%
2013 Subaru Brz Premium	6.6	6.6	17.1	16.7	14.9	15.0	99%
2003 Audi TT 225Q	6.7	6.7	16.4	17.1	14.8	15.2	98%
2004 Chrysler Crossfire Base	6.7	6.5	16.2	16.0	14.9	14.9	99%
2003 Mitsubishi Lancer Evo	4.8	5.0	12.7	12.7	13.4	13.6	98%
2004 Subaru Impreza Sti	4.9	4.8	12.6	12.3	13.3	13.3	99%
2003 Nissan 350z Track	5.8	5.4	14.5	13.5	14.4	14.1	95%
2005 Acura RSX TypeS	6.7	6.9	16.6	17.0	15.0	15.3	98%
2005 Chevrolet Cobalt SS	6.2	6.7	15.9	16.5	14.8	15.2	95%
2006 Honda Civic Si	6.6	6.9	16.3	17.1	15.0	15.3	96%
2006 Volkswagen GTI 2.0T	6.3	6.6	16.9	17.5	14.8	15.2	96%
2007 MazdaSpeed 3 GT	6.2	6.3	16.0	14.1	14.5	14.6	95%
2010 Chevrolet Camaro SS	4.6	4.5	10.5	9.2	12.9	12.6	94%
2009 Dodge Challenger RT	5.8	5.6	13.8	13.4	14.2	14.2	98%
2010 Ford Mustang GT	5.3	5.2	12.7	13.0	13.8	13.8	99%
2006 Mitsubishi Eclipse GT	5.8	6.4	14.4	14.7	14.4	14.7	95%

The average accuracy percentage found in Table 2 was calculated from the average of the individual accuracy of the previous 3 tests, as it can be seen, the physics engine which is powering the domain model has an overall accuracy of over 96.8%, it is important to notice that some differences does not necessary mean a problem in the simulated environment as the Road&Track magazines suffer from result inconsistency, which can vary from different causes, e.g., driver weight and skills which were not modeled on the system. For instance, the same 2007 MazdaSpeed 3 tested on different Road&Track reviews, shows differences of 8% in 0-60 test, 14% in the 0-100 test and 3% in the 1/4 mile test, these inconsistencies are not present in our physics engine which allows to be confident in the results, and even when they differ with real-life tests, we can expect the real-life tests to vary greatly from source to source. The first ITS prototype it is available worldwide for free for basic usage or paid for advanced modeling simulation and can be accessed at [www.nxgtrsim.com](http://www.nxgtrsim.com), the specific details about the statistics related to the usage are discussed in next section.

## 5. ITS prototype statistics data

The first prototype version v11.x was launched in June 15, 2011 and primary goal was to find users to provide feedback about the capabilities for the system, it had a successful response from community and by January 2012, it already had 1340 users from 30 different countries, being the most notable United States with 840 users, Canada 84 and Mexico 64, and over 1000 modeled vehicles. With the provided feedback from users around the world the next prototype version was released in mid January 2012 as version v12.x, in this second prototype the research interest was to get user usage analysis and data about how users interact with the system to be able to have enough information to feed the *student model*, in Fig. 3 we show the prototype usage by quarters since v12.x up to current version v13.4.19.

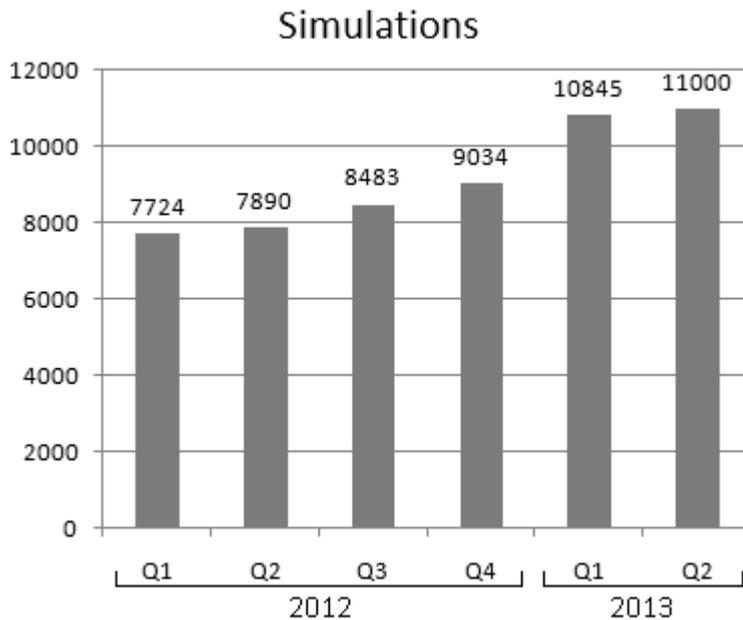

Fig. 3. ITS Prototype 2012-2013 Usage Statistics

As it can be seen in Fig 3., the prototype have had a usage positive increase with a 40.4% increase from 2012 Q1 as compared with 2013 Q1, at the time of this paper, the 2013 Q2 has not finished and the presented data was the result of the current trend. From the sample evaluated we have that users around the world have solved at least 54,976 problems until May 12, 2013 and the numbers keep growing at a ratio of ~800 per week. The countries which are more engaged with the system are United States which usage is over 27,617 simulations which represents the 50.2% of all traffic, in second place we have Canada with 4492 (8.2%), Philippines with 2501 (4.5%), Mexico with 2075 (3.8%), Poland with 1261 (2.3%) and finally United Kingdom with a total of 1162 for a reach of 2.1%.

The data shows that the system has been getting more mature and more people are getting used to the system, in the following section we discuss our conclusions and plans for future work

## 6. Conclusions and future work

Since the first prototype release v11.6.15 to the actual version v13.4.19, there has been a lot of changes, these changes were only possible by the community feedback, after over 50,000 problem solved with an accuracy over 96% we think the physics engine is stable enough to be integrated in the *domain model*.

As reviewed in introduction, a common ITS is composed by four models, in this paper we have focused in the initial *domain model* which have been completed with the development of the physics engine, and in a smaller scale, the *user interface model* which is still on very early stages as only one model has been completed.

As technology advances so does the potential problems to be solved which creates a never ending cycle of *domain model* improvements, so we are constantly developing new modeling, however our future plans involves focus more on the next model which would be the *student model*. With all the usage analysis of the past years, we have a very good understanding about how to detect when the user needs help and which methods have result in a more positive engagement experience. The *student* and *tutor models* needs to be develop at the same time as they are usually linked by an action-reaction event.

Our roadmap would be a next stage for *student* and *tutor models*, followed by an update of the current *user interface model*, after these two stages we can have a complete ITS out of prototyping stage, we do expect to have some 3D environments for improvement user engagement.

## Acknowledgements

I would like to thank to my professor Reyes Juárez-Ramírez for all the experience and support he has provided for this research.

Without any particular order I want to thank some of the users that have made this possible, with the nicknames: erwin, Ali, My Name, Adam Rod, Hvberty, patrick nyhan, Josh, Mitch (Canada), Bimmer, Bryan, christian fatzinger, Marcus, Corey Young, Jake Bridges, al fresco, Nico and all the thousand more that I am unable to thank here.

## Development of a self-assessment questionnaire for basic technical drawing skills: a preliminary study

Riccardo Metraglia<sup>a\*</sup>, Gabriele Baronio<sup>a</sup>, Valerio Villa<sup>a</sup>, Riccardo Adamini<sup>a</sup>

<sup>a</sup> *University of Brescia, Department of Mechanical and Industrial Engineering, Brescia, Italy*

---

### Abstract

The aim of this study was to develop and validate a new self-assessment questionnaire (SAQ) for basic technical drawing skills based on the Technical Drawing Evaluation Grid (TDEG) (Metraglia, Baronio & Villa, 2011). One hundred and seventeen first-year engineering students completed the TDEG-SAQ (first version) at the end of a training course of technical drawing. Eight factors relating to different skills were identified. Reliability analysis ranged from 0.74 to 0.92 for the questionnaire factors and was 0.96 for the overall questionnaire. Concurrent validity analysis showed the ability of the questionnaire to distinguish between genders and high school diplomas.

Keywords: technical drawing, engineering graphics, self-assessment, questionnaire, education

## 1. INTRODUCTION

Engineering graphics instruction is considered a process which has been significantly changing for the last years. The way engineering graphics is taught is changing as well (Clark & Scales, 2000), and engineering curricula have been improved to better prepare students for professional careers (Meyers, 2000). The ability to use 3-D software tools is currently considered the most important theme for industries, and software and technologies are becoming the core of engineering graphics courses. Traditional topics as manual geometry construction techniques and descriptive geometry are currently poorly considered both by students and faculties (Barr, 2012). Despite the efforts in evolving the ways of teaching, problems related with poor skills in engineering drawing seem to apply globally: America (Nicolai, 1998 as cited in Abdullah, Field & Burvill, 2011); Asia, (Abdullah, Burvill & Field, 2011); Australia, (Field, Burvill and Weir, 2005 as cited in Abdullah, Field & Burvill, 2011); Europe (Beckmann & Krause, 2011). Particularly, skills on reading and interpretation of 2D drawings and understanding of the engineering technology contained in the drawn artifact (Abdullah, Field & Burvill, 2011) appear the most common matter to concern. That applies particularly for students without prior experiences in engineering drawing (Beckmann & Krause, 2011) and students from non-technical high school (Metraglia, Baronio & Villa, 2011).

All those problems relate with lacks in knowledge and ability with graphics fundamentals, that, as said above, is losing importance in education programs and it is often considered assumed before engineering graphics courses (Meyers, 2000) where, in fact, it isn't. A distinction in graphics education between 'topics' and 'tools', saying that tools are to be considered as means used for learning about the topics, should be developed (Meyers, 2000).

In contrast with the increasing of the variety of offerings in engineering graphics programs, national and international institutions are promoting the development of instruments to make national qualifications comparable and to help skills better appreciated and recognized, for example in Europe, with the European Qualifications Framework (EQF) (Metraglia et al., 2011) and in America, with the Accreditation Board for Engineering and Technology (ABET) (Barr, 2012). Both EQF and ABET identified a similar set of outcomes – knowledge, skills and abilities – that must be attained at graduation, or at an exam.

For the basics of engineering graphics, i.e. technical drawing, a tool to assess drafting skills has been proposed in coherence with the EQF structure: the Technical Drawing Evaluation Grid (TDEG) (Metraglia et al., 2011). The TDEG takes into high consideration the difference between the ability in reading and understanding drawings and the ability in realizing it, considering fundamental the 'ability to read drawings', in contrast with Meyers (2000), that defines it a 'pertinent area impacting engineering graphics'. The Technical Drawing Evaluation Grid refers the abilities 'to read drawings' and 'to use technical drawing as a language of communication' to 8 A-levels, whilst the capability to produce correct technical drawings aimed to design synthesis refers to 8 B-levels. For each level, specific knowledge, skills and competences are described.

Among the main goals of the Technical Drawing Evaluation Grid there is to be a common self-assessment tool. (Metraglia et al., 2011). A questionnaire based on the TDEG is therefore needed to consent students to understand their preparation and to teachers to know the topics in graphic fundamentals that students consider as the hardest to understand.

However, to build a common tool of reference, the Technical Drawing Evaluation Grid should be designed coherently with the way students tend naturally to learn and cluster knowledge. The self-assessment questionnaire is so intended to understand, despite the way a technical drawing course is taught, the way students learn, so to evolve the TDEG in levels considering consistent topics rather than chunks of skills.

TDEG construction was based on a "concrete/sequential" approach (Butler (1987)), i.e. a traditional step-by-step teaching with theoretical lessons and exercises. Sadowski, Birchman and La Verne (2006) showed that that kind of approach is appreciated by male learners whilst female are expected to behave differently, because females seem to prefer an approach including study projects, experiments and discussion. The assessment grid should take into consideration those different learning styles. One of the aims of this study is to cluster the topics of the

TDEG basing on the way they are learned rather than the way are taught. The grid proposed in TDEG 2011 is expected to reflect in some way in skills self-assessment, and male and females are expected to differ.

Prior experience in engineering drawing, for example in technical high school, is expected to influence in some way the skills self-perception, and the answers in the questionnaire as well.

In this preliminary study, the first 5 A-levels and the first 4 B-levels of the TDEG were investigated. The complete TDEG can be found in the original paper (Metraglia et al., 2011). In Table 1, levels investigated and correspondent competences are reported.

Table 1. Technical Drawing Evaluation Grid – competences for the first levels

Levels	Competences (to be able to ...)
1-A	Interpret the morphology of a part through its representation in views and cuts
1-B	Independently carry out the representation in views and cuts of a part
2-A	Interpret the dimensioned drawing of a part and / or the main elements of an assembly drawing
2-B	Realize the dimensioned drawing of a single part and know how to extract the parts from an assembly drawing
3-A	Recognize the threaded parts represented in a drawing and interpret the thread designation
3-B	Realize the dimensioned drawing of a part containing threaded parts and to complete with thread designation
4-A	Interpret a complete picture of dimensional tolerances and surface finishes
4-B	Realize the dimensioned drawing of a part complete of dimensional tolerances and surfaces finishing
5-A	Recognize the housing of a removable unthreaded connection in a part drawing or its presence within an assembly drawing, and interpret their designation

## 2. METHOD

### 2.1. Design

A convenience sampling of one hundred and eighty first-year engineering students who had attended the course of ‘Technical Drawing’ taught at the Faculty of Engineering of the University of Brescia was selected to participate to the study. Students were mailed a coded questionnaire and asked to answer self-assessment questions on their technical drawing skills. The questionnaire was mailed one week before the final exam not to bias the skills self-perception with the score of the exam. Participation was voluntary and encouraged by the chance to win one of ten 16GB pen-drives extracted by drawing lots among the participants. Participants were naïve about the purpose of the study. Students had four days to return the questionnaire completed. One hundred and seventeen students (65.0%) returned the questionnaire. Data about participants’ gender and high school of provenience diploma were collected.

### 2.2. Materials

A questionnaire was developed by the researchers basing on the first 5 A-levels and the first 4 B-levels of the Technical Drawing Evaluation Grid. Skills and competences described for those levels were considered comprehensive of the program of the ‘Technical Drawing’ course taught at the Faculty of Engineering. The original questionnaire was made by 41 statements. Those statements were reviewed by five first-year engineering

students and the items which seemed ambiguous or difficult to respond to were discussed with the researchers. The original item pool was reduced and revised, and the final questionnaire was composed by 35 statements. Each statement was classified by the researchers as correspondent to one or more skills within a specific level of the TDEG. That classification (see Table 3 in 'Results' section) was not part of the submitted questionnaire. The Questionnaire is reported in Appendix A.

### 2.3. Procedure

Participants were expressly asked to think about each statement and indicate how true it was on a 5 points Likert Scale (1 = Not True; 2 = Slightly True; 3 = Moderately True; 4 = Mostly True; 5 = True). Particularly, the instructions included the following sentence (Keller, 2006): "Give the answer that truly applies to you, and not what you would like to be true, or what you think others want to hear. Think about each statement by itself and indicate how true it is. Do not be influenced by your answers to other statements.". Participants were also asked to indicate their gender and high school of provenience diploma.

## 3. RESULTS

### 3.1. Exploratory factor analysis

A principal component analysis (PCA) was conducted on the 35 items with oblique variation (direct oblimin). The Kaiser-Meyer-Olkin measure verified the sampling adequacy for the analysis,  $KMO = .90$ , and all KMO values for individuals items were  $> .57$ , above the acceptable limit of  $.5$  (Field 2009). Bartlett's test of sphericity  $\chi^2(595) = 2924.43$ ,  $p < .001$ , indicated that correlations between items were sufficiently large for PCA. Eight components had eigenvalues over Kaiser's criterion of 1 and in combination explained 72.50% of the variance. The items that cluster on the same components suggest they represent the self-perception of skills and competencies about: 1- Threads; 2 - Tolerances and roughness; 3 - Folding sheets and specification box; 4 - Interpreting and dimensioning elements from an assembly drawing; 5 - Dimensioning of a part; 6 - Interpreting the morphology of a part through views and cuts and consulting tables; 7 - Recognizing the correctness of views and cuts in a drawing; 8 - Removable unthreaded connections. A summary of the exploratory factor analysis with eigenvalues and percentages of the variance on the various components is reported in Appendix B.

### 3.2. Reliability

All the components but 'Folding sheets and specification box' had high reliabilities, Cronbach's  $\alpha > .8$ . 'Folding sheets and specification box' had a relatively medium reliability, Cronbach's  $\alpha = .74$  – it is anyway to remark that "for ability tests a cut-off point of  $.7$  is considered more suitable than  $.8$ " (Kline, 1999 as cited in Field, 2009). All the values of Cronbach's  $\alpha$  for the components are reported in Table 2.

Table 2. Eight components of TDEG SAQ reliability estimates (N = 117)

Components	Reliability estimate (Cronbach's $\alpha$ )
Threads	.92
Tolerances and roughness	.88
Folding sheets and specification box	.74
Interpreting and dimensioning elements from an assembly drawing	.88
Dimensioning of a part	.82
Interpreting the morphology of a part through views and cuts and consulting tables	.82
Recognizing the correctness of views and cuts in a drawing	.80
Removable unthreaded connections	.88

Items associated with each component are reported in Table 3 - numbers refer to the number of statement as is in Appendix A. Next to the number of each item, in brackets, it is reported the theoretical association 'statement-level on TDEG' that was made by researchers before the study, i.e. the correspondence between the specific skill described in the item and the level of the TDEG where that skill is supposed to be associated.

Table 3. Items for component from factor analysis and theoretical level assigned before the study (in brackets)

Threads	Tolerances and roughness	Folding sheets and specification box	Interpreting and dimensioning elements from an assembly drawing	Dimensioning of a part	Interpreting the morphology of a part through views and cuts/consulting tables	Recognizing the correctness of views and cuts in a drawing	Removable unthreaded connections
17 (3-A)	26 (4-A)	1 (1-A)	7 (2-A)	8 (2-A)	4 (1-A)	2 (1-A)	34 (5-A)
18 (3-A)	27 (4-A)	6 (1-B)	11 (2-A)	9 (2-A)	5 (1-A)	3 (1-A)	35 (5-A)
19 (3-A)	28 (4-A)		12 (2-A)	10 (2-A)	21 (3-B)		
20 (3-A)	30 (4-B)		13 (2-B)	14 (2-B)	25 (3-B)		
22 (3-B)	31 (4-B)		15 (2-B)				
23 (3-B)	32 (4-B)		16 (2-B)				
24 (3-B)			29 (4-A)				
			33 (4-B)				

Considering theoretical TDEG levels as factors, and clustering items for each level according to the data reported in Table 2, levels 2-A, 3-A, 3-B, 4-A, 4-B, 5-A had high reliabilities, with Cronbach's  $\alpha > .82$ . Levels 1-A and 2-B had relatively medium reliabilities, 1-A Cronbach's  $\alpha = .72$ , 2-B Cronbach's  $\alpha = .76$ . Level 1-B had just one correspondent statements and no reliability analysis was possible. All the values of Cronbach's  $\alpha$  for the levels considered as factors are reported in Table 4.

Table 4. Levels of TDEG reliability estimates (N = 117)

Levels of TDEG	Reliability estimate (Cronbach's $\alpha$ )
1-A (1,2,3,4,5)	.72
1-B (6)	-
2-A (7,8,9,10,11,12)	.82
2-B (13,14,15,16)	.76
3-A (17,18,19,20)	.86
3-B (21,22,23,24,25)	.85
4-A (26,27,28,29)	.85
4-B (30,31,32,33)	.83
5-A (34,35)	.88

### 3.3. Concurrent validity (gender)

One hundred and seventeen students returned the questionnaire completed: 90 males (76.9%) and 27 females (23.1%). An independent t-test was run to compare the means for males and females for the components identified through the factor analysis. For the eight components, the variances were equal for male and female participants. On average, male participants considered their skills and competencies for all the eight components higher than female participants did.

For 'Threads', the difference between males ( $M = 3.73$ ,  $SE = 0.09$ ) and females ( $M = 3.61$ ,  $SE = 0.14$ ) was not significant  $t(50) = 0.75$ ,  $p > .05$ . For 'Tolerances and roughness', the difference between males ( $M = 3.61$ ,  $SE = 0.09$ ) and females ( $M = 3.36$ ,  $SE = 0.12$ ) was not significant  $t(56) = 1.62$ ,  $p > 0.5$ . For 'Folding sheets and specification box', the difference between males ( $M = 4.01$ ,  $SE = 0.09$ ) and females ( $M = 4.00$ ,  $SE = 0.18$ ) was not significant  $t(40) = 0.06$ ,  $p > .05$ . For 'Interpreting and dimensioning elements from an assembly drawing', the difference between males ( $M = 3.54$ ,  $SE = 0.08$ ) and females ( $M = 3.23$ ,  $SE = 0.14$ ) was not significant  $t(44) = 1.99$ ,  $p = 0.52$ ,  $p > .05$ . For 'Dimensioning of a part, the difference between males ( $M = 4.23$ ,  $SE = 0.07$ ) and females ( $M = 3.94$ ,  $SE = 0.15$ ) was not significant  $t(40) = 1.76$ ,  $p > .05$ . For 'Interpreting the morphology of a part through views and cuts and consulting tables', the difference between males ( $M = 3.56$ ,  $SE = 0.08$ ) and females ( $M = 2.99$ ,  $SE = 0.17$ ) was significant  $t(39) = 3.09$ ,  $p < .01$ . For 'Recognizing the correctness of views and cuts in a drawing', the difference between males ( $M = 4.12$ ,  $SE = 0.08$ ) and females ( $M = 3.85$ ,  $SE = 0.14$ ) was not significant  $t(46) = 1.62$ ,  $p > .05$ . For 'Removable unthreaded connections', the difference between males ( $M = 3.22$ ,  $SE = 0.10$ ) and females ( $M = 2.87$ ,  $SE = 0.18$ ) was not significant  $t(45) = 1.17$ ,  $p > .05$ .

The comparisons between genders on the eight components are showed in Figure 1. Effect sizes of gender on each component are reported in Table 5.

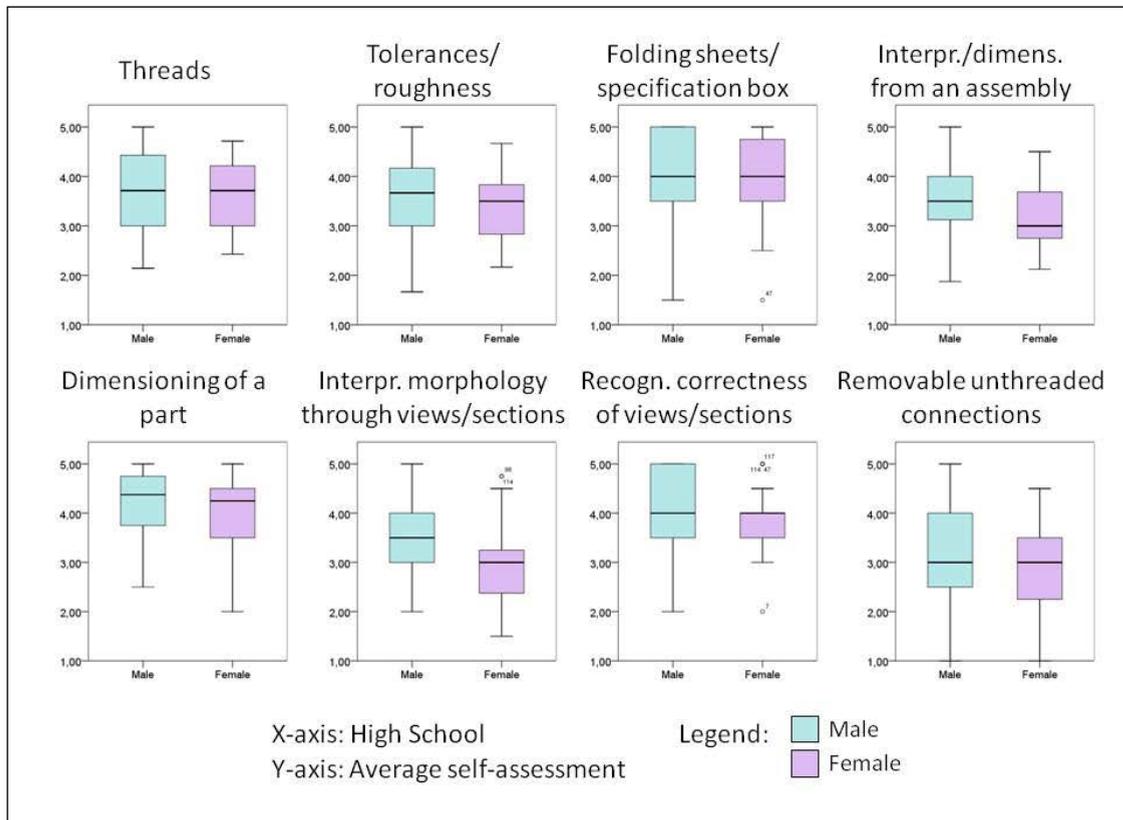

Fig. 1. Comparison between genders (Male = 90, Female = 27) on the eight components from factor analysis

### 3.4. Concurrent validity (high school diploma)

High school of provenience diplomas of the 117 participants were clustered in 3 groups: 1 – Scientific school; 2 – Technical school; 3 – Other school (with little or no background in technical drawing). Sixty-six (56.4%) participants came from a Scientific school; twenty-two (18.8%) from a Technical school; twenty-nine (24.8%) from Other school (Humanities school (six); Commercial school (five); Foreign (not Italian) non-technical school (six); Other schools not classified (thirteen)).

A one-way independent ANOVA (school: Scientific, Technical, Other) was run to test for differences among the means on each of the eight components for the participants considering their high school diploma. Further independent t-tests were run to test differences between pairs of groups when considered matter to concern from ANOVA analysis.

For 'Threads', on average, students coming from technical school ( $M = 4.00$ ,  $SE = 0.19$ ) self-assessed their skills greater than students from other school ( $M = 3.81$ ,  $SE = 0.14$ ) whilst students from scientific schools ( $M = 3.55$ ,  $SE = 0.10$ ) gave themselves the lowest evaluation. However, there was not a significant effect of high school diploma on the self-assessment,  $F(2,65) = 2.88$ ,  $p = .06$ ,  $\omega = .18$ . Turkey post hoc test revealed a difference between Technical School and Scientific school closed to the limit of significance (.058). A further independent t-test revealed that self-assessment for students coming from a technical school was greater than for students coming from a scientific school. That difference was significant  $t(86) = 2.26$ ,  $p < .05$ , and it represented a medium-sized effect  $r = .37$ .

For 'Tolerances and roughness', on average, students from technical school ( $M = 3.79$ ,  $SE = 0.19$ ) self-assessed their skills greater than students from scientific school ( $M = 3.51$ ,  $SE = 0.10$ ) whilst students from other schools ( $M = 3.48$ ,  $SE = 0.13$ ) gave themselves the lowest evaluation. However, there was not a significant effect of high school diploma on the self-assessment,  $F(2,67) = 1.21$ ,  $p > .05$ ,  $\omega = .06$ .

For 'Folding sheets and specification box', on average, students from other school ( $M = 4.36$ ,  $SE = 0.13$ ) self-assessed their skills greater than students from scientific school ( $M = 4.02$ ,  $SE = 0.10$ ), whilst students from technical school ( $M = 3.52$ ,  $SE = 0.18$ ) gave themselves the lowest evaluation. There was a significant effect of high school diploma on the self-assessment,  $F(2,70) = 6.95$ ,  $p < .01$ ,  $\omega = .30$ . Games-Howell post hoc tests revealed that there was a significant difference between students from other school and students from technical school ( $p < .01$ ). A further independent t-test revealed that self-assessment for students coming from scientific school was greater than for students coming from technical school,  $t(86) = -2.38$ ,  $p < .05$ .

For 'Interpreting and dimensioning elements from an assembly drawing', on average, students from technical school ( $M = 3.89$ ,  $SE = 0.18$ ) self-assessed their skills greater than students from other school ( $M = 3.41$ ,  $SE = 0.14$ ), whilst students from scientific school ( $M = 3.36$ ,  $SE = 0.08$ ) gave themselves the lowest evaluation. There was a significant effect of high school diploma on the self-assessment,  $F(2,63) = 3.90$ ,  $p < .05$ ,  $\omega = .24$ . Games-Howell post hoc test revealed significant differences between students from scientific and students from technical school ( $p < .05$ ).

For 'Dimensioning of a part', on average, students from technical school ( $M = 4.06$ ,  $SE = 0.09$ ) self-assessed their skills greater than students from other school ( $M = 4.09$ ,  $SE = 0.14$ ), whilst students from scientific school ( $M = 4.06$ ,  $SE = 0.09$ ) gave themselves the lowest evaluation. There was a significant effect of high school diploma on the self-assessment,  $F(2,78) = 5.49$ ,  $p < .01$ ,  $\omega = .25$ . Games-Howell post hoc tests revealed a significant difference between students from technical school and students from scientific school ( $p < .01$ ) and a significant difference between students from technical school and students from other school ( $p < .05$ ).

For 'Interpreting the morphology of a part through views and cuts and consulting tables', on average, students from technical school ( $M = 3.77$ ,  $SE = 0.19$ ) self-assessed their skills greater than students from other school ( $M = 3.55$ ,  $SE = 0.15$ ), whilst students from scientific school ( $M = 3.26$ ,  $SE = 0.09$ ) gave themselves the lowest evaluation. There was a significant effect of high school diploma on the self-assessment,  $F(2,66) = 3.53$ ,  $p < .05$ ,  $\omega = .21$ . Games-Howell post hoc tests revealed a difference between technical school and scientific school closed to the limit of acceptance value ( $p = .054$ ). A further independent t-test revealed that self-assessment for students coming from technical school was significantly higher than for students coming from scientific school,  $t(86) = -2.61$ ,  $p < .05$ .

For 'Recognizing the correctness of views and cuts in a drawing', on average, students from technical school ( $M = 4.23$ ,  $SE = 0.92$ ) self-assessed their skills greater than students from other school ( $M = 4.10$ ,  $SE = 0.75$ ), whilst students from scientific school ( $M = 3.98$ ,  $SE = 0.09$ ) gave themselves the lowest evaluation. However, the effect of high diploma on self-assessment was not significant,  $F(2,61) = 0.83$ ,  $p > .05$ ,  $\omega = .04$ .

For 'Removable unthreaded connections', on average, students coming from technical school ( $M = 3.66$ ,  $SE = 0.23$ ) self-assessed their skills greater than students from other school ( $M = 3.24$ ,  $SE = 0.17$ ), whilst students from scientific school ( $M = 2.92$ ,  $SE = 0.11$ ) gave themselves the lowest evaluation. There was a significant effect of high school diploma on the self-assessment,  $F(2,65) = 4.74$ ,  $p < .05$ ,  $\omega = .26$ . Games-Howell post hoc tests revealed a significant difference between students from technical school and students from scientific school ( $p < .01$ ). The comparisons between high schools of provenience on the eight components are showed in Figure 2. Effect sizes of high school of provenience diploma on each component are reported in Table 5.

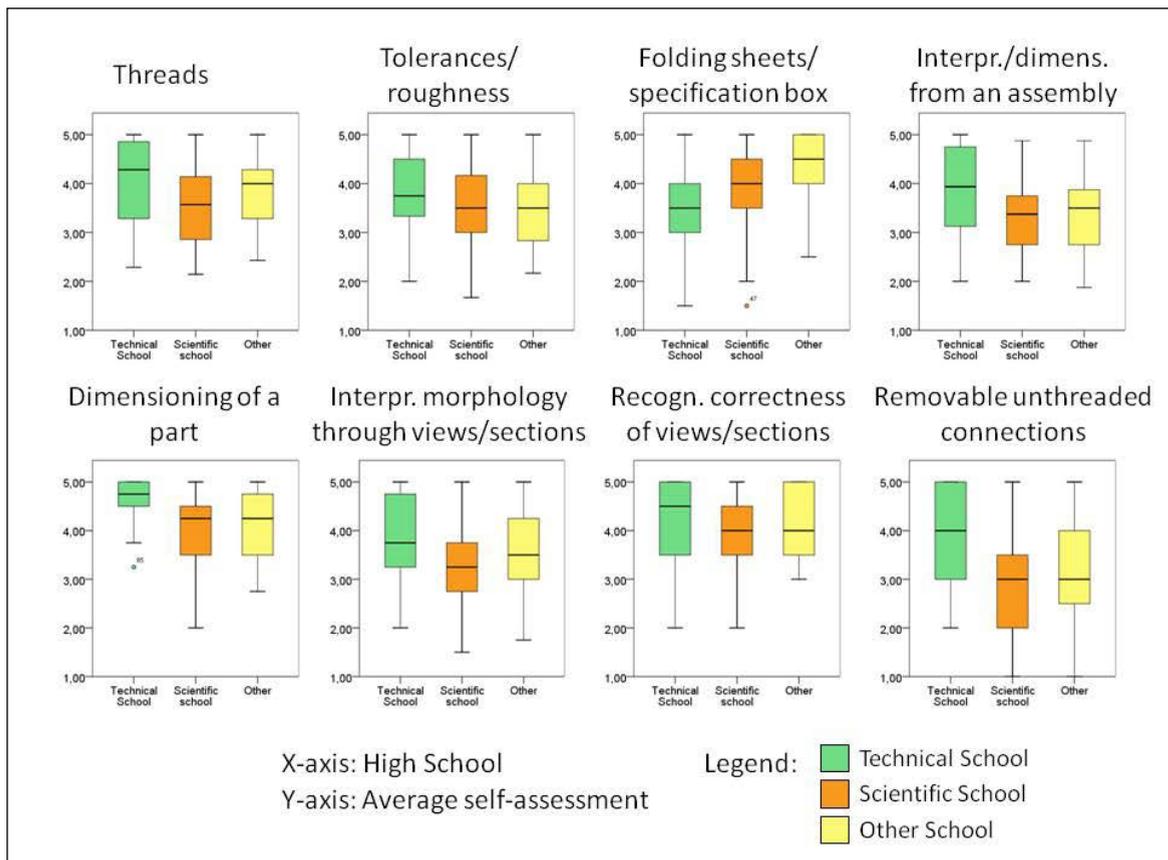

Fig. 2. Comparison between high schools of provenience (Tech. School = 22, Scient. School = 66, Other = 29) on the eight components from factor analysis

Table 5. Effect sizes of Gender and High school of provenience diploma on the components (N = 117)

Components	Effect size of Gender r	Effect size of High school diploma $\omega$
Threads	.11	.18
Tolerances and roughness	.21	.06
Folding sheets and specification box	.01	.30
Interpreting and dimensioning elements from an assembly drawing	.29	.24
Dimensioning of a part	.27	.25
Interpreting the morphology of a part through views and cuts and consulting tables	.44	.21
Recognizing the correctness of views and cuts in a drawing	.23	.04
Removable unthreaded connections	.24	.26

#### 4. DISCUSSION

A 35 items self-assessment questionnaire for basic technical drawing skills based on the Technical Drawing Evaluation Grid (TDEG) was developed by the researchers. One hundred and seventeen first-year engineering

students completed it after attending a basic technical drawing course taught in the Faculty of Engineering of Brescia. Items were constructed by researchers to reflect skills relative to various levels of the TDEG. However, exploratory factor analysis identified eight factors relative to specific skills that don't perfectly match with the ones of the proposed original levels. In particular, students tend apparently to cluster knowledge on specific topics (e.g. threads, tolerances and roughness, dimensioning of a part, ...) rather than to cluster between easier and harder things in understanding or realizing in a drawing. The sequential approach adopted to develop the TDEG is susceptible of improvement, with a redefinition of skills and competencies associated with the TDEG levels, clustering skills by topic rather than referring to a step-by-step procedure of teaching.

The proposed self-assessment questionnaire had on average a high reliability, even if there are some components that need more items to be more reliable. Moreover, dropping out six initial statements, some topics taught in the technical drawing course were not fully considered in the questionnaire, so that the self-assessment questionnaire was not representative of the whole preparation of the participants. The questionnaire showed a good concurrent validity distinguishing between genders and high school of provenience diplomas. The analysis showed that males self-assess their skills higher than females for the eight components, even if not in a significant way. For high school diplomas, the analysis showed significant differences in self-assessment among students coming from technical schools, scientific schools and other schools. Considerations about the possible reasons of those differences for each component are demanded to another research paper. A future research with a new version of the questionnaire will also study the predictive validity of the questionnaire, comparing self-assessments with the real marks students get at the exam.

---

 Items\* (original questions in Italian)
 

---

1. I understand if a sheet is correctly folded and the right position of the specification box
2. I understand if views and cuts positions are incorrect in a drawing
3. I understand if views and cuts realizations are incorrect in a drawing
4. I can interpret the morphology of a part through its representation in views and cuts
5. I understand if views and cuts are not sufficient to completely represent the morphology of a part
6. I know how to correctly fold a sheet and represent a specification box in the right position
7. Given a drawing, I understand the information in the specification box
8. In the drawing of a part, I know how to insert the dimensions of its elements
9. I can understand the real sizes of a part from the dimensions in the drawing
10. I understand if the dimensions in a drawing are not sufficient to completely represent it
11. In an assembly drawing I understand what are the various elements composing it
12. I understand if the dimensions in a drawing are incorrectly inserted
13. I know the main techniques about the machining of materials
14. I know how to use and read a caliper gauge
15. In an assembly drawing I know how to add dimensions regarding encumbrance and mechanical interfaces
16. In an assembly drawing I can understand the morphology of the parts composing it.
17. I know how to represent a thread in a drawing (e.g. screw, nut)
18. In a drawing I can recognize the various threaded connections (e.g. screw, nut) .
19. In a drawing I understand if there are threaded parts.
20. I know how to derive the characteristics of threads by their designation
21. I know how to use caliper, screw pitch gauge and tables to take the threading.
22. I know how to realize the dimensioned drawing of a part containing threaded elements in front view.
23. I know how to realize the dimensioned drawing of a part containing threaded elements in lateral section.
24. I know to realize cuts of threads.
25. I know how to represent and dimensions threaded details considering the kind of connection (consulting tables).
26. I know how to add variances to dimension when the dimensional tolerance is already expressed.
27. I know how to insert, once noted, the roughness indication.
28. I understand the meaning of dimensional tolerances in a drawing.
29. I understand the roughness indications in a drawing.
30. I know how to insert a dimensional tolerance once the type of coupling is noted.
31. I know how to insert a dimensional tolerance once the functionality of the coupling is noted.
32. I know how to draw a part with dimensions and dimensional tolerances.
33. I know when no to insert roughness indications being them redundant or discordant
34. In an assembly drawing I can recognize the presence of a removable unthreaded connection.
35. In part drawing I can recognize the presence of a house of a removable unthreaded connection.

\* = For all the items, the possible answers were: Not True; Slightly True; Moderately True; Mostly True; True

# Development of motivation scale for teachers

Elif Akdemir<sup>a\*</sup>, Ali Arslan<sup>a</sup>

<sup>a</sup>*Bülent Ecevit University, Ereğli Education Faculty 67300, "Zonguldak", Turkey*

---

## Abstract

The purpose of this study is to develop a motivation scale for teachers. The scale is developed based on Herzberg's two factor motivation theory. Initially constructed motivation scale has 51 items and was administered to 150 teachers. The explanatory factor analysis is conducted to identify the factors in the motivation scale. Four factors are identified as a result of the analysis. Four factors explained 60.9 percent of the total variance. Cronbach Alpha internal consistency coefficients varied between 0.811 and 0.904. The results indicated a reliable and valid motivation scale that can be used to measure teachers' motivation in Turkish.

Keywords: motivation scale, teachers, factor analysis

---

## 1. INTRODUCTION

Motivation is defined internal state that initiates, directs and sustains our behaviors (Woolfolk, 2001). Motivation divided into intrinsic and extrinsic motivation. While intrinsic motivated people participate the activities for its own sake; extrinsic motivated people participate the activities to get rewards (Moreno, 2010).

Theories that explain how human motivate are behaviorism, cognitivism and humanism (Arends & Kilcher, 2009). Behaviorists contend reinforced behaviors maintain, unreinforced behaviors extinct. That is, behavior is controlled by an external situmulus. If people receive an reward because of their behavior, they demonstrate same behavior more eagerly (Senemoğlu, 2001). Cognignivists explain motivaiton as a struggle of understanding and exploring world. People are motivated to reach equilibrium when they live cognitively disequilibrium (Eggen & Kauchak, 2004). According to humanists, source of motivation is satisfying the needs. Humans interacts their environment in order to satisfy their needs and, needs control human behaviors. Maslow proposed hierarchy of needs. Sequence of needs that must be satisfied (Santrock, 2011):

- \* Physiological. Hunger, thirst, sleep.
- \* Safety. Ensuring survival, such as protection from war and crime
- \* Love and belongingness. Security, affection, and attention from others
- \* Esteem. Feeling good about oneself
- \* Self-actualization. Realization of one's potential (highest and the most elusive need).

\* Corresponding author. Tel.: +90 372 323 38 70; fax: +90 372 323 86 93.  
E-mail address: akdemirelif@gmail.com

Self-actualizing people are accepted by self and others, spontaneous, democratic, creative, humorous, and independent, that is, psychologically healthy (Slavin, 2006).

Another humanistic motivation theory is Herzberg's two factor theory. First factor is motivator (satisfying) that intrinsic to job is achievement, recognition for achievement, the work itself, responsibility, and growth or advancement. Other factor is hygiene (dissatisfying) that extrinsic to job is company policy and administration, supervision, interpersonal relationships, working conditions, salary, status, and security. This study based on Herzberg's two factor theory (Herzberg, 2003).

The aim of this study is to develop scale of motivation for teachers. So, it can be used to measure motivation level of teachers.

## **2. METHOD**

### *2.1. Writing items of scale*

Initially, a pool of item was assembled from a variety of resources including a thesis, articles, and scales. Items were written according to Herzberg's motivation theories. Trial form of scale consisted of a total of 51 items. Teachers marked Any (1), little (2), moderate (3), very (4), completely (5).

### *2.2. Pilot Study*

Scale was applied to 150 teachers from different branches attending in Zonguldak province in 2011-2012 academic year for validity and reliability study.

### *2.3. Analysis of Data*

Factor analysis was conducted in order to reveal the construct validity of the scale. Eigenvalue is greater than 1 is considered to be significant factors. Items which don't load any factor and items loaded to multiple factor were extracted from scale.

## **3. FINDINGS**

Exploratory factor analyses were conducted for construct validity of scale. Kaiser Meyer Olkin Measure of Sampling Adequacy, Bartlett sphericity test and determinant value of correlation matrix were applied for appropriateness of data for factor analysis. KMO value of the data was 0.866 whereas the value of Bartlett's sphericity test was significant. Seeing that the KMO value was higher than 0.60 and Bartlett's sphericity test yielded a significant result, it was concluded that it would be appropriate to conduct a factor analysis (Büyükoztürk, Çakmak, Akgün, Karadeniz & Demirel, 2008).

Kolmogorow-Smirnow test was used for normality of data. According to analysis it was observed distribution of data wasn't normal. So, principal axis factoring method was applied as a factor analysis method. Common variance values of items were between 0.437 and 0.710.

Factors of scale, explained variance by each factor, internal constituency, factor loadings and corrected item total correlations of items obtained from factor analysis were presented in Table 1.

Table 1. Factor Analysis

	Communication		Progress in Profession		Institution		Expectation	
	Factor Loading	Item-total corr.	Factor Loading	Item-total corr.	Factor Loading	Item-total corr.	Factor Loading	Item-total corr.

48							0.723	0.753
49							0.672	0.664
50							0.656	0.654
Explained variance (%)	36.732		7.358		10.138		6.684	
Cronbach Alpha	0.873		0.811		0.870		0.904	

When examined Table 1, it is seen the scale consists of 4 factors that eigenvalue of it is greater than 1. First factor was named as a communication. This factor has 7 items. Factor loadings were between 0.592 and 0.744 ; corrected item-total correlations were between 0.594 and 0.711. it explained 36.732 % of total variance. Cronbach internal constituency coefficient was calculated as a 0.873. Second factor of scale was named as a progress in profession. This factor has 4 items. Factor loadings were between 0.460 and 0.794; corrected item-total correlations were between 0.504 ile 0.719. It explained 7.358 % of total variance. Cronbach internal constituency coefficient was calculated as a 0.811. Third factor of scale was named as a instution. This factor has 8 items. Factor loadings were between 0.477 and 0.727; corrected item-total correlations were between 0.540 ile 0.703. It explained 10.138 % of total variance. Cronbach internal constituency coefficient was calculated as a 0.870. Fourth factor of scale was named as a expectations. This factor has 7 items. Factor loadings were between 0.620 and 0.751; corrected item-total correlations were between 0.654 ile 0.785. It explained 6.684 % of total variance. Cronbach internal consistency coefficient was calculated as a 0.904. All factors explained 60,9 % of

total variance. Explained variance between 40% and 60% is sufficient for multi factorial designs (Çokluk, Şekercioğlu ve Büyüköztürk, 2010).

#### 4. CONCLUSION

Scale of motivation for teachers developed by researchers can be used to identify sources and level of teachers' motivation. Because motivated teachers can be successful in their profession. So, necessary precaution can be taken.

Scale constitutes 4 four factors. Each factor explain important parts of total variance. Also, factor loadings and corrected item-total correlations items is very high. Factors' internal constituency coefficient least 0.811. According to these data, it can be interpreted the scale (Appendix A) measure validly and reliably motivations of teachers. Also, scale can be tried in different samples.

### Abstract

The current changes made in the state curriculum, designed for primary and secondary schools in Slovakia, opened the possibility of changes in curriculum innovations in educational ethics and its effective management of pedagogical teaching at the level of the school curriculum. An innovative didactic model of teaching ethics has been developed by the research team aimed at implying expectations for the ethics teacher competence as a basis for its targeted and effective professional development through the self and continuing education. As we define the theoretical framework of the ethics teacher professionalization, we also present competency profile of the ethics teacher created by an expert and principles of continuous learning paradigm based on humanistic and constructivist pedagogy.

*Keywords:* Ethics; transformation; humanization; curriculum innovation; competency profile; professionalization of the teacher's continual education.

*E-mail address:* miroslav.valica@umb.sk

## 1. Introduction

The integral part of the Slovak educational system transformation is a normative definition of a competency profile / professional teacher's standards related to changes of the state curriculum based on humanistic educational paradigm. The teaching is a creative and reflective profession, which assumes that the teacher is able to reconcile the normative demands that are placed on his professionalism with a dynamically varying situation in the educational reality with regard to the transformation requirements for humanization and personalization of the state curriculum. The process of a professional development of the mature teacher represents a secular upward cycle of the permanent linking of ones theoretical knowledge, experiential learning in practice and didactic reflection and its integration into the context knowledge and didactic teaching concepts. The integration is possible only under the condition of theoretical reflection of the teacher's pedagogical practice where the teacher examines and reflects his own teaching activities critically and thinking based on the scientific theories. Without this fact the teacher's pedagogical decisions only become some kind of intuitive act and teaching innovation just a random process (Kosová, 2011). Reflection and self-reflection is leading to self-understanding, because their goal is to get to know your own reflection and interpret your own actions and intentions. It is a tool for understanding, evaluating and reshaping of teacher in relation to the educational process and the curriculum (Kasáčová, 2004).

Our main objective was to create a model expert manner competency profile of the ethics teacher reflecting on curricular changes and requirements for educational innovation in teaching this subject in the context of transformational changes of the state curriculum and legislative codification of "national" standard of a professional teacher. This proposed competency profile is the outcome for the targeted and effective professional development of the ethics teachers through the self-education and continuing education focused on innovation and changes in terms of the quality of teaching ethics.

## 2. The model of competency profile of the ethics teacher

The teaching subject of ethics has broaden a traditional composition of mostly doctrinal oriented subjects at primary and secondary schools on educational subject aimed at developing ethically valuable pro-social attitudes and behaviour in students. Emphasizes are placed on the development of social and moral capabilities (virtues) aimed at promoting ethical goals and mental hygiene as primary prevention of behavioural and learning problems of children. Social and moral competence factors represent personality development of the child (communication, positive evaluation of oneself and others, social creativity, expression of feelings and empathy, assertiveness, pro-social behaviour), while the ability of students is accentuated so that they can apply acquired social and moral competences in different life situations.

The curricular changes are opening the possibilities in terms of the change and innovation in ethics curriculum its effective teaching management on the level of the school curriculum. Based on the analysis of the current trends an innovative didactic model of teaching ethics was designed by the research team aimed at the facilitation of an active social learning of the students, leading to the development of the key personal, social and moral responsibilities, pro-social action in different social and cultural contexts (Valica, Fridrichová et al., 2011).

The teacher of ethics is interpreted as a professional who is qualified for theoretically profound and critical analysis of educational phenomena, processes in the teaching of ethics. This allows him to design the content and educational policies and procedures in the way so that they lead to the objectives set by the educational objectives without the ethics teacher manipulating his students and therefore creating optimal conditions for their moral development and self-development. At the same time he is able to explain his pedagogical practices as well as

defend in argumentation, nevertheless, to modify and successfully implement. Having defined the competence profile of the ethics teacher we have reflected on a new public educational program and the teachers' professional standards, the concept and the new curriculum ethics for elementary and secondary schools, an innovative teaching model, which implicates requirements for the competence of the ethics teacher. These were formulated by the addressed teachers of ethics in our study (Poliach, Valica, 2010) and the experts (Korim et al., 2010), who not only placed the emphases on the inter-founded theoretical training component but also highlighted the great importance of a pedagogical-psychological and didactic-methodical as well as the personality - ethical components of professional competence of the ethics teachers.

The proposed model of the teacher's competence profile consists of the following components (Valica, Fridrichová et al., 2011):

- Expert competences
- Moral and ethical responsibilities
- Pedagogical-psychological and didactic-methodological competences
- Self-developing competence

The expert competence of the ethics teacher consists of the content knowledge base, which needs to be given the complexity and multi-factor nature of the educational process. In our opinion, the ethics education is designed multidisciplinary in five related areas:

- The philosophic science is enabling teachers to understand objectives, goals and core values defining value-moral education of students in ethics education.
- The education sciences is enabling knowledge of the state ethics curriculum on the level where the ethics teacher is capable to design, implement and evaluate teaching ethics on the level of the school curriculum.
- The psychological science is enabling the teacher to get familiar with students and their individual developmental characteristics, developmental opportunities for each student in the ethics education.
- The sociological and cultural-logical science knowledge accentuating socio-cultural contexts of education in students in ethics education.

The knowledge base is becoming the professional competence of the ethics teachers in a case there is a multi-disciplinary integration of the knowledge structure and its "transformation" into theoretical concepts, ideas and practices which prove to be useful in a practical teaching. The condition is a reflection and introspection of the meaningfulness of the integrated knowledge base which is by confronted by the efficiency and effectiveness of educational activities of the ethics teaching in pedagogical practice.

The personal and ethical competences of the teacher consist of the personal and social skills, attitudes and values of the ethics teacher, which reflect in its ability to implement its own positive personality characteristics and social-moral characteristics (such as: value orientation, personality traits and behaviour) in the teaching of ethics in relation to the educational principles and interventions that form the basis of the professional ethics teacher. Educational style of the ethics teacher is grounded in the application of educational principles in the teaching of humanizing teacher-pupil relationship and based on unconditional acceptance of his personality and attribution of positive qualities, positive evaluation of student preferences and practices of inductive discipline, encouraging pupils to sociability, creating clear rules in the classroom and creating educational community out of the class. The precondition for the exercise of personal ethics and responsibility is a personal maturity of the teacher, which is manifested in the ability to accept itself, others, as well as to identify and change its position in the given reality based on the attributes that are (Kariková, 1999, p.45-85) specified in the following paradigm:

- an adequate assessment of reality
- the pursuit of self-knowledge

- ability to control your actions
- the ability to create a positive emotional bonds with others
- vigour and creativity
- resistance to stress, morality and character
- sense of humour and optimism
- an adequate communication ability.

Unlike the "classical" expectations where the teacher will be particularly effective in terms of the knowledge transfer to the student, the emphasis is now placed on the responsibility for the personalization and socialization, culture personality of each student. The ethics teacher is a professional, an expert possessing such professional pedagogical-psychological and didactic-methodological competencies that enables him to manage the cognitive and affective learning of students, diagnose, design and creatively look for different variations and alternative educational strategies and procedures appropriate for the moral development of students. Increasing demands on his professional self-reflection call for a theoretical reflection in their pedagogical experience and correction of their pedagogical approaches in ethics education.

The pedagogical-psychological and educational-methodical competence of the ethics teacher enables the following:

1. To identify individual psychosocial and moral characteristics of the student

The precondition is to:

- be aware of the patterns of psychosocial and moral development and personality of the pupil in given age period
- have the ability to identify individual psychosocial and moral characteristics of the pupil
- accept the individuality of each student

2. Identify psychological and social factors of students learning

The precondition is to:

- know the learning styles of students
- have the ability to identify individual learning style and educational needs of students (intact pupils, pupils with special needs)
- accept different styles of pupils learning depending on the mental, physical and social conditions

3. Identify socio-cultural context of pupils' development

The precondition is to:

- be aware of the differences between cultures in a multicultural environment and their impact on the learner
- have the ability to identify the individual characteristics of the learner, based on the socio-cultural environment
- accept student's differences without prejudice and stereotypes

4. Control the content and didactics of teaching ethics

The precondition is to:

- have acquired knowledge of their field, including inter-disciplinary linkers and reflection on the development of relevant disciplines
- navigate the educational documents (national educational program, school educational program, curricula, educational standards, ...) and compulsory pedagogical documentation
- have some knowledge of the methodology of the school curriculum
- have the ability to choose the content of ethics in accordance with the required and expected educational goals and enrich by schooling and regional specificities

- have the ability to identify and explore links within and between teaching subjects or areas of the curriculum
- have the ability to form a school educational program
- have the ability to make didactic content analysis of the ethics education

#### 5. Planning and designing teaching ethics

The precondition is to:

- be familiar with theoretical planning and design of educational process
- have the ability to plan and design educational process of ethics in accordance with the school educational program and individual needs of students
- have the ability to define learning goals which are student-oriented in order to develop their skills and formulate them in the form of educational requirements
- have the ability to provide a didactic analysis of the curriculum - use the content of the curriculum for basic elements (facts, concepts, relationships, procedures), be able to choose basic and developing curriculum in the context of the educational objectives of ethics and individual needs of students, choose tasks and activities for students
- have the ability to provide curriculum design of ethics teaching, tasks for pupils and pupil success criteria in order to meet the challenges
- have the ability to reflect on the actual process of learning and compare it with a process that is designed to make corrections
- have the ability to develop an individual educational plan for students with special educational needs in collaboration with colleagues
- have the ability to use, develop and provide material and technical base of educational process in teaching ethics
- have the ability to use the activity and creativity of students in planning of educational process in ethics education

#### 6. Implement the teaching of ethics

The precondition is to:

- know the methods and forms which support active learning of students
- know the methods and strategies of a personal student development (self-knowledge, self-awareness, self-esteem, self-confidence, self-regulation and self-actualization)
- know the methods and strategies of pro-social development of students (communication, empathy, assertiveness, mutual help, donations, sharing, and cooperation) and their application to application issues of ethics
- have the ability to select and utilize methods and forms when it comes to learning objectives with regard to ethics and individual educational needs of students
- have the ability to manage learning groups and classes
- have the ability to design effective strategies for teaching pupils with behavioural problems
- have the ability to communicate effectively with pupils, to influence positive atmosphere in the classroom environment and encourage the development of pupil's personality
- have the ability to change the planned action flexibly in regard to the current situation in the classroom
- have the ability to recognize the socio-pathological behaviour of students
- have the ability to use the activity and creativity of students for effective lesson implementation
- to appreciate the personal and socio-moral character of students

#### 7. Evaluate progress and results of teaching and student learning

The precondition is to:

- be familiar with theoretical evaluation of psychosocial and moral status and development of the pupil

- have the ability to establish criteria for evaluation of the progress and results of student learning, the ability to develop self-esteem of students

Self-developing competence of the ethics teacher is reflected in his motivation and capability to design his own professional development, gradually identify the professional role of the teacher and the school culture. These competences are stimulated by reflection and a systematic teacher's self-reflection. We understand it as a part of all teachers' professional activities related to the planning, implementation and evaluation of their own teaching activities as well as position of yourself in your professional development. It's involved in shaping their own didactic teaching as well as concept of a teacher in a professional, personal and ethical component of their competence.

Self-developing competences of the ethics teacher enable the following:

1. Plan and implement professional growth and self-development

The precondition is to:

- know their personal dispositions, values, strengths and weaknesses and demonstrate their use in teaching activities
- know the trends of the development and trends in the field of education
- know the system of career development of teaching staff and career opportunities
- have the ability to set goals of self-development of professional competencies

2. Identify with a professional role and school

The precondition is to:

- be familiar with the mission and goals of the school
- have the ability to identify the mission, vision and school values
- have the ability to act as a representative of the profession and schools
- have the ability to identify the role of facilitator, to communicate effectively with social partners, schools
- maintain professional ethics at a high level

Self-development competencies form the basis for the teacher while identifying their learning needs, comparing their real professional competencies expected by the competence profile of the ethics teacher.

### 3. Continual education of ethics teachers

The teacher of ethics is in the role of a reflexive professional who evaluates curriculum and teaching, their teaching experience determining his own teaching activities and new solutions to educational situations and problems. It also reflects the assessment of his teaching by getting students, colleagues, school management and parent's feedback. It reflects himself in the role of a teacher and also the transformation of the educational context of the school in relation to their own teaching. Based on a comprehensive reflection, an autonomous teacher can take a full responsibility for making decisions regarding objectives and content of the school curriculum, plan, implement and evaluate teaching. The teacher, who is able to reflexively "process" his practical experience in confrontation with pedagogical theory, can create a professional autonomy, allowing him to apply its own individual concept of didactic teaching ethics.

Generally speaking, the teachers of ethics reflect on their teaching. Their teaching is adapted to individual particularities of their students, their learning needs and interests, create favourable condition for their learning, monitor the progress continuously as well as give results of teaching. Based on this feedback they draw conclusions for themselves, reflect the educational context of the school and adapt their teaching approaches to new conditions and requirements for education accordingly. It is a reflexive teacher who takes into account the choice of instructional strategies and learning objectives as well as the need for structuring curriculum, teaching

activities and tasks of student's motivation to learn and create conditions for effective learning of students and mode of interaction and communication in the classroom (Vašutová, 2004).

However, according to Š. Porubský (2007 p. 131) the current Slovak teacher:

- doesn't have a comprehensive, paradigmatically clear and specifically applicable individual pedagogies in practice
- perceives educative reality as "given" (curricula) and his own position only as an interpreter and not the creator
- fails to perceive the relation between educational theory and its potential impact on increasing the efficiency of their own educational efforts

The teacher should enter into educational situations with own didactic concept, which is based on knowledge of educational theory. Its practical application in educational practice should be validated by action research of specific educational phenomena binding in its imagination "as it should work". If a teacher doesn't have a clear teaching paradigm he is resorting only towards elimination of unforeseen circumstances in the learning process. He either reduces the tuition to the level of only transmitting the information, where the pupil becomes only the recipient, or resigns to his educational and formative position according to slogan "humanization" and leaves everything up to pupils (Porubský, 2007).

Designing own career move as an ethics teacher is associated with its own self-education and continual training of teachers. In the ethics, the teacher's continual education is necessary to create a learning environment where a mechanical application of theory to practice is rather regarded as "wishful thinking" then a pedagogically viable role. The current trend in teachers continual education is a preference of those educational strategies that place emphasizes on theoretical reflection and practical experience of teachers in the way where a constant interaction in the world of theory and practice takes place. Therefore, it is necessary to promote a culture of reflective practice and active educational research in order to help teachers raise ethical education distance from their own practice and experience, which leads to improving the quality of authentic "practical" teaching theory, forming the base for deepening professional identity.

In the continual education of the ethics teachers executed by universities and institutions of continual education we propose the following principles to be applied based on paradigm of humanistic and constructivist pedagogy:

- Reflect on new approaches in adult education (transition from transmissible to proactive education ) so called transmission of knowledge in completed form without relation to the specific context of school reality and own experiences of teachers to change it to the approaches which is prioritizing exploration, discovery and designing of new knowledge based on its own activities and the acquisition of new experience for teaches in modelling and actual teaching situations,
- apply constructivist and reflexive approaches in the development of professional identity as an active designing and creative development of teachers professionalism based on reflection of own activities, experience, own search for self-discovery and the role of the teacher based of collaboration with colleagues,
- integrate theoretical and practical knowledge component of the ethics teacher by precise practical work and life experiences of teachers that need to be analyzed, interpreted, moreover, to broaden, to link with the theory, generalize and create or broaden their own didactic teaching concept of ethics in the educational school context, in other words to apply the approach from the practice to theory and from the theory to practice,

- prioritize strategies and methods of active teaching and learning of the ethics teachers(dialogic ahead of monologue methods, methods of problem, experiential, reflective and cooperative learning), organizational forms preferring individual and group lessons ahead of class teaching, self-education
- apply the block or modular approach along with a designing content of continual teachers education by using cross-curricular and interdisciplinary integration in the educational process and evaluation of learning outcomes, which means creating a coherent part of the program, which are arranged in the way so it would enable the compilation of consistent training units,
- link teaching and research in a conduct of the ethics teachers, which means to create a research culture associated with the creative teaching work - learning the role of a "researcher" knowing how to systematically analyze their own practice - particular teaching situation by an active research and based on that modify their teaching strategies, propose alternative solutions and measures in order to improve the quality of teaching,
- apply new approaches in assessing professional competencies of the ethics teachers projected in the presentation of competency teacher profile of the given teacher, focusing on their ability to examine own teaching activities critically, analyze it, interpret it, evaluate it, be capable of theoretical reflection of practical experience (place them in the context of theory),
- apply methods of distance education leading to active self-studying and in a contact study, strategy and methods of active teaching and learning of teachers should be preferred (more seminars and trainings).

#### 4. Conclusion

In the context of transition state curriculum in primary and secondary schools, an innovative model for teaching ethics was created by the research team as a tool and a theoretical framework for teachers of ethics for the purpose of improvement and innovation in ethical education. The presented model of the ethics teacher competence profile is the base for the meaningful and targeted continual education and professionalism heading towards achieving individual didactic concept of teaching ethics.

In continual learning, there is a necessity to form learning situations leading towards enhancement of professional set of values, beliefs, opinions and skills of the ethics teachers, which are sufficiently theoretically founded. It is a creation of academic space aimed at the role acquisition, strategies and methods that allow them to "self-construct 'own professional identity of the ethics teachers defined by competency profile. The point is that teachers of ethics would constantly be aware of the self-reflection and routinely clarify their "teaching philosophy", professional attitudes and personal beliefs leading to their own conception of didactic teaching ethics generating conditions for innovation of ethical education.

## Abstract

During the course of “Fundamentals and applications of Science of Representation - Geometric drawing” (held at the Faculty of Engineering at the University of Palermo) we successfully tested the adoption of informatics tools to enhance the comprehension and the critical analysis of complex figures in the geometrical space. The peculiarity in the teaching methodology was the adoption of interactive software products (*Cabri Géomètre* and *GeoGebra* concerning dynamic and geometrical constructions; the well-known *Rhinoceros* plug-in, *Grasshopper*, about generating algorithms; *Linceo* regarding implementing the graphic display of complex solids in augmented reality). According to our experience within didactic laboratories, the adoption of ICT allowed us to stimulate and interest students towards subjects of descriptive and projective Geometry and the expected results are very satisfactory. In this paper we show some of the most interesting examples of geometric constructions created by students.

*Keywords:* digital and interactive learning tools, dynamic geometry, generative algorithms, augmented reality.

## 1. INTRODUCTION

The integration of Information and Communication Technologies (ICT) in the field of teaching offers the opportunity to enrich and widen the learning environments, spaces where the structures of knowledge can be articulated.

In literature several experiences can be found, which describe the results and the possible developments of the couple education/technology in the learning/teaching processes.

At national level, over the last few years, the Ministry of Education, University and Research (MIUR) has promoted, financed and implemented, in partnership with the National Agency for the Development of School Autonomy (A.N.S.A.S.) and a network of associated universities, a teaching project of digital School called “Cl@ssi 2.0”, aimed particularly to the development of the ICT applied in the educational field.

e-mail: [francesco.dipaola@unipa.it](mailto:francesco.dipaola@unipa.it)

The national project involved several schools in the area, connected with each other and provided with multimedia devices and technological equipment, with the aim of experimenting possible changes and innovations of the learning environment through the use of technologies in support of traditional teaching (Falcinelli & Laici, 2013).

At European level, the process of renewal of the teaching methodologies has developed a series of similar projects, for example “Escuela 2.0” in Spain and the Project “Capital” in England.

In our university context, the educational path started five years ago in the *Drawing* courses (in the degree programme of *Building Engineering – Architecture* and that of *Environmental and Territory Engineering* of the Faculty of Engineering at the University of Palermo) allowed us to experiment teaching strategies which employ new hardware/software technologies. During the development of the lessons it was found that the exclusive use of analogical – traditional procedures slows down the students’ learning processes and limits the understanding of the objects of geometric space and, consequently, their encoding in a plane of reference.

On the basis of these critical issues observed during the development of the teaching laboratory exercises, it was decided to structure teaching/learning strategies allowing the synergic integration of traditional methods with new interactive procedures. The use of hardware (PC, tablets, IWB, graphics tablets, virtual and augmented reality devices) and software digital tools (dynamic geometry, modelling and programming programs) has significantly shortened the times of reception of educational contents, contributing to an active and conscious participation of the students.

The purpose of this paper is to describe a possible renewal path for the teaching/learning processes of the subject, moving on three levels of investigation:

- Organizing and structuring of the didactic educational environment;
- Identification of the most effective methodological – digital tools for the acquisition of the subject contents, aimed at the achievement of certain skills;
- Verification of the cognitive and practical abilities to apply the acquired knowledge, through the creation of digital models and their virtual display.

The main aim is to investigate the innovation and enhancement dynamics, which can be triggered in the learners, without focusing on the technologies in the strict sense (Fig. 1).

## **2. A DIGITAL CLASSROOM/LABORATORY FOR THE TEACHING OF DESCRIPTIVE GEOMETRY**

Before reporting some significant applications elaborated by our students, which summarize the teaching innovation process, we propose an ideal and desirable configuration of a university classroom adopting and promoting the integration of the digital and traditional teaching methods.

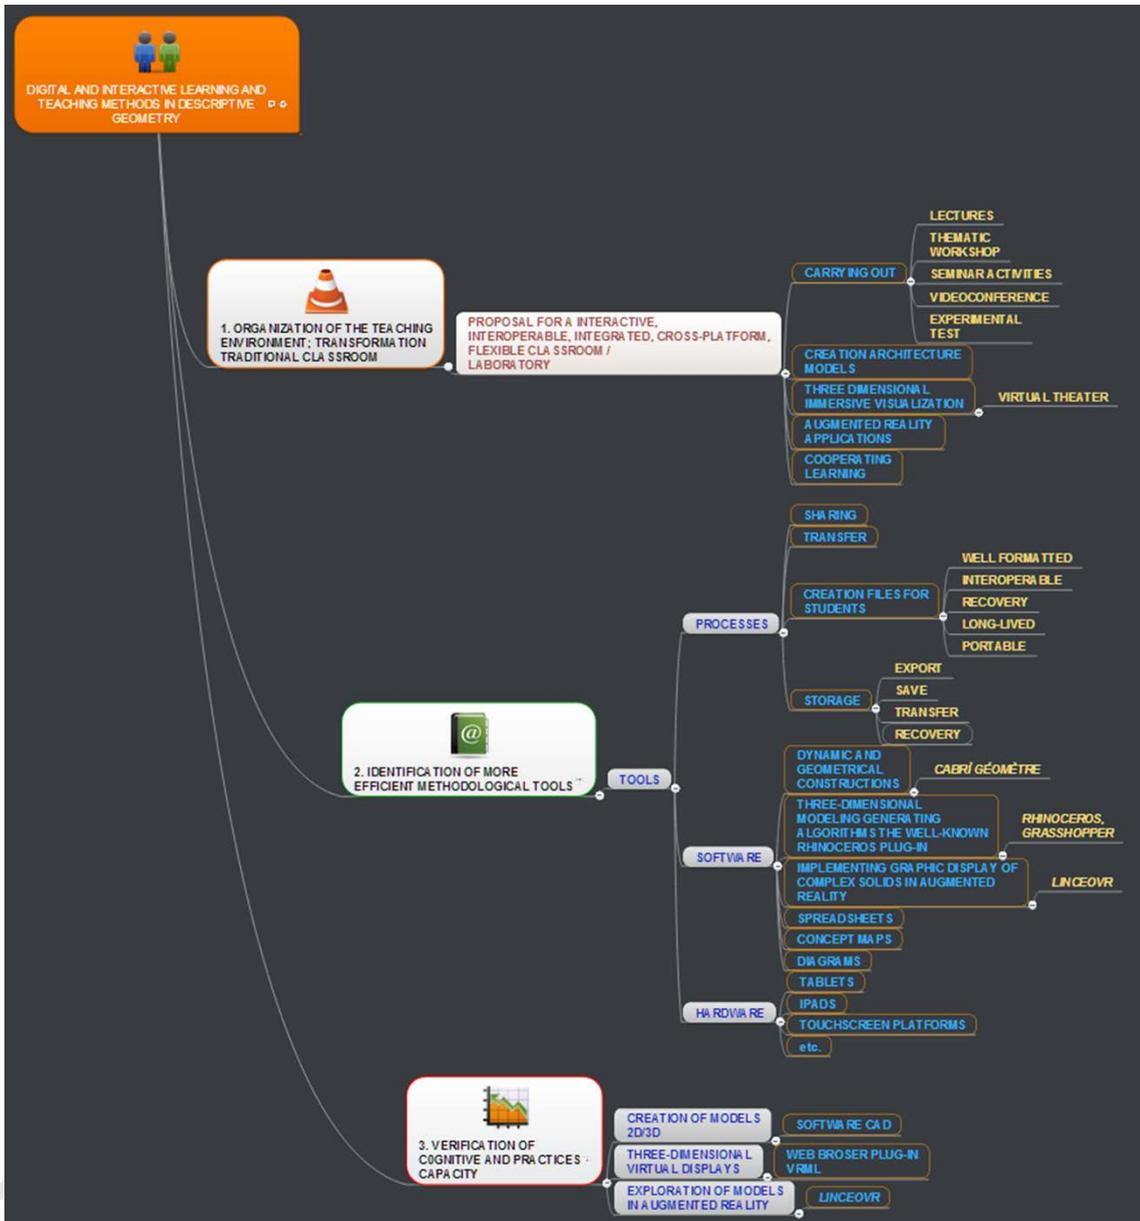

Fig. 1. Conceptual Map about digital and interactive Learning and Teaching methods in descriptive Geometry.

The classroom/laboratory, not yet existing at the University of Palermo, would create a structurally flexible environment, which facilitates the teaching/learning of interdisciplinary contents, and which is provided with hardware/software digital and interactive devices and equipment (Fig. 2 a,b).

In order to start and strengthen the teaching innovation process, it is necessary to change the traditional learning environments and to design new suitable educative spaces. The current spatial configuration of a traditional style classroom, structured in a random and undifferentiated way, should be more functionally redesigned for the logistical needs required by the technological – digital equipments.

In our investigation path, the multimedia digital classroom we propose is conceived as a laboratory becoming classroom, an original and versatile learning place where to develop interactive way of teaching, which allows the involvement of an even high number of students.

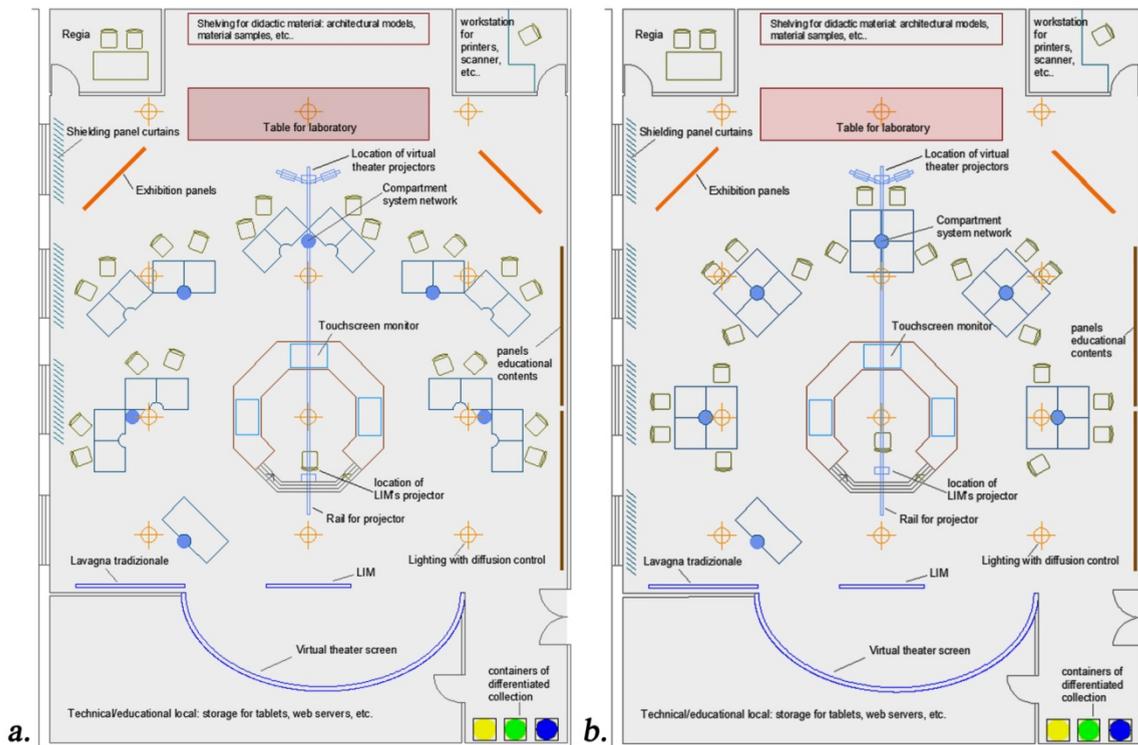

Fig. 2. A proposal of modular configuration for a university classroom/laboratory facilitating the integration of the digital and traditional teaching methods of descriptive Geometry.. a Configuration for laboratorial activities, videoconferences, thematic workshops, experimental tests; b. Configuration for interactive lessons, cooperative learning, seminars.

A classroom/laboratory with instrumental interoperable equipment, that can be integrated with already existing multiplatform devices, in which architectural models are created, virtual scenarios are opened, project experiences are shared with other universities. The proposed technological platform aims to create an environment in which technologies and services, useful for education and computer science culture and technological innovation diffusion, are integrated and available.

The teaching space is designed as an interactive environment, in which it is possible to experience also the immersive three-dimensional displaying techniques for the exploration of geometric models, through the installation of a “virtual theatre” properly set up (an virtual reality environment where, wearing special glasses, viewers can experience immersive environments, thanks to stereoscopic vision). In order to raise the quality of

learning/teaching, particular attention has been paid to the arrangement of the classroom layout, conceived as a highly flexible space, capable to rapidly adapt according to the purposes of the educational moment, to the different activities to be carried out (interactive lessons, cooperative learning, seminars, laboratorial activities, videoconferences, thematic workshops, experimental tests). The interactive lessons, created with open source applications, can be shared using tablets, iPads, touchscreen platforms related to 3D models and to the graphic constructions within the classroom.

### 3. INTERACTIVE DYNAMIC GEOMETRY APPLICATIONS AND GENERATIVE ALGORITHMS PROGRAMMING

The subject contents of the educational programme are presented to the class with the support of two well-known *dynamic geometry* software: *Cabri Géomètre* and *GeoGebra*. Particularly, the latter, developed in *JAVA* script (Hohenwarter et al., 2009), over the last few years has widely spread among the academic institutions, because it has some peculiarities which guarantee multiplatform operability and consultation through the most widespread browsers. In order to allow the students to consult and browse the geometric constructions made, an e-learning link with private access has been created on the web page of the Library of our Faculty of Engineering. On the course web page, in a dedicated section the html files of the graphic constructions are stored together with the synoptic tables about the handled themes, in order to facilitate the student to highlight and examine in depth some fundamental properties (Fig. 3).

In the explorative study of the geometric figures, the use of the above mentioned software proves to be a very useful exploratory investigation tool. The controls made available to the user allow to deepen the intrinsic relations among the geometric entities through the manipulation (repositioning, rotation, expansion) of control points in the created constructions (Fig. 4, 5, 6).

During the construction process, it is possible to validate the initial hypothesis, speculate and verify the properties and the relations which remain unchanged or vary during the geometric transformations.

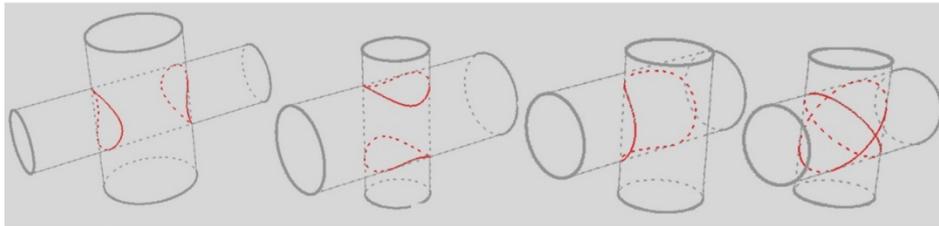

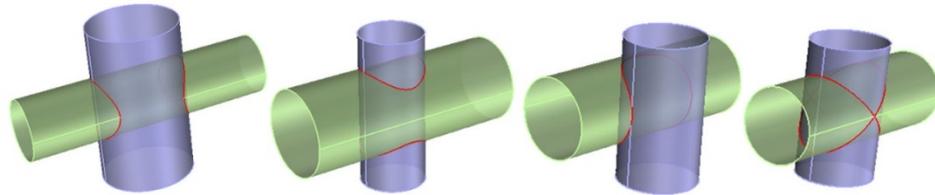

Compared with the traditional paper and CAD digital drawing, the students are allowed to change the position of the starting geometric entities, configuring, in this way, dynamic displays. For the understanding of the sequence of the graphic operations generating the geometric figure, important and effective interactive modalities are highlighted: the “step by step” reproduction of the graphic process; the display of the construction protocol with the list of the executed controls; the construction of “geometric places” of points, which satisfy certain conditions.

The use of these tools has allowed us to enhance the interaction between the theoretic – conceptual and the figurative component in the reasoning of descriptive Geometry, offering reflection occasions to sharpen the cultural and educational knowledge of the Science of Representation.

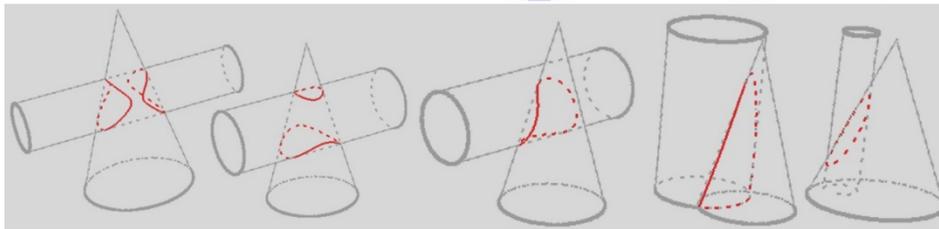

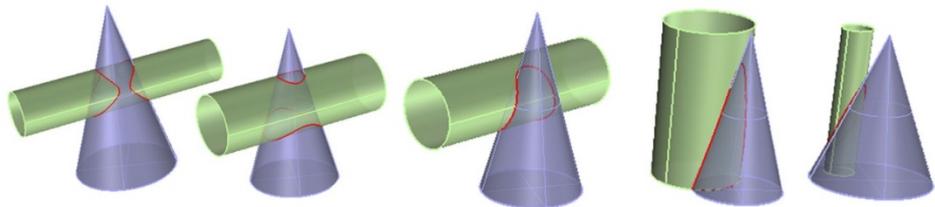

For example, a structured table is reported, which introduces the perspective reference system and the representation of the fundamental entities. The analysed figure shows the geometric layout of the perspective reference system simultaneously in 3D, according to a scheme in oblique axonometry at  $45^\circ$  (to the left) and, in 2D according to a two-dimensional scheme directly on the squared plane  to the right  Whilst remaining unchanged the construction process (executable “step by step”, operating with the buttons of the control bar at the bottom), the geometric entities can be manipulated modifying the visual perception of the entities image, on the squared plane and simultaneously in space (Fig. 7).

In the subject teaching planning, particular attention is paid to the study of surfaces (ruled quadric, developable quadric, of revolution, interpolation, helical, free forms) and of curves, generatrix and directrix, which compose them.

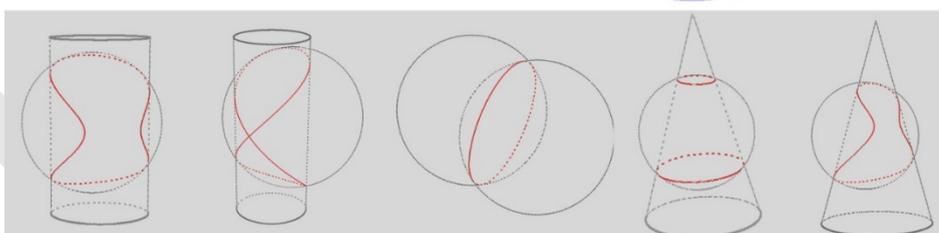

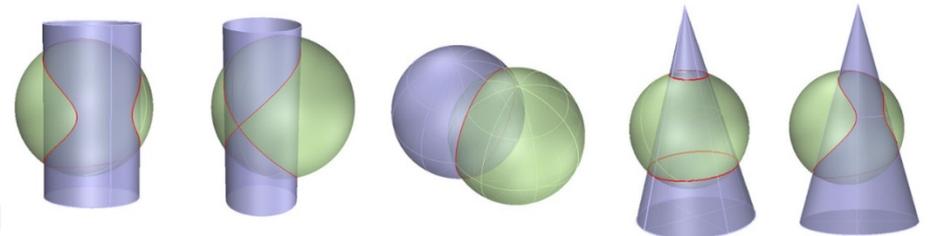

them and within a plug-

The shape (2011)

allow initial of of (8, 9).

The procedures adopted to construct them are structured parametrically controlled *Grasshopper*, generative architectonic modelling in of the well-known modelling software CAD *Rhinoceros*. use of generative algorithms for modelling of a geometric is an approach (Tedeschi, which has enabled us to: automate the procedures; generate parametric models that changes to the geometries; investigate on several spatial configurations intersection between different kind shapes (Fig.

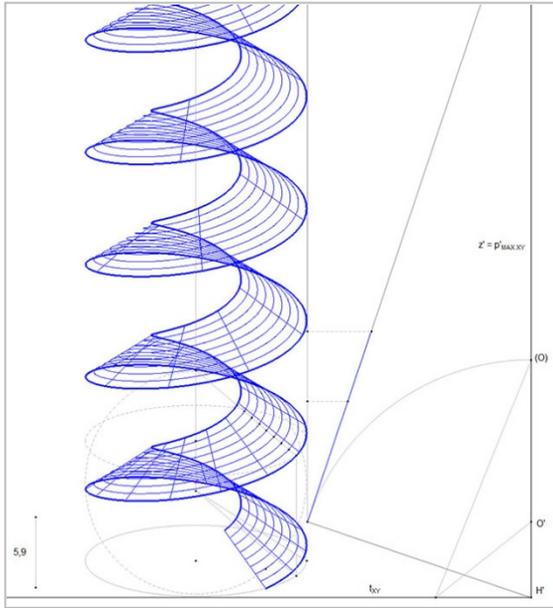

Fig. 3. Synoptic tables about the intersection of quadrics, in order to facilitate the student to highlight and examine in depth some fundamental properties.

#### 4. INTERACTIVE DYNAMIC GEOMETRY APPLICATIONS AND GENERATIVE ALGORITHMS PROGRAMMING

During the exercises in class, the students study and represent significant examples of existent architectures, which present geometric-spatial complexities handled during the course.

Geometric and architectural models created in class are exported into VRML format (Virtual Reality Modeling Language) for the display in a common Web browser and made available for the whole class in a single multimedia storage.

To better understand form, geometry and structure of the realized architectural models, our course employs also the Augmented Reality (or AR) technology. The AR, the set of technologies which allow to “augment” a real scene (Primavera, 2010), is a young computer science discipline at experimental stage, pertaining to “computer graphics”, that deals with the overlay of digital contents to the observed real world. It integrates new ICT and communication forms, showing a representation of an augmented reality in which, to the normal display perceived through our senses, artificial/virtual sensorial information is added.

In our context the AR is an excellent teaching aid, as it allows the students, through marker identification tracking procedures, to display in real time the constructed three-dimensional models.

With the simple movement of the selected marker it is possible to explore in all directions three-dimensional objects not actually existing (Fig. 10).

The technology using dedicated software (the one we used during the course is *LinceoVR*) is structured into three simple steps:

1. Object *identification* (the object usually consists of a printable marker, as link between the real and the virtual world) observable by means of a fixed or mobile viewer (video-camera, smartphone, tablet), with data processed by a computer.
2. Real time *tracking* in the space of the observed object.
3. *Mix* of the support (i.e. the 3D model) with the marker.

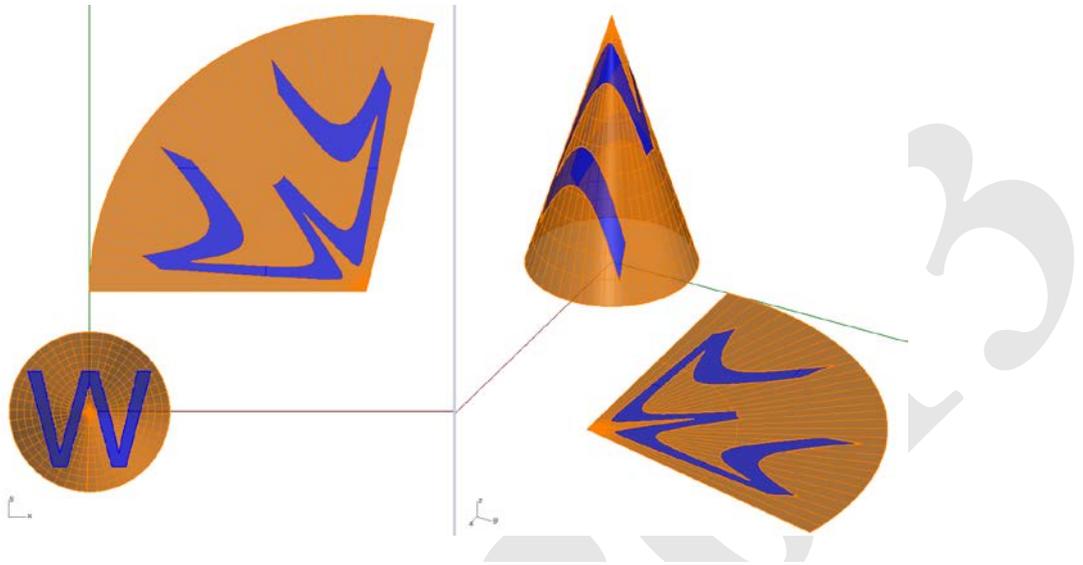

Fig. 8. Example of anamorphic projection of a plane figure (letter “W”) on a conic ruled surface and development of the system on a reference plane.

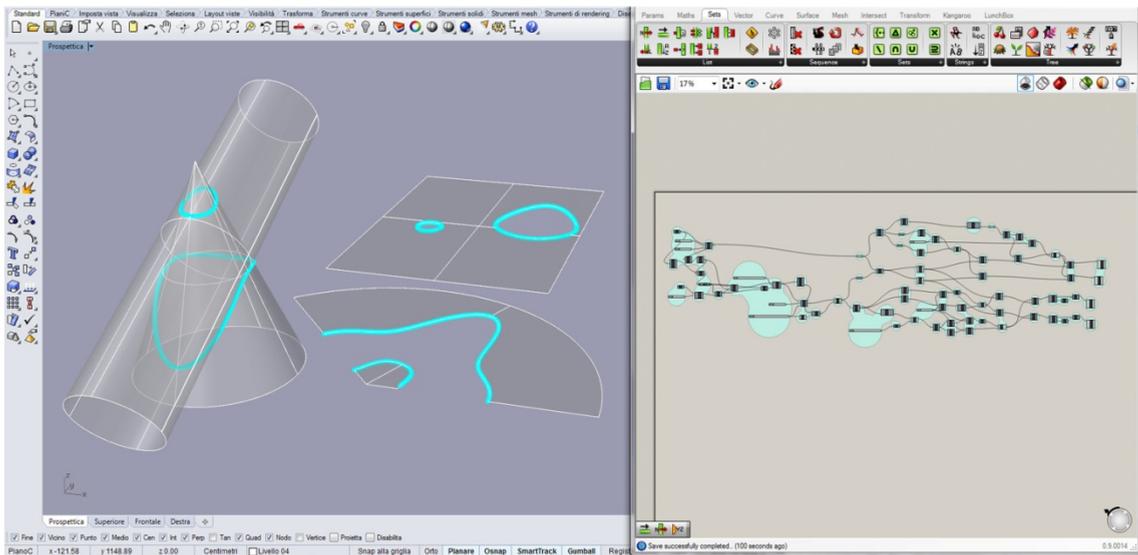

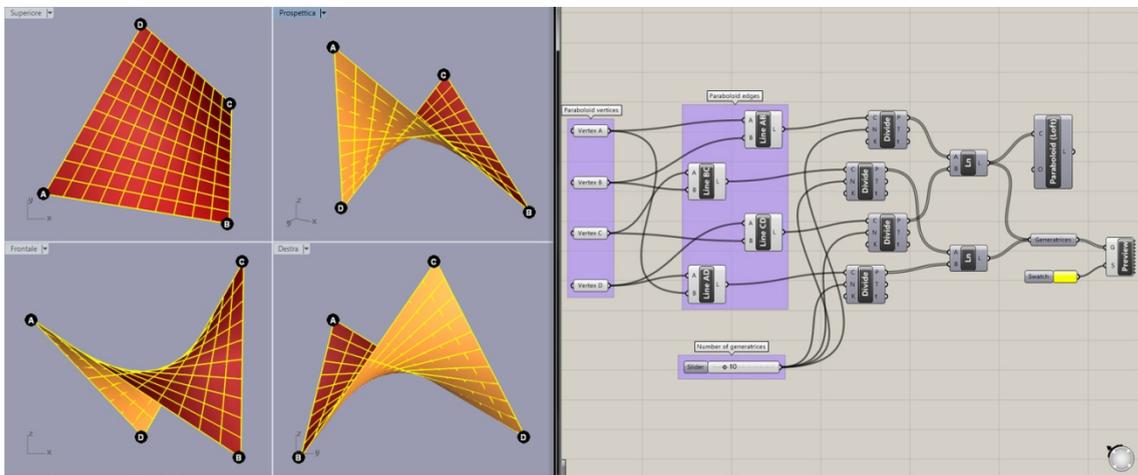

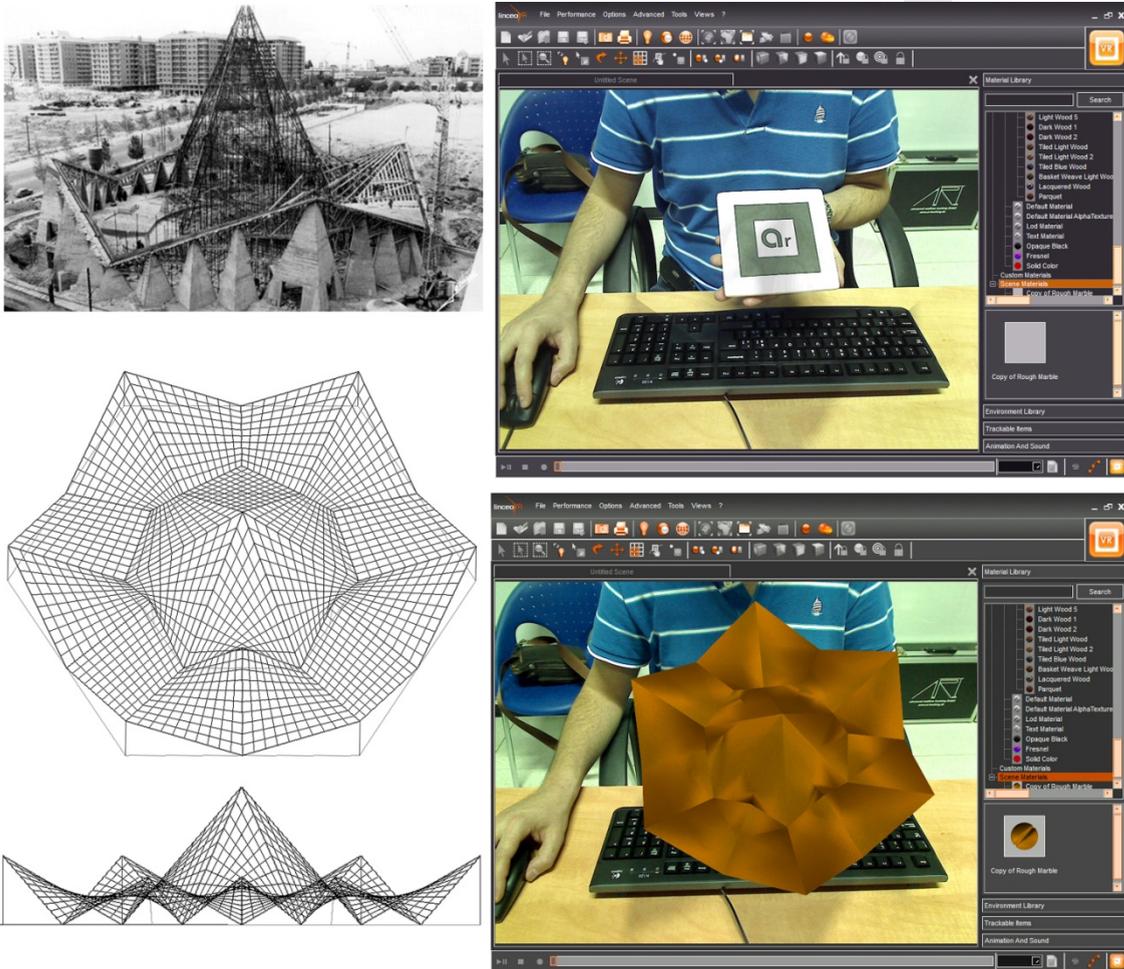

Fig. 9. Two examples of generative algorithms for the modelling of structured surfaces parametrically controlled within *Grasshopper*, a plug-in of the well-known CAD software *Rhinoceros*. At the top, a crooked rectangle with a portion of hyperbolic paraboloid subtended to it; at the bottom, intersection of a cone and a cylinder anyhow organized between them, and development of the surfaces.

## 5. CONCLUSIONS

On the basis of our teaching experience, structured and shared with the students through the introduction of technological solutions for communication, management and access to the discipline contents, we strongly believe that teaching cannot overlook the smart integration between ICT and knowledge anymore.

Innovation implies the acquisition of digital skills by the professors and their training to be in step with the new media languages, in order to effectively and consciously integrate them in the teaching of their discipline.

Pier Cesare Rivoltella, professor of Teaching and Learning Technologies at the Università Cattolica of Milan, well summarizes the necessary change of the teaching approach. In a recent speech given at the Pontificia

Università Lateranense, he says: *We live in a circumstance in which didactics seems not to be a professional skill for the professors anymore. This is proved by the fact that the new recruiting procedures will evaluate only their research activity. At the same time, didactics is nevertheless one of the main requirements to work in a context in which practices and behaviours of young people are increasingly marked by the presence of the new languages and meaning construction forms and more and more distant from the traditional lecture model.*

# Distributional assumptions in educational assessments analysis: Normal distributions versus generalized beta distribution in modeling the phenomenon of learning

José Alejandro González Campos \*

*Department of Mathematics & Statistics / Faculty of Natural & Exact, University of Playa Ancha, CHILE.*

---

## Abstract

This paper introduces the generalized beta (GB) model as a new modeling tool in the educational assessment area, evaluation analysis specifically. Unlike normal model, GB model allows us to capture some real characteristics of the data and it is an important tool to understand the phenomenon of learning.

This paper develops a contrast with the normal model, allowing to observe that there are situations in which, the most common assumption is that the normality of the data is not always the best. The theory of educational assessment should begin to open to new statistical tools offered, adding new models in order to capture one the best features of the data and reject strong assumptions as strong as symmetry.

**Key words:** Normal distribution, symmetry, unimodality, evaluation and learning analysis.

---

## 1. INTRODUCTION

The statistical modeling concept is changing nowadays; data were formerly needed to adapt or adjust to a specific or known model. The normal or Gaussian model became a natural assumption of many studies, particularly and strongly in educational evaluation (Fernández, 1997: 51-52). Currently it is intended that each data set has its own model, for example, to asymmetry or bimodality of these. Therefore distributional analysis processes in the field of educational evaluation should adapt to new trends, as these changes will help us understand more precisely the phenomenon of learning, for instance, determine more precisely the skill levels of our students (Cabrera, 2010a: 51-61). A statistical model is a Platonic representation ideal belonging to the universe of the possible rather than the probable. Particularly when we work with the normal model, we are associating a support characterized by the real line to this variable, which is better in many cases; however,

\* Corresponding author. Zipcode 33449. Phone 56-32-2500550. Valparaíso-Chile  
E-mail: labesam.upla@gmail.com

infinity is not part of the present and of many of the variables that are essential to the evaluation process, usually because their supports are bounded, where a direct example are the evaluations in the metric system of most countries. Such situations are not just a problem of the educational field, but also in multiple areas, such as agriculture (Haskett, 1995: 73-74), health (Gulco, 2009: 929-930), engineering (Oguamanam, 1995: 247-250 and Sulaiman, 1999: 573-575). In short, we have a responsibility, in this perspective, to propose new models, particularly with bounded support, ensuring that the models can accurately represent the characteristics and behavior of the data, ignoring ideal characteristics as symmetry, and proposing models that effectively represent the characteristics of the data (Arellano-Valle, 2005: 93-94).

Our proposal consists in the presentation of generalized beta model that serves as a model of best features of many of our variables in the educational field, presents also various forms and flexibility, which make it an attractive model. Finally we present an application to a concrete data set, corresponding to evaluations of three groups of students in a particular area, allowing visualize the goodness of fit with respect to the standard model.

## **2. LITERATURE REVIEW**

GB distribution proposed in this paper concerning to the generalization of its support, is completely different to other preview GB proposals. Cordeiro (2012), proposes a GB which is the composition of two different distributions, generating chances in distributional form, but not in the support; there is also Exponential GB distribution proposed by Barreto-Sousa (2010), which is a particular case of composition of distributions, as is the Beta-normal distribution by Eugene (2002) and the life model by Nadarajah (2005), however, all this generalizations are related with the form of the distribution, but not with the support, which is our proposal. There is another vision of GB raised by McDonald (1995), which are related to the increase of parameters in the characterizaton of the beta distribution, however, this proposal considered as support the interval of real numbers between 0 and 1, and the estimation process becomes extremely complicated.

## **3. THE RESEARCH PROBLEM and OBJECTIVES presented.**

At present the philosophy of modeling is changing: there is a trend to suggest models with more features for data identification, such as asymmetry, which obviously brings a positive impact on the measurement process and study of behavior, central aspects on the evaluation process (Cabrera, 2010b: 69-84), however it is difficult to incorporate this point of view, because the normality assumption, considering the distributional model, are the main part in a process of data analysis in the field of education. Fernández (1997) indicates that the normal model is "as a rule" the distribution in the assessment of learning. For this reason we want to present and propose the Generalized Beta model as a tool to better respond to the characteristics of our metric system, allowing an authoritative analysis and overcoming some distributional assumptions.

For this reason, the issue of this paper is: "Characterizing Generalized Beta distribution as a model that best fits to the metric characteristics of our evaluation scales and compare the goodness of fit with respect to the normal model based on a set of real data"

### **Objectives**

- Describe formal aspects of GB distribution and Characterize the GB model.
- Promote GB distribution, as an analysis model of educational assessments and Show the goodness of fit of GB compared to the normal model in a set of real educational evaluations.

**Αππενδιξ Α.** Promote a line of research on the implications of considering models with bounded support in the field of education, specifically in the process of evaluation and analysis.

### **4. RESEARCH METHODOLOGY.**

The working methodology is pro-positive type, in the sense that it aims at starting a new line of research in educational assessment analysis; this study considers the real characteristics of these processes, overcoming the problems of under- and overestimation generated with the assumption of normality.

Phases of Research: Preliminary analysis, characterization of generalized beta model, application, a posteriori analysis and evaluation.

### **SOME PRELIMINARY ANALYSIS.**

#### *The statistical modeling*

Statistical models have been widely used in a wide range of situations, for example to solve specific problems in engineering and the different scientific areas, and form the basis of the theoretical formulation of inference and much of the statistical methods (Arellano-Valle, 2005: 93-94). Today statistical modeling has methodological and technological backups that give a great viability as an area of educational development in modeling. A statistical model is a platonic conception of theoretical that, in a very generic way, can be seen as a mental constructor which aims to study and better understand how a phenomenon in which a cause and effect relationship underlies (Ojeda 2003: 71-72). Understanding this section is essential to understand the meaning of this work, since one of the main objectives of education is to understand the phenomenon of learning, this phenomenon has an ideal model that perfectly explains their behavior, however it's hard we can know it, so in the modeling process, i.e. the process of proposing models, it should be increasingly considered characteristic elements corresponding to data we observe. In this sense, it is presented the proposed GB model, as a further step in the understanding of a phenomenon so important, as is learning.

### *Model Selection Criteria.*

The criterion in the model selection will be based on how close they have proposed parametric models respects adjusted nonparametric model, assuming the latter as a reference. Non parametric model or non parametric estimated density will be identified by  $\hat{f}(x)$  now the density or proposed parametric model will be represented by  $f(x)$ . Then the selected model will be the one that minimizes the following relationship  $\|\hat{f}(x) - f(x)\|$ .

### *The Normal Distribution*

The normal distribution or normal model is known for its excellence in educational evaluation, but its use generally violates their assumptions. Its asymptotic properties make it an attractive model; however, these asymptotic results are not obtained in general with 20 observations, theoretical assumptions exist that allow this condition, see for example the central limit theorem and his regularity conditions. There are a number of bibliographic references such as Johnson (1995) and Casella (1990) therefore we will not go into more detail. It is a symmetrical model, characterized by two parameters,  $\mu$  which represents the mean and  $\sigma^2$  which represents variance. There is a process called standardization, which is a linear transformation, which generates a new random variable normally distributed; only now the mean is zero and variance is 1, as shown in Figure 1. The standard normal model is fully tabulated, so their probabilities are known.

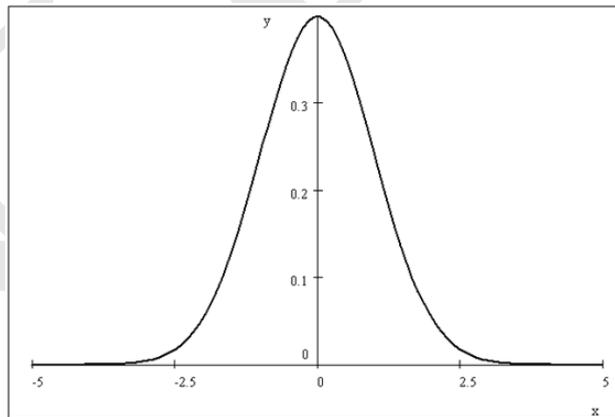

Figure 1: Normal Distribution

### **CHARACTERIZATION OF GB MODEL.**

The generalized beta distribution which is presented in this paper is related to the generalization of its support, a different concept of generalization shown by Cordeiro (2012). In probability theory and statistics, the beta distribution is a family of continuous probability distributions with support in the interval (0,1). The beta density is characterized by two positive parameters, generally indicated by  $\alpha$  and  $\beta$  or  $u$  and  $v$ , which are parameters of location and scale. The beta distribution has been applied to model the behavior of random variables limited to

finite amplitude intervals in a variety of areas. His density is  $f(x) = \frac{\Gamma(u+v)}{\Gamma(u)\Gamma(v)}(x)^{u-1}(1-x)^{v-1}; x \in (0,1)$

which can have various behaviors depending on the values of the parameters, from symmetric to fully asymmetric behavior, as presented in the graph in Figure 2.

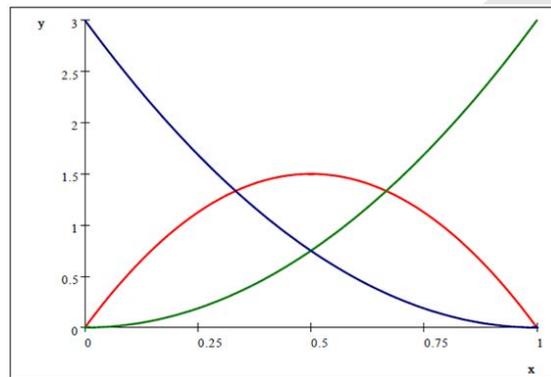

Figure 2: symmetric or asymmetric

We naturally want to extend these properties to different supports; for this reason, in the following sections we will present generalized beta distribution, to make later the contrast with the normal model.

### Generalized Beta Distribution

The generalized beta distribution naturally born to give greater flexibility to support bounded, where its

density function is defined as:  $f(x) = \frac{\Gamma(u+v)}{(b-a)^{u+v-1} \Gamma(u)\Gamma(v)}(x-a)^{u-1}(b-x)^{v-1}; x \in (a,b)$ , where, in

the same way as in the standard model, the parameters  $u$  and  $v$  are positive. The standard Beta distribution is now a situation of generalized Beta distribution, when  $(a, b) = (0,1)$ . If  $X$  is a random variable with Generalized Beta

distribution, then the notation is  $X \square BG_{(a,b)}(u, v)$  or equivalently  $X \square BG(u, v, a, b)$ .

### Model features

To facilitate operability of the model, consider the parameter  $b$  is written by  $b = a + h$ , thus the density is

$$\text{represented by: } f(x) = \frac{\Gamma(u+v)}{h^{u+v-1}\Gamma(u)\Gamma(v)}(x-a)^{u-1}(h-x)^{v-1}; x \in (a, a+h)$$

The following items are those that are usually presented to analyze and compare evaluations.

$$\text{Mean: } E(X) = \frac{u}{u+v}h + a$$

$$\text{Second Moment: } E(X^2) = \frac{(u+1)u}{(u+v+1)(v+u)}h^2 + \frac{u}{u+v}2ah + a^2$$

$$\text{Variance: } \text{Var}(X) = \frac{(u+1)u}{(u+v+1)(v+u)}h^2 + \frac{u^2}{(u+v)^2}h^2$$

In the estimation process we present two of the most relevant: the first is the maximum likelihood and the second is the moments method. In this process, assume that the parameter  $h$  or amplitude range of possible values of  $X$  is known. In the case of the maximum likelihood estimator, simply solve the following system:

$$\psi(u) - \psi(u+v) = \sum_{i=1}^n \frac{\ln x_i}{n} - \ln h$$

$$\psi(v) - \psi(u+v) = \sum_{i=1}^n \frac{\ln(h-x_i)}{n} - \ln h$$

Estimations by moments method, represented by  $\tilde{u}$  and  $\tilde{v}$  are, respectively  $\tilde{u} = \frac{\overline{X^2}h - \overline{X}k}{h(k - \overline{X^2})}$

$$\text{where } k = \frac{\sum_{i=1}^n X_i^2}{n}, \text{ then } \tilde{v} = \frac{\tilde{u}}{X}h - \tilde{u}.$$

## 5. APPLICATION

Knowing distributional behavior of educational assessments is critical to the educational field, because it allows the rethinking and evaluate the introduction of new methodologies or criteria, for example (See Figure 4, Course A), therefore, the statistical modeling applied to education, particularly to the evaluation analysis, is essential for understanding and walking toward understanding the phenomenon of learning.

The graph of Figure 3, allows for example to observe the result of the launch of the registration without prerequisite disciplines, which obviously does not have a normal behavior.

The next application is based on a sample of three courses at a Chilean State University, where evaluative scale from 1 to 7 is used, with 1 being very low and 7 very high. The application seeks to show a contrast between the normal and beta generalized modeling for evaluation analysis. The courses discussed were selected randomly and some information will be kept confidential.

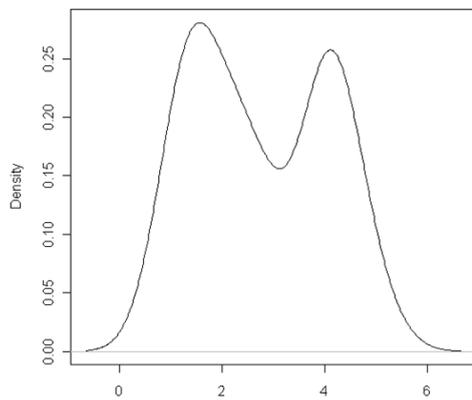

Figure 3: Sample means of evaluations

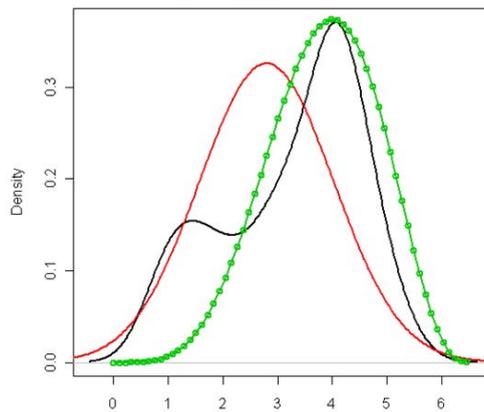

Figure 4: Model Comparison

The process of contrast between the two models is used as a reference or ideal model; an estimate nonparametric density, generally black in color represented unless otherwise specified. The selection criteria will be based on the smallest difference between the nonparametric model and the proposed one.

The estimates obtained by the maximum likelihood method, are presented in Table 1.

Table 1

Proposed model	Normal Model: red curve	Generalized Beta Model: green curve
Estimates of parameters	$\hat{\mu} = 2.8$ and $\hat{\sigma}^2 = 1.5$	$\hat{u} = 5.5$ and $\hat{v} = 3.8$

Figure 4 shows the comparison between the two fixes, where the green curve represents the Generalized Beta model, red curve to the normal distribution and the black color curve adjustment nonparametric. In Figure 5, we can see that the nonparametric asset gives evidence of the existence of two groups due to the bimodal behavior, complicating a contrast, as both models have uni-modal features; however the quality of the Generalized Beta model is higher than normal model, due to the degree of proximity to the non-parametric curve. Furthermore it is possible to show the limitations of the standard model at asymmetric behavior, causing over and underestimations, specifically in this case produces an underestimation of the peaks and an overestimation of the probabilities in the tails of the distribution.

A fit that will surely surpasses in quality to these two models, is to use mixture models, given the bi-modality of the real curve (McLachlan, 2000: 24-26), however, to get that, we need the expertise of a wide variety of models, and it is a good beginning for this. A similar situation is presented in the graph in Figure 5, except that now the notes correspond to a teacher and discipline completely different. The estimates obtained by the maximum likelihood method are presented in Table 2.

Table 2

Proposed model	Normal Model: red curve	Generalized Beta Model: green curve
Estimates of parameters	$\hat{\mu} = 3,5$ and $\hat{\sigma}^2 = 1,3$	$\hat{u} = 13,3$ and $\hat{v} = 9,9$

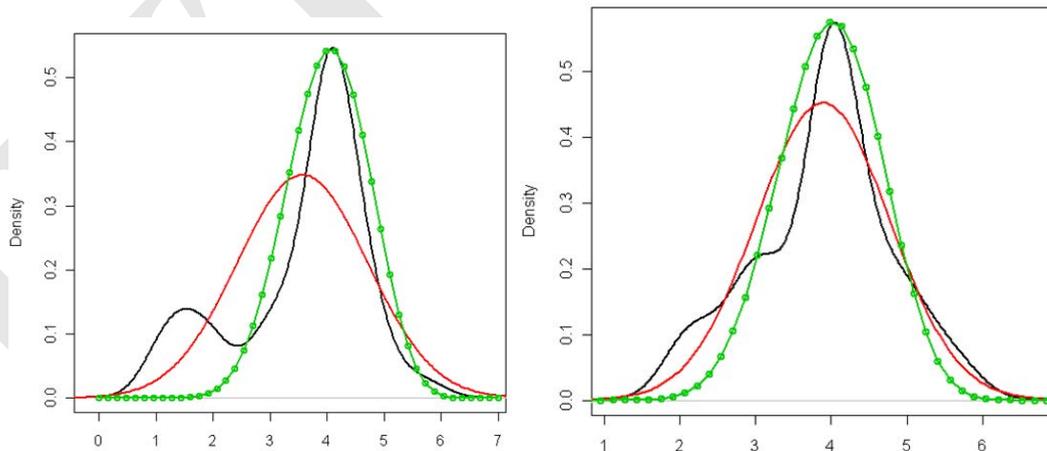

Figure 5: Model Comparison

Figure 6: Model Comparison

Again, the graph in Figure 6 shows the superiority in modeling for the case of the GB distribution.

The graph in Figure 6 shows another course, where it is difficult perceive differences is complex, although both have pros and cons, we need a quantum process to decide on the quality.

Using the criterion of selection of models defined, we have:  $\|f(x) - f_R(x)\| > \|f(x) - f_V(x)\|$ , where  $f_R(x)$  and  $f_V(x)$  are the normal and beta generalized models proposed, respectively, thus the generalized beta model is the best fit. The estimates obtained by the maximum likelihood method, are presented in Table 3.

Table 3

Proposed model	Normal Model: red curve	Generalized Beta Model: green curve
Estimates of parameters	$\hat{\mu} = 3,8$ and $\hat{\sigma}^2 = 0,77$	$\hat{u} = 14,5$ and $\hat{v} = 11$

#### A POSTERIORI ANALYSIS AND EVALUATION.

The presentation of the three situations will display an immediate necessity, which is adding more models to the educational field evaluation, allowing each day represent more accurately the actual behavior of the assessments. In the graph in Figure 6, the decision is complex visually, that is why we used numerical objective criterion for selection, and this criterion is not final, it is subject to improvements, as the field of nonparametric analysis is a young research line.

#### 6. CONCLUSIONS.

The proposed model provides a significant improvement in fit and modeling of learning assessments. This model considers information on the characteristics of the data, such as belonging to a bounded support, and it does not fall into the over estimation problems, which are really unlikely elements. The great advantage of the GB model in modeling assessments is its flexibility and adaptation to the asymmetries of the distributions, which again becomes an important aspect on how to better understand the phenomenon of learning.

The selection of a reliable model at this stage is critical to begin studying the impact of covariates in this model; for example, in the case of GB model, there are various tools for this type of analysis, such as Beta regression (Ferrari, 2004: 799-785). Ultimately, GB model presents interesting properties as an assessments analysis model and it could become a potential tool for good learning study. The signification of this paper is to

introduce a new model in the analysis of evaluations that considers real and current characteristics of the data, for example, a bounded support.

## Abstract

Usage of online resources has become a necessity in the daily lives of students, academics, researchers, teachers and all others who have grasped the potential of the virtual environment. The present study aims to appraise doctoral students' competences, knowledge and skills of using contemporary information technologies and online resources for research purposes. Findings from a survey of 93 doctoral students and degree candidates suggest that procurement of quantitative information for research purposes from online resources tends to be viewed as a theoretical possibility rather than an established practice. Doctoral students appear to lack essential knowledge, skills, awareness and competence to make use of online facilities for dissemination of their research results or for active participation in professional online communities.

Key words: doctoral students; competences; research; online environment; network society

---

## 1. Network society as an element of research environment

Network society, inevitably, is also a knowledge society whose beginnings coincide with the inception of the Internet in 1971 (Kāpenieks, 2011). As knowledge society displaced the industrial one, the philosophical underpinnings of technology application underwent a fundamental shift. The technologies that had grown out of the harsh industrial experience became counterproductive in the newly emerging context.

Network society is an element of research environment, a particular kind of noosphere (from Greek *noos* – mind) or an intricate system of thoughts and ideas whose purpose is to facilitate information exchange. To create new knowledge from the existing stock, each researcher must become involved in this system or noosphere.

This approach resonates throughout international strategic documents germane to the area of higher education. The provisions of the Lisbon Strategy about the integrated approach to the application of information technologies for research purposes boosted technological productivity. Doctoral students are prospective researchers whose competence set should definitely include ability to use information technologies and media literacy, which is a multilayered and interdisciplinary concept (Stakle, 2011). Technological progress infuses the

\* Corresponding author. Tel.: +371 29739686; fax: +371 654 22890.

E-mail address: marite.kravale@du.lv

concept of *networks* with new meanings that carry technological, communicative, cooperative and social connotations.

Ever since its establishment in 2000, the European Research Area continues to pursue its key priority – to eliminate the fragmentation and isolation of discrete research endeavours in the EU member states which obstructs free circulation of ideas and undermines synergy. Writings on Bologna Process and the upper level of the three-cycle model of tertiary education (bachelor-master-doctor) emphasise mobility, internationalisation, openness and cooperation.

The “EU 2020” strategy pinpoints the directions to be pursued for building an economy based on knowledge and innovation (Commission working document consultation on the future “EU 2020” Strategy, 2009) The strategy sets a number of quantitative aims. Particularly relevant to tertiary education is the target of providing adequate conditions for research and development and reaching an increase in public and private investments that amounts to 3% of GDP.

Network society warrants transparency, which is a fundamental precondition for successful research and innovation. In knowledge society, economic processes are directed by information and knowledge, their accessibility as well as people’s ability to manage information and transform it into economic and social benefits. A key implication for education is substitution of memorisation with ability to locate, analyse and apply knowledge (Eurydice, 2002), which makes development of research competences a top-list priority.

Competences are infused with the spirit of their time. In Bologna Handbook, Scott discusses the scale of environmental impact on doctoral studies and distinguishes between external and internal factors (Scott, 2006). These factors cast network society as an environment for ongoing development of doctoral students’ research competences with due consideration to their complex structural properties as discussed in EURODOC investigations.

## **2. External and internal environmental factors and doctoral students’ research competences**

Here In his analysis of external environmental factors, Scott brings up three key points (Scott, 2006):

- innovation as a fundamental precondition in knowledge society;

Innovation is impossible without free flow of ideas and knowledge, without cooperation or building a stock of commonly accessible resources. Leonardo da Vinci framework endorses an innovation network ‘*innoSupport*’ whose task is to reinforce the competitiveness and effectiveness of businesses. Research is an essential element of this innovation network.

What researcher’s competences are required in this context? Barring a thorough analysis of the concept of innovation, which would go well beyond the scope of the present paper, it is incumbent to quote such fundamental competences as breadth and width of knowledge; IT skills for data processing and interpretation; imagination; creativity; appreciation of other experiences as well as the doctoral student’s personality traits such as courage, risk taking, tolerance and ability to substantiate one’s arguments. Development of these competences is a task for third-cycle programmes.

- globalisation;

Globalisation processes are accompanied by ideological shifts – as the virtual environment continues to expand, various elements of the academic environment come to be recast in a new light. Globalisation requires mobility not only in the geographical sense but also within the realm of one’s study and related areas. It is impossible to innovate effectively without embracing such forms of mobility as cooperation among research institutes and centres, doctoral programmes and the research practice. In the context of globalisation, the success of doctoral research is essentially hinged on the accessibility of resources and the doctoral student’s participation

in scientific activities, which contributes to the novice researcher's communicative, cognitive and behavioural competences.

A network society with its joint information environment is a rich research resource in its own right. However, it is fraught with challenges such as intellectual property protection acts, which set barriers to rapid and comprehensive knowledge flow by blocking access to scientific literature (Kļaviņš, 2011). Paucity of financial resources is another major access blocker to digitalised scientific information.

- changing academic culture

In network society the hitherto unquestioned status of external expertise and authority diminishes and is gradually replaced by the researcher's own qualities such as aspiration, quick decision making and assiduousness. Countries where this approach has not yet managed to gain a strong foothold are grappling with a lamentable scarcity of academic talent. Regrettably, Latvia also counts among such countries. For doctoral students, self-initiative, aspiration, self-esteem and self-control are fundamental personality traits that underpin their research competences and, at the same time, a major thrust towards change in the academic environment.

Scott also distinguishes some internal environmental factors that are deeply rooted in local higher education traditions of different countries:

- successiveness and complementarity of three study cycles: bachelor-master-doctor;
- organisation of research practice or cooperation of educational and research institutions.

Thus, the context of the globalised environment and network society has reshaped the structure of competences expected from a researcher. Media literacy, in its broader sense, runs as a constant thread throughout any research. Well-developed media literacy promotes awareness of targets, conscious choice making and critical selection of information (Potter, 2004). These qualities are fundamental at any research stage. Yet how well are doctoral students aware of it?

### 3. Analysis of doctoral students' competences of using online resources for research purposes

In order to appraise doctoral students' competences, knowledge and skills of using contemporary information technologies and online resources for research purposes, a survey of 93 doctoral students and degree candidates was performed at the end of 2012. The respondents were asked to evaluate the present level of their knowledge and skills and the optimum level required for doing research. The questions focused on scientific communication via the Internet, procurement of quantitative information germane to the topic of one's study from online resources, online dissemination of one's findings and effective participation in professional online communities. The respondents were given the following five-point scale to evaluate their knowledge: (1) don't have a clear idea of what is meant here; (2) understand but don't know; (3) know to some extent; (5) am able to apply my knowledge. To evaluate their skills, the following five-point scale was proposed: (1) don't know this instrument; (2) am able to give an approximate formulation of what should be done; (3) am able to clearly state what should be done and interpret the result; (4) am able to perform to some extent; (5) am able to perform to full extent.

As regards using the Internet as a means of scientific communication, 25.2% of the respondents maintain that they know how this medium might be used for the purpose but as many as 72.3% admit to actually doing it but rarely. As concerns optimum level of knowledge, 92.3% believe they ought to be able to use the Internet for scientific communication. When appraising their current level of skills 31.3% report that they are only partially able to use the Internet for scientific communication whereas up to 64.4% claim to have a complete skill-set.

Non-parametrical Wilcoxon test was administered to ascertain statistically significant differences between (1) optimum and current levels of knowledge; (2) optimum and current levels of skills; (3) current levels of skills and knowledge; (4) optimum levels of skills and knowledge.

The findings reveal no statistically significant difference between current levels of skills and knowledge of using the Internet as a means of scientific communication. 79 respondents believe that the levels of skills and

knowledge should be identical whereas 14 respondents admit that the latter may exceed the former. Likewise, no statistically significant difference was identified between optimum levels of skills and knowledge. Meanwhile, statistically significant difference ( $p < 0.0001$ ) was discovered between optimum levels of knowledge and skills and their respective current levels. That is, doctoral students evaluate the optimum levels of knowledge and skills as well beyond the one's they currently possess. Nevertheless, for the most part, the respondents appear to have appropriate knowledge and skills to successfully use the Internet for scientific communication.

As regards using the Internet to procure quantitative information, 42.8% of the respondents claim knowing that such a possibility exists but only 38.9% appear to be actually making use of it. When evaluating the optimum level of knowledge, as many as 88.5% allow that they ought to know how to procure quantitative information online as the latter should be useful in their research. As concerns their current level of skills, 41.2% of the respondents report partial ability to apply the Internet for procurement of quantitative information and nearly as many (40.1%) claim complete ability. At the same time, only 84.2% believe that their present research requires it. These findings suggest that procurement of quantitative information for research purposes from online resources tends to be considered a theoretical possibility rather than an established practice.

As concerns online dissemination of one's research findings, 26% of the respondents admit to knowing of such an option, 30.1% cast their knowledge as incomplete and only 19.2% report actually acting upon their awareness. Interestingly, as many as 69.7% of the respondents allow they ought to know how to use the Internet to present the results of their studies to academic circles. As regards the current skill set, 36.4% maintain that they are unable to disseminate their research findings online; only 27% claim partial ability and as little as 19.2% consider themselves fully capable. Thus, doctoral students appear to lack essential knowledge, awareness and practical ability to present and disseminate their research findings online.

With respect to the respondents' current knowledge about effective participation in professional online communities, only 8.2% claim knowing what it is; 24.2% report partial knowledge whereas 27% admit to not fully understanding the question. In total, 58.2% of the respondents believe that they ought to be able to participate in professional online communities while a minor fraction of 14.1% appears not to give it full credit. 29.2% of the respondents realise their own deficiency and acknowledge that they lack essential professional capacities required for participation in online communities; 22.1% cast their ability as partial and as little as 10.1% claim possessing it to full extent. Only 56.6% of the surveyed doctoral students view participation in online communities as an essential aspect of doing research whereas 24% believe it is only needed to some extent.

In general, statistically significant difference ( $p < 0.0001$ ) was identified between doctoral students' optimum and current levels of knowledge and skills of using online resources for research purposes in network society.

#### **4. Conclusion**

Network society as a joint research area is underpinned by the very same principles that are fundamental to sustainable social development: cooperation, creativity, participation and tolerance. Globalisation has boosted the significance of virtual environment which, in turn, has essentially reshaped the structure of researcher's competences.

Media literacy, cast as ability to locate, select, critically analyse and apply information for research purposes, has become a fundamental resource for academic inquiry. Knowledge circulation is shaped by a number of external and internal environmental factors, and its effectiveness is heavily hinged on doctoral students' using the Internet both in doing research and in maintaining scientific communication on its outcomes.

The findings of the present study suggest that procurement of quantitative information for research purposes from online resources tends to be viewed by doctoral students as a theoretical possibility rather than an established practice. They appear to lack essential knowledge, skills, awareness and competence to make use of online facilities for dissemination of their research results or for effective participation in professional online communities.

Evaluation of doctoral students' competences to successfully make use of online research resources exposes a glaring discrepancy between current and optimum levels of knowledge and skills, which may significantly undermine doctoral students' integration in academic circles in a full capacity of professional researchers.

# Drawing children into reading: studies of art lessons' effects on literacy

Wendy Anderson Halperin<sup>a</sup>, Marlene L. Smith<sup>b</sup> And Robert L. Smith<sup>b\*</sup>

<sup>a</sup>*Drawing Children into Reading, 76990 14<sup>th</sup> Avenue, South Haven, Michigan 49090 USA*

<sup>b</sup>*Smith Educational Associates, 11258 Baldwin Road, Bridgman, Michigan 49106 USA*

## Abstract

This paper summarizes three mixed-methods studies of *Drawing Children into Reading*, (curricula for ages 4-8), four instructional projects evolving from the vision of Wendy Anderson Halperin, a children's book illustrator. Researchers conducted the inquiries in rural Michigan from 2008-2013. Participants with two years of instruction exhibited literacy levels characterized by:

- Proper pencil grips -- which partly account for better penmanship than control groups' printing
- Written word generation that exceeds control groups' stories by 50%
- Reading abilities measured at the top-proficiency level of state assessments (correlating three times more frequently)
- Increased powers of observation which may lead to more expansive composition/narratives.

Keywords: *drawing; literacy; instruction; handwriting; art; reading; writing*

## 1. Introduction

Everyone agrees that children deserve excellent literacy instruction, but what about drawing lessons? Do most children also benefit from explicit and ongoing instruction in representing their ideas pictorially? According to Brookes (1996, p. 47), "Only the rare child learns how to draw representationally or realistically on his own. It is just like learning to play piano, learning ballet, or learning to write stories. Children need information about the subject and guided instruction." Learning to draw well may be much more important than it appears. Among others who strongly agree, Horn and Giacobbe (2009, p. 52) make a case that "For young children, drawing is writing: it gives them opportunities to do what writers do: to think, to remember, to get ideas, to observe, and to record."

\* Corresponding author. Tel.: 269-465-4343

E-mail address: whalperin@gmail.com

Figure 1: Project creator Wendy Anderson Halperin

Figure 2: Halperin sometimes illustrates her books with crayons

This paper summarizes three mixed methods studies (Cresswell, 2009) of an approach to a curriculum known as *Drawing Children into Reading* (DCIR), intended for ages 4 through 8. The series of four instructional projects has evolved from the vision of Wendy Anderson Halperin, an author/illustrator who specializes in children's books. The researchers conducted the inquiries in a variety of rural settings in Michigan between 2008 and 2013. Further study is underway, specifically on Project Curiosity and the capacity of drawing to increase learning. More information is available at <http://www.drawingchildrenintoreading.com>.

Figure 3: Project instruction in a kindergarten room: A teacher uses a document camera to project the images she is drawing so the students have a clear view for replicating her techniques on their lap boards.

Figure 4: Typical DCIR Connection Project classroom

## 2. Drawing Children into Reading: Four projects and their conceptual frameworks

Many educational theorists have concluded that guiding preliterate drawing can improve printing, reading, writing and thinking -- if skillfully done (Arnheim, 1969; Catallo, 1969; Vygotsky, 1978; Williams, 1983; Calkins, 1986; Dyson, 1986; Sinatra, 1986; Sheridan, 1991,1997, 2001; Olson, 1992; Routman, 1996, 2005; Kress, 1997; Piazza, 1999; Gallas, 2003; Richards & McKenna, 2003; McBride-Chang, 2004; Horn & Giacobbe, 2007). Because drawing is a substantive cognitive activity that most children wish to do, many good things occur when instruction is provided. The connection between drawing instruction and penmanship was asserted by Gandhi (1993, p. 16) in his autobiography as he laments his own poor handwriting:

I am now of the opinion that children should first be taught the art of drawing before learning to write. Let the child learn his letters by observation as he does different objects such as flowers, birds, etc. and let him learn hand-writing only after he has learned to draw objects. He will then write a beautifully-formed hand.

The projects' goals extend well beyond penmanship, however, and may be stated thusly: Providing preschool and early elementary students with regular, sustained art instruction impacts their abilities to learn literate behaviors.

### 2.1 The projects' questions

*What would happen if a professional artist drew with children, and did so over and over for two to three years? How far can an illustrator take the very young with their drawing, fine motor and literacy skills? Can the advances children make when drawing with an illustrator be replicated by average teachers who receive training and materials?*

### 2.2 The project concept

When adults teach children to draw things they want to draw -- like ballerinas, bugs, and bulldozers, then forming the alphabet is not difficult: they become very familiar with making straight lines and careful curves. Next, they learn to read their own letters, words and books and become drawn into literacy through their own successes.

It is a belief that printing *is* drawing, which led Halperin to *Drawing Children into Reading* (Halperin, 2011a, 2011b, 2011c). This program consists of four projects in preschool, kindergarten, first and second grades: originally known as Project 50, Project 64, Project 120 and finally Project Curiosity, the names are evolving with

Source: <http://www.drawingchildrenintoreading.com>, June 4, 2013

**Project Pencil Grip (Project 50):** This is a year-long, innovative series of drawing classes for preschoolers. Each student uses 50 implements: one pencil, one sharpener, 24 crayons and 24 twistables, a hard-covered crayon suitable for young artists. A pilot was conducted during 2009-10 in a South Haven, Michigan classroom.

**The Connection Project (Project 64):** Kindergartners receive 64 crayons and learn the following in weekly 70-minute lessons: (a) drawing a straight line and a circle, (b) coloring with the finger muscles, not wrists or arms, (c) following step-by-step directions, and (d) inventing colors and making patterns. Using technology such as a document camera and a projector, teachers lead students in modeled instruction. Project 64 proponents, including participating teachers and others, believe literacy is also enhanced because students write and illustrate books throughout the year. Students draw many characters in heavy-cardstock books to illustrate program-provided narratives which consist of words from a beginning word list. Halperin and her colleagues report that all students read those words aloud fluently and proudly. In the fall of 2013, Project 64 began its seventh year.

The broader goals are to improve (1) hand-eye coordination, (2) following directions, (3) fine motor skills, (4) handwriting, (5) directionality, (6) drawing, (7) organization, (8) attention span, (9) self-esteem and (10) literacy skills. Students hear stories, learn interesting content (e.g., about Einstein, Lincoln, dinosaurs, rockets, dancing, as well as many other subjects), and connect drawing to books via a culminating illustrating project.

Figure 7: Proper Pencil Grip (Project 50) sample work

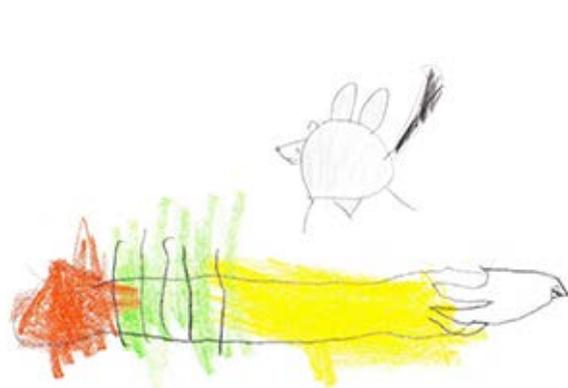

Figure 8: Preschool (Project 50) sample work

**The Genre Project (Project 120):** In the third phase of DCIR (begun in 2008), first graders gradually receive 120 colors which they learn to organize as artists do. Partly, the project goals are to continue improving the outcomes listed above for Project 64. The project also advances to new horizons though. To increase the connection with literature, students experience various genres in depth and are eventually exposed to 19 different genres. The first graders further connect drawing to books by drawing/writing in each of the 19 types. Thus, their new artistic skills are intended to link with and lead to excellent handwriting, composition and reading skills.

**Project Curiosity:** This second-grade project was inspired by and is designed in the style of Leonardo da Vinci's notebooks. Drawing is used as a way to explore our surroundings, gather and process information students want to understand. This includes planting gardens, for example, and then drawing the plants' intricacies. Study of Project Curiosity is underway as implemented by Illinois teachers who received DCIR professional development.

### 3. Study1

Study 1 measured how well teachers could be trained by the illustrator/author to lead Project 64 for kindergartners (ages 5 – 6). Teachers receive one week of intensive training and a well-developed curricular package including CDs which allow the students to draw with the illustrator as well as their own teacher.

#### 3.1 Research methodology for study 1

In 2009-10 we observed the learners responding to the Project 64 and Project 120 instruction on multiple occasions and collected samples of children's artwork and writing. We interviewed and interacted with stakeholders: teachers, children, parents and the project's director/originator using qualitative methodology.

We briefly oriented 24 primary-level educators from outside the district on the program's intents and techniques. For each of the three tests described in Table 2 below, the educators then individually sorted 40 randomly-selected papers into two piles: those they believed had participated in the program's instruction and

Figure 9: Project 120 sample work

those they believed had not participated. Tallies of the educator's correct selections (that is, a participating student's paper identified as such or a control group member's paper identified as being drawn without benefit of instruction) and incorrect selections were recorded. After completion of the tasks, the reviewers' comments were recorded for study.

### 3.2 Study 1 settings

This study was limited to the elementary school in South Haven, Michigan where Halperin's program originated and where the kindergarten teachers were fully committed to the curriculum. The school had two years of experience to critique at the kindergarten level and one year at first grade when we began our inquiry. 155 students were involved during the school year via weekly lessons. The school's ethnic make-up was as follows in 2008: 79.7% White, 12.6% Hispanic, 3.3% African American, and 4.4% Other. The school was 62 percent "economically disadvantaged" according to the Council of Chief State School Officers. The control group was from a second school with similar demographics within the same public school system.

### 3.3 Study 1 findings

The following results (Table 2) indicate the percentage of time the outside evaluators were able to correctly identify those who participated in the drawing instruction.

Table 2: Outside evaluators' ability to distinguish project participants' work from the control group's

<u><i>T</i></u> <u><i>est</i></u>	<u><i>Project 64 and 120 Evaluation Description</i></u>	<u><i>Percent of time project papers were correctly identified</i></u>
1	Can educators distinguish random samples of 20 participating kindergartners' <i>drawings/writing</i> from 20 nonparticipating kindergartners' <i>drawings/writings</i> ?	79.1%
2	Can educators distinguish random samples of 20 participating first graders' <i>drawings</i> from 20 nonparticipating first graders' <i>drawings</i> ?	76.9%
3	Can educators distinguish random samples of 20 participating first graders' <i>writing</i> from 20 nonparticipating first graders' <i>writing</i> ?	61.2%

The interviews of stakeholders included teachers, parents and students. The main theme emerging from the interviews of teachers was that the participating children developed greater focus and ability to "notice" things. For example, they noticed punctuation and letters within words. The teachers in kindergarten asserted that the drawing lessons contributed to 100% achievement of district reading expectations this year. The teacher thought the "noticing things" carried over into other aspects of the children's learning, for example paying attention to punctuation when reading. They also felt that the children paid more attention to details that children of previous years failed to notice. Organization of materials is a strong focus of DCIR, so teachers felt that the children were more organized than those of previous years. Fine motor skills are also more highly developed than without Project 64. The teachers all reported that the children had more confidence in their ability to try new tasks.

The teachers described the drawing lessons as "calm and peaceful" and "not stressful" for the children, noting that 100% of them achieve success in the lessons. The children's work is kept in portfolios rather than going home weekly and, as an intentional result, the children are unable to compare their drawings with other students' work. At the end of the year, all of their drawings are sent home. While one parent expressed her wish to see children's drawings come home throughout the year, when the procedure's purpose was explained, she understood the usefulness of letting children progress without developing feelings of inferiority -- which often results from comparing their drawings with others' more gifted work.

To consider the view from guardians, we interviewed six parents whose children were participants. All of the parents commented on their child's level of confidence. Several felt that the success their child had with drawing extended into other areas of life as shown by the child's willingness to try new tasks. They felt that this success also gave the children confidence and, as a result, success in other areas of their lives. The parents all felt that their children's handwriting and ability to draw was impressive. Some commented on their child's love of color and art. All of the parents commented on their child's powers of observation. Several said that the Project 64 participants saw details that even they, as adults, missed.

The third type of interview involved meeting individually with 35 first graders who were participating in Project 120 at the time. Halperin has created a curriculum with many types of drawings in order to appeal to a broad spectrum of children's interests. Out of 35 children, there were 25 different responses about what was their favorite thing to draw. Dinosaurs and the human skeleton ranked at the top. All of the children thought the drawing lessons were fun and one child commented on how quiet and "creatiful" the room was during their drawing lessons. One forward-looking child commented that he was learning things to pass on to *his* children. The children also enjoyed making the "little books" that they could read.

#### 4. Study 2

The second study focused on Project Pencil Grip (Project 50) which is intended for children aged 4-5 who are enrolled in preschool. The Project Benchmarks evolved into the following:

- All involved preschoolers will learn to draw common objects such as pencils, numbers, flowers and people along with many other things that can be made with circles, squares and triangles.
- 15-minute interviews of the teachers will reflect satisfaction (defined as willingness to continue using the approach the following school year) with the Project 50 curriculum and outcomes.
- 75% or more of participating preschool students will make adequate progress with their pencil grip skills as measured by informal assessments.

Lessons lasted between 45 and 70 minutes (usually at least 60) no more than once per week. Approximately 32 lessons were administered across an eight-month period. An example of an instructional technique was the use of a systematic way of picking up the writing instruments. The children were taught to lay their pencil on the table in front of them with the pointed lead toward them. Then they "pinched" the pencil with their thumb and index finger just above the sharpened part of the pencil. They picked up the pencil, used their other hand to push the pencil to rest against their hand, and then used the middle finger to make it "comfortable". All children were taught this routine whenever they wrote or drew to ensure that pencils were gripped in an effective manner. Eventually this routine became habit for the participants.

Another instructional technique was established and followed in order to develop flexibility of the index and middle fingers. Halperin taught the children a song named “Little Bunny FooFoo.” While singing this song the children moved the index and middle fingers, on their writing hand, at the middle joint. This routine was repeated at some point during each lesson.

#### 4.1 Research methodology for study 2

In November of 2009, we observed the children, taped the instruction and took field notes on what occurred. Returning in the spring, we again examined the children’s papers, observed their performances in the curricular activities and photographed their pencil grips. Samples of the photos are shown below in Figures 10 and 11.

Figure 10: Correct pencil grip example

Figure 11: Incorrect pencil grip example

A second trial of the children’s pencil grips was conducted by another educator in the same week that we captured our photos. This produced two sets of photos of the children’s pencil grips for comparison and contrast. The researchers also conducted brief interviews of the classroom teacher and of Wendy Anderson Halperin and examined the children’s grips and artistic products during instruction.

#### 4.2 Study 2 setting

The study was conducted in the same school as the first study. Because these preschoolers were considered “at-risk” student, they had qualified for a state-funded preschool experience. They attended all day and received instruction from a teacher and an aide.

### 4.3 Study 2 findings

In the pilot test of Project 50, preschoolers (100% of whom are “at risk”) did learn to draw recognizable objects, and the classroom teacher was eager to continue Project 50 in the subsequent school year. Table 3 presents the data.

Table 3: Measures of pencil grip performance

<u><i>Trial</i></u>	<u><i>Sample size</i></u>	<u><i>Percentage achieving both pencil grip objectives</i></u>
<i>1<sup>st</sup> set of photos</i>	<i>n=15 ( 1 absence)</i>	<i>73</i>
<i>2<sup>nd</sup> set of photos</i>	<i>n= 13 (3 absences)</i>	<i>92</i>

Using the Project 50 approach to holding the pencil increases students’ ability to move their twistables, crayons or pencils with their fingers rather than with their entire arm. Photographic data from two trials suggest that the preschoolers’ pencil grips meet our two objectives of (1) helping students consistently adopt a pincer grip in which the pencil rests on the middle finger and (2) encouraging students to rely on the thumb and two fingers (rather than upon more digits, the fist or other grips commonly seen in young individuals).

Based on our classroom observations and the two sets of photos of individuals’ pencil grips, we conclude that Project 50 positively impacts children’s pencil grips: at least 73 percent of preschoolers who receive regular instruction in the manner piloted did display grips which satisfied both of the two objectives we had defined.

Given one of the researcher’s 30+ years of observing kindergarteners’ pencil grips, we assert that these Project 50 outcomes soundly surpass the commonly-seen grips that typical five-year-olds bring to school. Also, instruction does appear to lead to pencil habits that persist outside of instruction time, teachers report; students do independently emulate Project 50 routines for picking up and holding implements for drawing and printing.

### 4.4 Study 2 limitations

Despite their reputation for supplying hundreds of words, photos are not infallible. Depending on the angle of the camera, it can be difficult to gauge whether the two objectives are being met. Using two sets of photos may not alleviate such problems. Using a digital camera and checking the image before moving on to the next student can help avoid unusable images. Other types of writing/coloring instruction may have been occurring in school or in other settings (along with the Project 50 instruction) which could have influenced students’ grips. Student absences were typical problems, and the test case remains only one classroom in one community.

Finally, these results were obtained using the project's originator who is a professional artist and a skillful teacher. Whether the results generalize to other educators is untested by this action research.

### 5. Study 3

There were two broad purposes for the inquiry. First, we wanted to know to what extent children retained their pencil grips and ability to form letters well during a four-year period of time. Second, because the DCIR lessons are designed around quality books and orally-presented information, we wanted to know how Project 64 and Project 120 impact the general academic performance of the students who have participated in both.

#### 5.1 Research methodology of study 3

From September 2007 to June 2008, illustrator Halperin sustained a weekly drawing session with 44 kindergartners. She spent 70 minutes, once a week drawing with two classes. The following year Halperin worked with the 44 children plus an additional 67 first graders once a week for 70 minutes. The children having received two years of DCIR instruction had completed 3<sup>rd</sup> grade by June 2011 when this study measured longitudinal outcomes, which were contrasted with a control group's abilities. The research question had evolved to become: Does Project 64 participation in kindergarten and Project 120 instruction in 1<sup>st</sup> grade continue to impact the academic performance of the children after a period of four years?

In May of the school year 2010-2011 we collected drawing/writing samples of the students in the research school and the students in a control school. We gave both groups the same prompt which was to "*Draw a picture and write a story about a good time you had with your family.*" Both groups of students wrote in their classrooms. The research group was given the directions from their classroom teachers, and the control group was given the directions from the researcher with the classroom teacher present during the entire writing time. To look at academic progress with writing, it was necessary for us to gather information about the students' writing and not just their handwriting and drawing abilities. Marlene Smith designed two rubrics to measure multiple aspects of the *craft* of writing.

#### 5.2 Study 3 settings

Maple Grove Elementary School in South Haven and a control school also from southwest Michigan were the research settings. The schools share similar demographics with an almost equal number of Caucasian, African American, Hispanic and Asian students. Maple Grove School consisted of 62% at risk students, while the control school had a 60% at risk population, according to the State of Michigan.

### 5.3 Study 3 findings

Table 4 shows data produced by applying the first of two rubrics to papers of the 22 children randomly chosen from each school (i.e., subsets of the research group and control group). Proportions represent the number of on-target responses in relation to the entire group.

Table 4: Quantitative findings from study 3

<b>Item</b>	<b>Research School</b>	<b>Control School</b>
Total # of Correct letter formation out of the first 20 letters	18 /22	8/22
Spacing between words	20/22	19/22
Punctuation used	19/22	18/22
Attempted 'Invented' Spelling	22/22	22/22
Total # of sentences in all of the responses	135	95
Total # of details connected in drawing and writing	106	41
Correct pencil grip	20/22	12/22
Total # of colors in illustrations	111	105
Illustrations anchored	19/22	9/22
Total # of details in illustrations	262	126
Total # of students who used Cursive	0/22	4/22
Total # of descriptive words used	110	73
Total # of descriptive phrases (appositives) in sentences	38	12
Total # of words in essay	1,546	1,151
Total # of inaccurate verbs and/or pronouns used	2	27
Total # of incomplete sentences	0	22
Total # of incorrect capitalizations	13	43
Total # of incorrect use of punctuations	13	29

A second rubric was constructed and each of the 22 children's work was scored with it. The rubric below (Table 5) shows the totals for each group of students (research and control). The totals are raw scores to show the total number of students who scored in each of the four performance levels on the rubric.

Table 5: DCIR grade three scoring rubric  
School

C= Control School---R= Research

Attributes	1 Point in Value	2 Points in Value	3 Points in Value	4 Points in Value
Letter Formation	Letters are not well formed and difficult to read. <b>C=4 R=0</b>	Letters are mostly legible. <b>C=5 R=3</b>	Letters are well formed. <b>C=4 R=1</b>	Letters are well formed and easy to read. <b>C=9 R=18</b>
Sentences	0-1 sentence <b>C=1 R=2</b>	2-3 sentences <b>C=7 R=2</b>	4-5 sentences <b>C=7 R=5</b>	6+ sentences <b>C=7 R=13</b>
Words	0-19 words <b>C=3 R=1</b>	20-39 words <b>C=10 R=3</b>	40-59 words <b>C=2 R=2</b>	60+ words <b>C=7 R=16</b>
Spelling	Few High Frequency Words spelled correctly. <b>C=2 R=1</b>	Some High Frequency Words are spelled correctly. <b>C=3 R=0</b>	Most High Frequency Words are spelled correctly. <b>C=6 R=3</b>	All High Frequency Words are spelled correctly. <b>C=11 R=18</b>
Spacing	Few words are appropriately spaced. <b>C=0 R=0</b>	Some words are appropriately spaced. <b>C=2 R=1</b>	Most words are appropriately spaced. <b>C=4 R=1</b>	All words are appropriately spaced. <b>C=16 R=20</b>
Punctuation	Little punctuation is used. <b>C=1 R=1</b>	Some punctuation is used appropriately. <b>C=5 R=1</b>	Most punctuation is used appropriately. <b>C=6 R=2</b>	Punctuation is used appropriately. <b>C=10 R=18</b>

Capitalization	Little capitalization is used.  <b>C=3 R=3</b>	Some capitalization is used appropriately.  <b>C=4 R=1</b>	Most capitalization is used appropriately.  <b>C=4 R=4</b>	Capitalization is used appropriately.  <b>C=11 R=14</b>
<b>Attributes</b>	<b>1 Point in Value</b>	<b>2 Points in Value</b>	<b>3 Points in Value</b>	<b>4 Points in Value</b>
Descriptive Words	1-2 words <b>C=10 R=0</b>	3-4 words <b>C=4 R=4</b>	5-6 words <b>C=0 R=5</b>	7+ words <b>C=8 R=13</b>
Vocabulary	All grade level words. <b>C=5 R=1</b>	Some grade level words. <b>C=1 R=0</b>	Most grade level words. <b>C=8 R=11</b>	Many words exceed grade level. <b>C=8 R=12</b>
Story Sequencing	Ideas are unclear. <b>C=5 R=1</b>	Some ideas follow a logical order. <b>C=1 R=0</b>	Most ideas follow a logical order. <b>C=6 R=5</b>	Ideas follow a logical order and are clear. <b>C=10 R=16</b>
Illustration Match	Pictures serve as decoration and do not support written ideas. <b>C=6 R=2</b>	Some pictures support written ideas. <b>C=6 R=3</b>	Most pictures support written ideas. <b>C=1 R=2</b>	Pictures support written ideas. <b>C=9 R=15</b>
Illustration Extensions	Few details used extend written ideas. <b>C=12 R=7</b>	Some details extend written ideas. <b>C=6 R=1</b>	Most details extend written ideas. <b>C=1 R=3</b>	Details extend written ideas. <b>C=3 R=11</b>
Illustration Anchored	Pictures float on the page. <b>C=13 R=1</b>	Some pictures are grounded. <b>C=0 R=1</b>	Most pictures are grounded. <b>C=0 R=1</b>	Pictures are grounded. <b>C=9 R=19</b>
Column Totals	Control-65 Research-20	Control-54 Research-20	Control-49 Research-45	Control-118 Research-203

Some areas that are exciting to educators are the total number of words used and the total number of sentences used. Both of those areas are significantly higher in the research school sample, which would agree with studies finding that children who can form letters easily will write more (e.g., Routman, 2005). Another positive attribute is the number of details connecting the drawing and writing. The study confirms other literature asserting that when children draw first, their writing will contain more details and more descriptive writing. The four items concerning accurate use of punctuation, capitalization, nouns and adjectives, and the use of complete sentences are very interesting because the results support the contention that the power of observation can be taught and can permeate literacy performances.

2011 data from the Michigan Educational Assessment Progress (MEAP) reinforces the assertion that Project 64/120 participants become good readers. The state reading tests are scored from 1-4 with a 1 being the highest. The MEAP reading results of the 22 students from the research school shows 19 of them scoring a 1(one) on the assessment. The control school had a total of 6 (six) out of 22 students scoring a 1 (one) on the assessment. These results reveal that the research school students performed more than three times better than a control group with similar demographics. More study would be needed to ascertain whether the South Haven students have made academic achievements beyond a typical 62% at-risk population.

Participants with two years of Drawing Children into Reading instruction also exhibited literacy levels characterized by the following attributes:

- Retained proper pencil grips which in part account for better penmanship than a control group of similar demographics
- Word generation that exceeds the control group's stories by more than 50%
- Increased powers of observation which may have led to more expansive composition/narratives.

In study 1, two veteran teachers each expressed the belief that DCIR groups of children had greater observational powers than children the teachers had taught in previous years. They asserted that this group of children noticed things like punctuation, endings on words, and were able to "sound out" words because they noticed the phonetic parts of words. They claimed that very few kindergartners in previous years had these abilities, but that this group of children had many members who *did*. Independently, a third grade teacher who had 15 of the 33 Study 3 children in her classroom, commented that these DCIR-instructed children were "different." When questioned what she meant by that, she explained that they "thought outside the box." She said, "They are very creative, have a lot of initiative and confidence to try new activities and have good powers of concentration."

## 6. Discussion

All beginning writers struggle with fluency and legibility. To remind yourself of how difficult it is to learn to write, try composing with the hand you don't usually use. Unless you are ambidextrous, you will notice how your resulting lack of speed and the cognitive energy that must be put into mechanics reduces your ability to activate deeper reflective processes that normally would help you compose your thoughts. Beginning writing is even more taxing when spatial judgments are still forming. Once students have mastered fluent, legible handwriting, they can focus more of their attention on their composing -- on generating and organizing ideas (Graham, 2009). However, children who learn handwriting more slowly than the classmates they see around them often develop a negative mindset about writing (Graham, 2009) which may develop into long-term hindrances.

Psychologist Lev Vygotsky, when arguing in 1930 that play and drawing are both preparatory of authentic written discourse, stated that “written language of children develops in this fashion, shifting from drawing of things to drawings of words.... The entire secret of teaching written language is to prepare and organize this natural transition appropriately...” (1978, p.115-116). DCIR presents such a method of teaching children to draw and write that is a natural transition and highly appropriate for ages 4-8.

Our main question about this program has always been in what ways it succeeds in advancing children's literacy. These inquiries suggest that *Drawing Children into Reading* is successful in building students' confidence in both drawing and printing. Parents and teachers report that students are more observant and more organized. Their pencil grip and fine motor skills improve because of the program, and that grip persists across several years. Study 1 showed that the end-of-year drawings participants produce without adult guidance can be distinguished from the work of a control group more than 75 percent of the time. At the end of first grade, participants' writing alone could also be distinguished from the control group's more than 60 percent of the time.

How do stakeholders react to the new instructional program? Participating students, teachers and parents all express strong support for all of these projects. Students were definitely engaged by the tasks. We have observed steadily growing teacher interest in the program. Study 1 and our five years of observation indicate that DCIR is easily attainable by interested educators in urban, suburban or rural settings. Professional development - - conducted in summer workshops and supported by ongoing electronic interactions such as web sites, blogs and social media – enable average elementary teachers (without art majors) to implement the curriculum that Halperin continues to develop and guide.

Based on study 2, we believe these instructional routines, if conscientiously conducted, develop students' control of the images they generate and thereby encourage children (1) to draw and write more frequently, (2) to attempt a wider array of “characters” or subjects, and (3) to experience greater success at communicating with others through their papers. Samples have been small; however, if these outcomes prove typical, then DCIR is a powerful way to lead students toward literate behaviors.

Study 3 investigated the longitudinal effects of DCIR, encompassing Projects 64 and 120. Using the entire curricular package should have cumulative impacts, and triangulated data point to affirmation of the desired outcomes even with only two-fourths of it evaluated. Participants with two years of instruction exhibited literacy levels characterized by continued control of the writing utensil and improved printing, more expressive communication as witnessed by the DCIR students generating 50% more words than their counterparts, higher standardized reading scores, and increased powers of concentration and observation. Most importantly, there is evidence that participants deepen their interest in reading and writing because of the in-depth discussion of literature, history, science and other topics during the artistic engagement of DCIR.

## 7. Conclusion

Three studies of Drawing Children into Reading, employing a mixed-methods approach with both quantitative and qualitative measures, were conducted across a five-year span. The results show that (1) outside educators can distinguish participating students' papers from control groups' papers; (2) students, parents and teachers support the curriculum; (3) pencil grip is improved and persists; (4) project students' literacy products are superior to control group members' drawings and written samples; and (5) high standardized test scores in reading correlate with participation.

In five years, the project has expanded from 44 students to more than 14,000 students drawing, reading, listening, developing fine motor skills, using correct pencil grips and feeling new confidence about drawing and communication. The learning outcomes -- now being witnessed across several states -- include legible handwriting, increased attention span, and improved observational skills that support students in their reading and writing efforts.

### Abstract

The parallel development of the psychometric assessments and the computer technologies determined a big revolution regarding the construction and the application of psychological and educational tests. This report describes a computerized system that allows researchers to creating, applying, and tabulating surveys and paper instruments in an automatized way. Many studies describe the use of this tool, highlighting its main characteristics. This system can be considered a useful tool, since it permits to input data with higher precision and no need for previous codifications. Further, it allows researchers to know the latency period from the answer to each and every item. The prospects about new versions of the system stress on: extending the number of measured topics; creating automatic corrections systems; managing data via internet; and selecting the most valid items to measure each matter or specific groups of persons.

*Keywords:* Computerise system; digital tests; psychometric measurements

## 1. Introduction

The psychometric studies and measurements have been growing in the last decades, at the same time as the computer sciences have strongly developed by means of the advances in and technologies. The application of computers in the research field permits to widen the quantity of contents that can be measured; and to generate handy systems for the correction and the administration of assessment tools via Internet; to select the most suitable items for each and every assessed topic (ideal tests) and for specific groups of individuals (computerised adaptive tests). Many benefits can be obtained by using those systems, but still more research is needed to discern the real possibilities of the computerised systems of evaluation (Kyllonen, 1995; López-Pina, Ato, Sánchez, & Velardino, 1990; Olea & Ponsoda, 1999; Olea, Ponsoda, & Prieto, 1999; Renom, 1993).

Prieto, Carro, Orgaz, and Pulido (1993), and Brown (1997), point out that one of the main applications of computers is represented by the construction and the administration of computerised tests, which could eventually substitute the typical paper tests. This could lead to safer, more precise and quicker data storage (with no need for prior codifications) as well as immediate feedback while showing the results. Further, computerised tests permit to measure the latency times for each answer, as well as to create multimedia presentations including text, graphics, pictures, and even videos or simulations.

It is evident that computerised systems of evaluation give more reliable and precise data, at the same time that they increase the efficiency and rapidity of analysis. Moreover, these systems exempt researchers from routine and mechanical tasks, so that they have enough time for the interpretation and the discussion of the outcomes (Moreno, Oña, Martínez, & García, 1998).

This project aims to construct and show a computerised system that makes researchers create, apply and tabulate paper questionnaires and surveys in an automatic way.

## 2. Logical development of the theme

The editor of surveys in its version 3.0 represents a technological development of previous software, which permits researchers to create and apply paper tests using an automatized system. It is constituted by four sections: instrument development; instrument administration; results collection; and configuration.

Within the instrument development section, researchers can create items and define the variables in which results will be stored (figure 1).

El título de la figura 1 hay que ponerlo más separado de la imagen. Y figura 4 muy separado (posiblemente a mis cambios). Igualmente, dado que hay poco texto, y que las letras no se ven muy bien, yo pondría las imágenes más grandes (no distorsionar, tira de la esquina).

The instrument administration section represents the user interface for the survey respondents, and stores their answers, the time spent in answering, as well as their doubts and attempts for each item (figure 2).

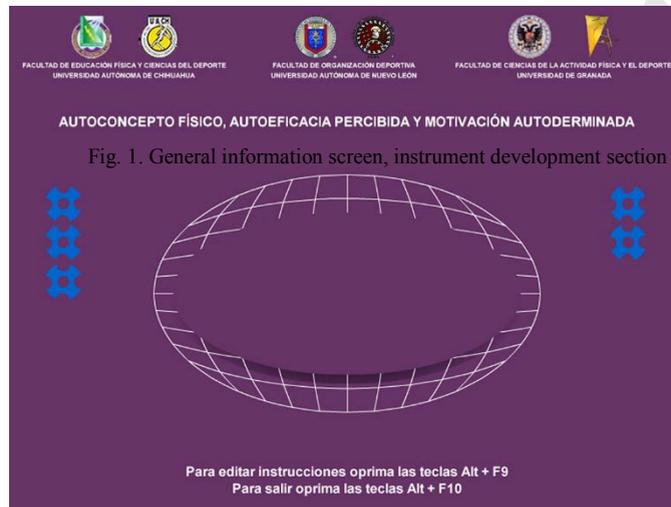

Fig. 2. Main menu, instrument administration section

Using the results collection section, it is possible to save the answers, the times and doubts of each survey respondent in text formats. The conversion of data into text makes to import the outcomes to any statistics software easier and quicker (figure 3).

Fig. 3. Display example for the results collection section

Within the configuration section, researchers will be able to choose the relevant characteristics of the user interface, such as colours, font size, coordinates, etc. (figure 4).

Fig. 4. User configuration display, configuration section

By means of this editor it is possible to define 15 different types of items, according to the information that researchers want to obtain from the surveys respondents. The types of items are described in table 1.

Table 1. Items type description

Item type	Description
Shift bar	The respondent chooses one out of several options by shifting a bottom.
Numerical count	The respondent can increase or reduce a numeric value, or insert a number directly into the system.
Hierarchy	The respondent organizes a hierarchy by means of dragging and dropping.
Free lap	The respondent writes his/her answer in a one-line space.
Mask lap	The respondent writes his/her answer in a one-line space, according to an established format.
List	The respondent selects one out of several options presented.
Fixed check list	The respondent selects a fixed number of options out of several presented. The number of option that can be selected is previously established.
Free check list	The respondent selects one or more out of several options presented.
Memo	The respondent writes his/her answer in a multi-line space. The answer is recorded into an independent text archive.
Proportionality	The respondent assigns points or percentages to each and every option in the item.
Radio 2 options	The respondent can select his/her answer by means of two bottoms.
Current-wished-change	The respondent tells the current and wished frequency of a certain action. Further, he/she tells how much effort would put in improving this action.
Ability-interest	The respondent says how able he/she perceives himself/herself and how interested he/she would be in improving a certain action.
Double numerical counter	
Double list	

The editor also allows generating "skips" within the survey. It means that when a determined answer entails avoiding asking for more information on the same topic, the system will automatically skip to the items of the next theme (figure 5).

The screenshot shows a window titled "DATOS GENERALES" with a grid of buttons. The buttons are arranged in two columns. The left column contains: Barra desplazamiento, Contador numérico, Jerarquizar, Laguna Libre, Laguna Máscara, Lista, Lista Chequeo Fija, Lista Chequeo Libre, Memo, and Proporcionalidad. The right column contains: Radio 2 opciones, Actual-Deseable-Cambio, Capacidad-Interés, Contador numérico Doble, Lista Doble, Lista salto, Lista Chequeo Fija salto, Lista Chequeo Libre salto, Memo salto, and Proporcionalidad salto. At the bottom of the window, there are two buttons: "Editar Instrucciones" and "Finalizar".

Fig. 5. Types of items, instrument editor

### 3. Implications and conclusions

According to the objectives postulated and to the outcomes determined by using the trial version of this system, we can consider it as an effective tool to create measurements instruments, since it permits the data storage with no previous codification stages, and it assure more precision, rapidity, and reliability when compared to paper instruments.

Our outcomes are confirmed by Moreno et al. (1998), who state that the main contribution of this kind of editors to the social sciences field consists in representing a viable and effective model for using computers while elaborating, creating and grading scales. This statement has an effect on the reliability of data obtained. Furthermore, the phases of collecting and tabulating data can be carried out in an easier and quicker way, saving time for more difficult tasks such as the interpretation of the outcomes.

The expectations towards a new version of the editor are focused on widening the objects to be measured; creating solid correction systems; selecting the best items according to the topic studied (ideal tests) or according to a specific group of individuals (computerised adaptive tests); and enhancing the administration via Internet.

# Educational and autoeducational value of autobiographical writings

Gabriella Aleandri<sup>a\*</sup>, Alessia Checchi<sup>b</sup>

<sup>a</sup> *Department of Education, Cultural Heritage and Tourism, University of Macerata, Piazzale L. Bertelli, n. 1, Macerata, 62100, Italy*

<sup>b</sup>*PhD in Human Sciences, University of Macerata, Piazzale L. Bertelli, n. 1, Macerata, 62100, Italy*

## Abstract

Recently, the high educational and autoeducational value, functions and meanings of autobiographical writings, as evidenced by the numerous studies and research about (i.e. Demetrio, Alberici, Merrill, West, etc.), has been increasingly discovered and widespread. The autobiographical writings, in fact, allow you to retrace your life, events, people, places, the most important objects, to discover new meanings to the experiences, to be able to orient themselves in decision-making, interpersonal relationships, to plan efficiently your lives, to produce new knowledge and learning, to feel satisfaction and wellbeing too. This paper will present some results of a research based on an original autobiographical format administered to a group of adults attending a yoga class or yoga trainers, in order to analyze the meanings that they have recognized about some events and choices during their lifetime, in a lifelong and lifewide learning and education perspective.

*Keywords:* education, autoeducation, lifelong learning, autobiographical writings.

## 1. Introduction

In current globalized and complexity societies the human right to education, aimed to social and cultural participation, assumes a central role in pedagogical perspective as well as in institutional policies.

Pedagogical sciences, in fact, just as they have as main purpose and aim the education, growth and training of man, intended primarily as a person and as an active and involved citizen, first of all aware of the rules which shall base, imprint and conduct civil living together in society, solidarity, collaboration and cooperation, are closely related with the deep awareness of himself/herself, of his/her experienced realized during his/her life, of the meanings those experiences, facts, people met, events and so on have represented for himself/herself.

So, autobiographical writings allow to recall to memory, to remember and to give sense and meanings, even news, to all lifelong and lifewide experienced.

Through autobiographical writings you can discover the fundamental values and principles have enlightened and guided your choices during your lifelong growing processes. Through autobiographical writings, furthermore, you can argue and understand better which has been your past to plan and build more efficiently your future life, discovering and improving your potentials and interests, in personal, relational as well as vocational perspectives.

E-mail address: gabriella.aleandri@unimc.it.

The biographical and autobiographical methods, in fact, are now used recurrently in the human sciences, especially in education and adult education, in the perspective of lifelong and lifewide education and training, and thus pertinent in lifelong learning of professionals.

It is crucial, indeed, to be able to create effective awareness and synergy among many environments and contexts of life, such as family, school, extra-school, working place, etc., to reach and widespread an effective culture of lifelong and lifewide learning and education.

## **2. Values and functions of autobiographical writing in a pedagogical perspective of lifelong and lifewide learning**

Autobiography, biography network, taking especially charge of each people, it is able to take the care of a life plan that could lead to a decent quality of life and wellbeing.

Rethink and rebuild our personal history, through autobiographical writing, also allow, in a certain way, to reconstruct the surrounding environment, framework and context.

Sennett (2008), however warns us from the negative consequences of our present society, as it is built on an economic system based on a type of production that separates the operation from thought, creativity and innovation. It does not allow, that is, to ask questions that will broaden the horizon not only problematic, but also the horizon of meaning and the creation of its own ethical vision.

And, then, in our fragmented and piecemeal, glocal (Bauman, 2005) and distracting, risk, hurried and quickly changing society, how to retrieve the dimensions of meaning, identity, history? Just by doing writing and writing about yourself (Aleandri, 2012, 9-10).

Writing, furthermore, differently from speaking, allow words and concepts to remain sculpted over time and that implies a thinking and rethinking work before writing.

Writing also enable you to improve consciousness and awareness about yourself, due to the distance we can keep while we are writing too.

The writing, requiring time for reflection and the drafting of the text, thus it enables to ponder carefully and thoroughly both what you want to communicate with and the modalities and terms chosen.

Such dynamics of writing are also reflected in their turn in cognitive processes, therefore we can say that writing restructures thought. And the writing allows increasingly detailed and in-depth insights, opening up spaces of discovery consisting not only of the outside world but also of the inward and subjective.

Writing enables, therefore, in pedagogically relevant perspective, to free the man through the fulfillment of the basic need of bringing other partakers into their events (which have become experiences through the provision of sense and meaning permitted by the reflection that writing involves): so, that is an adhered need to the nature of the human being, which Aristotle, more than two millennia ago, had already wisely called "social animal".

Current Italian illustrious and distinguished pedagogists as Demetrio (1999, 2002, 2003, 2008, 2011), Alberici (2000, 2002), Laneve (2009), as well as Anglo-Saxon scholars as Merrill and West (2009), have often studied and agreed that autobiographical writing is very efficient and effective to discover always new meanings about your lifespan experiences and to improve your awareness and knowledge of yourself, useful to orienteering, to your

lifelong and lifewide growing processes towards becoming actual, fulfilled and satisfied adult and to plan coherently and congruently your life project.

In this paper we will present some results of a research we have carried out through some surveys, based on an original autobiographical format administered to a group of adults attending a yoga class or yoga trainers, in order to analyze the meanings that they have recognized about some events and choices during their lifetime, in a lifelong and lifewide learning and education perspective.

A project of autobiographical writing for educational and training purposes, and self-educational and self-training ones, through the administration of a format that guides the writing of yourself, "Writing of a lifetime. Writing for ...".

Through the stimuli presented in the format remember recalling is facilitated through solicitations of memory, not only cognitive, but also perceptive, emotional, affective.

In addition, that format has a very wide range of uses, because it is very flexible and it can be adapted to many aims and objectives: for example, has been recently used also to improve inclusion (Aleandri, Giaconi, 2012).

### 3. Some data analyses

The autobiographical format "Writing of a lifetime. Writing for ..." was administered to 13 adult people attending a yoga course or yoga trainers.

8 are women and 5 men, mostly in their forties, 8 of 13 participants have between the ages of 40 and 50 years, 3 are in their thirties, only two distance themselves more from the mean age of the participants (43.9), one is 28 and the other is 71 years old. The most common degree is baccalaureate higher (8 of 13), then there are 4 graduates and one achieved only a low secondary level. At the group level professions are quite diversified: there is a doctor, a biologist and nutritionist, a banking, two employees, a musician and sound engineer, an herbalist, a sale attendant, a workman and a yoga teacher. Three people are not pursuing any work: a housewife, a retired and an unemployed.

All participants had at their disposal a week of time for completing and returning the format to the group of researchers.

During and after the administering of the format we could have a direct feedback on the perception and satisfaction of the same by surveyed, and they answered they had found that it very interesting and it was really appreciated by the vast majority of the participants.

Data analyses have been realized through the research method based on the grounded theory by Glaser and Strauss (2009).

First of all, subjects had to complete the title of the format "Writing of a lifetime. Writing for ...", by thinking and choosing the word they would have preferred to explain their most relevant significance they have attributed to their writing work through the format guide.

Only one forgot to fill the word. Only one, again, gave a sensitive and fragile expression to make we aware, just from the beginning, about her difficult and negatively perceived life and experiences. 75%, instead, have indicated a dynamic concept, in a process perspective, to open to the hope, to the future, or to look deeper inside themselves.

After filling in the autobiographical format participants were asked to complete a questionnaire on cognitive assessment of the utility of the format and his/her participation in yoga classes, with the aim of detecting the response from participants on the ability of the format to construct meanings for understand the previous life, raise awareness and self-knowledge, stimulate the planning and the ability to project themselves into the future, exploring the use of self-knowledge for professional purposes. A second part of the questionnaire was devoted to the assessment of the effects of yoga practice, the questions included in this case the evaluation by the subject, based on personal experience, the usefulness of yoga as a path of growth of awareness and knowledge self, was asked to assess how self-knowledge is functional to a proper practice of the profession and the construction of meaning of their previous experience and their own lives.

We can report that just from a quick reading revealed a diffusely positive evaluation of all the questions that implied a value judgment on a scale of 4: for nothing, little, pretty, very much. Were in total 10 questions with this type of response, well 8 have received responses on the two highest steps of the scale of values (very much and enough) with percentages around and greater than 90%. Let us analyze more specifically.

Eleven of 13 participants declare that the compilation of the autobiographical format, through the stimulation of memory, memories and past experiences, contributed very much or somewhat increase the level of awareness and self-knowledge in terms of feelings, emotions, reactions. We must highlight that in addition, in a subsequent application, as many as 11 out of 13 state that a greater self-awareness is useful for professional purposes, 1 the subject declares quite useful, only one believes that awareness is not at all useful for professional purposes, but it must be said that this person plays the craft worker.

On the request if the writing was helpful to rebuild and give meanings or better understand their way of life and the experience gained, 5 participants answer that was very useful, enough 4, 4 others believe that it was of little use and no from a completely negative response choosing the answer for nothing. The situation is more or less similar with regard to their evaluation of the format on the ability to stimulate the projection in the future: 6 indeed state that has been quite useful and 2 that it was very.

For the part of the questionnaire dedicated to yoga, what emerges is a high appreciation and evaluation of the utility of the path of the already recognized as good for the format. The number of years of practice in the sample is quite high: 5 participants on total practicing yoga for 15 years, 5 others practice it by a period of time ranging between 5 and 10 years, only 3 practice for only a year . The methods of approach to this discipline is evenly distributed between: curiosity generated by flyers or advertising in their own neighborhood, readings of personal interest in the topic, relatives, friends or acquaintances who have spoken of the thing. It has been asked to provide a concise definition of yoga and its interpretation of all definitions emerge 3 basic concepts: 1) to self-awareness and self-knowledge invoked by as many as 8 people, 2) the union and integration between different aspects of 'being (body, mind, soul), 3) that of being understood as a psycho-physical balance, pursuit of happiness, etc.. All participants, without exception, said they would recommend yoga to their loved ones, a very large majority for reasons related to health and wellbeing.

To the question "through yoga believe that there have been improvements in terms of self-awareness and knowledge of yourself" in 12 respond that it is very or fairly useful, one person described him as not very useful but it should be noted that this is a subject a format that has emerged from the deep self-knowledge since childhood. As to yoga and its impact and usefulness in their work are 9 to state that it is very useful, 3 state that it is not enough and even here only one says that it is not at all but it is the same person who had declared the limited use of self-

knowledge in the professional field as he works as a laborer. He was then asked participants if they felt that a spiritual approach to existence had given back, or could give back, meaning to their life experience, even here 12 people chose the answer "very" and the thirteenth stated that his life is always been rich in meaning.

Another question posed to the participants in the questionnaire was their assessment of yoga as a path of growth in personal, professional and social. It appears that 100% declare very useful yoga as a path of personal growth, the 92.3% considers it very useful or somewhat useful in professional terms and 84.6% considers it very or quite useful in social terms.

A final figure that emerges from the results of the questionnaire is the definition that the participants give their identity according to the professional role, family, according to competences and according to spiritual practice. What we found is that only 3 define themselves primarily according to the profession and are exactly a musician, a doctor and a biologist / nutritionist; 8 put between the first and second place in the familiar role as an element of perception of their identity but insofar as the self-perception based on the skills possessed there was a widespread distribution in the intermediate values (between the 3rd and 4th place in a scale of 5), the particularly significant finding is that as many as 5 out of 13 subjects define themselves primarily in terms of their being yoga practitioners.

# Educational inequality during primary school

Cornelia Riedel\*, Hartmut Ditton

*Ludwig-Maximilians-University, Chair of Research in Education and Socialisation, Munich, Germany*

---

## Abstract

By using school history, we want to answer the question, how institutional conditions and one's social background have an impact on students receiving different educational tracks at fifth grade. These impacts could be explained by the theories of Boudon (1974) and Bourdieu (1983). Therefore one can assume that structural characteristics of the pupils' social background (e.g. low capital of the family) as well as radical changes during primary school (e.g. relocation) have a negative impact on their school career. This paper presents analyses using data from the National Educational Panel Study (NEPS).

Keywords: social inequality; educational inequality

---

## 1. Introduction

A central theme in educational research focuses on social inequality concerning educational success and educational participation as well as educational decisions. It is a known fact that family background has a huge impact on these areas. Nevertheless there is a lack of findings based on longitudinal data with a sufficient large number of participants.

By using data from the National Educational Panel Study (NEPS) we want to answer the following questions: Is it not only the pupils' social background that has an impact on one's school career? Is there more? Do radical changes like moving to another city during primary school lower the chances of receiving a recommendation for higher secondary school (Gymnasium)? And what about repeating or skipping a class? Are students who repeated a class less likely to reach a higher educational track? Does it matter when a student repeated a class?

\* Tel.: +49 89 2180 4822.

E-mail address: cornelia.riedel@lmu.de

The analyses, presented in this paper are based on data from NEPS and will focus on educational careers at fifth grade. As a starting point, retrospective data will be used to explore the students' school history.

## 2. Theoretical Background

Generally accepted is the fact that educational decisions and transitions in particular (such as from primary school to secondary school) are of exceptional importance for educational careers. The research in this area is essentially based on the works of Raymond Boudon and Pierre Bourdieu.

According to Boudon (1974) two effects can cause educational inequality: primary effects on the one hand and secondary effects on the other hand. Primary effects explain differences in educational performances and educational success between students due to differences between social groups (e.g. based on the family background). Secondary effects explain different choices made by different social groups. This means, even if students have similar school performances, the possibility of going to a higher educational school is higher for students with an advantaged family background than for those living under less advantaged circumstances.

Bourdieu (1989) argues similarly. According to him each individual occupies a social status, which links to one's social class. Furthermore one's social class depends on the availability of cultural, economic, social and symbolic capital. Thus social inequality (and therefore educational inequality) is reproduced through the unequal equipment of each individual's capital.

Due to both theories we can assume that students with an advantaged family background are more likely to reach good school performances such as good grades and therefore are less likely to repeat a class (and more likely to skip a class). Furthermore they should receive recommendations for higher secondary education and attend them.

In addition, if a student gets confronted with radical changes during primary school like changing a class because of relocation, there could be a negative effect on his or her school performance. Eventually, we suppose that relocation decreases the probability of achieving such a recommendation for higher secondary school and attending this school type.

## 3. Data and Sample

This paper uses data from the National Educational Panel Study (NEPS), which holds data from students (the target person), their parents, teachers and even the head of school (of the school they are attending) as well as competence tests (Blossfeld, Roßbach, & von Maurice, 2011). The first wave which is used here relies on information of students at fifth grade which include, next to basic information like gender or age, further information such as the school type they are attending. Furthermore, information given by the students' parents is included in the database. With their help we can get useful facts about the school history of the fifth graders (e.g. repeating or skipping a class, change of domicile) or the family background (e.g. monthly household income). Some information is even given by both, parents and students (e.g. repeating a class).

The original database holds 6,112 students (and 4,786 parents) which were recruited, but there are 334 (605) temporary dropouts. Therefore 5,778 students and 4,181 parents participated in wave 1. This was in fall of 2010 when the students were at the beginning of fifth grade. We kept only the cases from those with information from both, students and their parents. For regression analyses students attending special needs schools, primary schools or comprehensive schools had to be excluded. Therefore the final sample is  $N = 3,846$ . Due to this, students going to higher secondary school are slightly overrepresented in this sample (compared to the original database).

## 4. Findings

### 4.1. Descriptive Statistics

At first, some descriptive statistics are shown to get an overview of the data. According to figure 1, one can see that most students (44.2%) go to higher secondary school (Gymnasium) at fifth grade. On the contrary,

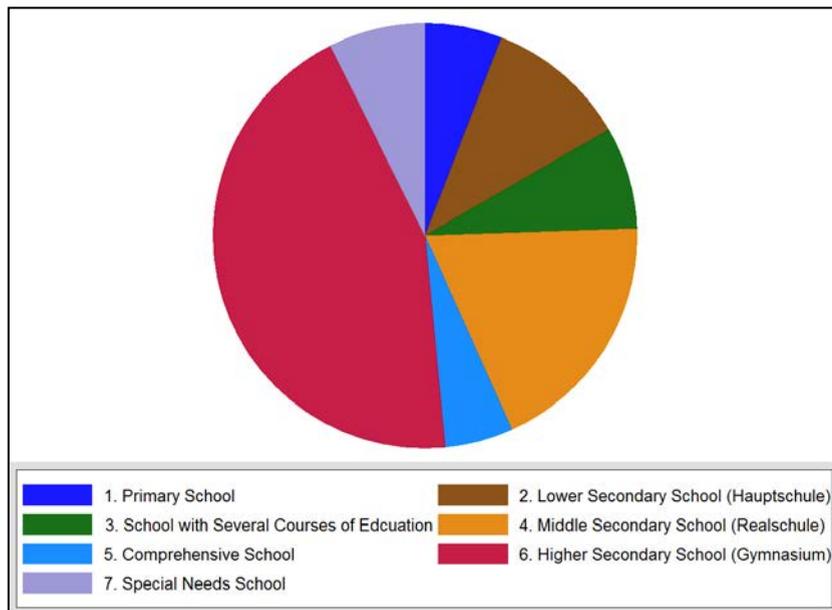

Figure 1. School type at fifth grade

about 10.8% go to lower secondary school (Hauptschule) and another 7.4% attend special need schools. Due to specific federal specifications even 5.9% are still going to primary school. If the original database of  $N = 6,112$  would have been used, the outcomes would change a little. In this case only 39.5% of students are attending a higher secondary school and more students (12.2%) studying at lower secondary school.

Table 1. Repeating a class during primary school

Repeating a class	N	%
1. class	118	30.33
2. class	98	25.19
3. class	87	22.37
4. class	36	9.25
5. class	50	12.86
Total	389	100.00

As stated by students about 12% repeated a class during their school career, and 9% repeated a school year based on parents' answers. There are some gender differences, 11.6% of the boys and 8.2% of the girls repeated a school year. By taking a deeper look at table 1, one can see that students repeat mostly their first school year if they repeated a school year at all. The risk of repeating a class decreases during primary school (from class one to four) and increases up to 13% when entering secondary school. Table 1 includes students attending special needs schools. If we drop them, then only 287 instead of 389 students repeated a school year.

Table 2. Skipping a class during primary school

Skipping a class	N	%
1. class	8	11.94
2. class	29	43.28
3. class	17	25.37
4. class	13	19.41
Total	67	100.00

Based on parents answers 1.5% of all students skipped a class during primary school. Table 2 shows that most students, if skipped a class at all, skipped their second one. Fifth class sippers are of course not included, because they would attend sixth grade right now and are therefore not included in the database.

Table 3. Recommendation and school type

Recommendation for higher secondary school	School type higher secondary school		
	No	Yes	Total
No	989	157	1,146
	86.30	13.70	100.00
Yes	83.81	9.24	39.79
	191	1,543	1,734
Total	11.01	88.99	100.00
	16.19	90.76	60.21
Total	1,180	1,700	2,880
	40.97	59.03	100.00
	100.00	100.00	100.00

Table 3 represents the contingency between a recommendation for higher secondary school (Gymnasium) and the actual attendance of a higher secondary school (students going to primary school, comprehensive school or special needs school are not included). Both variables are strongly correlated and highly significant ( $r = .749$ ,  $p = .00$ ). If one receives a recommendation for higher secondary school 89% follows it. 91% of all students' going to higher secondary obtains such a recommendation. Similar numbers are shown for students not going to higher secondary school. 86% follow the recommendation given by their primary teacher.

#### 4.2. Analyses

To answer what decreases or increases the possibility of the transition from primary school to higher secondary school (Gymnasium) at fifth grade, we used stepwise logistic regression analyses. Due to similar findings this paper only contains higher secondary school as the depending variable (table 4). Findings regarding recommendation for higher secondary school as the depending variable are explained in the text but are not presented separately.

First of all we put two variables as indicators for school success in our model. Table 4 shows that a recommendation for higher secondary school significantly increases the chance of going to such a school type. Moreover, the worse the overall average grades of a student (in mathematics and German, grades from 1 to 6) the least likely that one is going to higher secondary school at fifth grade. Both variables stay highly significant in all three models.

The second model included students' relocation and repeating a class during primary school. A change of domicile doesn't have a significant effect on recommendation or attending higher secondary education, though correlations have shown that these variable highly significant correlate with each other. Repeating a class and receiving a recommendation for higher secondary education are weakly negatively correlated but highly significant ( $r = -.232$ ,  $p = .00$ ). If a student repeated a class during primary school (first to fourth class) it significantly lowers his or her chance of receiving a recommendation for higher secondary school. By taking a deeper look at each class, we can assume that this result is only significant if someone repeated the first class (not shown in the table). Skipping a class (not in the table) and recommendation as well as attending higher secondary school correlate significantly high with each other but don't have a significant impact in the model. This could be explained due to the small sample.

Table 4. Prediction of higher secondary school

	Variable	OR	Pseudo-R <sup>2</sup>	N
Step 1	Recommendation for higher secondary school	23.21***	.48***	2567
	Overall average grade in math and German	.32***		
Step 2	Recommendation for higher secondary school	22.59***	.49***	2528
	Overall average grade in math and German	.32***		
	Relocation	.99		
	Repeating a class during primary school	.54*		
Step 3	Recommendation for higher secondary school	21.95***	.49***	2506
	Overall average grade in math and German	.33***		
	Relocation	.10		
	Repeating a class during primary school	.54*		
	Judgment of economic household situation	1.18**		
	Gender	1.18		

\*\*\*  $p \leq .01$ ; \*\*  $p \leq .05$ ; \*  $p \leq .10$

The master model (step 3) included information about the family background. In comparison with the monthly household income the parents' judgment of their economic household situation is a better predictor for

recommendation as well as going to higher secondary school. Because of that, we used the economic judgment variable instead of the monthly household income. It states that the higher one judges his or her economic household situation the better the chances for students' receiving a recommendation for higher secondary education and attending the recommended school type. The control variable gender doesn't have an impact on the depending variable as well as the recommendation given by a primary teacher.

## 5. Summary

Altogether we can confirm that primary and secondary effects increase educational success and therefore reproduce educational inequality. As anticipated, the recommendation for a higher secondary school and the students' grades are good predictors for attending such kind of school. Contrary to our expectations, a change of domicile during primary school doesn't influence someone's school career.

Besides, we had a closer look at the economical capital of the students' family. Our findings proofed that judging one's economic household situation is a better predictor for higher school recommendations than one's monthly household income. We considered, that a monthly household income doesn't represent one's socioeconomic status as adequate the judgment of one's financial situation. Because how poor or rich somebody feels does not only depend on his income. Furthermore, it depends on additional criteria such as regional conditions. If someone lives in an area with high rental prices he possibly feels not as rich as someone living in an area where there a cheap rental prices even if both have the same monthly income. We should take this in consideration for further analyses.

# Educational technology and human capital: a model and simulations

Ahmet Kara <sup>a \*</sup><sup>a</sup> *Istanbul Commerce University, 34672, Istanbul, Turkey*

---

## Abstract

This paper develops a labor market model of educational technology-induced human capital, and demonstrates that the labor market for the vocational school graduates in Turkey is trapped into equilibria characterized by low levels of human capital and employment. First, we employ a stochastic equilibrium method so as to model and analyze the equilibria in question in the absence of educational technology. We prepare and use a carefully-crafted questionnaire to collect data for the key endogenous variables and relations and estimate the main parameters of the model. Second, we incorporate the effects of educational technology into the model and undertake system dynamics simulations so as to demonstrate the extent to which educational technology utilization could help avoid the equilibria in question, leading to higher levels of human capital and employment.

Keywords: Educational technology; Human capital; Social capital; Vocational school graduates; Labor market.

---

## 1. Introduction

Human capital is among the central, educational technology-related concepts that have persistently remained at the center of social inquiry in the last twenty years. As a central organizing concept, it refers to the “the knowledge, skills, competences and attributes embodied in individuals that facilitate the creation of personal, social and economic well being” (OECD, 2001:18). The extent to which educational technology plays a role in the formation of knowledge, skills, and competences in question is an issue we will take up in this paper.

The particular context where relations between educational technology and human capital will be examined in this paper involves the recent labor market for the vocational school graduates in Turkey.<sup>†</sup> Clearly,

*E-mail address:* [tbfakulte@ticaret.edu.tr](mailto:tbfakulte@ticaret.edu.tr)

<sup>†</sup> For an informative account of vocational education and training in Turkey in the context of European Qualifications Framework, see Borat (2005). Zaim (2009) provides an example of impact assessment for support

the job competences of graduates could be influenced by the prior technology-related educational methods involving, for instance, computerized learning practices in the school and in the workplace. Properly mastered software packages used for virtual undertaking of the tasks as well as estimation, projection and simulation of the processes required by the work are likely to be an integral component of effective job performance.

To theorize about the relations among the key variables involved, we will develop two interrelated sub-models, the first of which is presented in the second section which analyzes human capital in the absence of the effects of educational technology. The third section *presents* the empirical results. The fourth section extends the first model so as to incorporate the effects of educational technology and undertake system dynamics simulations. The concluding remarks follow in the fifth section.

## 2. The Model<sup>‡</sup>

Consider a labor market where workers provide a labor service, say  $L$ , to firms. Let  $Q_t^{DL}$  denote the *quantity demanded* for service  $L$  supplied by workers, which indicates the quantity of labor firms are willing and able to hire at time  $t$ .  $Q_t^L$  depends on the price of labor at time  $t$  ( $w_t^l$ ), prices of other inputs hired/used by firms at time  $t$  ( $w_t^i, i=2, \dots, m$ ), human capital of workers at time  $t-1$  ( $HK_{t-1}$ ) and social capital<sup>§</sup> of workers at time  $t-1$  ( $SK_{t-1}$ )<sup>\*\*</sup>.

$$\text{i.e., } Q_t^{DL} = f^D(w_t^l, \dots, w_t^m, HK_{t-1}, SK_{t-1}),$$

which is a labor demand function.  $Q_t^{DL} \in (0, \infty)$ . However,  $Q_t^{DL}$  is properly transformed so as to take values between 1 and 7.  $w_t^l \in (0, \infty)$ ,  $i = 1, \dots, m$ .  $HK_{t-1} \in [1, 5]$ , and  $SK_{t-1} \in [1, 5]$ .

to basic education in Turkey. Yılmaz (2009) points out a quality-centered problem of education and human capital (in relation to growth) in Turkey. For an example of a relatively different account of the relation between human capital and growth, see Tatoğlu (2011).

<sup>‡</sup> This model is based on a revised version of Kara (2010), and benefits, in part, from Kara (2007a, 2007b, 2013) and Kara and Zaim (2012).

<sup>§</sup> Social capital refers to “the collection of resources owned by the members of individual’s personal social network, which may become available to the individual as a result of the history of these relationships.” (Gaag, 2005:20). There are a number of works in the literature, such as Boorman (1975), Reingold (1999), Allen (2000), Fernandez, Castilla and Moore (2000), Munshi (2003), Calvó-Armengol and Jackson (2004, 2007) and Yueh (2009) which explore the links between social networks and employment. There are also models in the literature, which examine the relations between social capital and growth. A subset of these models are presented by Chou (2005) who explores how “social capital impacts growth by assisting in the accumulation of human capital”.

<sup>\*\*</sup> Human capital and social capital affecting period  $t$  are acquired in  $t-1$  and are available at the beginning of  $t$ .

Let  $Q_t^{SL}$  denote the *quantity supplied* for service  $L$ , which indicates the quantity of labor workers are willing and able to supply (sell) at time  $t$ . Suppose that  $Q_t^{SL}$  depends on the price of labor at time  $t$  ( $w_t^l$ ), the human capital of workers at time  $t-1$  as well as the social capital of workers at time  $t-1$  ( $SK_{t-1}$ ).

$$\text{i.e., } Q_t^{SL} = f^s(w_t^l, HK_{t-1}, SK_{t-1}),$$

which is a labor supply function.<sup>††</sup>  $Q_t^{SL}$  was rated on a scale with 1 representing the lowest score that can be assigned, and 7 representing the highest. Hence,  $Q_t^{SL} \in [1,7]$ .

For analytical purposes, we will assume that the labor demand and labor supply functions have the following explicit forms:

$$\ln Q_t^{DL} = \alpha_0 + \alpha_1 \ln HK_{t-1} + \alpha_2 \ln SK_{t-1} + \sum_{i=1}^m \delta_i \ln \omega_t^i + u_t$$

and

$$\ln Q_t^{SL} = \beta_0 + \beta_1 \ln HK_{t-1} + \beta_2 \ln SK_{t-1} + \gamma \ln w_t^l + v_t$$

where  $u_t$  and  $v_t$  are independent normally distributed white noise stochastic terms uncorrelated over time. They have zero means and variances  $\sigma_u^2$  and  $\sigma_v^2$  respectively.

To theorize about the movements over time (i.e., the dynamic trajectory) of human capital, we will assume that the relative strength (or magnitude) of the labor demand compared to the supply provides an impetus for human capital to be adjusted upwards over time. Taking this assumption into account, we formulate the following adjustment dynamic for human capital.

$$HK_{t+1} / HK_t = (Q_t^{DL} / Q_t^{SL})^k,$$

where  $k$  is the coefficient of adjustment. Taking the logarithmic transformation of both sides, we get:

$$\ln HK_{t+1} = \ln HK_t + k (\ln Q_t^{DL} - \ln Q_t^{SL}).$$

<sup>††</sup> The demand and supply equations could be obtained through appropriately formulated profit maximization and utility maximization problems, respectively.

We will call this the dynamic adjustment equation. Substituting the functional expressions (forms) for  $\ln Q_t^{DL}$  and  $\ln Q_t^{SL}$  specified above, setting the values of  $SK_{t-l}$ ,  $w_t^l$ ,  $i=1, \dots, m$ , to their average values  $SK_{t-l}^{avr}$ ,  $w_t^{lavr}$ ,  $i=1, \dots, m$  and rearranging the terms in the equation, we get,

$$\ln HK_{t+1} - \ln HK_t + k(\beta_1 - \alpha_1) \ln HK_{t-1} = k(\alpha_0 + (\alpha_2 - \beta_2) \ln SK_{t-1}^{avr} + \sum_{i=1}^m \delta_i \ln \omega_t^{iavr} - \gamma \ln w_t^{lavr}) + k(u_t - v_t),$$

which is a second order stochastic difference equation, the solution of which, for the intertemporal equilibrium human capital,  $HK^*$  is as follows:

$$HK^* = \exp \left\{ \frac{k(\alpha_0 + (\alpha_2 - \beta_2) \ln SK_{t-1}^{avr} + \sum_{i=1}^m \delta_i \ln \omega_t^{iavr} - \gamma \ln \omega_t^{lavr})}{k(\beta_1 - \alpha_1)} + \frac{\lambda_1}{\lambda_1 - \lambda_2} \sum_{j=0}^{\infty} \lambda_1^j z_{t-j} + \frac{\lambda_2}{\lambda_2 - \lambda_1} \sum_{j=0}^{\infty} \lambda_2^j z_{t-j} \right\}$$

where  $z_t = k(u_t - v_t)$

$$\lambda_1 \lambda_2 = k(\beta_1 - \alpha_1)$$

$$\lambda_1 + \lambda_2 = 1$$

In case where  $\lambda_1$  and  $\lambda_2$  are conjugate complex numbers, i.e.,  $\lambda_1, \lambda_2 = h \pm vi = r(\cos \theta \pm i \sin \theta)$ , the intertemporal equilibrium human capital is:

$$HK^* = \exp \left\{ \frac{k(\alpha_0 + (\alpha_2 - \beta_2) \ln SK_{t-1}^{avr} + \sum_{i=1}^m \delta_i \ln \omega_t^{iavr} - \gamma \ln \omega_t^{lavr})}{k(\beta_1 - \alpha_1)} + \sum_{j=0}^{\infty} r^j \frac{\sin \theta(j+1)}{\sin \theta} z_{t-j} \right\}$$

where  $r$  is the absolute value of the complex number, and  $\sin \theta = v/r$  and  $\cos \theta = h/r$ .

To study whether this intertemporal equilibrium human capital is high or low, and whether it remains stable over time, we need to empirically estimate the parameters involved. This is done in the next section.

### 3. Empirical Analysis<sup>\*\*</sup>

**3.1 The sample:** Data for this study was gathered using a questionnaire including questions about labor demand, labor supply, wages, human capital and social capital of vocational school graduates in Turkey. The questionnaire was distributed to 500 labor market participants in 2007-2008. 391 questionnaires were returned. Most questions (item) were rated on a scale with 1 representing the lowest score that can be assigned, and 5 representing the highest.<sup>§§</sup> The level of competence of the vocational school graduates, rated by the employers/firms will be taken to be a proxy for the human capital of the graduates. The degree of communication, coordination and cooperation/collaboration among the schools, graduates, firms and other partners in the vocational education and placement system and social networks, rated by the participants in the social networks in question, will be taken to be a proxy for the social capital of the graduates.

### 3.2 Estimation of the parameters:

**(i) Labor demand:** Because of the availability, at low wages, of new graduates of vocational schools as interns, the effect of their wages on their labor demand is negligible. Similarly, because of the low substitutability between new graduates' labor and other inputs, the effects of other input prices on the labor demand in question are negligible as well. Thus, input prices are left out of the labor demand function. We assume that minimal human capital and minimal social capital induce minimal quantity demanded for labor, i.e., if  $HK_{t-1} = 1$  and  $SK_{t-1} = 1$ , then  $Q_t^{DL} = 1$ , which implies that  $\alpha_0 = 0$ .

The regression-results are as follows:

$$\ln Q_t^{DL} = 0.514 \ln HK_{t-1} + 0.526 \ln SK_{t-1}$$

(2.322)                      (2.420)

$R^2 = 0.77$ . t-statistics are given in parentheses. Thus,

<sup>\*\*</sup> The empirical work and estimations in this section benefit, in part, from Kara and Zaim (2007). The constructions of the sample, labor demand and labor supply functions as well as the derivation/presentation of the analytical results in this section follow the procedures (and, in part, wording) similar those of Kara (2007a, 2007b, 2010 and 2013).

<sup>§§</sup> In some cases, the highest score was 7.

$$\alpha_0 = 0$$

$$\alpha_1 = 0.514$$

$$\alpha_2 = 0.526.$$

**(ii) Labor supply:** The quantity of labor new graduates of vocational schools are able to supply is not quite dependent on wages (which are left out of the labor supply function for this particular case); rather it is determined by the competences of the graduates (human capital) and the capacities of the social networks (social capital) which enable the graduates to find jobs. We assume that minimal human capital and minimal social capital induce minimal quantity supplied for labor, i.e., if  $HK_{t-1} = 1$  and  $SK_{t-1} = 1$ , then  $Q_t^{SL} = 1$ , which implies that  $\beta_0 = 0$ . To measure the human capital and social capital elasticity of labor supply, we asked some labor market participants questions, the answers of which yielded the following: a 1% increase in human capital leads to about 0.833 % increase (on average) in the quantity supplied of labor. A 1% increase in social capital leads to about 0.333 % increase (on average) in the quantity supplied of labor. Thus,

$$\beta_0 = 0$$

$$\beta_1 = 0.833$$

$$\beta_2 = 0.333.$$

**(iii) The coefficient of adjustment (k):** For simplicity, we will assume that  $HK_{t+1} / HK_t$  is proportional to the ratio of demand to supply, and hence,  $k = 1$ .

Given the empirical values of the parameters obtained above, we get,

$$\lambda_1 = 0.5 + 0.262i$$

and

$$\lambda_2 = 0.5 - 0.262i.$$

With all the needed parameter values at hand, the intertemporal equilibrium human capital is:

$$HK^* = \exp \left\{ 0.54 + \sum_{j=0}^{\infty} 0.56^j \frac{\sin \theta(j+1)}{\sin \theta} z_{t-j} \right\}$$

For analytical convenience, we will carry out some of our analysis in terms of logarithmically transformed human capital,  $\ln HK$ , rather than  $HK$ . Since  $\ln$  function is an order-preserving transformation, analysis in terms of  $\ln HK$  and  $HK$  will yield the same qualitative results; and the quantitative results could be

transformed into one another. The expected value of the logarithmically transformed intertemporal equilibrium human capital is:

$$E(\ln HK^*) = 0.54 + \sum_{j=0}^{\infty} 0.56^j \frac{\sin \theta(j+1)}{\sin \theta} E(z_{t-j})$$

Since, by virtue of the assumptions about  $u_t$ , and  $v_t$ ,  $E(u_t) = 0$ , and  $E(v_t) = 0$ ,

$E(z_t) = E(u_t) - E(v_t) = 0$ . Thus,

$E(\ln HK^*) = 0.54$ .

In view of the logarithmically transformed human capital scale of  $\ln 1=0$  to  $\ln 5 \cong 1.60$ , an intertemporal equilibrium expected human capital of 0.54 is low. As proven in the appendix A, the logarithmically expressed low human capital is also stable over time in the particular sense that it has a stationary distribution with a constant mean and variance.

The low level of equilibrium expected human capital implies a low level of equilibrium expected employment, i.e., substituting  $\ln HK^* = 0.54$ , and  $\ln SK_{t-1}^{avr} = 0.9$  into the  $E(\ln Q_t^{DL})$ , we get 0.75, which is low as well. This indicates a low human capital-low employment trap facing the vocational school graduates over time.

The following section will extend the model in this section so as to incorporate the effects of educational technology and undertake system dynamics simulations that will illustrate the extent to which educational technology could help avoid the trap in question.

#### 4. Educational Technology: Simulations

We will extend the previous model by reformulating the demand equation so as to incorporate the effects of educational technology. One of the central channels through which the effects of educational technology become evident is the growth of workers' productivity. Let  $\Phi$  represent the productivity growth rate. For the sake of simplicity, we will assume that demand for labor will increase in proportion to the growth of productivity over time, which is influenced by the rate of educational technology utilization over time.

We will represent the impact of the change in the rate of educational technology utilization on the productivity growth with the following equation.

$$\Phi = n \cdot T_t, \text{ where } T_t \text{ is the rate of change of educational technology utilization at } t.$$

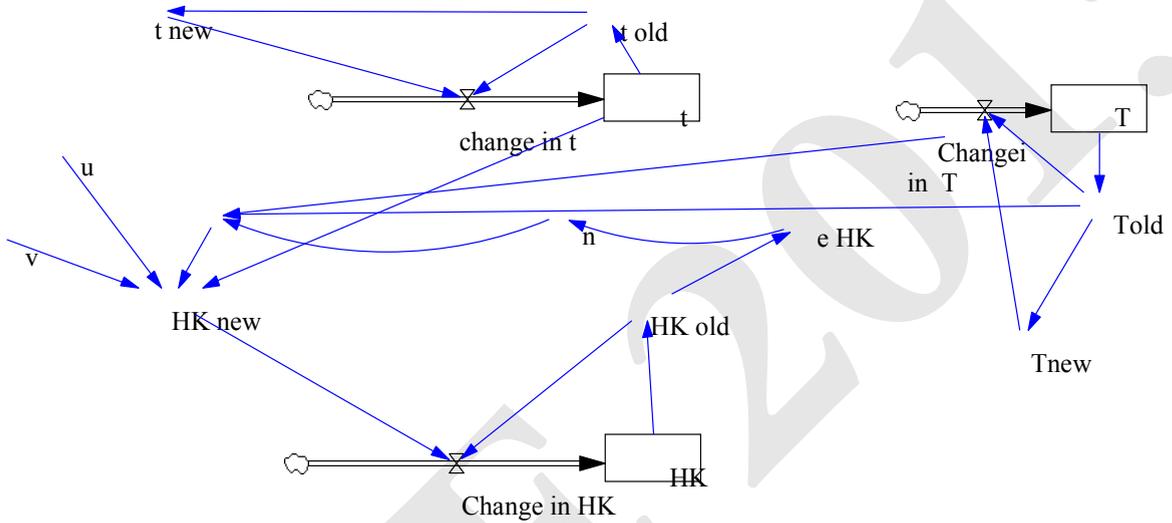

The parameter,  $n$ , is required to satisfy the following properties: At low levels of human capital, the impact of  $T_t$  on productivity growth is high. As the level of human capital and educational technology utilization increase, advantages of technology utilization will be more and more appropriated and exhausted, and hence the impact on productivity growth will become smaller and smaller. These properties will be captured by the following equation.

$$n = (\text{Maximum } HK_t - HK_t) / (\text{Maximum } HK_t - \text{Minimum } HK_t)$$

We will measure the educational technology utilization on a Likert scale with 1 representing the lowest use and 5 representing the highest use. Using VENSIM, a system dynamics simulation software, we will model the

equilibrium  $Q_i^{DL} = Q_i^{SL}$ , and simulate the effect, on human capital, of a 0.1 increase in the technology utilization in each period. The simulation diagram and simulation results are given below:

Simulation Diagram: HK represents human capital is in logarithmic form. e HK is human capital in the standard form.

20	1.36881

Simulation graph: Graphical trajectory of human capital

A modest increase (0.1) in educational technology utilization in each period resulted in a considerable increase in human capital over time (i.e. from 0.54 to 1.36). Considering that the maximum value, in this study, of human capital in logarithmic terms is  $\ln 5=1.6$ , the increase is quite significant. A simple calculation would reveal a considerable increase in the level of employment as well.

## 5. Concluding Remarks

The paper develops a labor market model of human capital and demonstrates the presence of a low human capital-low employment trap plaguing the vocational school graduates in Turkey. The paper explores an educational technology-based way out of the trap in question.

The extent to which the educational technology utilization could influence human capital and market outcomes points out the existence of a considerable potential for educational technology-centered improvements in real life processes. Explorations of particular ways in which educational technology could contribute to different sectors of economy in particular and different dimensions of economic and social life in general would be worthy of future research.

# Education and education practices among quilombolas: the school and the cultural diversity

Aguiar, C.M.<sup>a\*</sup>; Adam, J.M.<sup>b</sup>

*Universidade Estadual Paulista-UNESP/Rio Claro/São Paulo*

*<sup>a, b</sup>Universidade Estadual Paulista, Av. 24A, 1515, Rio Claro, 13506-900, Brasil*

## Abstract

This text examines different aspects of the discussion on the disconnection between teaching and its practices and contents vs. the cultural diversity within the contexts it operates. Among these aspects one should highlight the types of comprehension and construing of the world, as these map our notions of Education and Culture and take place within an interconnected way. Here, we take as the basis for reference the study on culture and educational activities reflecting specific ways to understand and construe the world, within a quilombola community (black community) in Brazil.

Key Words: Cultural diversity; school organization; quilombo's education; culture and education.

## 1. Introduction

This text examines different aspects of the discussion on the disconnection between teaching and its practices and contents vs. the cultural diversity within the contexts it operates. Among these aspects one should highlight the types of comprehension and construing of the world, as these map our notions of Education and Culture and take place within an interconnected way (Aguiar, 2010). Here, we take as the basis for reference the study on culture and educational activities reflecting specific ways to understand and construe the world, within a quilombola community (black community) in Brazil.

The cultural practices in this community, which delineate their way of life, express the disconnection that exists between them and the contents of school practices. In the quilombola's daily activities – as they live in a rural area relatively close to the urban environment – education incorporates different knowing and merges different knowledge. Traditional resources mixed with other resources from modern days are used as teaching tools and as resources that help older people to spread and instill knowledge, therefore helping younger people to explore and adapt to the world around them.

It is worth mentioning that most adults in the community know very little or have no formal learning. Yet, they know how important school is and its influence on modern life, and they use this understanding to forge these two worlds of knowledge and recognition – the knowing from its practices and what comes from younger people learning at school.

Community data were collected 'in loco' during our work and field research, having as our basic procedures our research and observation, using ethnography as our fundamental methodology.

The notions of education and cultural diversity discussed here may inspire educators, researchers and parents who have an interest in issues associated to learning and its system(s) – which are different issues that afflict those involved with this field of knowledge and which are usually translated into searches, exchanges and reflections.

### Multiculturalism: some definitions

A discussion we consider important is how the cultural difference has been studied by authors that discuss it within society and in the environment of our close interest, the school. Moreira (2002) highlights that the word ‘multicultural’ has been used to indicate the pluralistic characteristic of western societies today, and the different types of responses to such plurality. He quotes Kincheloe and Steinberg (1997), who consider the “multiculturalism” represents the nature of such response, which includes formulating conflicting definitions in our social world, arising from different economic, political and social interests.” For Moreira, within the realm of education, multiculturalism relates to the nature of the response that is given within the school environment.

Stuart Hall (2003) considers that multiculturalism can be both a qualitative and a substantive term. While qualitative, it describes the social characteristics and the movement of maintaining the original identity and life in common within a society where communities with different culture live together. While substantive refers to the political strategies used to manage the cultural differences in these societies.

Some authors, including Astrain (2003), make a distinction between multiculturalism and interculturalism and highlight that the latter is not just about two cultures that are mixed together or that integrate. The interculturalism is about the recognition of these existing differences and the mutual understanding and valuation of the different social groups irrespectively of their specific cultures. The prefix “inter” would express a positive intention that is concretely expressed by the effort to suppress barriers between different peoples, ethnic communities and human groups.

The discussion about cultural differences at school has taken differences nuances, ranging from the issue of mere acceptance and the respect for the culture brought by students and their families to questioning the originality of such culture and its handling by the media. Moreira (2002) refers to the critical multiculturalism showing the relations of power that are present when one discusses the different cultures that exist in social institutions. He reports that “by accepting that the cultural difference and power are intimately related, there is a need to reject, as done by Stoer and Cortesão (1999), the so-called benign multiculturalism. Such perspective is restricted to identifying the differences and encouraging the respect, tolerance and coexistence between them. He does not include, in his approach, the purpose of destabilizing the relations of power involved in situations where differences coexist. The effort to examine them and question them characterizes what has been called the critical multiculturalism.”

Within the critical multiculturalism perspective is the discussion about the pattern of interaction of different players within the school institution. Different interacting cultures bring aspects that are connected to patterns of the politically right that are present in the task of teaching, just as values that are connected to the everyday life of families, students and teachers and values and principles brought by the media and by the dominant ideology. Therefore, the critical multiculturalism proposes a reflection that will allow us to address different cultures and explain existing contradictions, either accepting or refuting these interactive patterns that, above all, are based on negotiation and mutual respect.

From these questioning by the authors discussed here and the observation and exchange with the target community (as well as other herein mentioned), we started to follow the reflection about the reality experienced

by those living in the quilombolas, particularly the practices related to the process of sharing and acquiring knowledge, which are distant from those used by schools.

### Sharing knowledge in the quilombola community

An event told by people living in the quilombola community is explanatory by itself. During a school test for children at about eight years of age, there is the following question that the student is expected to fill in: snake is a \_\_\_\_\_ animal. A child fills in “dangerous” but his answer was considered wrong because the correct answer would be “venomous”.

Although this is an example of what could take place at any school, it shows that there is a disconnection between the school and the student cultural universe or the knowledge the student brings with him to school, or from learning within the environment he lives. It is as if only what the school proposes were right; the answer that was considered to be wrong is laughable; and the school fails to teach that there are many ways to define a snake or any other thing or animal. Additionally and most significantly, is that the school instills prejudice in relation to other ways to understand and construe our world.

On the part of those living in the quilombola community, some social practices express the way they understand how knowledge is shared and learned. An example of these practices can be seen on a yard in the village, where children and adults leave several toys, including broken toys. In many instances, when they return from school, children get together to play at that site and, as they play, one can see their effort to fix a broken toy. It is common for adults to get engaged and help them fix the toys while there is a lot of talking going around.

During this activity, adults teach, in oral conversations, information about their way of life, about Brazil and the quilombo history; about life in general and the processes experienced. During these conversations, sometimes there is an education about the need to squander, sometimes there are historical facts about some specific toy and the memory of people and times that are, in one way or another, associated to that specific toy. Historical data are brought up: sometimes old names of some toys, that have changed and children did not know, and that are used as a source of references about the way of life, where people can make their own toys or can give it to others without having to buy it.

Sometimes they speak about how important it is not to throw toys away, even those that are broken, so that other children can play with them; sometimes about the type of tree that has provided wood to make some specific toy and the importance of taking care of the forests and nature. As a result, reflections come up, involving most different themes, building the fabric, for the benefit of children and youths, that depicts life in that place and the way they manage their everyday issues. Punctuated by facts from the history they have lived, where empirical data mingle together. These are procedures that express their beliefs about their way of life and consumption models, highlighting consumption values that govern the community relation with objects, people and the place.

As a quick clipping, follows some important historical details, taken from official data and which are also taught by adults to younger people.

Adults explain, for instance, the meaning of several words or terms that are a part of their cultural universe. Like quilombo, that comes from "ochilombo", from a Bantu dialect, that is today spoken by some peoples in Angola, from where most Brazilian slaves came. It used to mean a camp used by nomad populations. In Brazil, it was used as a name for nuclei of slave resistance.” (www.mds.gov.br)

They try to give long explanations about their origins and strengthen the importance of this knowledge and give several representative examples to children. Children listen actively and appear curious by asking questions on the subject. And they learn that quilombolas “are descendents from the inhabitants of quilombos. Most of them formed by black slaves that managed to escape from slavery in Brazil at the time. They ran away from sugarcane mills or coffee plantations and took refuge in the quilombos, sites of resistance and protection. Old slaves formed communities around these nuclei; and the communities of today, over one hundred years after slavery was abolished, have been named quilombolas, the areas of quilombolas or the territories of quilombolas”. (www.mds.gov.br)

They show the importance of community life, tell about the significance of building family ties and highlight the social process their ancestors went through so that they could be where they are today. One of the adults, member of the community, is graduated in History and in his explanation, historical and official data are taught to children in a formal and candid way when he speaks about the quilombola communities. He draws a Brazilian map on the ground and shows, by state or region, where there is, and still remains, to this date, a number of communities that are self-proclaimed quilombolas.

“Quilombola communities are ethnical-racial groups, according to self-attributed criteria, with their own historic trajectory, owners of specific territorial relations and with a black ancestry associated to a resistance to the historic oppression they suffered, according to Decree nº 4887/03. These communities are the rightful owners of their lands, as consecrated by the Federal Constitution of 1988. [...] An assessment by Fundação Cultural Palmares (FCP) has mapped 3524 quilombola communities in Brazil. There are other sources, however, that estimate that there are approximately 5 thousand communities.” (www.cpis.org.br)

“Quilombos do not belong to our slavery past. Neither are they communities that stand alone in time and space, without any participation in our social culture. [...] Quite contrarily, there are over 2 thousand quilombola communities throughout the Brazilian territory, which are alive and active, fighting for their right to be the owner of their lands, as provided by the Federal Constitution of 1988.” (www.cpis.org.br)

“There are quilombola communities in at least 24 Brazilian states: Amazonas, Alagoas, Amapá, Bahia, Ceará, Espírito Santo, Goiás, Maranhão, Mato Grosso, Mato Grosso do Sul, Minas Gerais, Pará, Paraíba, Pernambuco, Paraná, Piauí, Rio de Janeiro, Rio Grande do Norte, Rio Grande do Sul, Rondônia, Santa Catarina, São Paulo, Sergipe and Tocantins”. (www.cpis.org.br)

In one of the activities at a quilombola community, several people, while mixing earth, water, grass or fresh cattle manure to get a uniform, strong mass that is used to make large bricks or walls of a “taipa” or “pau-a-pique” house, sing tones, like in a choir and they also get together in long conversations, a time they use to introduce subjects of general interest that are important to the community. During the time they knead clay with their feet, children get involved, and they talk and laugh together. During this activity, one can see men and women engaged with the task of teaching and learning about their past and looking into their future.

Actually, this is about a class with many teachers, it very different from the one children experience at school, at a site that is also very different from the school facilities; where everything takes place on the ground, as they play with their props. Historical data are shared among all those present. Some subjects draw special interest and everyone gets involved in the discussion when the subject is slavery, language and beliefs, or the role of women, allowing them to show the different realities they experience, in different places, by many quilombolas in Brazil.

Regarding their language, for instance, one can highlight that “many quilombolas have their own language, formed by merging different dialects of black slaves brought from Africa with Portuguese. Like Cupópia, from Quilombo de Cafundó, in Salto de Pirapora, in São Paulo State countryside. This language was

extensively logged, for the first time, in 1978, when it had 40 speakers. Today there are 12 speakers of Cupópia among 80 people living in the Cafundó.” (Vogt and Fry, 1996)

### General notes

Concerned with the technology advances and disappointed with the urban cultural universe, several members of the quilombola community claim that children education should not be delegated to school only. They believe that as children and young people mature before their adult lives, they need to tread different paths and this requires dedication and time from adults and the community. And school can only offer one form of learning.

The activities performed by groups of people in the community, for instance, to perform tough and/or urgent tasks that require focus and objectiveness, can lead to visible inner changes in those involved, who learn to share their tasks, work collaboratively, leading to stronger social ties. It strengthens the notion of who we are, as we are similar and different at the same time. It shows that each one has a role in the life of the other, in a mix that strengthens, teaches and encourages people while preparing them to accept the different, their quests and struggles.

Through manifestations of culture and their practices, which permeate our relation with the other, is that one can imprint the way and the measure to experience the world that surrounds us. One understands, respect and values what is best known.

Expanding traditionally established limits to teaching and learning concepts increasingly requires an articulation between the educational processes and the socio-cultural conceptions. Identifying and understanding the ways of life and construe the world, as these are present in different social fabrics, by making visible the elements that associate culture and education, one may open new ways for educational proceedings that are more suited to people’s needs. The dynamic characteristic of our social relations, along with social-educational proceedings, performed in the daily lives, involving the exchange of knowledge, is a rich and promising field for essential information, so that one can define the socio-cultural and political role of school and education. (Aguiar, 1994)

Knowledge plays a key role for human choices. For educators and researchers, expanding knowledge about different ways of life opens space for new inspirations and creativity, therefore strengthening adequacy to the context in which school works. Education takes a large space in each individual life and this field can range through several areas of knowledge and human needs.

Addressing cultural diversity as a possibility to expand the actions and the understanding of the world can help untangle webs which, in education, are fossilized. It is required to shed light and start new quests for the cultural diversity that exists among peoples, in a way that can show horizons that are still uncovered.

# Education as a factor of income differentiation of the population in Latvia within the period from 2000 to 2011

Ilga Lavrinovica<sup>a</sup>, Olga Lavrinenko<sup>b</sup>

<sup>a</sup>*Daugavpils University, Faculty of Social Sciences, Daugavpils, Latvia*

<sup>b</sup>*Daugavpils University, Faculty of Social Sciences, Daugavpils, Latvia*

## Abstract

The tendencies of income change and income differentiation levels, as well as the impact of education on income differentiation of the population in Latvia within the period from 2000 to 2011 are determined in the present article with the use of the regressive analysis.

Keywords: income, income differentiation, education

## 1. Introduction

A high level of income differentiation contributes to the increase of poverty, as well as decreases the benefits of economic growth for poor families as due to the large initial inequality the poor get smaller share from benefits. Consequently, without reference to the level of income in a country, wide income differentiation has a direct negative impact on social welfare. Thus the research of income and its differentiation has been of great importance at state, as well as regional level.

## 2. Methodology and Research Methods

Factors of income differentiation that have influence at micro level are explained by the theory of human capital, theory of filter or economic theory of signalling, as well as they have probable character that forms under the influence of occasional causes.

One of the researchers of the human capital theory was Theodore Schulz. He wrote: „one of the forms of the capital is education, human it is called because this form becomes a part of the human and capital it becomes as a result of being a source of future satisfactions or future profits, or both together” (Schulz T., 1960),

J.Mincer (Mincer J.,1994) believes that relation between the profit and education is not constant during the life time of the employee. In total approximately 25% of income inequality are due to the differences in education. The importance of production experience makes up approximately the same share. One more important factor that is included into analysis is the number of working days per year. By the impact of these three variables – education, experience and the number of working days – J.Mincer explains 60% of all differences of the level of labour income. The researcher R.Eckaus (Eckaus R.S., 1969).

The model introduced by G.Becker (Becker G., 1975) explains the inequality of income not only due to the labour (in fact – human capital), but also possessions. Return on investments in a

person in average are higher than return on physical capital. But in the case with human capital it decreases with the growth of investments, when in the case of other assets (real estate, securities, etc.) decreases little or does not change at all.

However, education should not necessarily be interpreted as independent variable. The level of educational background depends largely on natural skills of the person and conditions of his or her upbringing in a family. Education, consequently, can be only as a mediator and not as a principal cause for higher income.

The researches of P.Taubman (Taubman P., 1978) using the samples of twins show that 45% of income differences are due to the genetic potential, 12% due to the social origin, and due to education – only 6%. R.Herrnstein (Herrnstein R. J., 1971) proves that if social privileges were removed, there would be a new for of elite – biological elite.

Other researchers (A.Spence (Spence A., 1974), K.Arrow (Arrow K., 1973), A.Berg, J.Stiglitz) interpret education as a mean of selection, some kind of filter that sorts students.

However, there is an opposite point of view: the place of the worker in income hierarchy is conditioned by his or her social origin that is measured by the indicators of family income, the level of education of parents, the professional status of the head of the family etc., as well as it is explained with the transfer of moral values, motivations and behaviour stereotypes from generation to generation. Education here plays a role of a mediator, modifying inequality in social origin into income inequality.

K.Jencks (К. Дженкс, 1997) believes that income determination process has probable character and is formed under the influence of occasional causes: correlation between education and income is found only for aggregate group values, as in the analysis of individual data the correlation practically disappears. In addition, according to the evaluation, all factors that influence the level of income – origin, genetic potential, gender, age, colour of skin, education, occupation and others – are able to explain not more than 22% of all differences of income. Hereof the conclusion can be drawn that income depends mainly on the number of occasional causes – „luck”, „fortune” of the person.

It is necessary to note that education significantly influences the income of the individual, however the fact that education is the main determinant of income is insufficiently proved by the researchers. It is impossible to ignore both mental capacities, and characteristics of families. The quality of education is also important. Resources of family and personal potential of the individual change over time into certain qualities that are demanded on a labour market that leads to certain earnings.

For the research of the level and differentiation of income of the population the authors use several averages - an arithmetic average, structural averages - a median, and quintiles.

Herfindahl index is calculated according to the formula:

$$K_r = \sum_{i=1}^n d_i^2, \quad (1)$$

where  $d_i$  - the share of each population group in the total amount of population monetary income,  $i=1,2,\dots,n$  – the number of groups (Литвинов, В.А.,1997)

The limits of values of Herfindahl index is from 0 to 1. At number of groups advancing to infinity Herfindahl index advances to 0. When there is only 1 group, the coefficient is equal to 1. Herfindahl index is indifferent to the line of theoretically possible uniform distribution. Herfindahl index takes inequality of distribution for an axiom, and its changes reflect the changes in the proportions between groups, i.e. in ratios of shares of separate groups in the total amount of the monetary income of the population. At the set (invariable) number of groups increase of Herfindahl index in the current period in comparison with the period, taken as a base, directly testifies to concentration increase, i.e. concentration of the monetary income is more increasing in hands of one group and, respectively, indirectly characterizes the degree of deviation of the actual distribution of the income on groups of the population from the line of their theoretically possible uniform distribution (Литвинов В.А., 1999).

For the analysis of influence of the factors of differentiation of the population the regression analysis is also used in the present research.

### 3. Results

The empirical base of the research is the questionnaires of the population of Latvia carried out by SKDS firm within reports of the University of Latvia on economic development of Latvia for 2000, 2005, 2007, 2008 and 2011, and also questionnaire of the population "Social inequality III", carried out by the Institute of philosophy and sociology of the University of Latvia in 2009.

In the article for the study of income of families the indicator of the monetary income after payment of taxes on one family member (including social transfers) is used.

#### *Tendencies of income change of the population of Latvia.*

During the research 2 tendencies took place: the tendency of increase in the average income of the population during the period since January 2000 till January 2008 (the average income increased by 222% at increase of inflation index during the similar period for 57,1%) and a tendency of reduction of the average income of the population during the period since January 2008 till 2011 (January) (the average income decreased by 22%, the inflation index during the similar period increased for 1,8 %) is established. (Table 1).

Table 1. Income of the Population of Latvia in Quintile Groups within the Period from 2000 to 2011, Lats per Month

Indicators	Year	In Latvia	Part of the population				
			First quintile group (20%)	Second quintile group (20%)	Third quintile group (20%)	Fourth quintile group (20%)	Fifth quintile group (20%)
Average income in lats	2000	66	17	36	52	69	161
	2005	106	35	67	90	128	232
	2007	151	62	95	126	183	308
	2008	213	78	128	164	225	446
	2009	202	76	125	163	221	443
	2011	166	58	104	147	190	332
Quintile points in lats	2000		1-28	29-44	45-60	61-83	84-2500
	2005		5-54	55-75	76-100	101-150	151-1000
	2007		0-80	81-100	101-150	155-200	205-800
	2008		0-114	115-149	150-199	200-291	292-3000
	2009		0-100	101-145	146-180	181-267	268-2000
	2011		0-85	86-126	127-160	161-220	221-900

**Source:** calculations of the authors in the SPSS program according to the questionnaire of the University of Latvia within the report on development of national economy for 2000, 2005, 2007, 2008, 2011 and questionnaire data of the University of Latvia "... for 2009

The average income per one family member in Latvia in 2000 made 78% from the size of the minimum consumption basket (84 lats a month), in 2005 the average income per one family member was made even to the size of the minimum consumption basket and made 105 lats a month. During the period from 2006 to 2009 the average income per one family member considerably advanced the size of the minimum consumption basket (by 1,1-1,5 times), however in the winter of 2010-2011 returned to the level of 2005. As for the families where each member of a household has less than one set of the minimum consumption basket, than up to 2009 their quantity decreases: with 81% from all Latvian families in 2000 to 40% in 2009, however result of 2011 returned to quantity of households with consumption below the minimum basket on the level of 2005 and made 65%.

Thus, the tendency of increase in the average income of families during the period from 2000 to 2008 is stated, it is also possible to state a negative influence of crisis on the income of the population of Latvia. In 2008 and 2009 influence of crisis on the income of the Latvian households is expressed very poorly, most strongly the consequences of crisis were revealed in the winter of 2010-2011.

#### *Tendencies of the change of income differentiation of the population of Latvia.*

Analyzing the changes of the total income in quintile groups during the period from 2000 to 2011 (see table 2), it is established that the total income of the population of the first (poorest) quintile group fluctuates within 5-9% slowly, and the total income of the fifth (richest) quintile group slowly, but steadily decreases (from

47% to 40%). The dynamics of the change of the size of the total income of the second, third and fourth quintile groups is not unambiguous therefore it is impossible to judge the differentiation according to the total quintile income and it is necessary to apply other methods to establish the tendencies of the change of income differentiation of all population.

Table 2. The Share of the Income of the Population of Latvia in 20% Groups by Years, in Percentage

Group of the population	2000	2005	2007	2008	2009	2011
First (20%)	5	7	9	7	8	7
Second (20%)	10	14	12	9	11	12
Third (20%)	18	17	19	17	16	18
Fourth (20%)	19	21	20	25	23	23
Fifth (20%)	48	41	40	42	41	40
Total:	100	100	100	100	100	100

**Source:** calculations of the authors in the SPSS program according to the questionnaire of the University of Latvia within the report on development of national economy for 2000, 2005, 2007, 2008, 2011 and questionnaire data of the University of Latvia "... " for 2009

Table 3. Herfindahl Index

	2000	2005	2007	2008	2009	2011
Herfindahl index	0,31	0,27	0,26	0,28	0,27	0,27

**Source:** calculations of the authors in the SPSS program according to the questionnaire of the University of Latvia within the report on development of national economy for 2000 and questionnaire data of the University of Latvia "... " for 2009

Thus, it is established that the influence of crisis up to 2011 did not change the established tendency of reduction of income differentiation of the population of Latvia, and caused only small short-term increase in income inequality. However it has socially acceptable character in Latvia within the EU .

The assessment of education as a factor of income differentiation of the population.

As a result, the authors conducted regression analysis revealed the presence of a linear relationship between income per household member and education.

Table 4. Linear Regression Coefficients for the Year 2000

Model		Unstandardized Coefficients		Standardized	t	Sig.
		B	Std. Error	Coefficients		
1	(Constant)	11,607	13,483		,861	,390
	education	25,834	6,190	,135	4,174	,000

Note: a Dependent Variable: income of one member of the family per month in lats

Predictors: (Constant), education

Source: calculations of the authors in the SPSS program according to the questionnaire of the University of Latvia within the report on development of national economy for 2000

**Conclusion** The model is significant for 1% level since the value of  $F$  - criterion is equal to 17, and the corresponding significance value is almost equal to zero. Coefficient of regression are significant for 1% level (the exception makes only the last coefficient –importance at 5% level).

Having interpreted the results of the regression analysis, it is possible to draw the following conclusion: the increase of the number of years of training of one family member for 3 years leads to the increase of income in average for 28,5 lats a month

Having built the linear regression according to the data of 2007 for Latvia in whole, where a dependent variable is the population income per 1 member of a household, and independent variable is education of one of the family members (number of years of training).

Table 5. Linear Regression Coefficients for the Year 2007

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	
	B	Std. Error	Beta			
	(Constant)	80,492	11,880		6,775	,000
	Education	33,996	5,435	,233	6,255	,000

Note: a Dependent Variable: income of one member of the family per month in lats

Predictors: (Constant), education

Source: calculations of the authors in the SPSS program according to the questionnaire of the University of Latvia for 2009

The model is significant at 1% level since the value of  $F$  – criterion is equal to 39, and the corresponding significance value is almost equal to zero. Regression coefficients are significant at 1% level. Having interpreted the results of the regression analysis, it is possible to draw the following conclusions:

- the increase in number of years of training of one of the family members for 3 years leads to the increase of income in average for 34 lats a month.

Having built the linear regression according to the data of 2009 for Latvia in whole (see the appendix) where dependent are the same variables, was established the following:

Table 6. Linear Regression Coefficients for the Year 2009

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
(Constant)	73,011	72,469		1,007	,319
education	54,235	26,999	,296	2,009	,051

Note: a Dependent Variable: income of one member of the family per month in lats

Predictors: (Constant), education.

**Source:** calculations of the authors in the SPSS program according to the questionnaire of the University of Latvia for 2009

Having interpreted the results of the regression analysis, it is possible to draw the following conclusion: increasing the number of years of education of the members of the family of one of the 3-year increases in average income per month 54 lats.

Table 7. Linear Regression Coefficients for the Year 2011

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	
	B	Std. Error	Beta			
1	(Constant)	106,130	7,945		13,359	,000
	Education	23,670	2,776	,306	8,525	,000

a Dependent Variable: TIR\_IEN

Note: a Dependent Variable: income of one member of the family per month in lats

Predictors: (Constant), number of years of training .

**Source:** calculations of the authors in the SPSS program according to the questionnaire of the University of Latvia «...»for 2011

The increase in the number of years of training of one of the family members for every year leads to the increase of income in average for 23,7 lats a month.

#### **4. Conclusions and Recommendations**

The tendency of the increase of the average income of families during the period since January, 2000 till January, 2008 is established: average income increased by 222% at the increase of the inflation index during the similar period for 57,1%.

The tendency of the reduction of the average income of the population during the period since January 2008 till 2011 is established: average income decreased by 22%, the inflation index during the similar period increased by 1,8%.

It is possible to state the negative influence of crisis on the average income of families in Latvia. In 2008 the influence of crisis is expressed very poorly, in 2009 - also, however consequences of crisis revealed themselves most strongly in the winter of 2010/2011.

It is established that despite insignificant fluctuations of the indicators characterizing differentiation of the population of Latvia, the influence of crisis did not change the established tendency of reduction of income differentiation of the population of Latvia since 2000.

If the influence education factor on average income a month per 1 family member in dynamics from 2000 to 2009 crisis year is analysed, it is possible to state the increase of education aspect influence.

### Abstract

This study aimed to explore the effects of applying WebQuest learning activities to disaster prevention education for 8<sup>th</sup> grade students. A total of 61 8<sup>th</sup> graders were divided into control (n=30) group and experimental (n=31) group with three teaching units. Descriptive statistics, One-sample t test, paired-sample t test, and One-way ANOVA were used to analyze the collected data. The findings of this study show that the immediate learning effectiveness between both groups of the students is significant. In addition, students in the experimental group performed better in areas of disaster prevention knowledge and learning attitude and skills. Also they were satisfied with the WebQuest teaching approach, learning interaction, and learning quality.

## 1. INTRODUCTION

Natural disasters always wreak havoc. For example, the typhoon Morakot in 2009 and the 9.0-magnitude earthquake off northeastern Japan in 2011 inflicted catastrophic damage and casualties to Taiwan and Japan, respectively. Both economies suffered heavy losses. To prevent natural disasters from causing casualties and damage, disaster prevention must be incorporated into school curricula, which echoes the UN-initiated “Disaster Risk Reduction Begins at School” campaign. The disaster prevention education in Taiwan is aimed at spreading knowledge of local disaster types and causes and teaching students to adopt a right attitude toward disasters and take proper measures when disasters strike. More importantly, such education must equip students with the skills for disaster prevention and train them to prevent natural disasters in their daily life. When awareness of environmental disasters among primary students is raised through disaster prevention, they can take effective action to prevent disasters, hence mitigating the consequent damage (Wang, 2003).

In the Internet era, online resources are indispensable for learning. WebQuest is a strategy for teachers to combine thematic inquiry-based learning into teaching. It broadens students’ life experiences beyond textbooks and motivates them to learn and develop various thinking abilities such as analyzing, comparing and organizing (Cheng, 2005). Through WebQuest teaching, teachers facilitate students, who are the focus of learning, to actively explore questions, formulate and confirm hypotheses, and discuss and arrive at conclusions by asking them questions or providing them with related data (Chan & Chang, 2001). This study therefore investigates the effect of WebQuest approach in disaster prevention education on junior high school students’ learning effectiveness and disaster prevention literacy.

## 2. LITERATURE REVIEW

As the name suggests, WebQuest teaching is a new curricular design that enables learners to seek knowledge of an issue, analyze and discuss it via collaboration with team members through quests on the web (Dodge, 1995; Batchelor, 2002). WebQuest consists of six elements: introduction, task, process, resource, evaluation, and conclusion. With these elements, teachers employing WebQuest can formulate a structured teaching strategy to effectively organize the teaching content and provide meaningful and quality learning for learners (Dodge, 1995 ; March, 2003). It creates a learning environment where learners can collaborate with peers to seek meaningful knowledge to research and critically consider an issue or make decisions. Specific tasks and proper resources and assistance are given through scaffolding to learners, who are induced to construct non-structural knowledge and then are facilitated by teachers to complete the tasks through cooperative learning. The WebQuest teaching, however, means more than just students copying and pasting web information. With the aid of multimedia, WebQuest guides students to internalize the information into useful knowledge through high level thinking, enlightening them to develop multiple intelligences (Kimberly & Cleborne, 2002; MacGregor & Lou, 2004). Cooperative learning has various benefits for students such as enhancing their learning achievement, encouraging them to use more advanced comprehension strategies, improving their achievement and intrinsic motivation, and helping them build positive interpersonal relationships with peers (Lu, 2005).

Disaster prevention education can spread knowledge of correct precautions, measures to take during and after disasters. Furthermore, it teaches students to cultivate a positive attitude toward disasters and contribute efforts to disaster mitigation, reducing physiological and material losses (Ye, et al, 2004). However, formal natural disaster prevention or mitigation education still can’t be found in Taiwan’s educational system. Instead it remains a mere component in natural or social subjects, focusing on knowledge of disasters and prevention. The more important qualities such as disaster prevention skills and attitude and post-disaster psychological reconstruction are neglected due to lack of teaching hours or teacher professionalism. Besides, regular disaster prevention drills are either absent or mere formalities in most schools with students displaying a lax attitude. To minimize the huge

losses incurred by natural disasters in Taiwan, comprehensive disaster prevention education must be incorporated into school curricula (Hsu, 2003).

Given the advantages of WebQuest and importance of disaster prevention education, this study thus employs the six elements of WebQuest in designing disaster prevention lessons to investigate the effectiveness of WebQuest teaching on preparing 8<sup>th</sup> grade students for natural disasters.

### 3. RESEARCH DESIGN AND IMPLEMENTATION

This study adopts a design of quasi-experimental research. The subjects are two classes of 8<sup>th</sup> graders, which are picked out of the four classes taught by the researchers through purposive sampling. The experimental group consists of 31 students (17 males and 14 females) and is divided into 5 teams of 6 (with one group containing 7 people) based on heterogeneous grouping according to the students' abilities, whereas the control group contains 30 students (16 males and 14 females) and is also divided into 5 teams of 6 based on free grouping. The experimental group conducts learning through WebQuest-based teaching websites; the subjects try to complete tasks, with sharing, discussion and commenting with team members as well as observing of other teams' outstanding works via Live@edu platform. In contrast, the control group is given traditional teaching and asked to carry out group discussion in class.

The research tools adopted by this study include Disaster Prevention Education Learning Achievement Test, Disaster Prevention Literacy Questionnaire, Learning Satisfaction Questionnaire, Lesson Planning Design, WebQuest Learning Opinion Questionnaire, and Microsoft Live@edu. The Disaster Prevention Literacy Questionnaire covers three dimensions of disaster prevention knowledge (8 items), attitude (15 items), and skills (18 items) based on the course objectives and ability indicators for junior high schools promulgated in the Ministry of Education's Disaster Prevention White Paper. The 5-point Likert Scale is used in the first two dimensions. This questionnaire is approved by expert validity test; 3 experts and 3 teachers reviewed the agreed on the content. The Learning Satisfaction Questionnaire is compiled based on the work of Wang (2002), Wu (2005), and Yang (2001), covering 5 categories of teaching method, learning quality, learning interaction, learning evaluation, and reflection on learning. The WebQuest Learning Opinion Questionnaire is developed based on the work of Chen (2005) and Chen (2010), containing four dimensions of teaching website design, WebQuest structure, reflection on WebQuest learning, and cooperative group learning. The Microsoft Live@edu is a free platform of educational assistance and communication, with various services and applications like E-mail, skydrive, calendar, document sharing, blogging, instant communication and grouping.

### 4. RESEARCH RESULTS AND ANALYSES

The data analyses of this research show the following results. The students' disaster prevention knowledge mainly comes from their school teachers (28.7%), followed by the Internet (22.3%), family and relatives (16.0%), TV and movies (14.9%), extracurricular reading (12.2%), and classmates and friends (5.9%). In terms of the teaching method, in the first teaching unit of earthquake, the results of students' learning achievements between the experimental group (M=66.21) and control group (M=68.25) do not show significant difference (F=0.006, p=0.938>0.05). In the second unit of typhoon and flooding, after excluding the pre-test impact effect, the experimental group has a slightly higher mean value (M=70.97) than the control group (M=67.917); however, there is no significant difference in the learning achievements between the two groups. In the third unit of mudslide. The result of the experimental group's learning achievements (M=71.613) is higher than that of the control group (M=59.73), and there is a significant difference between the two groups (F=12.196, p=0.001<0.05). These results indicate that after excluding the entry behavior difference of the two groups, there is no significant difference in learning effectiveness between the two groups for the first two teaching units. For the third unit,

however, a significant difference in the learning effectiveness between the two groups is found, indicating that WebQuest teaching obviously outperforms the traditional teaching up to the third unit. Besides, WebQuest teaching does not result in significant difference in learning achievements from the traditional teaching is inconsistent with that of Li (2002) and Cheng (2005). The reason for this finding may be due to the fact that the teaching hours are fewer in this study.

The statistical results indicate that there is a significant difference in the students' learning retention test between the information technology integrated instruction and traditional instruction. This shows that the WebQuest teaching in experimental group has created a lasting effect despite the short teaching period, leaving an impression of disaster prevention knowledge on the students. This finding is consistent with that of Chen (2009) and Su (2012), which states that IT integrated instruction outperforms traditional instruction in terms of students' learning retention. Through IT-aided teaching lessons, learners are initiated into using, analyzing, combining and evaluating information, activating deeper thinking and internalizing the learning content to store it in the long-term memory, hence the better learning retention.

The analysis of the disaster prevention literacy questionnaire shows the following results. In the category of disaster prevention knowledge, the experimental group obtains a t-value of 14.039 ( $p=.000<.05$ ), reaching significant standard. The result is significantly different from the test value of 3, indicating that the experimental group's knowledge acquirement is well above par. In the category of attitude toward disaster prevention, the experimental group has a t-value of 10.431 ( $p=.000<.05$ ) with the result significantly different from the test value of 3, showing that the experimental group displays a positive and active attitude toward disaster prevention. In the category of disaster prevention skills, the experimental group acquires a t-value of 6.303 ( $p=.000<.05$ ), with the result significantly different from the test value of 3, which suggests that the experimental group demonstrates aggressive response to skill attainment. The t-value of the students' total scores in this questionnaire reaches 12.237 ( $p=.000<.05$ ), significantly different from the test value of 3, indicating that the experimental group's overall disaster prevention literacy is well above par. In summary, the experimental group's achievements in both individual categories and total scores are well above par, with only one exception in the category of the attitude toward disaster prevention. The result of the question item that "I want to learn about how other countries carry out disaster prevention work" does not reach significant standard ( $p=0.054$ ), indicating that the students are less concerned about international affairs. Nevertheless, the one-sample t-test results of the other question items in this questionnaire all reach significant level. This demonstrates that the experimental group is concerned about the disaster victims and the environment, adopts an active attitude toward disaster prevention in daily life, and is willing to accept the disaster prevention teaching from the school and government. Through WebQuest website teaching, teachers can enable students to learn at their own pace and heighten their learning motivation by introducing multimedia into enriched content. The IT-integrated instruction creates a virtual reality environment for learning that can't be emulated by traditional teaching.

In terms of the learning satisfaction of the experimental group, the t-values for the five categories of teaching method, learning quality, learning interaction, learning evaluation, and learning reflection are 13.151, 11.453, 8.913, 10.205, and 10.909, respectively. All reach significant standard ( $p=.000<.05$ ) and are significantly different from the test value of 3, showing a great level of satisfaction on these dimensions. The total scores of this questionnaire obtains a t-value of 12.368 ( $p=.000<.05$ ), indicating that the experimental group is highly satisfied. In addition, there is no significant difference between the students' satisfaction with the WebQuest website design and the test value of 4, which suggests that students' satisfaction scores average about 4 in this category, except for the question item that "I think the WebQuest teaching website is perfect and needs no improvement", whose score is lower than the average. The findings from the student interviews reveal that the video clips are good but take too much time to load (S03), the website can be more animated (S04), too much text makes the website too difficult to read (S07), and the WebQuest website link can be placed in the class's homepage.

## 5. CONCLUSION AND SUGGESTIONS

### 5.1. Conclusion

The results of the study show that the experimental group and control group have reached a significant difference in both the immediate learning effectiveness and the retention of learning achievements. Besides, the experimental group performs better in disaster prevention literacy, is satisfied with learning activities and has positive feedback on WebQuest teaching. It is also observed that WebQuest instruction motivates the students to be active learners and to develop cooperative learning and improve interpersonal relationship and communication skills through group discussion. The students also express a high level of satisfaction with the learning activities. WebQuest integrated instruction is a new learning method for students. Benefits will be evident to students once they get accustomed to it. With well-designed lesson plans, the WebQuest teaching can bring valuable diverse learning experience to students and enable them to tap into their own information literacy, turning them into active learners.

Compared with traditional instruction, the WebQuest teaching is well received by the students, who are highly satisfied with the learning activities and have acquired a great sense of accomplishment. They become active learners, are able to obtain more knowledge, and are willing to apply WebQuest teaching to other fields of study. One vital element in the design of WebQuest teaching is division of labor among peers through cooperative learning, which allows students to complete their assigned tasks based on their own abilities so as to enhance their learning motivation and sense of accomplishment. By integrating diverse teaching strategies, teachers can not only boost students' learning interest but also improve their teaching quality.

### 5.2. Suggestions

For future studies, researchers may look extensively into related literature on WebQuest so they can follow the five FOCUS principles to customize their WebQuest teaching websites and activities that both meet their teaching objectives and suit students' abilities. Besides, the experiment period may be lengthened to one semester to ensure that more stable patterns of change in students' knowledge, attitude and behavior can be observed. Furthermore, WebQuest disaster prevention education can include field trips that tap into local resources and environment characteristics. This way students' motivation and learning effectiveness may be strengthened.

## Abstract

This study aims to explore the effects of applying blended teaching approach to English sentence translation for vocational high school students. This study adopted quasi-experimental research design with 9-week traditional and blended teaching sessions for two classes of students. Learning attitude questionnaires for pre- and post-teaching sessions, learning satisfaction questionnaire, interview, pre- and post-tests, and students' records were analyzed by ANCOVA, one-sample t-test, and paired t-test. The results of the study show that there is no significant effectiveness found in the blended-teaching group. Also, the students in the blended teaching group show significant learning satisfaction than those in the traditional teaching group. Finally, there is significant difference found in learning attitudes among the two groups of students.

Keywords: blended teaching, learning attitude, learning satisfaction, vocational high school students

---

## 1. INTRODUCTION

The traditional, face-to-face classroom teaching has long seen problems such as students lacking motivation in learning. However, with the development of technology, students now can learn English through various media. Among these media, the Internet is the most influential and changes the learning patterns. Thus, blended teaching method, which combines the traditional face-to-face teaching and learning through the Internet, appeared (Taradi, Taradi, Radić, & Pokrajac, 2005). A number of tools are available for students on the Internet, such as Moodle, weblog, and Face Book. These tools allow users to post messages on the platform with having to design a web page. Given its ease of application, they are commonly used among student communities. This study therefore investigates students' learning effect, learning attitude, and learning satisfaction toward a blended teaching that employs a weblog as a platform for teaching English sentence translation.

## 2. LITERATURE REVIEW

Blended teaching is a method that combines on-line teaching with traditional class teaching (Garrison & Kanuka, 2004; Ayala, 2009; Shih, 2010; Lou et al, 2012). More specifically, in this method, part of the classroom teaching is replaced by net activities (Albrecht, 2006). There are many advantages of blended teaching. Hiltz (1994) compares virtual classroom with traditional teaching and indicates that in the teaching conducted through the net, learners have more frequent and versatile interactions, and the learners have more opportunities of discussion. Kleinman and Entin (2002) also states that students who use on-line learning are more positive in giving feedbacks to peers. Singh (2003) points out that blended learning not only provides more flexible combinations and choices, but also brings about many benefits.

Weblog is a net tool that is free, easy to use, and can be readily adopted in learning, communication, content management and personal publication (Wang, Fix, & Bock, 2005). Moreover, weblogs can enhance learners' expression, feedback, thinking, and sharing, hence offer the opportunities of self-expression and self-reflection (Topping, 1998; Oravec, 2002; Brescia & Miller, 2006; Ferdig and Trammell, 2004), and increase communication between learners and instructors (Supyan et al, 2010; Shih, 2010). Given these advantages of weblogs, this study thus employs weblog as the platform of instruction and conducts blended teaching on English sentence translation in order to investigate the learning effect and learning attitude of vocational high school students in studying this subject.

## 3. RESEARCH DESIGN AND IMPLEMENTATION

This study adopts a design of quasi-experimental research. The subjects are a class of second-year students in a comprehensive high school in Taiwan. The experimental group consists of 38 students from Food Processing Program, and the control group contains 38 students from Food Service Program and Arts Program. The students are divided into groups of three. The experiment takes nine sessions of instruction on English sentence translation. The experimental group receives blended teaching, whereas the control group receives traditional teaching. Before the experiment, questionnaires on learning effect and learning attitude of English sentence translation are conducted on both groups. After the experiment, questionnaires on learning effect, learning attitude, and learning satisfaction are again conducted on both groups.

The collected data are analyzed by Kendall Coefficient of concordance to ensure the consistency of evaluation. The Kendall's W value of the control group is .987,  $p=.000<.05$ , while the experimental group's Kendall's W value reaches .971,  $p=.000<.05$ , indicating the three teachers are highly consistent in evaluation. The questionnaire on learning attitude is approved by expert validity test; three experts and three experienced English teachers review and agree the content. The learning attitude questionnaire is divided into three dimensions: cognition, emotion, and behavior. The questionnaire on learning effect is also reviewed and approved by expert validity test. The learning effect questionnaire is divided into 4 categories: opinions on peers' feedback, opinions on teacher's feedback, opinions on the process of studying English sentence translation, and opinions on the overall learning method. The weblog, which is set up at Wretch, includes functions such as composing, giving feedback, posting pictures, uploading audio files, uploading video files, posting messages, etc. The analyses of this study contain both quantitative data and qualitative data. Quantitative data include descriptive statistics, one-sample t-test, and paired t-test. Qualitative data contain instruction records and content of post-experiment interviews. The quantitative and qualitative analyses are used to collaborate with each other in order to understand the influence of different methods on vocational high school students' learning effect and learning attitude toward studying English sentence translation.

#### 4. RESEARCH RESULTS AND ANALYSES

The data analyses of this research show the following results. Most of the students use computers 1 to 3 hours. Most of them post messages on the weblog every two or three days, and the majority visits other teams' sentence translation work twice a week. Moreover, the content of the messages posted on the weblog belongs to the categories of sharing the processes of sentence translation practice, sharing questions and problems, learning experience of group discussion, and encouragement and support to classmates.

Comparing the learning effect of the two groups of students reveals that there is no significant effectiveness found in the blended teaching group. This research result is inconsistent with that of Yu (2008) and Singh (2003) stated that blended learning improves learning effect compared with traditional learning. The reasons for this research result may be due to the fact that students are not tested on English sentence translation in the entrance exam, so they consider such skill dispensable, or even not worth learning. In addition, vocational high school students are fundamentally poor in English, and it is difficult to enhance students' ability in sentence translation with only 9 sessions of experimental teaching. As a consequence, there is no significant difference in the learning effect between the two groups.

The comparison of learning attitude toward translation course of the two groups indicates a significant difference. The learning attitude of the experimental group between the questionnaires for pre- and post-teaching sessions shows a difference of p value of .000, indicating the two groups have reached the significant difference, whereas the control group's learning attitude obtains p value of .213, indicating that the experimental group has significant difference on learning attitude between the pre- and post-teaching sessions but the control group.

The results demonstrate that applying blended teaching to vocational high school English translation course does have positive effect on students' learning attitude. This finding is consistent with that of Miyazoe and Anderson (2010), which asserts that blended learning has positive influence on students' learning attitude, and also with that of Ferdig and Trammell (2004) and Wang (2009), which declare that teaching with weblogs can improve students' learning attitude.

Student's learning satisfaction is assessed by a questionnaire compiled by the researchers. The questionnaires were analyzed by one-sample t test. The statistical results show that the control group does not reach significant satisfaction on peer feedback, teacher feedback, sentence translation processes, and overall opinions on the teaching method. And the total scores of learning satisfaction present clear dissatisfaction. On the other hand, the experimental group has reached .05 significant satisfaction on peer feedback, teacher feedback, sentence translation process, and overall opinions on the teaching method, indicating the experimental group is satisfied with all these categories.

These results corroborate the findings of Kleinman and Entin (2002) and Miyazoe and Anderson (2010), which state that blended learning promotes students' learning satisfaction. These results also agree with the findings of Ducate and Lomicka (2005), Wang (2009), and Shih (2010), which mention that using weblogs as the teaching platform can enhance students' learning satisfaction.

This research observes that the students interact enthusiastically and accept others' suggestions with an open mind. Their interactions with the teacher are also active and positive, and the learning effect is better than through traditional learning. Moreover, the platform of weblog motivates students to study and to practice often, consequently leading to the improvement of English translation skills. In conclusion, students prefer learning English sentence translation through weblogs than through the traditional teaching method.

## 5. Conclusion and suggestions

### 5.1. Conclusion

This research discovers that the experimental group and control group show no significant difference in the learning effect of sentence translation, which is inconsistent with Singh (2003) and Graham (2004), which believe that blended learning can effectively promote learning effect. On the other hand, this research notices that in blended teaching, students can practice English sentence patterns on the weblog and look up the answers on the Internet when they encounter difficulties. Consequently, students of the experimental group steadily become more confident in English sentence translation and are more interested in writing. Furthermore, students under blended teaching can ask questions any time during the teaching process and make corrections instantly on the weblog. As a result, learning attitude is improved. This finding agrees with Miyazoe and Anderson (2010), Ferdig and Trammell (2004), and Wang (2009), which point out that blended learning has positive influence on students' learning attitude, and that teaching with weblogs can improve students' learning attitude. Moreover, this research observes that students show better learning satisfaction when learning English sentence translation with blended teaching method: students interact actively, and accept others' suggestions with an open mind; their interactions with the teacher are also active and positive, and the learning effect is better than through traditional learning; furthermore, the platform of weblog motivates students to study and to practice often, consequently leading to the improvement of English translation skills; students prefer learning English sentence translation through weblogs than through the traditional teaching method. These observations corroborate the findings of Kleinman and Entin (2002), Miyazoe and Anderson (2010), Ducate and Lomicka (2005), and Wang (2009) that blended learning promotes students' learning satisfaction, and that using weblogs as the teaching platform can enhance students' learning satisfaction.

### 5.2. Suggestions

For future studies, researchers may include more group discussion and teacher's feedback in addition to course instruction. Some talented students may be able to solve problems by themselves, but most students do need assistance in the process of learning. Thus, the teacher needs to closely observe students and provide timely help and encouragement. Moreover, students need more assistance at the beginning of the experiment, so the teacher may have one or two teaching assistants to help solve students' problems, since the sooner the students solve their problems, the more significant their learning effect.

## Abstract

By the development of technology, ready patterns and characters through computers have replaced the original pre-school children's books illustrations. It has been seen as a problem that these illustrations aren't suitable for pre-school children's cognitive, social, linear, visual development. Document review on qualitative research method is used in research. 10 children books of various publishers in Turkey illustrated on computer media and 10 children books written and illustrated on computer media by 4<sup>th</sup> class students of Education Faculty's Graphic Branch are examined, appropriateness of illustrations have been put forth by a data collecting material-13 criterion and expert opinions. In the study, it is concluded that the necessity of taking the views of experts and giving task to expert illustrators in the preparation of children's books in computer media.

Key Words: Keywords: illustration, pre-school, art education

## **Introduction**

After the industrial revolution technology affects all areas such as developing a revolutionary impact on graphic arts. This affect caused graphic artists' well tracking of technology, so creativity, design power, hardware synthesis of the aesthetic use of the computer environment has become compulsory. Graphic programs are not only equipment used by graphic artist in the production; they are creative to support design. Conscious using of graphic programs which have significant role on the artists and the art works is very important, they should be support the artists not dominating. Graphic artists made by hand their original illustration designs which are in graphic design areas, began to make the computing environment of today and made up with the technological developments. Many illustrations made by artists are belongs to children's story books for the period 0-6 years. Children of this age period learn to recognize by looking, touching, smelling before reading and talking. Considering that the close relationship between seeing and learning, It is an unavoidable reality that the story books which are good illustrated and proper language expressions have an important place in the lives of children in this age group. Besides good language expression suitability of illustration, the choice of the appropriate character size, the use of suitable materials and book cover pages, harmony between the page arrangement and illustrations are very important criteria. In this study, document analysis and the data collection material is prepared according to the criteria mentioned above

## **Problem**

By the development of technology predefined templates prepared on computer and carelessly drawn illustrations are taken placed instead of original illustrations made in the hands of artist's. When we think the contribution of illustrated children's books to preschool children's cognitive, social, linear, aesthetic, it is seen as a problem, some illustrated children's books published by various publishers in Turkey by using graphic programs for the ages of 0-6 illustrated not suitable for children in this period not suitable for children in this period in accordance with the illustrations and layouts of these books.

## **Purpose**

In research; demonstration the affects of children's books between the ages of 0-6 illustrated on computer environment to the child's life, demonstration the required qualifications of illustration which is submitted to children whose aesthetic and visual accumulation, skills developed during this period, and drawing attention to families are aimed. Also making example illustrated children's books appropriate to the development of children between the ages of 0 to 6.

## **Sample and Limitations**

This research is limited to 10 children's books selected from various publishers which published in the academic year 2012-2013 in Turkey, have been illustrated on computing environment. Also it's limited to 10 children's book for the period of 0-6 ages which stories written and illustrated by fourth graders Graphic Arts Department of Marmara University, Ataturk Faculty of Education. Examples are examined and evaluated by persons who trained on this area. Research data are limited to findings obtained from data collection material prepared by researcher.

## **Definitions**

In research, selected books of various publishers in Turkey is defined as I. GROUP BOOKS books made by Graphic Arts Department's students is defined as II. BOOKS GROUP BOOKS.

## Method

Document analysis method among qualitative research methods was used in this study. Document review, research, analysis of written materials that contain information about the targeted cases and covers subjects. Examination of the document as a standalone data collection method may be used in combination with other methods of data collection (Ali Yıldırım, Hasan Şimşek, 2006). Documents for research essay are done, data collection material prepared (table 1). 13 questions are determined for creating data collection material by the researcher. After determining the questions, it is requested to evaluate the books to two groups to 10 persons expert in the field by using the survey forms. Data collection material used three options to yes-partly-no. Descriptive analysis technique is used for statistical analysis. The qualitative data obtained from each of the experts based on their responses to a question tabled by specifying frequencies and percentages. The data obtained for this purpose, first a systematic and clearly depicted, described and interpreted in the descriptions and conclusions reached examine the relationship between cause and effect. Descriptive analysis is often included direct quotations (Ali Yıldırım, Hasan Şimşek, 2006). The data were classified according to the results of research in the light of the preliminary information obtained as the stages of data collection can be arranged (Remzi Altunışık, Recai Coşkun, Engin Yıldırım, Serkan Bayraktaroğlu, 2001).

## Solution of Data

Table 1 Questions and Answers of Research

QUESTIONS	BOOKS	ANSWERS (NUMBER)			ANSWERS (%)		
		YES	PARTLY	NO	YES	PARTLY	NO
1. Is the illustration on the book cover interesting?	I. Group Books	36	40	24	36%	40%	24%
	II. Group Books	63	37	0	63%	37%	0%
2. Is the emphasis used in appropriate place?	I. Group Books	44	36	20	44%	36%	20%
	II. Group Books	67	33	0	67%	33%	0%
3. Is the movements of characters (gestures, facial expressions, emotions, etc.) are reflected in right way?	I. Group Books	37	46	17	37%	46%	17%
	II. Group Books	73	25	2	73%	25%	2%
4. Are illustrations carrying artistic concerns?	I. Group Books	29	38	32	29%	38%	32%
	II. Group Books	60	30	10	60%	30%	10%
5. Are the colors of illustrations inner, intuitive and creative?	I. Group Books	40	35	24	40%	35%	24%
	II. Group Books	63	31	6	63%	31%	6%
6. Are illustration technically integrated with text and is technique sufficient for the age group?	I. Group Books	34	44	22	34%	44%	22%
	II. Group Books	75	23	2	75%	23%	2%
7. Is the template elements draw attention in figures created in computing environment?	I. Group Books	41	33	24	42%	34%	24%
	II. Group Books	7	40	52	7%	40%	53%
8. Are there careless iterations (copy-paste) on illustrations elements?	I. Group Books	36	30	33	36%	30%	33%
	II. Group Books	8	30	60	8%	31%	61%
9. Does the page layout aesthetic and appropriate to age group?	I. Group Books	31	37	30	32%	38%	31%
	II. Group Books	82	17	1	82%	17%	1%

QUESTIONS	BOOKS	ANSWERS (NUMBER)			ANSWERS (%)		
		YES	PARTLY	NO	YES	PARTLY	NO
10. Are the illustrations compatible with the text content?	I. Group Books	48	37	15	48%	37%	15%
	II. Group Books	88	9	3	88%	9%	3%
11. Do the illustrations support language development?	I. Group Books	40	41	19	40%	41%	19%
	II. Group Books	66	33	1	66%	33%	1%
12. Do the illustrations develop the child's imagination and creativity?	I. Group Books	35	41	24	35%	41%	24%
	II. Group Books	62	35	2	63%	35%	2%
13. Do the illustrations develop child's aesthetic point of view?	I. Group Books	38	26	36	38%	26%	36%
	II. Group Books	67	28	3	68%	29%	3%

## RESULTS AND COMMENTS

For two group book, in accordance with the answers to data collection material it is analyzed, graphical editing and percentiles are made, given with comments.

## EVALUATIONS

### Question-1 Is the illustration on the book cover interesting?

Looking at the conclusion, book covers of the first group of books is found interesting by 24% and found partially sufficient by 40%. Proportioning on the first group children's books issued by publishers prepared on computing environment shows us the need of careful examination of books by expert persons. Because children who can't read the book will look to the cover of the book and will be attracted by magical atmosphere of the story. Children with this illustration will gain insight about the book first without knowing the contents of the book. For this reason, the cover picture should outline the content of the book (Alev Sınar Çilgin, 2007). The second group of books, book covers is found good at a rate of 63% and found partially sufficient at rate of 37%, this shows us when designing a book cover, training in this area is necessary. Book cover illustrations are as important as those inside the book. When designing on computer environment by taking into account physical characteristics of children between the ages of 0-6 and aesthetic values, the title, the illustrator's name, publisher's name and age group is important to note. Should be noted that this is an element of their design.

### Question-2 Is the emphasis used in appropriate place?

Looking at the conclusion, emphasis isn't used in appropriate place by 20%, partially used 36% and used in a good manner by 44% in first group books, this shows us in illustration made in computing environment, there aren't adequate relationship between illustration and text, designer cannot reflect his/her emotions and artistic viewpoint by his/her drawings, graphics programs not used carefully. Emphasis used in appropriate place answer is given by 67%, and partially used answer is 33% in second group books. Various / different illustration expressions for the child a chance to plunge into a new world, and thus expand the possibilities of the imagination means (Cem KARA, 2012). The designer creates the movement element by the help of the visual

elements and ensures mobility of element by the emphasis. Emphasis makes intensifying interaction by continuous movement with interruptions and explosions. Suitable and proper emphasis facilitates transmission of the message and provide permanence of information (Serpil Gvendi Kaptan, Ata Yakup Kaptan, 2004) Illustrators have been trained in this area who know the computer programs in accordance with their capabilities available to their comments by using artistic styles with the emphasis on aesthetic values will provide opportunities for enriching children's imaginations. Illustration drawn in the event of the child at the forefront of important items to establish the relationship between image and text, making it easier intensify attention provides easier. (Glseren Tr, Aye Turla, 1999)

**Question-3 Is the movements of characters (gestures, facial expressions, emotions, etc.). are reflected in right way?**

Looking at the conclusion, the first group of books, the result is presented as characters in the illustration reflected properly by 37%, reflected partially by 46% no reflected by 17%, this shows us by the movement of the created characters is so much ignored as a result. However, movements, postures, gestures and mimics the characters create a hero in every child's dream of the period; analysis to sketch the necessity of a solid phase should be done before developing in the computer. Creating the original characters on stage of computer is in the hands of the illustrators. The answers received from the second group books, slice of the answers given importance to the movement of the characters by 73%, partly taken into account by 25%, not taken into account by 2%. Students who illustrate this group books make character analysis and sketch figures from the front, side, rear postures as well as crying, laughing, as emotionally behavior reflected before creating character and prepare illustrations by paying special care to space relations and embody characters through the eyes of the child. According to the results when illustrator is competent on graphic programs, illustrator is reached success in using his own style and enriches the child's imagination. Pictures cases, the existing lines to express mobility make it easy to establish a relationship between image and text. Still pictures almost a motion photos or event doesn't express the viability is not suitable for little children. (Glseren Tr, Aye Turla, 1999)

**Question-4 Are illustrations carrying artistic concerns?**

Looking at the conclusion, the responses of first group books are that carry artistic concerns by 29%, partially by 38%, don't carry artistic concerns by 32% ratio. This situation can be seen as a result of the first group books causes a negative impact on dream force, aesthetic and artistic point of the improvement of preschool children. The responses of second group books are carrying artistic concern by 60%, partially 30% and not carrying artistic concern 10%, this can be indicator of students trained in this area uses graphic programs creatively in illustrations and thus their works are successful and carries artistic values for children between ages of 0-6 age thanks to giving importance to artistic values and avoid from commercial concerns. Illustrations lends an aesthetic child at a young age, learning accelerates or slows down according to the nature of the illustration. Faced illustrations of children in this period, the child must lead to spectacular painting. These illustrations are expected improve the capabilities of detection, day dreaming, a sense of beauty, socialization, information and entertainment in children (Serdar Tuna, 1997)

**Question-5 Are the colors of illustrations inner, intuitive and creative?**

Using of colors has been found inner, intuitive and creative by 40%, partly creative by 35% and not creative by 24% in the first group books. When we look at rates in the first group books it is given importance to expressive power of color, even if. Using of colors has been found creative by 63%, partly creative by 31% and not creative by 6% in the second group books. Colors are highly intuitive, inner and creative at child paintings (Şahika Çağlar Özünel, 2000). If we take into consideration the situation, it should be noted that use of color in child books will help child to face a different perspective. Harmony and unity between colors is very important in using many colors together as stated by Tür and Turla. The use of color shouldn't be forefront of line, and colors and lines should form a whole. Vivid colors, should be compatible with the fund, and must not allocate attention (Gülseren Tür, Ayşe Turla, 1999). Such an explanation and sincerity of author, however, may contribute to the development of creative and aesthetic of readers.

**Question-6 Are illustration technically integrated with text and is technique sufficient for the age group?**

Integrity of illustration with text has not been found sufficient by 34%, partially found by 44% and found by 22% in the first group books. In this situation, it can be concluded the first group books prepared by computer graphics programs aren't appropriate technically to the level of creativity of children, don't paid attention between the technical and the text used to capture the atmosphere. Books in the second group, 75% by creating technical illustrations integrated with the text, 23% partially and 2% not. It can be concluded that trained students can combine technique by their ability to match their own artistic interpretation of the text books. The most important advantages of the work of the computer imparted illustrator, evaluation and modification of the arrangement of colors as soon as possible to make lots of income. In addition, the software used in almost every way, and this software is able to adapt to the illustrative work can bring an unlimited choice of artistic creation. Software used in the basic drawing tools (airbrush, pencil, brush, etc.) and the use of computer technology in terms of reserves located brings some advantages (Nihan Sarı, 2006). It should be noted that a negative effect on the artistic development of children's benefits when it is not used carefully.

**Question-7 Is the template elements draw attention in figures created in computing environment?**

Template elements draws attention has been rated by 41%, partially by 33% and not by 24% in the first group books. This can be concluded as some template elements used from place to place in illustrations. Facilities provided by the computer should be use carefully; illustration artist interpretation should take precedence. Composition is a system bought together elements in the context of the basic principles of design. There is a bond between character and event around in children's books, in this sense, the place of the character in the composition is also important. By taking account location, scale and proportion of the character in sketches in the integrity of the composition, determination of dimensions of the points still need to be considered by the designer truthfulness. The child's love the character created, following with great interest totally depends on the conception and creativity. (Halime Özge Mardi, 2006). Therefore, the composition sketch stage, the relationship between the text formats, aesthetic values should be considered. In the second group, the items are encountered templates of 7% and 40% partially encountered, conscious not to have 52% of the items in good hands templates can be seen as necessarily a result of the computer correctly.

**Question-8 Are there careless iterations (copy-paste) on illustrations elements?**

In the first group books, drew attention to the careless iterations 36%, 30% is partially careless iterations, no iterations rate of 33%, as a result it can be concluded there is an occasional careless copy-pastes and use of unnecessary duplication. In the second group book careless iterations drew attention to the rate of 8%, 30% is partially careless iterations, and no iterations to the rate of 60%, as a result in sketching stage of students trained in this area resolved creativity, resolving design by taking into account the children's artistic development, the form of each element forming part of the composition of the text elements that capture the atmosphere of integrity and avoidance of unnecessary duplication that can be seen in the illustration.

**Question-9 Does the page layout aesthetic and appropriate to age group?**

In the first group books, the page layout is appropriate to age group by 31%, partially appropriate by 37%, isn't appropriate to age group by 30%, so as a result, the child's age group is not addressed, relationship between text, images that holds page layout is not observed. These books are available on the market with commercial concerns, increasing restrictions on page arrangements, efforts to save paper, revealed moderate, not suitable for the child's age level, can be called mediocre shows that are placed on the shelves of books. In the second group books, the page layout is appropriate to age group by 82%, partially appropriate by 17%, isn't appropriate to age group by 1%, as a result children's books is more than just illustrations, size of the book and page arrangement are also carried importance, illustration with computer graphics, layouts using programs should be considered as an element of the composition. Not only the illustrations, paper quality, page size, fonts, blocks the effect of manuscripts, the cover arrangement should be given importance, in particular should not errata (Şahika Çağlar Özünel, 2000).

**Question-10 Are the illustrations compatible with the text content?**

The first group books, the text content is compatible with by 48% illustrations, is partially compliant by 37%, is not appropriate by 15%, as a result we see generally done illustrations appropriate to the content of the text. In the second group the books, illustrations of the text content is compatible by 88%, are partially compliant 9%, to be incompatible by 3% as a result of students trained in this field sketching phase resolve the relationship between text and image and they are conscious of the artistic values, give attention even illustrated in computer environment. The vivid colors, drawings' aesthetics increase the interest to works. However, the issues to be reflected in the first degree by means of illustration, text - image relationship are most important factor in children's books. (Fahrettin Bozdağ, 2000)

**Question-11 Are the illustrations compatible with the text content?**

The first group of books, illustrations support the development of language rated by 40%, partially sufficient rated by 41%, isn't sufficient rated by 19%, as a result, books illustrations are partially sufficient, Illustrations of books published in the market is not qualified to support the language of the child, illustrations are not qualified to develop language skills for the child who is illiterate yet and signifies pictures by looking. In order to aid the development of the language of the book, lavishly illustrated book to be read to children, children to explain the

pictures in the book, answer questions about the book complete half left sentence, explain the book was left unfinished, and then the owner should be encouraged to summarize their own words. These are ways to stimulate and support of literature for development of children's language literature (Mübecel Gönen, 2005). The second group books, illustrations can support language development by 66%, partly support by 33%, not support by 1%, as a result, we can say students design books in support of the development of the child's language and illustrators are important as text authors. Illustrations have a separate expression language as the text. In other words, pictorial narratives, beyond putting out whatever is in the text, the main idea of the text plan, or overlapping, but it is now located next to the new one with a new and rich narratives or should be. (Cem Kara, 2012)

### **Question-12 Do the illustrations develop the child's imagination and creativity?**

The first group books, illustrations is to develop the child's imagination and creativity by 35%, partially develop imagination and creativity by 41%, don't develop by 24%. According to illustration artist Nazan Erkmekçi: Illustrations for children, written and drawn there, to be the most perfect form of art. For the children write, drawing is very separate art and requires a different understanding. Individuals in stage of development to develop self-confidence are very important. This group of illustrations in books designed in computer is not at the forefront of creative anxiety. Therefore, it can be considered the gains to the child will be more without thinking with commercial concern, so illustrators and publishers of books will develop children's imagination and creativity, so will give an aesthetic point of view. In the second group books, illustrations improve the child's imagination and creativity by 62%, partially improve by 35%, don't improve by 2%. As can be seen nowadays trained illustrators, although an indispensable tool in the field of computer illustration, computer illustrations would make sense in an ingenious intuition and imagination, and is intended to reach. Pictures imagination enriches the child's imagination be included in the elements. Imagination items and fantasies embodies by lines. Thus, children more easily able to establish the relationship between fantasy and real. how much detail given in illustration is important. Illustration should be as simple as to help to establish a relationship between the text and event. If there is a detail in the picture must always be mentioned in the incident. On the other hand a lot of cases, without significant unnecessary details or distract the child and makes it difficult to establish the relationship between image and text (Gülseren Tür, Ayşe Turla, 1999)

### **Question-13 Do the illustrations develop child's aesthetic point of view?**

The first group books, illustrations can improve the child's aesthetic skills by 38%, partially improve by 26%, don't improve by 36%, as a result that illustrations isn't just a picture for the child's understanding of the text, but also an aesthetic point of view as it develops creative thinking is also a duty to bring this group is neglected books. Zafer Gençaydın said the seriousness of the work reveals by "devoid of wisdom knowledge and aesthetics is dangerous, life devoid of aesthetics is primitive and ugly". The second group books; the illustrations that can improve the child's aesthetic ability rate by 67%, improves partially by 28%, don't improve by 3%, as a result trained illustrators use their plastic values of the drawings made in computer is to develop the child's artistic view and this isn't ignored during drawing. When child selects books from the shelves is consciously so should be guided by parents who have knowledge of aesthetics.

## CONCLUSION AND RECOMMENDATIONS

In the first group books it is seen failure in formal specifications, suitability to the text, the artist's interpretation in expressing of the text in compositions, unconscious use of plastic elements (color, color harmony, color contrast, space occupancy, texture, space, rhythm, feeling, comments, etc.) unconscious use of aesthetic values due to the acquisition of absence of an effort, although the characters are important for preschool-age children gesture and expression are not observed, absence of necessary emphasis made on the illustration for complete understanding of the main idea of the text content and the main idea, less attention to the cover of book which is a statement that described in the book and also an advertisement item, graphic programs isn't use in technique which is very important for expressing the subject in illustrations, although the layout of the book illustrations should be carry as much as aesthetic values made as haphazard arrangements, not given enough attention of illustration reflect the text, adjusting to the content of the text, proper selection of the colors used in the text. In this case, pre-school children's books are preparation carelessly, caution should be taken in this regard arises.

In the second group books, it is seen illustrations drawn parallel to the text is associated with the text, all considered with emphasis on composition and on-site as part of the expression is used, the characters need to be in place as part of a narrative using gestures, draws attention to the book cover illustrations, page layout, text, images used at the relationship between aesthetics, art books as a whole places great emphasis on aesthetic values used carefully, reached purpose by books made in computing environment by the use of technique and appropriate use of purpose of graphics programs to the level of children.

## RECOMMENDATIONS

In various publishing houses on the market for the period of the pre-school in computer books observed, illustration problems. These books which has commercial concern, have problems such as sizes and the layout of the page and the print quality issues, and for these reasons, careful preparation of children's books publishers, received the support of expert illustrators and children's pedagogues is to be observed. Preparing and illustrator should be work together in stage of preparation; it is recommended illustrator may think illustration and layout together, if possible. This people for being adequate in the field are required to follow computer programs and technology, changes in the graphics area, the child's developmental stages, the developments in the field of contemporary artistic values and development on their field.

Illustration shouldn't be done by every person who knows about computers. Approaches like "all who know the graphics programs can make this job" is wrong, trained in the art also important besides knowing the program. For the development of pre-school children's creativity and imagination illustrators should give importance to aesthetic values for the development of gaining artistic eye, should give importance to the relationship between text and illustrations for the child's language development. To raise awareness of parents it should be organized seminars, conferences, issuing articles in children magazines.

## Abstract

In educational establishments, a study has been done on the results of Total Quality Management (TQM) between student and teacher. Training prudential students in company with a coherence and solidarity by the educational establishments, which play a part in forming of the public, will be possible only by training in line with the expectations of students and the public. TQM (Total Quality Management) has a great contributory in forming of this education system. Adapting to TQM (Total Quality Management) will make important changes in classroom. By the help of this method, the communication distance between student and teacher will disappear. Therefore, student and their self-confidences will increase within guidance. For TQM (Total Quality Management) the thing is to catch the better not the perfect. TQM (Total Quality Management) has important superiorities in development of education system and according to its education that can meet the expectations of the public. It's a more rational process to apply this method in educational establishments than manufacturing sector. When it is compared with traditional education, it's seen that it has more superiority in development of education system and in training of qualified personals who can meet the expectations of the public. TQM (Total Quality Management) creates an opportunity to restore trust of the public to the education system.

Keywords: Total Quality Management, education system, student and teacher;

## 1. INTRODUCTION

Societies that hold the knowledge by human sources will be dominate in centuries to come, it is inevitable. All countries must invest in human sources which will work in goods sector, service sector and information sectors and will keep these sectors alive. Educational institution which sustain this human source is vocational education. Therefore, we have to prepare vocational education to information society by reviewing it once again, in our country.

In recent years, big changes have occurred in the economic field in the world, in parallel with this, changes have been needed in every field of working life in our country too. In this sense, role and importance of the education have increased in the economic, social and cultural development. It has become an obligatory to review current structure and content of secondary education, in particular vocational secondary education.

In our day, there is an intense competition in global market. It's gaining more and more importance to grow man power has the quality to meet expectations of business world in this competition. If education system will fail at growing qualified man power, the price for this failure shall be paid either by enterprises thereby training their available employees with a very high cost, or by society thereby standing for purchasing of goods and services of

E-mail address: lutfiyedahil@arel.edu.tr

poor quality.

For many years, state institutions and organizations and private enterprises have difficulties with finding personnel is suitable for the qualifications they want. Non-existence of qualified personnel in a country, where most of the young individuals graduated from higher education have become unemployed, results in increasing of the worries about education institutions.

If it is desired to have a dedicated work force with specific skills, concept of quality should be considered and discussed in education institutions, before the enterprises. This is because a quality product and service will be possible only by a good education.

In accordance with National Education Basic Law, law no.1739 and dated 1973, that determines the structure of education system in Turkey, education system is composed of two main parts as formal education and non-formal education. Formal education includes pre-school education, primary education, secondary education and higher education. From 2009, studies have been maintained for raising access to pre-school education of 5-age-group children up to 100%. As for 8-year compulsory primary education, it includes 6-14 age group.

In primary education grade in which different school types don't exist, all students follow general education program. Programs for vocational and technical education don't exist at this grade. After 8-year compulsory primary education, there options are offered. General secondary education, vocational and technical secondary education and non-formal education. Secondary education, in Turkey, aims at young individuals between the age of 14-17. Secondary education, which is raised to four years in 2006, is followed by high education; two-year vocational school of higher education and/or four-year university education. Current education system in Turkey is illustrated on Figure 1 (ERI, 2012).

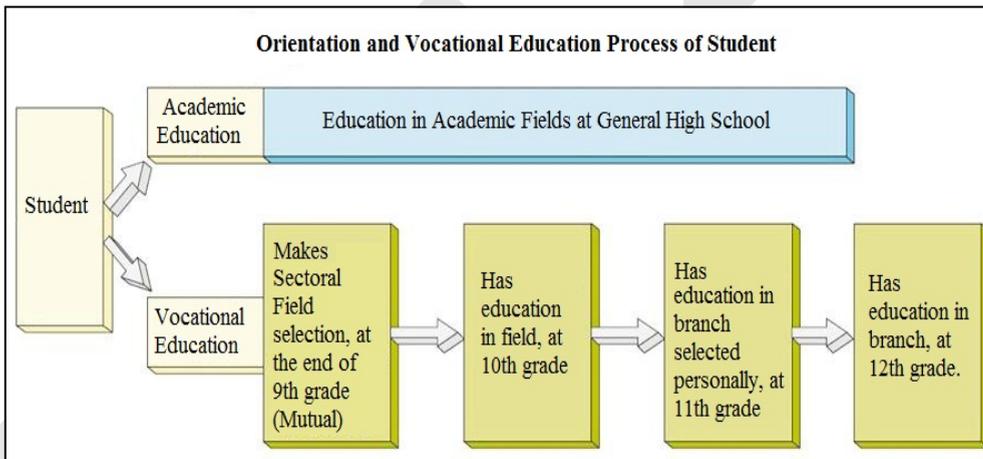

Fig 1. Current education system in Turkey (VTTW 2012).

As you see on Figure 1, student who reaches to secondary education process, goes towards academic or vocational education. No option other than progress in higher education is offered to the students who go to general high school as having an academic purpose, that is way these students go training centers under the current conditions or seek to increase their chances in higher education by taking private lessons. As for students who head towards vocational education, they must have education at the field to be selected or has to be selected

by them and then must begin to work, because their academic education alternative is too low. Due to the education is taken by the students, who take mutual lesson at 9th grade, intended for field at 10th grade and for branch at 11th grade, will be based on determination of their futures, their educational levels must go parallel with current technological conditions. While conventional education model focuses on ability of individuals in reading, writing and calculations of basic arithmetic, the basis of focusing on imagination and design phases of the role of individual in production process needs to be structured on eight key competences, aligned as; 1) communication in native language, 2) communication in a different language, 3) basic mathematics, science and technology competences, 4) digital competence, 5) learning to learn, 6) interpersonal and civil competences, 7) entrepreneurship and 8) cultural expression. Cycle of instruction schedule is illustrated on Figure 2.

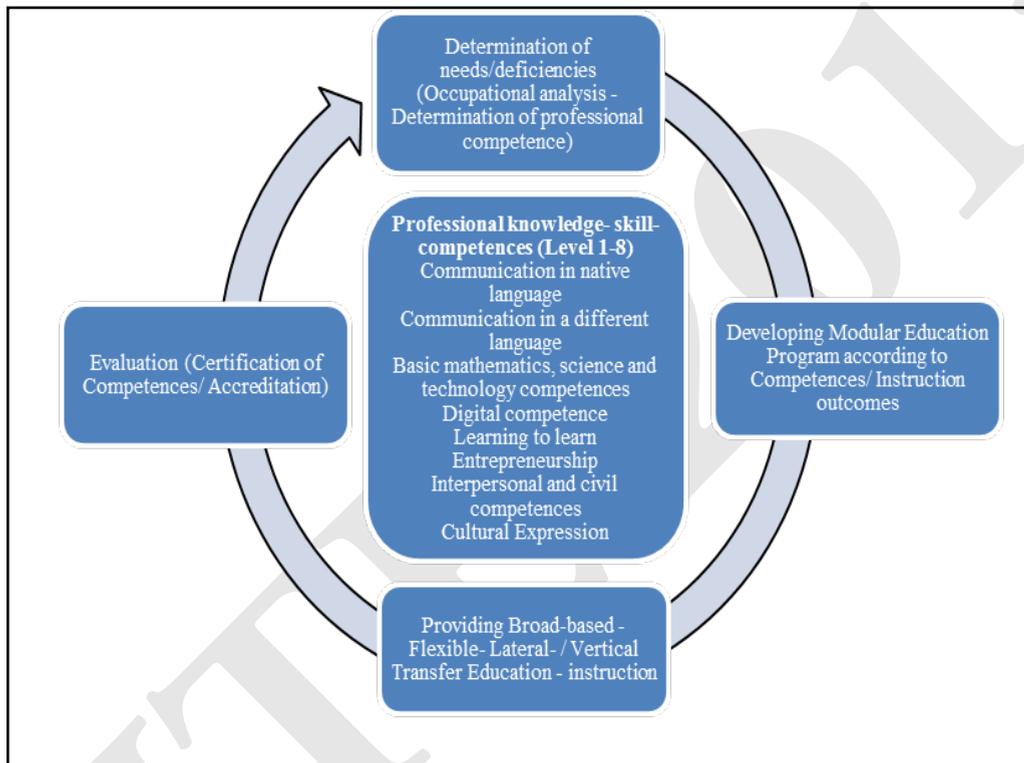

Fig 2. Instruction schedule cycle (VTTW 2012).

Countries have the desire to solve basic problems of vocational education by crossing into models of forming new instruction schedule, need to establish “Instruction Schedule Cycle” firstly. After this stage, a structure that allows education programs to be updated constantly in parallel with market demand, should be added in this cycle. Managements forms of this structure are important as well as its establishment. It should be provided that employee, employer, education institutions etc.all stakeholders work together in order to system can work. It will mean that if one wheel doesn't work, system doesn't work too. These wheels are illustrated on Figure 3.

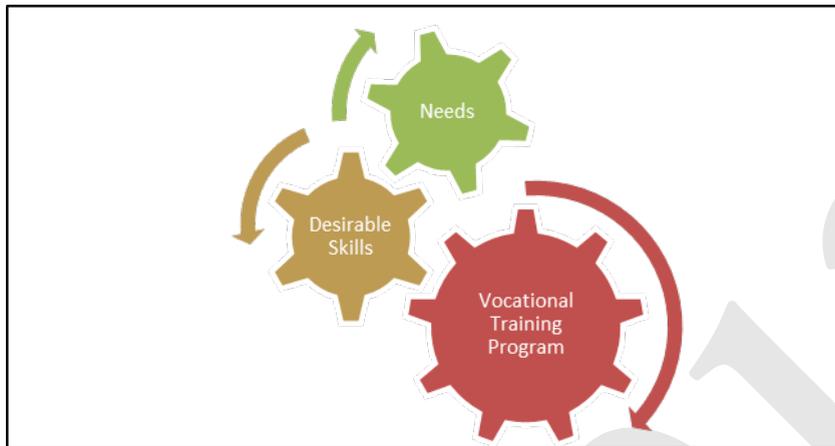

Fig 3. Wheels of Instruction Schedule (VTTW, 2012).

In our country, classical education concept dominates in all education institutions in particular higher education institutions. This concept raises individuals who are greatly passive, with weak character in investigation, without self-confidence, cannot easily accommodate with innovations and change.

In classical education, education activity is generally practiced through a one-way information transfer from teacher to student. As for student, listening silently instead of participating is considered as a proper environment for instruction. In this environment, success is achieved by measuring generally how much of the transferred information is kept in mind? It is not taken into consideration whether the students graduated from universities (outcomes) are suitable for expectations of our clients (society, establishment in which career is built, protectors and even students in person) or not.

In classical education concept, there is almost no information exchange between education institutions and neither “suppliers” nor “clients”. It seems like that success of such a system depends on carrying out how it is planned. As for our “outcomes” are being admired by supreme establishments are in our client position (society, establishment in which career is built, protectors and even students in person) it is not among the worries of education institutions. On table 1, Income, process and outcome concepts in the Conventional Education Concept are illustrated.

Table 1. Income, process and outcome concepts in the Conventional Education Concept (Karabulut, 2004).

Income	Process	Outcome
Student Teacher Classroom, Laboratory Library	Information transfer from teacher to student	Students with information storage

While the reason why desired purposes cannot be achieved in this concept is seen as that the rules are violated, education institutions don't feel the need to cooperate with the establishments where our graduates work, with the protectors and the students in order to enhance the success; and motivation of students and teachers is not important in this concept.

### *1.1 Total Quality Concept in Education*

Access to quality education has been becoming more and more important for Turkey. We should offer, primarily, a comprehensive basic education program to our young individuals in order to they can make their potentials real, participate effectively in social life in the way they want and benefit from employment opportunities are with dignity. Afterwards, we should offer programs that give wider and transferable skills as well as vocational skills within the scope of quality secondary education.

On one hand, while steps are important for enhancing vocational and technical education has been taking, on the other hand, problems are important in many fields, such as access and attendance to secondary education, quality of offered education, general education and vocational education and even quality differences among different vocational education programs, learning level accessed by our young individuals, relationship between vocational education and labor markets, and experiences of our young individuals in working life, attract the attention ERI (2012).

Quality concept has been a subject that was interested too much throughout history and that was born with production relations even though their dimensions are different. Although it is suggested that first records on quality go back to B.C. 2150, existence of the quality as a concept runs across 19th century (Yalçın, 1998).

In our days, it is commonly accepted that quality should be used in all firms and in all fields of firms. Although quality issue has been brought into question by directors of modern organizations more frequently and on a great number of academic and business publication, on media and in education seminars, it is seen in the literature that there is been no agreement on quality subject and quality has been defined in many different ways (Reeves and Bednar (1994). For Reeves and Bednar (1994), quality is defined as "The most important power leading the economic development of the companies in international market"; as for Jüren it is "suitability for use"; as for Crosby it is "suitability for necessities" Tan and Peşkirçioğlu (1991). For Kauro Ishikawa, one of the leaders of Total Quality Management, quality is defined as to develop the product is control-applied, the most economic, the most useful and always consumer-pleasing, and then to make design of it and to produce and to provide after selling services" Deimer (1994). Apart from these, although it is possible to give many definition of quality, the common property of definitions made is that they discuss the quality as the customer-oriented concept Peker, 1993 and Kavrakoğlu, (1996).

Total quality management is a management concept that defines the quality as "suitability for purpose" and that defines the purpose as "requests of client". As being different from the other regimes, total quality management is seen as a regime that can be adapted to structure of any kind of organizations and makes the organizations, which they are adapted, more excellent. It is argued that the most important reason why total quality management is different than the other regimes is that it has a way of thinking which creates the synthesis formed by evaluating the necessities of the establishments in a too different way than conventional approaches, in other words, it has a philosophy. Because it is possible to adapt philosophic properties of quality management to structure of any kind of organization. It is possible to put these philosophic properties in order, as Yenersoy (1997).

#### Main Objective:

- To maintain own entity

- A healthy infrastructure is assurance. In order to provide persistence in quality, management efforts should be supported by a correct work system.
- Customer satisfaction.

Education institutions that play role in forming the society may train prudential students in unity by means of giving education in accordance with the expectations of students and society, it should be prepared an environment to enhance quality of goods and services by training the people as producer and consume. The point is allow the students to realize the necessities that will head them towards developing, constantly. It should be kept in mind that Total Quality Management is a problem solving method that will meet necessities in question. In order to develop qualification of education and to raise success of student, it is required to create the infrastructure that will meet expectations of education organizations, students and society. A studying method that is participative and based on collaboration, should be formed.

A balance should exist between their own qualifications of school directors and teachers and qualifications required by their duties; they should get the most proper behavior in resolving knowledge and skill deficiencies acquired before service, in benefiting from in- service training and in applying new method and new technology. In the rapidly changing world, no education institutions has the opportunity to give knowledge and skills are enough for a lifetime, at once. Countries look over their education systems, constantly, and restructure them in accordance with the conditions of age and today.

Table 2. Student size in general and vocational education (VTTW, 2012).

Years	Total	General Secondary Education	Vocational and Technical	(%) 3/1
1997-1998	2.129.989	1.166.195	963.794	45,2
1998-1999	2.280.676	1.282.605	998.071	43,8
1999-2000	2.316.350	1.399.912	916.438	39,6
2000-2001	2.362.943	1.487.415	875.528	37,1
2001-2002	2.579.819	1.673.363	906.456	35,1
2002-2003	3.023.602	2.038.027	985.575	32,6
2003-2004	3.014.392	1.963.998	1.050.394	34,8
2004-2005	2.949.449	1.937.055	1.012.394	34,3
2005-2006	3.258.254	2.075.617	1.182.637	36,3
2006-2007	3.386.717	2.142.218	1.244.499	36,7
2007-2008	3.245.322	1.980.452	1.264.870	39,0
2008-2009	3.837.164	2.271.900	1.565.264	40,8
2009-2010	4.240.139	2.420.691	1.819.448	42,9
2010-2011	4.748.610	2.676.123	2.072.487	43,6

As seen on Table 2, when statistics of education is examined, it is seen that interest to vocational and technical education increased by 2003-2004 academic year. While total rate of vocational education at secondary education is 32,6% in 2002-2003 academic year, the rate of students of vocational education increased to 43,6% in 2010-2011 academic year, in proportion to students of general education. The main reason why the interest to vocational technical education increased, is explained in several ways. One of them is defined as the increased demand of growing economy to labor. Post crisis, between the years of 2002-2007, average annual growth rate was 7,3. Growing manufacturing industry formed 727 thousand additional employments in the period in question. In growing period, especially in Marmara region, there was a strong demand to vocational high schools, this demand could not be met because of the lack of capacity. Another reason for the interest increase to vocational secondary education is defined as the opportunity of open admission that is provided to MYO (Vocational school of higher education). It is seen that positive and negative effects of open admission will be always an object at issue. As for another reason for the interest increase to vocational secondary education, the reason is the efforts in order to remove the coefficient application by means of government. Both expectations from government in this direction and efforts of government and support given by society to these studies, provide an increase in rate of schooling at vocational secondary education. Although it has been decided to remove the coefficient completely for 2011-2012 academic year, there are worries about that this subject will be delayed for a longer time, because this subject has been brought to trial by politicians, and therefore it causes worries about in preferring vocational secondary education even if just a bit (VTTW, 2012).

### *1.2 Centralist Education System*

Education system is highly centralist in Turkey. Education and instruction entities, programs and curriculums are prepared in center. According to data of OECD, 94% of decisions about education is made at central level, in Turkey. Existence of differences continue among the regions, provinces, districts and schools. That is why charge of central organization has gradually increased over the years; this approach caused development of central staff and gathering teams of experts in Ankara, and moreover, local staffs that are not given authority and responsibility cannot be grown. Therefore, even locally designed projects are obliged to be carried out as center-oriented. Local demands have no impact on the curriculum that is determined centrally. Central curriculum restricts creativeness of teacher (VTTW, 2012).

### *1.3 Occupational Standards, Educational Standards, Learning Outcomes*

When the subject of validity of formal, common and informal learning is discussed, it is possible to mention three type standards about competences. Two main standards are related to category:

- 1) Occupational standards
- 2) Education-Instruction standards
- 3) Measurement of learning, evaluation, validity and certification process standards

First two are related to main standard category. These two categories work according to different logics that reflect different priorities, motivations and purposes. Occupational standard is a classification and also are definitions of main works done by people. According to the logic of employment, in these standards, it is emphasized what should people do, how can he do this and how well should he do. These are expressed as competences and are written as learning outcomes. For this reason, when educators prepare their programs, they should base these upon current occupational standards or should determine learning outcomes in the studies that they do with relative sector. All countries have occupational standards; every country has specific style and format. International Standard Classification of Occupations (ISCO) supported by ILO (International Labor Organization) is a occupational standard which is mostly-accepted. Occupational standards function as a bridge between labor market and education system; because educational standards (curriculums and pedagogy) are developed based upon occupational standards.

#### *1.4 It is possible to align total quality principles in education as following.*

- Determination of objectives are suitable for expectations of society.
- Reaching the set purpose at once.
- Measuring the level of reaching the purpose.
- Adopting to follow the developments as a principle.
- Giving importance to qualified training.
- Establishing the active communication network.
- Giving importance to team work in management.
- Providing the motivation in management.
- Establishing a democratic management system.

#### *1.5 Properties of Total Quality Education*

It is possible to align properties of total quality education as; Relations with suppliers, full participation, continuous improvement.

#### *1.6 Relations with Suppliers*

In contrast to conventional management concept, Total Quality Management predicts a close cooperation with the other education institutions providing income (Student, teacher and education material) to itself. Since, unless “income” is quality, an education with desired quality cannot be realized. For this reason, it is extremely important that also institutions that provides students to customer education institution, should give quality education. Today in our country, the reason why university education hasn't the desired quality is, before the sustained educational activities, that secondary education institutions cannot train students in expected standard.

In this case, the duty of university managements is to indicate clearly they expect how a student profile and which properties should be exist, by providing a close cooperation with institutions related to secondary education (Ministry of National Education, relative General Directorates. National Education Directorships and school managers) and to give the needed support for providing this.

#### *1.7 Full Participation*

Quality of educational activities should not be expected only from instructor. As we mentioned before, the purpose is not to load knowledge. Directors of education institution are responsible for forming the learning environment. For providing general participation, motivation of instructors, students and other personnel should be provided. The main rule of providing the quality is to provide active participation of everybody in a working group or quality circle. Working groups related to education are an important and inseparable part of quality organization of the institution.

By cooperating with the other teachers, incorporating these teachers into team work by means of teacher is in leader position, gives positive results. If we need to clarify the issue by an example; an economy professor who applies Total Quality Management on Master program at “Eastem Miane Technical Coltege”, indicated that students began to read the graphics properly and interpret the basic equations properly with the help of mathematics professor. Again in the same program, he indicated that success of the students increased in marketing class as a result of insisting on price theory through the request of marketing professor. Student, who apprehends whole subject by means of team work and knows he has a role and responsibility in dealing with the problems in his team, will control himself and his team friends in order to increase the success, by protecting his duties and responsibilities.

### *1.8 Continuous Improvement*

Total Quality Management is not to catch the perfect, it is to catch better of the good. Seeking to better is a thinking and practicing process. Total Quality Management concept that aims to raise quality of products and to increase productivity in manufacturing firms, also aims to raise quality of education in education sector.

Quality improvement is required to continuous improving of all activities in the education process. Better quality can be reached by internal and external quality improvements. The main purpose of improving the internal quality is to make business processes more simple and more fluent. Avoiding from the problems and failures in the business processes, will decrease the cost in the long term. The purpose of improving the external quality is to raise satisfaction of external customer. For this, innovations should be reflected on curriculums and new learning methods should be practiced. In this way, quality of our products, in other words, quality of students trained by us, will increase too. If education institutions want to enhance current quality of education or to present new quality purposes, they should adopt continuous improvement as a principle.

## **2. Instructor and Student in Total Quality Management**

Certain changes will come into existence in classroom environment by adopting Total Quality Management. By putting Total Quality Management into practice, an instructional profile that that can establish a dialog with his student instead of the formal relationship between student and teacher and that can focus on the student, that guides student away, that doesn't criticize but leads the way, that shares the knowledge rather than give coordinated knowledge, that looks for knowledge in external environment, not in classroom, that follows the developments of science and technology, that promotes the students to research, that knows all kinds of necessities of student, that looks for the reason of the failure but doesn't judge, will be drawn.

By practicing Total Quality Management, the radical change in the top management and teaching staff, will affect the students unavoidably. Students graduated from the schools where Total Quality Management is applied, will develop skill in the fields of communication, team work, problem solving, learning. Student won't be bored in the lessons any more, will express his thoughts easily and will head towards search and examine. He will go an upper foundation by Desire to Knowledge acquisition. A society that follows technological developments, that loves team work, that has respect for his teachers and friends, that products but doesn't consume with students, will come into existence. A student who became qualified before the service, will see with a critical eye. It will bring student in ability of reel thought. In this way, individuals that became qualified before the service, will play a big role in country development.

## **3. Result**

In comparison with conventional education concept, Total Quality Management has great superiorities in developing education system and in growing qualified personnel that can meet expectations of society. Total Quality Management creates an opportunity in restoring reliance of the society on education system. Missing of business world to reach qualified personnel, will be met by continuous improvement of education system. It seems that this improvement cannot be provided by conventional education system, which is closed to environment. Improving the education system will lead to an increase in producing power of country. For this reason, it is more significant and essential to practice Total Quality Management in education institutions, before the production enterprises. If our education system fails and produces outcomes of poor quality, it will mean wasting all of the sources of society.

Total Quality Management has a qualification that will provide important contributions to competition in global market, by means of catching the innovation in our enterprises and society, and that will bring a breath of fresh air to our education system. In order to make Total Quality Management real in education institutions, however, top

management must read philosophy of Total Quality Management like a book, set his heart on and take the leadership. If not, making Total Quality Management real won't be possible.

INTE 2013

Execution of Total Quality Management in education provides the following advantages:

- Avoidance of wastage
- Increasing the quality
- Forming of well-kept buildings and environment
- Procuring successful academic members
- Raising the morale and prolificacy
- Achieving perfect exam results
- High success rate
- Specialization
- Getting support from families, industry and society
- Active usage of sources and enhancement of this usage
- Continuous improvement and development.

When enterprises producing good and service carry out concept and philosophy of Total Quality Management properly, they will reap many benefits of this modern management model. In the same way, this model, which is carried out in education sector too, will bring several benefits especially in terms of students, educators and personnel.

First of all, high student will be achieved. Because 7 requests and necessities of students are in the heart of this model. Along with high student success, there will be an increase in number of student that will want to check in this education sector. Therefore, advantage to find qualified student among the increased number and to make selection, will be caught. Anyone works in education sector will develop a sense of responsibility. Similarly, it can be brought directors of education sector in strong competences of leadership and planning.

Workers will have high morale due to participation in management and decisions. A desire and an ability to finish a given work in a shorter time, will be created to workers. In order to production of unlimited, common and continuous knowledge, as opposed to inadequacy in information transfer, "learning the way to reach the knowledge and improving himself continuously" of human has become the main objective of education. In other words, the underlying purpose of for modern education is to give behaviors of "Capability development", "Creativeness", "Impersonating", "Adaptation to new situations in the future", "Generating new solutions for new problems". Education sector and system should adopt concept of Total Quality Management that has view of continuous improvement and development in its philosophy and should put it into practice. If the desire is to have a self-dedicated labor with significant skills, concept of quality should be handled in education institutions before the enterprises and should be discussed. Because a qualified product and service will be possible only by a good education. It should be kept in mind that Total Quality Management is a problem solving method that will meet need in question. In order to develop qualification of education and increase success of student, a working system of education organizations based on sharing and cooperation, should be formed in schools.

Result is obtained by a teacher profile that can establish a dialog with his student instead of the formal relationship between student and teacher and that can focus on the student, that guides student away, that doesn't criticize but leads the way, that shares the knowledge rather than give coordinated knowledge, that looks for knowledge in external environment, not in classroom, that follows the developments in science and technology, that promotes the students to research, that knows all kinds of necessities of student, that looks for the reason of the failure but doesn't judge.

## Abstract

The planning in Physical Education (PE) is a crucial competency of Pre-service Teachers (PTs) that is developing throughout the university courses. The adjustment of the time planned is a common problem for PTs without experience, and they show high differences between the time that they program and the real time that they employ during the intervention phase of teaching PE. We created a computerized time sheet to deliver visual feedback to PTs about this difference. Our aim was to accommodate quickly the adjustment of the time in planning in PE in a few sessions of visual feedback and coaching meeting with the supervisor of the faculty. We expose the computerized sheet and its application on one PT (an individual case) with a repeated measures series (three trials of baseline and ten trials of intervention were carried out). The results show us the efficacy of the computerized sheet (visual feedback and coaching meeting). We could verify the inflection of the curve since the first treatment trials, decreasing the differences between the time planned and the real time employed during the classes. We conclude that this method is a good way for PTs training during their university courses and for in-service teachers who want to improve their accuracy of planning PE in the future.

*Keywords:* Coaching; time management; repeated measures; computerized sheet

## 1. Introduction

Since the classic paradigm of Competency-Based Teacher Education (García-Álvarez, 1987; McDonald, 1974; Morgan, 1984), and the rise of this competencies' learning in the European Space for Higher Education, all the abilities that a Pre-service Teacher (PT) must have after his degree are again at the height of the science of teaching (Nizam, Mahmoud, Bani, & Mohammad, 2009). Among these competencies, the planning of teaching is one of the most important areas because all novice teachers find support in it to increase their security and their intervention into the classroom (Del Villar, 1993). Other authors also stated that planning was more important than intervention to assure a greater level of efficacy. Curtner-Smith (1996) measured the

\* Corresponding author: Jesús Viciano. Tel.: (+34)958246641

E-mail address: [jviciano@ugr.es](mailto:jviciano@ugr.es)

impact that an early field experience had on 28 pre-service PE teachers in secondary school. In this research the planning competency was more important than the intervention for achieving success in the teaching process. Fernández and Barquín (1998) declared that teachers considered the planning more important than the evaluation phase to improve as a professional, and to be a good curriculum maker and a good planner for assuring certain teaching efficacy.

One of the most important aspects in planning PE is the time management of the class; PTs need to adjust it for an accurate plan in PE and it supposes an added difficulty to planning PE correctly. Numerous researches have been developed around this issue (Viciana, Fernández, Requena, Zabala, & Lozano, 2003; Lozano, Viciana, & Piéron, 2006; Momodu, 2000). Among the time categories that we are necessary to plan and apply correctly, the Motor Engagement Time (MET) is perhaps the most important. MET is the time that the students are involved in physical activity, and motor learning depends on it. However, the time that students spend paying attention to the PE teacher while he/ she explains the tasks or theoretical contents [Student Attention Time (SAT)] and the time employed to organize the students before the tasks [Organization time (OT)] are also important. When these two categories of time increase they cause a decrease in MET. So if our goal is to get an effective motor learning session in PE, we need to reduce OT and SAT in order to increase MET as much as possible. Planning is the instrument to achieving this, but we need to teach this competency in the university and the PTs need to practice different plans to assimilate the strategies for good planning (Van Der Mars, 1994; Viciana, 2002).

It is well known that feedback helps teachers to be aware of their actions in teaching (Viciana & Salinas, 2008). Viciana et al. (2003) developed a computerized sheet to deliver feedback about the time management that PTs employed in a practical session of PE. In 2002, the University of Granada gave this computerized sheet an award in the first edition of the 'Teaching Innovation Awards'. For these reasons, we decided to apply the use of this computerized sheet to deliver visual feedback to a PT (in a coaching meeting) in order to teach him to adapt his intervention in the classroom. This could allow us to achieve good levels of MET with respect to the time of MET planned. Consequently, the purpose of the present pilot experience was to examine the effect of the application of a computerized sheet to deliver visual feedback on good levels of MET with respect to the time of MET planned in PE classes in a PT. We hypothesized that the application of the computerized sheet to deliver visual feedback could allow to the PT to achieve good levels of MET with respect to the time of MET planned.

## 2. The computerized time management register sheet

The computerized time management sheet has an entry screen where you can choose registering the time management in a practical PE session or registering the feedback that the teacher delivers to the student during the session. The figure 1 shows the sequence of different screens in this computerized sheet from the beginning to the results presentation.

In general, the computerized sheet has several buttons corresponding to the different time categories. It works like a continuous chronometer that only changes the amount of time to the category that you click on. Each category has its own display to see the chronometer working in each case or stopped if the category is not clicked. The categories and buttons that you can control and register in the computerized time management sheet are:

- a) *Motor Engagement Time*. The time that the students are involved in physical activity. There are three options inside (alternative tasks, consecutive tasks and simultaneous tasks). These three subcategories let us control if a student is doing physical activity the whole time that a task is being carried out or the

time employed in the task we need to divide between two students (alternative execution) or more than two (consecutive execution). Simultaneous execution means that all the students are involved in physical activity during the tasks, and the global time registered for the task is equal to the MET.

- b) *Student Attention Time.* The time that the students are paying attention to the teacher's explanation. There are three options or subcategories (Initial session information; initial task information; and feedback given to the students). The three subcategories add time to the total amount of the general category SAT.
- c) *Organization Time.* The time that the teacher spends organizing the materials and the students prior to the task. There are two subcategories (material and resources organization; and student organization). Both categories add time to the general category OT.
- d) *External and Internal causes of unforeseen time are also registered.* They both add to the total amount of time in the general category of "unforeseen time" (UT).
- e) *Finish session.* This button stops the general time counter of the session. After this button is clicked, the computerized application generates an internal file to process the data.

After this process is finished, we can ask the computerized sheet to generate figures that show the different categories registered and the comparison to another model or a previous time value that you can introduce into the sheet (such as the time value of the categories planned prior to the practical session). These figures let us compare the time planned and the time employed in the categories of the PE session analyzed in a visual way (Martínez Álvarez, Cocca, Ocaña, Gómez-López, & Viciano, 2008).

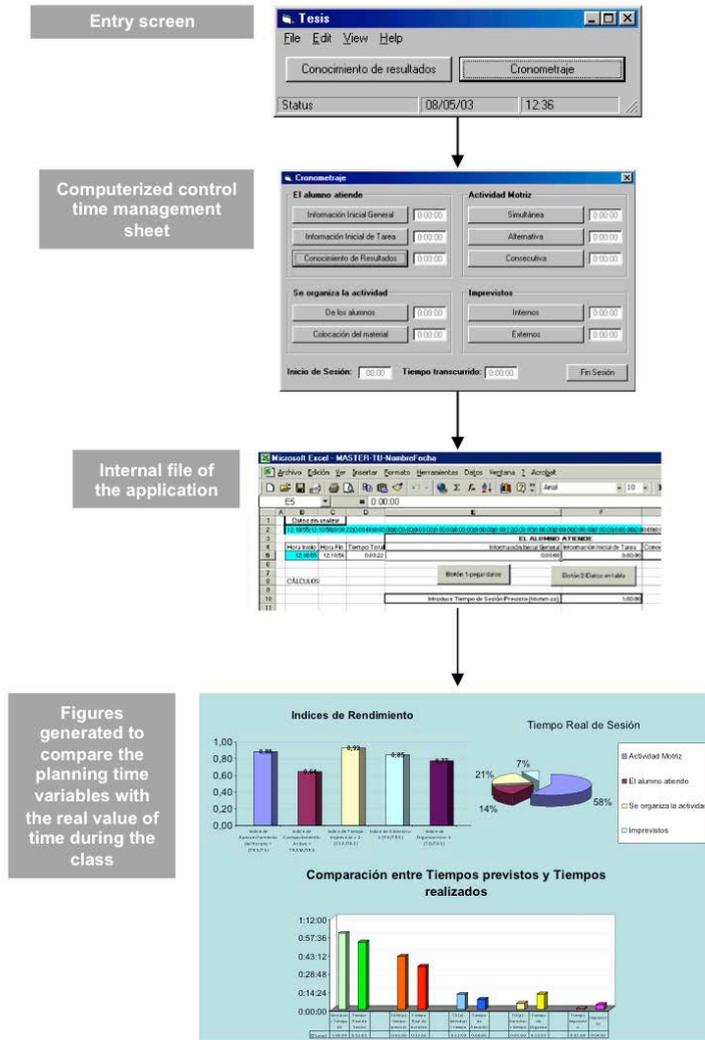

Fig. 1. Sequence of screens on the computerized time management register sheet

### 3. An experimental case to analyze the usefulness of the computerized time management register sheet

#### 3.1. Participants

The participant was a male PT that studied in the Faculty of Physical Education and Sport of Granada University. He was 24 years old and he was in his last year at the university doing the internship programmed by the supervisor in a School Center. The observer and supervisor was the teacher of Planning in PE subject and he was the main researcher of this study. All sessions carried out in this study were applied to a secondary school group, formed by 27 students (10 females and 17 males, aged  $14.0 \pm 1.0$ ).

#### 3.2. Design and variables

We employed an observational dependent temporal series design. We used only one case to analyze the usefulness of the computerized sheet. We used three trials for the baseline (practical sessions) without treatment (feedback), and ten trials with their corresponding visual feedback of the management time categories made by the PT (registered and compared to the planned values).

The dependent variables were:

- a) Motor engagement time (MET). The time that the students are involved in physical activity.
- b) Student attention time (SAT). The time that the students are paying attention to the teacher's explanation.
- c) Organization time (OT). The time that the teacher spends organizing the materials and the students prior to the task.
- d) Unforeseen time (UT). The time employed in unforeseen causes during the class.
- e) Motor engagement time adjustment (METad). The difference between planned MET and real MET during the practical session analyzed.
- f) Student attention time adjustment (SATad). The difference between planned SAT and real SAT during the practical session analyzed.
- g) Organization time adjustment (OTad). The difference between planned OT and real OT during the practical session analyzed.
- h) Total absolute adjustment. This variable is composed by the sum of all adjustments in their absolute value.

The variables 1-4 were registered by the computerized sheet, and the variables 5-8 were calculated (planned time minus real time registered). The independent variable was the visual feedback given by the computerized sheet and the coaching meeting (PT and supervisor) carried out after the practical session was finished.

#### 3.3. Instruments

The computerized time management register sheet was used for controlling the time during the practical sessions of the study. It works as a chronometer, changing the category depending on the button that the observer clicks during the practical sessions. The description of the sheet and some illustrations appear in figure 1. The variables controlled by the computerized sheet are described above.

#### 3.4. Procedure

During a teaching unit, the PT and the supervisor planned a set of practical sessions with some special characteristics with the aim to control all possible contaminating variables. These characteristics were the following: (i) The same content was planned in all sessions (introduction to team sports); (ii) the different

temporal variables were planned with the same amount of time in all practical sessions. MET was 30 minutes, SAT was 12 minutes, OT was 8 minutes, and UT had to try to be at zero; (iii) all the sessions were planned with 50 minutes, because it was the time available on the schedule; (iv) all sessions were applied to the same group of secondary school students in the same school center and at the same hour.

Principally, the PT applied the three sessions corresponding to the baseline, where no feedback was delivered to the PT after intervention. Secondly the ten sessions of the treatment were developed and a coaching meeting with the supervisor was carried out after each one. These coaching meetings had feedback as the main issue to discuss. This feedback gives visual information about the real time managed by the PT and the time planned as a criterion of efficacy. The adjustment or the difference between these two values of time (planned and registered) was the main object of the discussion between PT and supervisor, and several strategies to solve the adjustment were discussed.

#### 4. Results

The results of the temporal variables registered by the computerized sheet are shown in table 1. We had shown the results in minutes and seconds because it is the best way to interpret the differences with the criterion (MET = 30; SAT = 12; OT = 8; UT = 0).

Table 1. Data registered by the computerized time management sheet for each category

VDs	Sessions of the baseline			Sessions of the treatment									
	1	2	3	4	5	6	7	8	9	10	11	12	13
MET	22'18"	24'30"	23'50"	23'51"	25'42"	25'50"	26'30"	27'28"	27'42"	29'30"	30'30"	28'52"	29'25"
SAT	16'34"	15'13"	16'40"	13'52"	12'40"	10'06"	14'30"	13' 20"	11'14"	9'21"	10'27"	11'38"	10'33"
OT	6'56"	8'57"	9'10"	9'12"	10'31"	8'34"	8'15"	8'04"	09'32"	9'09"	8'35"	8'48"	9'12"
UT	3'12"	1'20"	0'25"	3'05"	1'07"	5'30"	45"	1'08"	1'32"	2'00"	28"	42"	0'50"

Note: MET = Motor engagement time; OT = Organization time; SAT = Student attention time; UF = Unforeseen time. VDs = Dependent Variables measured.

Table 2 shows the calculated variables. They represent the differences between the times registered during the practical session and the times planned prior to the intervention. They are also shown in minutes and seconds to facilitate the interpretations of the adjustment. We can observe that the total adjustment (the sum of the absolute adjustment of all variables) decreasing across the sessions of the treatment.

Table 2. Calculated variables (difference between registered variables by the computerized time management sheet for each category and the planned variables)

Temp. adjust.	Sessions of the baseline			Sessions of the treatment									
	1	2	3	4	5	6	7	8	9	10	11	12	13
METad	-8'12"	-5'30"	-6'10"	-6'09"	-4'18"	-4'10"	-3'30"	-2'32"	-2'18"	-30"	30"	-1'08"	-35"
SATad	4'34"	3'13"	4'40"	1'52"	40"	-1'54"	2'30"	1' 20"	-46"	-2'39"	-1'33"	-22"	-1'27"
OTad	-1'04"	57"	1'10"	1'12"	2'31"	34"	15"	04"	1'32"	1'09"	35"	48"	1'12"
UT	3'12"	1'20"	0'25"	3'05"	1'07"	5'30"	45"	1'08"	1'32"	2'00"	28"	42"	50"
TOT. adjust.	17'02"	11"	12'25"	12'18"	8'36"	12'08"	7"	5'04"	6'08"	6'18"	3'06"	2'30"	4'04"

Note: METad = Motor engagement time adjustment; OTad = Organization time adjustment; SATad = Student attention time adjustment; Temp. adjust. = Temporal adjustment; TOT. adjust. = sum of all absolute adjustments; UF = Unforeseen time.

Next, figure 2 represents the curves of the evolution of the adjustments (METad and Total absolute adjustment) across all the sessions developed (baseline and treatment).

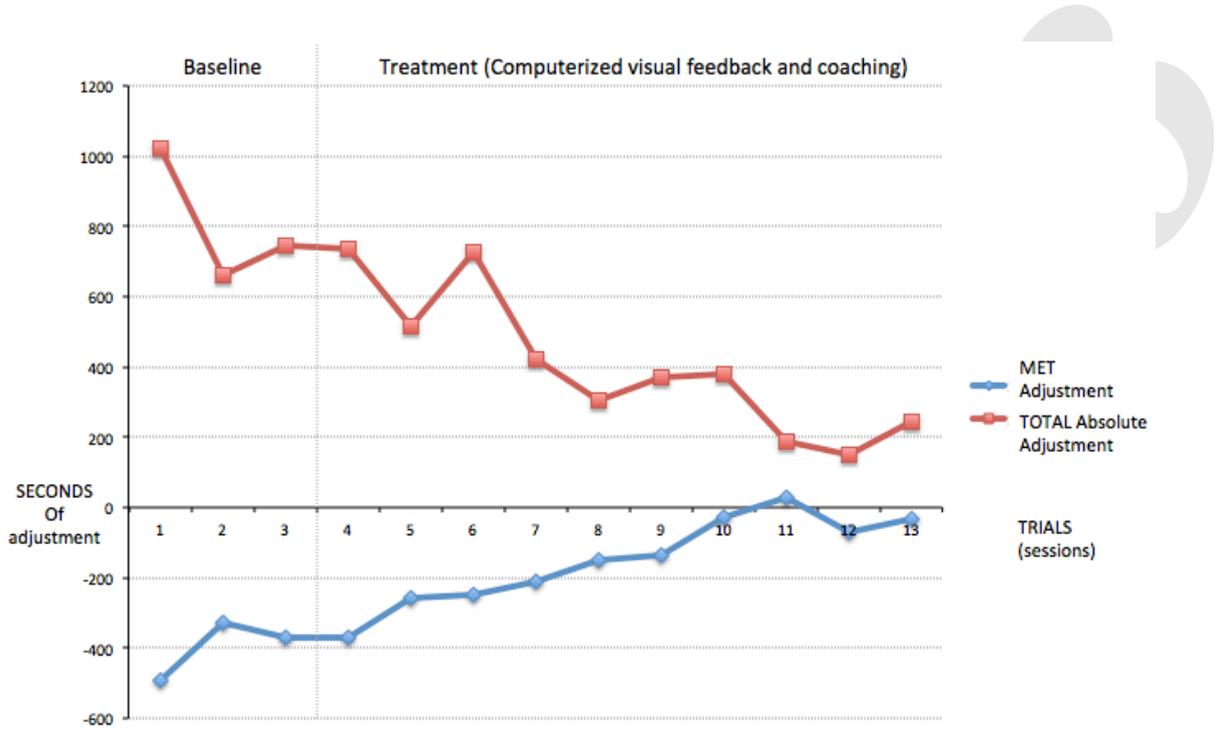

Fig. 2. Curves of adjustment of MET and Total Absolute Adjustment during all the sessions carried out in this study

## 5. Conclusions

The computerized time register sheet is easy to use and it contributes efficiently to the pre-service teacher training in PE. The PT who experienced this formative process valued it as a very positive experience. He highlighted the help that the computerized sheet gave him to be aware of his mistakes in planning and intervention. The use of this computerized sheet in PE faculties could contribute to better teacher and coach training using the visual information from their practical actions. Finally, the use of the present computerized sheet could be a better pedagogical resource than the traditional manner that we used to put into practice (only verbal recommendations for PTs after their interventions).

### Abstract

The purpose of this study was to determine the effect of inquiry based learning method on students' motivation. Nonequivalent Control Group Design was employed as the research method and the population of this study was comprised of first-grade students attending the Faculty of Education at Hacettepe University. The Motivated Strategies for Learning Questionnaire (MSLQ) which was developed by Pintrich, Smith, Garcia and McKeachie (1991) and adapted into Turkish by Büyükoztürk, Akgün, Özkahveci and Demirel (2004) was applied to determine students' motivation. For the evaluation of the data, statistical analysis was applied.

*Keywords:* Inquiry based learning, student motivation, chemical equilibrium

## 1. Introduction

Laboratory work plays an important role in science and chemistry teaching. Several researchers also suggest that students will be more successful through participation in activities in the science laboratory (Hofstein and Lunetta, 1982, 2004; Hodson, 1990; Tobin, 1990; Garnett and Hacking, 1995). They believe that positive developments will occur in learners' meaningful learning, in their conceptual understanding and in their views of the nature of science especially in consequence of their participation in inquiry based laboratory activities.

Researches stress the fact that traditional lab work is not adequate in achieving the goals (Hofstein and Lunetta, 1982; Tobin and Gallagher, 1987; Tobin, 1990; Hofstein and Lunetta, 2003). In such traditional lab education, confirmatory activities are used in general (Lunetta and Tamir, 1979; Domin, 1999; Hofstein and Lunetta, 2003). Students follow the instructions step by step and do the experiments; indeed they often focus on completing the experiments they are working on, and they fail to understand the process of experiment in depth. According to many students, working in the lab means working with materials of experiment, and such objectives as learning and changing the views are given the secondary importance (Hofstein and Lunetta, 2004). Therefore, inquiry based work in the laboratory should be done (Abd-El-Khalick et al., 2004). Inquiry based learning is defined as the process of learners' creating meaningful and useful knowledge from knowledge at-hand by asking questions, drilling, and analyzing the knowledge (Perry and Richardson, 2001). In the learning environments where inquiry based learning takes place, students perform the experiments and the activities individually or in groups, and thus it is made sure that knowledge becomes more meaningful and more permanent. In this process, students try to respond to the problems to be answered or solved with their research which they construct through active participation (Tatar & Kuru, 2006).

Hofstein and Walberg (1995) contend that laboratories based on inquiry are the centers for science learning; because they make students participate in such processes as comprehending scientific questions and problems, generating hypotheses, designing experiments, collecting and analyzing data, and making inferences about scientific problems and phenomena (as cited in Qing, Jing and Yan, 2010).

Hofstein, Nahum and Shore (2010) found that students actively took part in the learning process in inquiry based lab settings, and that they developed positive attitudes towards laboratories. The participants stated that inquiry based lab experiments provided them with the opportunity to develop independent thoughts, to understand the chemical concepts, and to form a group atmosphere with more fun.

According to Domin (1999), students recognize the problems related to the experiment, identify the sub-problems, collect the data necessary for the solution of the sub-problems, and reach scientific conclusions by analyzing the data that they obtain so as to test their hypotheses in the case of experiments to be done by means of inquiry. They play active roles during such experiments since they determine their own problems and they themselves develop the solutions to those problems (Hodson, 1990).

Ergin, Şahin, Pekmez and Öngel Erdal (2005) emphasized that students needed to prepare a research activity for the inquiry based experiment activities, which was assigned by the teacher. For instance one such activity could be: "research the way heat is gained and lost for different systems".

In this process, students are expected to decide as to what different systems can be, to design their own experiment, and to collect and analyze their own data (as cited in Aydoğdu and Ergin, 2008).

A review literature demonstrates that inquiry based learning methods have been found to be more effective than traditional instruction and made contributions to the development of students' academic achievement, thinking, problem-solving, motivation and laboratory skills (Haury 1993; Smith 1996; Shymansky, Hedges, and Woodworth 1990; Rubin 1996; Crawford, 2000; Holbrook and Kolodner, 2000; Marx et al.,

2004; Oliver-Hoyo et al. 2004; Oliver-Hoyo and Allen 2005; Tuan et al., 2005; McReary, Golde, and Koeske 2006; Madden, 2011).

### *1.1. Significance of the Study*

A review of national and international literature demonstrates that inquiry based activities contribute to students' understanding the nature of science (Backus, 2005), to the development of their knowledge of the topic (Lord and Orkwiszewski, 2006), their skills of scientific process (Holfstein, Shore and Kipris, 2004; Deters, 2005; Aydođdu&Ergin, 2008), their attitudes towards science learning (Jones, Gott and Jaman, 2000; Gibson and chase, 2002; Lord and Orkwiszewski, 2006), their motivation in science learning (Tuan, Chin, Tsai and Cheng, 2005), and their communication skills. In research conducted by Allison and David (1972) and by Charen and George (1970), it was found that inquiry based experiment activities made contributions to the development of students' critical thinking skills (as cited in Qing et al., 2010). In our country, science courses are often taught through confirmatory type of activities, and inquiry based experiments are scarcely used. This paper aims at contributing to performing inquiry based experiments in science classes and making its use widespread; and the effects of such experiments on students' motivation are also investigated in line with our purpose. Thus, answers are sought to the following question:

Are there any significant differences between students taught with inquiry based learning approach (experimental group) and students taught with traditional instruction (control group) with respect to intrinsic goal orientation, extrinsic goal orientation, task value, control of learning beliefs, self-efficacy for learning and performance, and test anxiety in terms of chemistry course?

Sub research problems of the study are:

- Are there any significant differences between students' MSLQ pre-test scores in experimental group and control group?
- Are there any significant differences between students' MSLQ pre-test and post-test scores in experimental group?
- Are there any significant differences between students' MSLQ pre-test and post-test scores in control group?
- Are there any significant differences between students' MSLQ post-test scores in experimental group and control group?

## **6. Method**

### *2.1. Research Model*

The study was conducted in the Nonequivalent Control Group Design (Fraenkel and Wallen, 2006; Gay and Airasian, 2000).

### *2.2. Study Group*

A total of 37 students attending the Department of Secondary Science and Mathematics Education at the Faculty of Education of Hacettepe University participated in the research.

### *2.3. Data Collection Tools*

Motivated Strategies for Learning Questionnaire (MSLQ): The Motivated Strategies for Learning Questionnaire was employed in order to determine students' motivation in chemistry course. The MSLQ which was developed by Pintrich, Smith, Garcia and McKeachie (1991) and adapted into Turkish by Büyüköztürk, Akgün, Özkahveci and Demirel (2004) so as to evaluate university students' motivational adjustment and their use of differing learning strategies for their courses at university. The MSLQ comprised of two main parts: motivation, and learning strategies. The motivation part contains 31 items and the sub-dimensions of intrinsic goal orientation (IGO), extrinsic goal orientation (EGO), task value (TV), control of learning belief (COLB), self-efficacy for learning and performance (SLP), and test anxiety (TA). The results of confirmatory factor analysis which was performed to determine university students' motivation for chemistry were:  $\chi^2/df = 3,04$ , GFI= 0.87, AGFI= 0.77 and RMSEA= 0.07. The reliability coefficients were 0.74 for IGO, 0.575 for EGO, 0.89 for TV, 0.72 for COLB, 0.91 for SLP, and 0.56 for TA (Şen, 2011). In Table 1 the theoretical framework of motivation part of MSLQ can be seen.

Table1: The Theoretical Framework of Motivation Part of MSLQ

	Factor	Explanation
Value	Intrinsic goal orientation	Learners' beliefs and concerns about the importance of tasks
	Extrinsic goal orientation	
	Task value	
Expectancy	Self-efficacy	Learners' beliefs and concerns about performance
	Control of learning belief	
Affective	Test anxiety	Learners' affective reaction to a task

(Büyüköztürk, Akgün, Demirel, & Özkahveci, 2004)

#### 2.4. Data Analysis

The data obtained were analyzed through Mann-Whitney U-test and Wilcoxon Signed Rank Test.

#### 2.5. Procedures

The chemical equilibrium experiment was done via inquiry. The aim of the experiment was to prove the availability of the balance in the reaction occurring between the KSCN and  $\text{Fe}(\text{NO}_3)_3$  solutions. Prior to the experiment, groups of 3-4 students are formed, and the in-group roles are distributed.

1. Starting position: The experiment/observation is done. (Teacher: plans a starting position for the scientific problem). The teacher puts two solutions, the names of which are unknown to the students (the solutions of  $\text{KSCN} + \text{Fe}(\text{NO}_3)_3$ ), into reaction in a test tube. The students are asked to observe the phenomena occurring. (Result: a dark brown solution is derived.) No mention is made about chemical equilibrium here to the students. They are guided through activities and inquiry to conclude that there is chemical equilibrium.

2. It is made sure that students wonder and do self-inquiry: Students activate their prior knowledge and present their views. (Teacher: promises the students, structures the inquiry, gets them to define the words.) The teacher asks the students to make comments based on the dark brown solution obtained, and to state their initial thoughts: what happened here?

3. It is made sure that students formulate their thoughts and compare them with others' views: (Teacher: gets the students to state their opinions, ensures that a comparison is made between the prior knowledge of each student.) The students comment on their observations. One of the group members writes down what things are considered to be important by the group. The groups are asked to present in front of the class what they have written. The notes which are about chemical equilibrium are determined by the teacher. No mention of equilibrium is made yet. The teacher asks a new question: What will happen if we add a little more  $\text{Fe}(\text{NO}_3)_3$  solution to this solution? Note down your predictions.

4. Hypothesizing: Having determined the scientific problem, groups of students form their hypotheses. (Teacher: helps first with formulating the scientific problem, and then with formulating the hypotheses, highlights the difference between the two.) The students generate a hypothesis on what happens if the  $\text{Fe}(\text{NO}_3)_3$  solution is added to the mixture. If my hypothesis is real, I should observe these things, etc.

5. The students reflect on how to test the hypotheses (experiments, observations, questionnaires, documents, etc.) (Teacher: permits students enough time to work autonomously, and makes sure they compare their views.

He confirms the method of inquiry chosen.) Here, students have access to the sources of knowledge and reach the knowledge to test their hypotheses.

6. Testing the hypotheses: The hypotheses are tested with the method or methods (experiments, observations, questionnaires, document research) selected. (Teacher: brings together the materials (or circumstances) needed to apply the method of inquiry selected.) He adds a bit more  $\text{Fe}(\text{NO}_3)_3$  solution to the mixture and concludes: a darker brown solution is obtained. Here the causes are questioned. The changes at microscopic level are questioned. How did the addition of the  $\text{Fe}(\text{NO}_3)_3$  solution influence the concentration?, .....

7. The results are obtained, they are noted down for presentation (Teacher: helps with shaping the results.) The data obtained are organized. The groups perform their presentations.

8. Each hypotheses is tested for validity: unless a hypothesis is valid, they go back to step 3. (Teacher: encourages and re-starts the process of inquiry.) If the hypothesis is valid (teacher: helps with choosing the support and forming the synthesis. He recommends a new application situation.) The knowledge obtained is validated by the teacher, or is refused.

### 3. Findings

Table2: Mann-Whitney U-test results

	IGO	EGO	TV	COLB	SLP	TA
Mann-Whitney U	171,000	87,500	129,000	169,500	166,500	168,000
Wilcoxon W	361,000	258,500	300,000	340,500	356,500	358,000
Z	,000	-2,552	-1,280	-,046	-,137	-,092

a. Not corrected for ties.

b. Grouping Variable: Group

According to the Mann-Whitney U-test results, there is no significant difference between the scores of the posttest of students in the experimental and control group ( $p>.05$ ).

#### 4. Conclusion and Discussion

According to the statistical results, it was found that students' extrinsic goal orientation developed after the application. Extrinsic goal orientation is defined as evaluating students' themselves and comparing with friends in reaching goals, having grades or performance (Pintrich, Smith, Garcia, &McKeachie, 1991). This is a finding supporting the finding obtained in earlier research studies concluding that inquiry based activities promote students' motivation (Crawford, 2000; Holbrook and Kolodner, 2000; Marx et al., 2004; Tuan et al., 2005; Madden, 2011). In a similar vein, Gibson and Chase (2002), and Shimoda, White and Frederiksen (2002) also concluded that inquiry based activities were influential in students' having positive attitudes towards science learning.

Several researchers (Blumenfeld et al., 1991; Eilam, 2002; Lepper, Woolverton, Mumme and Gurtner, 1993; Polman, 2000) stated that inquiry based activities might raise students' motivation due to the fact that they give students freedom in making their choice, provide them with opportunities to carry out self regulation and to take part in projects they are interested in (as cited in Tuan et al., 2005). In this current research, the results stating that students' motivation increases on the sub-dimensions of extrinsic goal orientation are in the form of the proof of an experimental process.

#### 5. Recommendations

Well-constructed research problems are likely to contribute to students' meaningful learning. Inquiry based experiments instead of traditional laboratories of confirmatory type make students more active. The inquiry based experiment method can easily be implemented in our country, where the constructivist approach is adopted; and it is capable of making positive contributions to increasing the other affective variables in addition to achievement.

According to the research results and the results encountered in literature, it affects many affective variables influential in achievement. Therefore, making inquiry based experiment techniques widespread on the course and topic basis will lead to the emergence of healthier results for both teachers and researchers. In prospective research studies, alternatives to the traditional confirmatory type laboratories may be recommended.

# Efficiency Measurement in Higher Education: Concepts, Methods and Perspective

Maja Mihaljević Kosor<sup>a\*</sup>

<sup>a</sup>*University of Split, Faculty of Economics, Cvite Fiskovića 5, Split 21000, Croatia*

---

## Abstract

The aim of this research is to provide a conceptual basis for addressing efficiency in economics, focusing on higher education. The definition of economic efficiency using the Pareto criteria is presented. It is followed by the application of these concepts to higher education framework. The concepts and methods for estimating efficiency in higher education are quite complex and this may impair policy recommendations stemming from an incorrect definition or understanding, still, efficiency is a suitable and needed goal for any educational system, especially in a developing country.

*Keywords:* efficiency; higher education; inputs; outputs

## 1. Introduction

In the current literature on education, there is an apparent lack of theoretical guidance and the term 'efficiency', although extensively used, is either not carefully defined or the definitions differ. The aim of this paper is to provide a conceptual basis for addressing efficiency in a higher education (HE) framework. Although the concepts of efficiency are quite complex, and this may impair policy recommendations stemming from their inappropriate use or incorrect understanding, still, efficiency is a suitable and essential goal for any educational system, especially for a developing country.

The paper is organised as follows. In section 2 the origin of the theory of efficiency is analysed, the definitions of consumption, production and allocative efficiency are presented, and the concept of efficiency in the neoclassical framework is examined. Further modifications to the efficiency concept are examined in section 3 when the concept is applied in the HE framework. Section 4 introduces methods and techniques used in measuring efficiency in education and also presents some of their problems. Given the limitations apparent in the critical appraisal of efficiency in HE several definitions for efficiency are proposed and techniques for measuring them are considered. Concluding remarks are offered in section 5.

## 2. The Theory of Efficiency

To ensure a Pareto efficient allocation there must be consumption, production and allocative efficiency. Assuming a two-person, two-commodity pure exchange model, an allocation is Pareto efficient when, firstly, the consumers have the same marginal rates of substitution between any two goods (consumption efficiency or exchange efficiency), secondly, the producers have the same marginal rates of technical substitution between any two inputs and these (production efficiency) and finally, when the consumers' marginal rate of substitution is equal to the producers' marginal rate of transformation between the two goods and (allocative efficiency or product-mix efficiency). This analysis of consumption efficiency assumes that the commodities are fixed in supply and hence, the inputs devoted to their production are also fixed. Contrastingly, in the analysis of the production efficiency one assumes that the quantities of various commodities can be altered by reallocating inputs between their productions.

Symbolically, in a two-good (X, Y), two-input (L, K), two-person (A, B) exchange economy necessary conditions for Pareto efficiency are:

Table 1. Pareto efficiency conditions

Conditions	Efficiency
$MRS_{xy}^A = MRS_{xy}^B$	consumption (exchange) efficiency
$MRTS_{LK}^X = MRTS_{LK}^Y$	production efficiency
$MRS_{xy}^A = MRT_{XY}; MRS_{xy}^B = MRT_{XY}$	allocative efficiency

Only under these conditions is Pareto efficiency attained and no individual can improve his/her position without making another individual worse off. Achieving only the consumption and production efficiency does not ensure that the right combination of goods is produced in the economy. Therefore, it is only when allocative efficiency is attained that all the alternatives for Pareto improvements are exhausted. However, not every Pareto

efficient outcome can be considered as desirable and the Pareto efficiency criterion does not imply equity. Therefore, Pareto efficiency is a necessary but not a sufficient condition for social welfare.

The foundation of the theory of efficiency and its measurement was laid out by Farrell (1957) who used three main measures of efficiency. He explicitly decomposed total economic efficiency (referred to by Farrell as the overall economic efficiency) into two components: technical and price (allocative) efficiency. However, the difference between total economic efficiency and allocative efficiency in Farrell's framework remains unclear. A different view can be found in Devine, Lee, Jones, and Tyson (1985) who acknowledge two main elements of productive efficiency: technical and factor price efficiency. In their view, technical efficiency implies producing a maximum level of output from a given set of inputs and unchanged technology. Factor price efficiency assesses the ability to use the most favourable combination of inputs given their relative prices.

In general, allocative efficiency refers to the distribution of productive resources among alternative uses which allows the production of an optimal output mix, i.e. allocative efficiency is focused on selecting between different technically efficient combinations. In a competitive market, allocative efficiency is attained when three conditions are fulfilled: each level of output is realised by equating the marginal cost to price, each consumer's marginal benefit is equal to the price and, finally, the relative marginal benefits are the same for all consumers. Next we will analyze how these concepts are transposed to an HE framework.

### **3. Concepts of Efficiency in Higher Education**

Efficiency concepts are frequently found in national education planning documents but without clarification as to whether efficiency is a final goal or a channel to achieve a certain educational objective. When used by economists the term efficiency is mostly context-specific, whereas practitioners affix diverse, conceptually different, uses to the term. In this section the conceptual and definitional issues regarding efficiency in education is presented. In order for efficiency in education to be defined it is necessary to point out some of the characteristics of the education sector, focusing on higher education.

Firstly, higher education institutions can be considered as multi-product enterprises (e.g. Belfield, 2000, and Cohn and Cooper, 2004) which produce multiple outputs and have multiple inputs which are difficult to measure since many of them do not have market prices, e.g. number of students enrolled, their prior attainment and teacher characteristics. Furthermore, higher education providers use what Rothschild and White (1995) call 'customer-input' technology i.e. customers (students) are also inputs in the production (function) and the quality of students recruited may serve as a signal of the quality of the HEI. Along these lines Dixit (2002) points out that the education system consists of multitask, multiprincipal and multiperiod organisations that are quite similar to monopolies and have poorly observable, complex goals. Given the multiple goals it is difficult to apply some simple criterion for measuring success or failure in achieving the specified goals and it follows that there are no absolute criteria that can lead us in the measurement of efficiency and effectiveness of a HE system.

The commonly examined types of efficiency in both the public sector and education studies cover both technical and allocative efficiency. An extension of these two concepts can be found in McMahon (1983) who discusses four concepts of efficiency in the provision of education. These are technical, price, exchange and allocative efficiency and each is described in turn. According to McMahon's terminology, technical efficiency examines the time and resources used in the production of a given output (these resources include teaching methods, instructional materials, student's learning activities, over some time period). Price efficiency is an extension of technical efficiency since it takes into consideration the relative costs of resources (e.g. whether the educational services in the HEIs priced in a cost efficient way). To provide a distinction from Farrell's (1957) original concept of price efficiency, a more appropriate term in this case would be factor price efficiency; this can

then be linked to the definition by Devine, Lee, Jones, and Tyson (1985). Continuing with McMahon's terminology, exchange efficiency represents education's ability to meet the needs of other institutions (business, civic and religious organisations), and concerns questions like whether the credentials are valued in the labour market or whether workers are overqualified. Allocative efficiency is attained when there is technical, (factor) price and exchange efficiency, i.e. it represents the maximisation of satisfaction given scarce resources with competing uses (and it allows for a comparison of educational costs with its expected benefits). Related to the four concepts considered, the concept of exchange efficiency is sometimes conflated with allocative efficiency. Given that price efficiency is an extension of technical efficiency, often there is not as clear a distinction between these efficiency concepts. The two dominant concepts in education (i.e. technical and allocative efficiency) are analysed next, while also examining additional concepts applied in educational studies and how they are incorporated in the proposed efficiency framework.

Blank (2000) defines technical (in)efficiency as the extent to which services can be expanded without increasing resources, or alternatively, the amount by which resources can be contracted without reducing the services. This seems consistent with the previous classification. Allocative efficiency is here defined as the extent to which a service bundle can be expanded by selecting another mix of resources at given costs, or by which a resource bundle can be contracted by changing the mix of service deliveries at given revenue. However, this definition of allocative efficiency is oriented towards costs and revenues without taking into consideration the social benefits and is not consistent with the features of public sector providers (and HEIs), where cost minimisation and revenue maximisation are not the dominant economic goal. More relevantly, this allocative efficiency concept is not considering the other aspects of efficiency as described by McMahon, thus Blank's definition of allocative efficiency actually corresponds to McMahon's price efficiency.

Another description of allocative efficiency can be found in Hoxby (1996) who argues that allocative efficiency is "getting the amount of education right" (p. 54), while productive efficiency concerns minimising the cost of schooling provision. Hoxby also uses the cost aspect when examining productive efficiency which is expected considering that she is examining school finance in a sample of secondary schools in the USA. In a similar vein, Barr (2000) points out that allocative efficiency is centred on producing the types of educational outcomes which equip individuals, socially, politically and culturally, for the societies in which they live. The efficient level of educational output is, thus, at the point where expected marginal social benefit equals the resulting marginal social cost. However, quantifying this relationship is complex and some of the main problems in doing so are discussed in the next section.

The above discussed studies introduced various concepts of efficiency used in the education framework. The goal of this section was not to devise new efficiency concepts but to provide a critical examination of the ones already in use. Although in some cases the terminology between the authors differs, many of the efficiency concepts can be related back to the framework developed by Devine, Lee, Jones, and Tyson (1985). This particularly refers to productive efficiency, consisting of technical and factor price components. The definitions differ more when the concept of allocative efficiency is taken into consideration. This concept is often confounded with factor price efficiency and some authors do not acknowledge that this concept goes beyond the boundaries of a decision making unit (e.g. HEI). The terminology proposed in this paper is similar to definitions by Hoxby (1996) and Barr (2004a) where allocative efficiency refers to a comparison of marginal social costs and benefits, and does not solely relate to a comparison of HEI costs and revenues, as some authors state. In terms of estimating efficiency in education, several very distinct techniques have developed in the literature. The next section provides a survey of these techniques and introduces an approach that will be followed in this paper.

#### 4. Measuring Efficiency in Education

Two most widely applied approaches in efficiency measurement are the Stochastic Frontier Estimation (SFE) and the Data Envelopment Analysis (DEA). The former is developed along statistical lines and pioneered by Aigner, Lovell, and Schmidt (1977) and the latter is a non-parametric technique based on linear programming and developed by Charnes, Cooper, and Rhodes (1978). The majority of this type of research has been related to education institutions in the USA and, lately, in the UK and the Netherlands. Although widely used, both methods have a number of disadvantages. A third method for examining efficiency in HE is also presented, it uses regression analysis and is rooted in the educational production function literature. Some of their main characteristics are presented next and the main problems encountered when using these approaches are identified and discussed.

*Stochastic Frontier Estimation (SFE).* When using stochastic frontier analysis, the researcher establishes a functional form for the relationship between a set of explanatory variables and the dependent variable. The estimated coefficients are assumed to be constant across observations. Stochastic frontier estimators, as previously noted, provide parametric estimates of efficiency. The difference between stochastic frontier estimators and traditional parametric regression is that the error term in SFE is composed of two parts: a normally distributed random error term ( $u$ ) and a second term capturing the remaining error i.e. inefficiency ( $v$ ). The presence of the first type of residuals ( $u$ ) allows the tools of statistical inference to be employed, and this is often considered a considerable advantage of this techniques. However, an assumption regarding the distribution of this noise needs to be made along with those necessary for the inefficiency term ( $v$ ) and the production technology. Given that a considerable structure is imposed upon the data from stringent parametric form and distributional assumptions, misspecifications can be incorporated in the efficiency measure. Additionally, SFE uses information on prices and costs which, according to Worthington (2001), may introduce additional measurement errors.

A recent application of SFE is Agasisti and Johnes (2010) who use a panel dataset to estimate a stochastic frontier models of costs for 57 public Italian universities from 2001-2003. Costs are defined as current expenditures during the year and exclude capital costs and depreciation. Outputs include measures of student numbers and of research activity (number of students on undergraduate courses in sciences, number of students on other undergraduate courses such as the arts, humanities, and social sciences, the total number of research students and, as a measure of research activity, the value of grants for external research and consultancy). The authors find that the estimated technical efficiencies are high, with an average efficiency score of 81 percent. Average costs are in line with studies of university costs conducted in other countries. However, it may be argued that all of these output variables can actually be considered as educational inputs, as suggested by the discussion at the beginning of this section. Furthermore, there are some outliers in the estimation of technical efficiency (universities with very low scores) which the authors cannot account for, this may suggest that there may be some problems in the statistical method used.

In the UK, a study using the SFE by Izadi, Johnes, Oskrochi, and Crouchley (2002) specified a constant elasticity of substitution (CES) cost function and used data for 99 universities in 1994-1995. The dependent variable was the total expenditure of the institution and there were four independent variables (undergraduate student load in arts subjects, in science subjects, postgraduate student load and the value of contracts and research endowments). Again in this study no proposal was made as to how the inefficiencies can be remedied and what were their causes.

*Data Envelopment Analysis.* In contrast to the previous approach, DEA is a non-parametric method thus it provides efficiency estimates which are not conditional on the specific functional form, although it does impose some restrictions such as monotonicity and convexity (in Thanassoulis, Portela, & Despic, 2008). Linear programming methods are used to assign an observation-specific set of weights to outputs and inputs in such a way that the ratio of weighted output to weighted input is maximised for each observation, subject to certain constraints. This approach amounts to constructing a piecewise linear surface over the data so that the actual input/output quantities are either on or in the interior of this frontier. The method can handle multiple inputs and multiple outputs and this makes it an appealing choice for measuring the efficiency of HEIs (examples of this technique include Johnes and Yu, 2008; Johnes, Johnes, Thanassoulis, & Kortelainen, 2011). This method seeks to evaluate the efficiency of a given decision making unit (DMU) relative to the performance of other DMUs producing the same good or service. The unit of analysis for DEA is in most cases an institution or a department, however a new approach has been developed that performs individual-level DEA, i.e. it is applied to individual students (Johnes, 2006b). Still, preliminary evidence indicates that the results of institutional ranking obtained by

using individual-level DEA and the university-level DEA differ and hence further research is necessary to determine the way DEA should be applied in evaluating efficiency in education.

There are several disadvantages of this approach identified in the literature. Primarily, there is no scope for (regression-type normal) residuals to be evaluated, and hence statistical inference cannot be used to examine for the possible bias resulting from external shocks, measurement error or omitted variables. Furthermore, the entire deviation from the frontier ('envelope') is examined as being the result of inefficiency which may lead to an under or over-statement of efficiency and, as Worthington (2001) notes, being a non-stochastic method there is no technique with which probability statements on the shape and the placement of this frontier can be made. Some authors have also brought into question the validity and stability of DEA efficiency results. For example, Smith and Mayston (1987) evaluated the sensitivity of DEA measures to omissions of outputs and inputs. In their evaluation of UK's local education authorities they find that the exclusion of an important output distorts the results of the analysis. Furthermore, DEA only provides relative efficiency scores so it might just be that the selected decision making units are all actually underperforming compared to global best-practice. Performance in DEA analysis is evaluated entirely on the basis of a physical transformation process without taking into account the behavioural objectives of service providers i.e. maximising service provision or revenue (service-oriented approach) or, in contrast, minimising resource consumption or resource expenditure (resource-oriented approach) and efficiency is measured against a benchmark of current best practices.

*Regression analysis.* An additional approach to examining efficiency in HE is from the education production function literature and uses regression analysis (Smith & Naylor, 2001; Johnes & McNabb, 2004; Beirne & Campos, 2007). Here, the use of economic principles to assess the efficiency of HEIs relies on the analogy between educational enterprises and firms, where educational enterprises produce educational outcomes in a way similar to firms producing outputs. Hence, the underlying economic principles from the neoclassical theory of the firm (Baumol, Panzar & Willig, 1982; Varian, 1999) are applied to model the functioning of educational enterprises in which a production function can be used to express the relationships between an institution's inputs and outputs. In a higher education system, universities comprising of faculties, art academies, colleges and polytechnics can be considered as multi-product enterprises using what Rotschild and White (1995) label as a customer-input technology. The quality of students recruited has an impact on peer effects in the HEI which in turn have been found to have a significant effect on student attainment and non-completion (e.g. in Sacerdote, 2001; Smith & Naylor, 2001; Johnes & McNabb, 2004; Winston & Zimmerman, 2004; Stinebrickner & Stinebrickner, 2006). Some other inputs which serve to measure an HEI's contribution to educational outcomes are the socioeconomic background of students, parental income and occupation, student's gender, age, marital status, tuition fee status, race, country of origin, etc. (e.g. in Smith & Naylor, 2001; McNabb & Johnes, 2004; Kokkelenberg, Dillon & Christy, 2008). These inputs and outputs, although being important determinants of educational outcomes, are rarely considered in the two previous approaches leading to questionable results and potentially misleading policy proposals. Using the above mentioned variables is particularly important in light of the reforms in education in Europe since, for example, it allows the examination of the possibly adverse effects on completion and student attainment associated with increased tuition fees and other costs of study. Additionally, the use of regression analysis may identify students who are more at risk of prolonging their studies thus enabling the HEI to act before this inefficiency occurs and the student drops out or extends the duration of their studies. This type of analysis is beyond the scope of DEA or SFE. Another advantage of this approach is that the focus is on students as the main decision making units, a level which is mostly disregarded when using SFE or DEA. The regression method also provides estimates of parameters whose significance can be tested.

## 5. Conclusion

A substantial amount of research has been carried out focusing on inputs and outputs of the education system, in most cases in order to obtain some ranking of institutions in terms of efficiency scores. However, published indicators that are appearing in e.g. 'league tables' often take the form of some simple 'efficiency' ratios such as costs per student or ratio of students achieving a certain qualification divided by the total number of students in a year. The problems of using such indicators have often been pointed out and are related to the specific nature of the educational system. Ideally, all inputs and outputs should be included in an efficiency analysis. However, a separate issue is the level of the analysis, i.e. the unit which is observed and characteristics related to it that should be considered. In HE studies the units in most cases are the individual students, the HEI, the same subject across different HEIs, different departments at the same university or individual universities. In the empirical studies where an individual level approach is taken (similar to Smith & Naylor, 2001) there is an advantage over the aggregate-level studies in that they provide more information and may point out to significant determinants of educational outcomes. In contrast, results from aggregate level studies analysed using DEA or SFE are more easily analysed and interpreted, but there is a considerable loss of information due to the aggregation process and there are also limitations using the mathematical programming approach in examining efficiency and this was presented above.

There is an evident gap in the research in measuring HE efficiency and a diversity of definitions of efficiency may be encountered. This is to some extent understandable given the complexity of the educational process and the general lack of relevant information and data. The terminology proposed in this paper is consistent with that customarily found in the literature on efficiency measurement and provides a clearer understanding of technical and allocative efficiency concepts in the context of higher education.

The review of empirical work on efficiency measurement reveals that the calculation of efficiency scores using DEA or SFE dominates the empirical work. However, there are problems primarily related to the difficulty in measuring educational outputs, inputs and establishing a connection (causal link) between them. Moreover, there are significant limitations in producing simple technical efficiency estimates (i.e. scores) of HEIs in order to rank them. Indicators appearing in 'league tables' often take the form of simple 'efficiency' ratios, such as costs per student or ratio of students achieving a certain qualification divided by the total number of students in a year. The problems in using such indicators have often been pointed out and are related to the specific nature of the educational system. As Adnett, Bougheas, and Davies (2002) caution, 'league table' results are usually based on unadjusted attainment and do not capture objectively the educational value added. Hence they encourage dysfunctional effects, i.e. schools trying to improve their position in the league tables through 'cream-skimming' or grade inflation (Adnett and Coates, 2003; Johnes, 2004). Additionally, when using DEA or SFE a problem may arise in explaining these efficiency scores, because they are relative rather than absolute. This means that the technique identifies benchmark HEIs (from the dataset) which themselves may have scope for efficiency gains relative to some absolute standard not captured by the dataset. Other problems are mostly related to the difference in results stemming from different specifications of inputs and outputs (and data availability) and the choice of technique for estimation. Caution should be taken in how the information stemming from efficiency research is used and this leads to a conclusion that results from such investigation cannot be considered as providing definite guides to policy measures and recommendations. This does not imply that there should be no efficiency studies, but that caution should be taken in interpreting any particular set of results given the conceptual and measurement issues raised in this paper.

# Elearning content 'usability': semiotic and didactic parameters in digital texts and textuality

Elisabetta Zuanelli\*

*University of Rome, "Tor Vergata", Faculty of Economics, Via Columbia 2, Rome, Italy*

## Abstract

The paper deals with the notions of e-learning content digital texts and digital textuality as design guidelines for the development of didactic materials in the light of semiotic and psycholinguistic approaches. A typology of didactic texts/goals and the cohesive relation between language and visual components in didactic tutorials as far as perception, comprehension and finalization of content will be dealt with.

The semiotic and didactic assumptions will be theoretically illustrated and discussed through the analysis of a number of online demo referring to maths, medicine, and economic sciences presentations.

Conclusions on the need for design implementation of e-learning content will be summed up through a specific checklist of semiotic and pedagogical features for e-content development.

Keywords: e-content semiotics, e-learning textuality, didactic digital texts, iconic-linguistic relation

## 1. Theoretical and applicational issues in elearning content development

As I proposed in earlier contributions, the pedagogical approach to e-learning is basically influenced by e-learning technology (Zuanelli, 2003).

Learning processes through e-learning technologies roughly include: HW, SW and web infrastructures that support learner's activities of communication and interaction with other subjects of the learning community: teachers, tutors, other learners, etc. as well as with electronically supported didactic material (i.e. e-content/learning objects, etc.): synchronous and asynchronous software and multimedia services, courseware, etc.), on one side; on the other side LMS/LCMS and pedagogical platform services: teleconferences, forum, FAQ, blogs, etc.; administrative services; didactic services: enrolling, tests administration, etc.

As a consequence we can state that:

- e-learning contents are basically influenced by their technological HW/SW infrastructure; e-learning implies use and reuse of materials requiring innovative ways of didactic interaction. These innovative

\* Corresponding author.

Email address:

electronically based procedures positively influence learning processes but at the same time pose new problems as regards the multimedia integration of the didactic message and of the learning objects;

- electronically supported didactic messages and learning objects imply a brand new attention to different methodological procedures as preconditions to perception, memorization and learning itself;
- e-learning requires a prospective definition of new learning paths in order to take care of the didactic integration of different media and content.

Core specifications for the integration of multimedia multicultural e-learning content may be summarized as follows:

S.1.classification/organization of e-learning content

S.2 definition of methodological criteria for a structured elaboration of courseware in the perspective use of content within a platform, with or without the aid of a teacher and/or tutor

S.3 definition of final, intermediate and immediate didactic objectives and tasks in different thematic and functional e-learning paths

S.4 finalised elaboration of didactic content as different from free content

S.5 methodological description of learning units/learning objects as related to S.2

S.6 methodological orientation to e-learning paths as related to approach, method and techniques

S.8 LMS specification of different learning services for different end users

S.9 elaboration of tools for guided learning paths and courseware: informative, operative, transactional units and typologies of e-content: e-books, e-papers, videos, etc.

S.11 supply procedures: on line, off line, print, download, etc.

S.12 communicative interfaces for didactic interaction

S.13 didactic metacommunicative and metalinguistic guides: instructions, introductions, applications, etc.

These specifications would require the following modeling of e-content:

Table 1. Methodological specifications for e-learning content usability

psychopedagogic modeling	goals	approach	content	method	activities
e-based modeling of didactic communication and interaction	type of didactic communication/elearning support	multidisciplinary approach	definition of learning paths	method/content	didactic techniques/e-learning tools
modeling of didactic electronic interface learner/machine (accessibility/usability design )	multifaceted web design	approach	learning architecture	communicative interfaces for didactic content and interaction	didactic electronic devices
modelling of metacommunicative aids for elearning interaction	aided /self directed learning	content presentation	didactic techniques	metalinguistic activities  communication activities/services  interaction instructions	structured/unstructured content
a semiotic approach to interface design	syncretic elaboration of audio-visual materials	content development	textual- iconic typology	function of language content and metalanguage	techniques of didactic presentation

### *1.1. The notion of e-learning usability*

The literature on the subject (Ardito et alii, 2006) sums up different approaches and confirms that the theoretical field is largely conditioned by a juxtaposition of different items subsumed under the notion of e-learning usability (accessibility) such as:

- usability of platforms (LMS and LCMS): functionalities for pedagogical activities
- usability of didactic e-content namely courses/modules in an overall path (structured or unstructured: the sequence of didactic templates, containing didactic functionalities)
- usability of instructional content for achieving didactic goals: structure and sequencing of units/content, didactic elaboration of texts, images, videos and the sincretic structure of materials.

The notion of usability in this paper does not refer to LMS or LMCS. It refers to e-content didactic structure and interface of courses and tutorials as developed into texts, having to do with on line content presentation whether within LCMS or on other platform supports.

As we shall demonstrate, e-learning content development generally lacks a number of instructional specifications needed for on line interaction. In particular:

- the lack of didactic metalanguage and psychopedagogical tips for learning activities
- clear definition/perception of didactic goals in the course and in a unit
- thematic and functional interactional cues in words or icons
- thematic environment (maths, computer science, medical science, economy, etc.)
- typology of texts as related to learning content goals: informative, procedural, transactional (what the learner will get as a result of learning materials and suggested activities)
- finalized typology of e-content texts: descriptions, comments, observations, generalizations, etc.
- audio-visual textuality.

### **E-learning context usability**

An overall appreciation of an e-content context should take into consideration a number of usability variables such as e-learning functionalities, namely didactic activities provided by the course/units/materials; typology of pedagogical texts and related textuality; semiotic communication syncretism of different codes (written and/or oral language, images, drawings, videos, animation, pictures, etc.); clear finalization of messages as related to comprehension, memorization and retrieval for use, both theoretical/conceptual and/or applied/operative.

All together these features of instructional design should appear in e-learning digital texts as provided in visual/auditory displays.

### **E-learning content structure usability**

As for the architecture of the course/lessons display, we should consider a hierarchical, relational and linear sequence of contents: for instance, the possibility of navigating through the course moving from one specific page to related links and moving back without losing context. This implies the definition of the e-learning context

to be related to the course functionalities and the permanent visual contextualization of the learner (see a 'dated' example in [www.pragmema.it](http://www.pragmema.it), home formazione, ecdl, pedagogical database of courses and free demo, 2001).

### E-learning didactic structure

Key didactic parameters, in general (Zuanelli, 2009a), as preconditions for the effectiveness of learning goals in content structure are:

- the preliminary definition of the learner's background knowledge
- metalinguistic tools for the language of presentation
- didactic meta-communication having to do with the cues and explanations of learning tasks and learner's expectations
- e-learning typologies of digital multimedia texts and related digital textuality.

#### 1.2. Internet design: e-learning text typologies and digital textuality

The notion of *text* in linguistics defines a text as an oral and/or written sequence of phrases. These phrases respond to a number of *textuality* parameters, the most important of which are logical-semantic *coherence* and related *cohesion* (deBeaugrande & Dressler 1983).

Cohesion refers to language means used in the production of texts. A typology of texts regard linguistic communicative functions realized (informative, narrative, descriptive, argumentative, didactic, etc.) and pragmatic/performative functions as well (deBeaugrande & Dressler, 1983; Zuanelli, 1981, 2006, 2009b).

From a communicative viewpoint, the possibility of integration of oral, written and iconic components of texts poses a semiotic theme that we may define as the *cohesive syntactic functions* in icons and words (Zuanelli, 2009b, 2013) or else the syncretism of the visual components, written language, graphics, drawings, videos and oral language as well. This is partially the object of the studies in *semiotics of interface design* (Ferreira, 2005; Ferreira J., Noble J. and Biddle R., 2005; Zuanelli 2009b, 2013)

In *digital communication* (Zuanelli, 2006, 2009b, 2012), the identification of pragmatic functions in digital interaction is assigned to the notion of *digital text*.

A *digital text* is the integration of the pragmatic component having to do with the functionalities of a program/software, the *macro-act*, with the content to which functionalities are applied, namely the *electronic text* (Zuanelli 2009b, 2012). The integration of the two allows for a specific definition of usability parameters in web design.

A first look at icons as present in graphical user interfaces (GUI) of sites, informs us of two basic things. First, icons and words define both the **context of interactions** and the **actions suggested for interaction to users**. The context is generally rendered through a visual and linguistic metaphor whereas actions are conferred to visual metonyms. Second, graphical interfaces use different functional typologies of visual information: graphs, icons, colors, space, etc. with the implication that 'concrete', better said 'figurative' icons, as well as already known visual information are better understood than 'abstract' or new ones (Dormann, 1994; Ferreira 2004).

Digital textuality includes a number of information visual elements as appropriate to digital interaction according to *knowledge* and *communication architecture* (Zuanelli 2006, 2009b).

I consider e-learning content software as a specific application of digital communication.

In an e-learning perspective, digital texts correspond to e-learning software as developed in courses and tutorials for pedagogical interaction.

The psychological coexistence of multimedia and multimodal integration of content (Kumar, 2007) is a crucial point and requires a semiotic and psycholinguistic approach to e-content development.

If we limit our analysis to the relation of linguistic-iconic texts we can detect at least the following criteria for the analysis of *digital multimedia textuality*.

Textuality parameters, besides coherence and cohesion, suggest that the virtual situation of interaction, namely a didactic one, has to do, specifically, with the *informativity* of texts and their *acceptability* on behalf of addressees. This implies, as well, attention to specific variables of age, dual information processing, etc.

In general, text coherence as related to linguistic-iconic contents allows for the following modalities of cohesion.

*Linear cohesion*, can be defined as the sequence of images straightly related to an oral text: it is the case of descriptions, informations, comments, namely *representative pragmatic speech events* having to do with transference of conceptual meanings related to principles, notions, situations, etc.

*Relais* (Barthes, 1964) *cohesion* has to do with an alternated sequence of words and images where words let images proceed and viceversa (as in narrative texts, movies, cartoons, etc.).

*Procedural cohesion* is a specification of *relais* cohesion that is needed in interactive stimuli for operative and transactional cues where an oral, written or iconic information require the user's response to proceed.

*Redundant cohesion* has to do with the referential or *performative (directive)* function of oral/written language as matched by a visual metaphor/metonym: the photographic translation of an object (the concept of 'car' as an instance of 'goods' in economy) or metonymic icons for performative functions, i.e. the image of an X for closing, an oriented icon to proceed or the icon of 'file' for opening a file (Zuanelli, 2009b, 2012).

For the development of didactic digital contents, I propose a simple typology of didactic functions/goals having to do with related digital texts and textuality in content presentations.

**Informative goals** have to do with the presentation and description, comment of specific knowledge: historical, economic, mathematical, etc. The audio-visual development presents a number of solutions such as the auditory and/or written explanations matched with drawings, graphs, pictures, as in a face to face presentations aided by traditional technologies. The conceptualization of received information may process facts, principles, notions as related to a specific discipline.

**Operative goals** have to do with texts that translate received information into an operative task and therefore include directive cues: how to perform a maths addition, how to make a medical diagnosis, how to perform a computer task.

**Transactional goals** relate to digital texts that imply a complex interactional task either conceptual and/or operative in a complex computer event virtualization (a statistics elaboration, the solution of a maths problem, the writing of an electronic text).

Digital textuality in transactional goals corresponds to the functional virtual environment for different simulations and tasks: 'an addition for a bill in a restaurant', 'a medical diagnosis in a hospital', 'a desk invoice for a professional accountant' are instances.

## 2. Case studies

The analyses of demo examples of online tutorials/courses offer a 'field' analysis of presentation problems in e-learning content textuality as follows.

### *Case study 1.*

The presentation of measurement language for **weight** in comparative terms:

**Grade 1: Mathematics curriculum/measurement**, state of Louisiana ([www.link2math.com/demo](http://www.link2math.com/demo))

**Objective:** " Use of comparative and superlative vocabulary in measurement settings (e.g., **longest, shortest, most, hottest, heaviest, biggest**)".

As we shall see, the iconic animation, auditory and written support are meant to represent and explain weight comparison as correlated with specific nomenclature to be learnt.

We may guess the didactic objective is twofold: understanding the conceptual difference in weight comparison and acquiring the linguistic skill in maths nomenclature: **light** as opposed to **heavy**, **heavy** as opposed to **heavier**.

The presentation is assigned to an animated video governed by a linguistic oral/written representation of the notion followed by questions of knowledge elicitation/verification and tasks of specific measure nomenclature.

### **Presentation:**

iconic animated text1: narrative (informative goal)

auditory text1: dialogue related to narrative event

auditory text2: directive didactic dialogue (operative task)

written text 2: representative words/phrases (referential function+ representative function of nomenclature)

iconic text 2: referential representation of objects and animals

The video animation presents a boy and a girl in a car.

The car gets stuck.

The girl gets off and tries to push the car.

She asks the boy why she does not succeed in doing it.

The boy says that the explanation, a **larger weight**, can be given by answering a few simple questions. Here comes the directive text in the form of questions and answers,

## Questions

The video shows an **elephant** and a **deer** (in a balloon **visual format**); the boy asks which has a **larger weight**.

Fig.1. Question on animals size

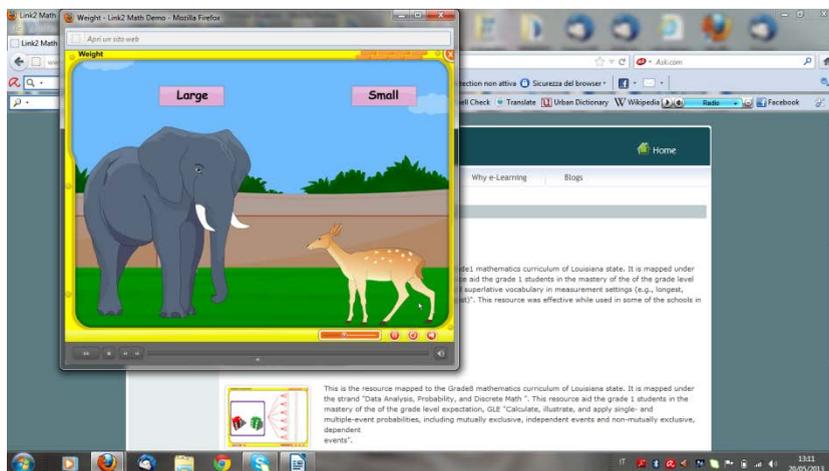

Fig. 2. Labelled drawings

The drawing opposes two labels appended to the two animals: **large** versus **small**.

The visual and conceptual implication seems to be that 'large' has to do with 'size'.

The girl answers: "the elephant".

Then the boy asks which is **lighter**: a **car** or a **bicycle**.

The drawing opposes a **car** to a **bicycle** and opposes, as well, **lighter** to something not defined as heavier.

The girl answers: " a bicycle".

Finally, the boy asks the girl to think of different human actions: holding, pulling, pushing, lifting.

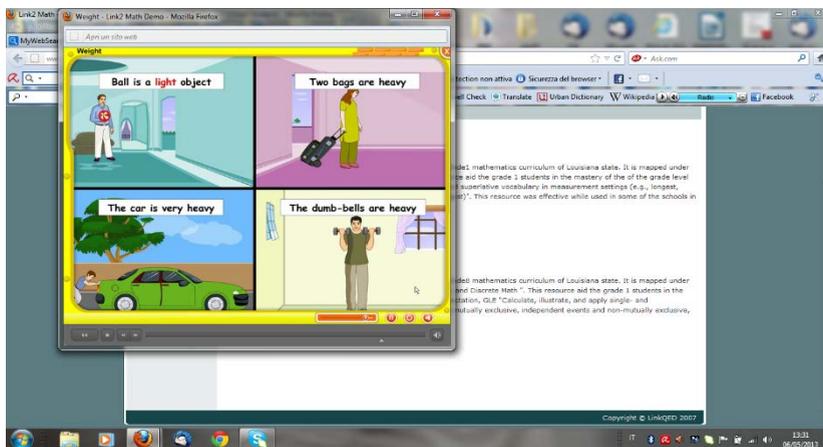

He shows four images that oppose 'light' to 'heavy', as related to different actions.

We suppose the implication is a relation of cause-effect (if **light** then **holding**), (if **heavy** then **pulling**, **pushing**, **lifting**???)

**Light** is opposed to **heavy** through the different actions as related to different objects.

The implication here would be that certain objects are **heavy** and other ones are **light** as related to actions.

However, the conceptual effort is threefold: an auditory and visual correlation, the reference item **light** as opposed in the three examples to **heavy** objects whose context may be misleading, the correlative comparison of weight.

In fact:

The man **is holding** a ball, that is light

A woman **is pulling** two bags (why not one?) that are heavy

A man **is pushing** a car, which is heavy

A boy **is lifting** dumb-bells, which are heavy too.

The comprehension needs the activation of a number of suggested iconic and linguistic inferences.

If you drag/pull something, then that something is heavy; if you push something, that particular something is heavy; whereas holding a ball is naturally a light task whilst lifting dumb-bells requires an effort because dumb-bells are heavy.

The implication is that when one does something with an object, the weight may be light or heavy, according to the object, depending however on human activities you are engaged in.

The task is threefold: an informative conceptual task, an operative one, namely the measurement comparison, and the linguistic skill for denomination of concepts.

On behalf of students, the 'logical' sequence of presentation needs iconic inferences as well as linguistic ones, which do not seem coherent.

Let's see:

**larger weight** (measure) as applied to a car;

**large-small** opposition as applied to **size of animals/objects**;

**lighter** as comparison of two objects of different size and weight, a bicycle and a car, of different weight;

**light**, the ball, as opposed to **heavy weight** referring to human actions and objects.

The non-coherent confusing inferences implied are:

- non positively redundant inferences between codes (iconic and linguistic)
- erroneously related concepts (**weight** is not necessarily related to **size**, in any case):
  - elephant versus deer **yes**
  - car versus bicycle **yes**
  - dumb-bells versus ball **no**
- with the plurality/polisemy of meanings of icons and words: **larger** is referred to size (elephant) and **measure** as well (**larger weight**, namely **greater than**).

Finally, the lexical semantic dissymmetry should take into considerations *language relativity*, having to do with the mother tongue of students and the filter effect:

Italian **alto** is opposed to English **high** and **tall**

Italian **basso** is opposed to **low** and **shallow** and **short**, etc.

This analysis reveals a considerable number of problems as related to the compliance of iconic-linguistic didactic goals, whether conceptual/informative, operative and transactional and the questionable syncretism of different codes: iconic and linguistic ones (auditory and written ones) in the complex textuality of functions of the two.

## Case study 2

In another maths example of the same site, having to do with the explanation of probability, the visual and auditory presentation of the throw of dice, leading to a number of results graphically presented in a sequence, poses questions as to simultaneous application of maths operations, to be inferred by the text and to the quickness of audio-visual presentation that should require a longer latence of response.

### Case study 3

In a different maths demo, math fact fluency demo, proposing auditory and written presentation of real world scenarios, the oral narrative text is matched with a visual animation of the chosen avatar representing the student, entering a math bistro and ordering something. The bill would be the addition of  $7+3=10$ . The pleasant animation does not propose the analytical explanation of the given result, although interactively elicited.

### Case study 4

In a medicine tutorial, [www.emedsim.com](http://www.emedsim.com), the clear definition of the didactic goal and the audio-visual presentation of the diagnosis procedure is matched with a written presentation and suggested written cues to be combined with a contextual list of written diagnostic options which are not sequential.

Fig.4. Image with interactive tip (informative)

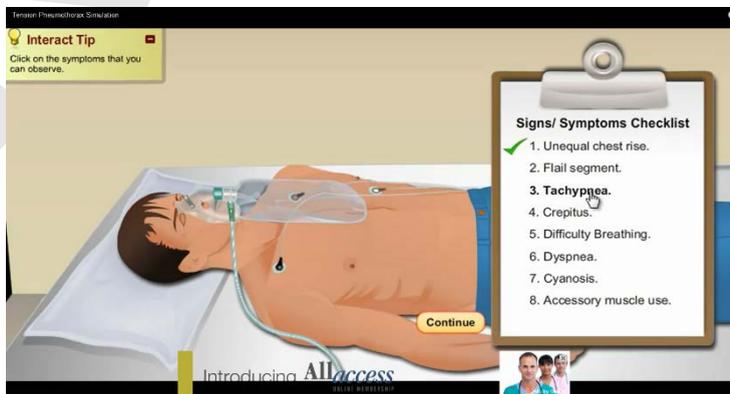

Fig.5. Image with three interactive tips

As we can see, interact tips are of three types: a wider explanation, a choice of diagnostic options, the invitation to proceed by means of the cue: “continue”. There appears to be a lack of *medicine metalanguage*, the nomenclature for different signs/symptoms, whose *background knowledge* seems a pre-condition to the choice of the diagnostic choice.

Besides, the possible interactive result would be an uncertainty as to which cues to respond in a preliminary way.

### Case study 5

In an economics demo, the linear auditory-written explanation of the notion of 'goods' is matched with a visual metaphor of a car, which implies a semantic inference of *hyponimy*: **car** is included in the *hyperonym goods*.

If we apply previous definitions to the analysis of pedagogical implications and evidenced problems in different cases as discussed above, we obtain the following scheme:

Table 2. Synoptic presentation of textuality problems in e-content multimedia digital texts

audio visual didactic texts	inadequate	too fast	wrong visual implications	language implications
Oral text narrative descriptive operative transactive	not specific for didactic purposes: -perception -comprehension -functional translation (narrative as different from directive)	not time enough for processing visual and auditory inputs	different linguistic and iconic inferences	lexical dissymmetries between different languages
Textual-iconic finalization: representative/performative	the textual explanation does not correspond to a conceptual or operative goal	+ -	flat representation of an oral explanation/error of conceptualization	visual interference
Required inferences iconic inferences language inferences	inferences for the same concept do not coincide/wrong inferences	processing time is not enough	linear cohesion of icons does not correspond to linear cohesion of words	polysemy of icons and words
Language filters lexical dissymmetries	+ connotation -	n.a	language relativism	+ -

## Conclusions

The complexity of multimedia-multimodal e-learning content development implies the analysis and integration of a number of didactic communication variables, based on a semiotic-linguistic approach to e-learning digital

texts and multimedia textuality.

The identification of problems requires specific solutions to be derived from digital communication theory.

These, in turn, should be appreciated in instructional design.

## Elements of science in cypriot folk stories

Hatice Kayhan<sup>a\*</sup>*<sup>a</sup> Cyprus International University, Faculty of Education, Department of Turkish Teaching, Nicosia, North Cyprus*

---

### Abstract

Children need literature. Literary and folk creations that enrich and beautify their limited lives and life experiences that are shaped only by their families and close surroundings, that teaches them concepts and values are very good and valuable guides to children in many other ways. Folk and fairy tales, nursery rhymes, riddles, puzzles, lullabies, proverbs are just some of these creations. Nursery rhymes in children's literature help improve language skills, riddles also help practice and improve language skills and the development of intelligence and fairy tales improve children's imagination. And children meet stories and folk tales after they have spent enough time with the heroes of the fairy tales and when it is time to meet the real world and heroes. Story's definition in a dictionary is telling an event orally or verbally and prose describing a real or imaginary event. As a part of literary, story is more realistic than a fairy tale since it describes events that have or may happen and they are shorter than a novel (Şahin and Turan,2010:148). The source of these stories date back to old India. It was claimed that the first example of stories have been "1001 Arabian Nights" (Demirel, 2010:198). Stories are narrations that are longer than fairy tales and shorter than novels. Children may find many information, ideas and comments given answers to questions like "why" and "how" they ask in order to solve the mysteries of the story (Oğuzkan, 2006).

This study tries to determine the scientific elements in few Cypriot Folk Stories selected via content analysis method. The researches have selected themes "Earth and the Cosmos, Physical Events, Matter and Change, Livings and Life" and have created list of codes related with these themes. The researches have applied content analysis method to the content of few Turkish Cypriot Folk Tales compiled by Mustafa Gökçeoğlu according to the related themes and codes. At the end of the research, the scientific elements detected in the folk tales have been indicated in tables classified according to the themes and codes and the examples have been shared. It is believed that the results of this research will help Turkish, literature, science-technology and classroom teachers who are looking for interdisciplinary integrations with regards to teaching science and will help them gain a different point of view.

Keywords: story, science elements, Cyprus Folk Stories

## 1. INTRODUCTION

Oral literature is usually viewed as narration only aimed at entertaining. However, this type of narration has indeed been the resource for many areas from sociology, anthropology to ethnography. When examined, a story telling that there has been a famine of seven years might actually be pointing out to a draught that has lasted for longer. Therefore, folk stories told in oral form from generation to generation should be examined and it should not be forgotten that these are not solely a product of the mind and imagination, but are almost always based on the past events experienced in a society. Further, these products also transfer a lot about the ways of living, values, belief and belief systems of the society they are created in to the next generations.

Gökçeoğlu states that verbal folk literature is very effective in the common ground in societies and teaching the ethical rules and keeping the society under control. Further, the motives explained in links in stories that are told and likes most also reveal the criteria of the taste of societies (Gökçeoğlu, 1999:7).

In this study, few examples of Turkish Cypriot Folk Tales have been selected; the scientific elements in these stories have been determined and whether or not these scientific elements are suitable to be used in teaching of Science have been discussed. It is believed that the results of this research will help Turkish, literature, science-technology and classroom teachers who are looking for interdisciplinary integrations with regards to teaching science and will help them gain a different point of view.

## 2. Method

In this study, the “scanning” pattern within the “descriptive research” method has been utilized (Büyüköztürk, Kılıç-Çakmak, Akgün, Karadeniz ve Demirel 2008, 16). According to Karasar (2006, 77), in the scanning pattern, the subject forming the subject matter of the study is tried to be defined within its own conditions. In this respect, Turkish Cypriot Stories have been selected as examples.

### 2.1. Data Analysis

Scientific elements in the stories have been determined via content analysis through document examination. The analysis unit has been selected as “sentences or paragraphs”. Document examination includes examination and analysis of written materials covering the targeted concept or concepts (Yıldırım and Şimşek, 2000, 140). The main purpose of content analysis is to reach and reveal the concepts and relations that may explain the data collected. Thus, similar data shall be gathered around common concepts and teams and it will be possible to organize and interpret such data in a manner that is easily comprehensible by the readers (Yıldırım and Şimşek, 2000, 162). In this study, “coding by pre-determined concepts” method has been utilized which was defined by Strauss and Corbin (1990). The researchers have selected the “The Earth and the Cosmos, Physical Events, Matter and Change and Livings and Life” themes, which are also included in the Curriculum of (Ministry of National Education, 2013) Science and Technology Lesson and have issued code lists. The researches have analysed the contents of the Turkish Cypriot Folk Tales compiled by Mustafa Gökçeoğlu according to these teams and code lists. The scientific facts in the stories have been classified and indicated according to the teams and codes in tables and the related examples have been shared with the readers.

## 3. Findings

Mustafa Gökçeoğlu’s book “Hikâyelerimiz Tekerlemelerimiz” has thirty folk stories. The researches have analysed the contents of these stories according to the “The Earth and the Cosmos, Physical Events, Matter and Change and Livings and Life” themes that have been selected from the Science and Technology Lesson curriculum: The distribution of 68 codes of these themes are indicated in Table 1.

When table 1 is examined, you can see that many codes related with Livings and Life (f:25) and Matter and Change (f:24) have been identified. Further, there are Physical Events (f:13) and the Earth and the Universe (f:6) teams. Some of the citations from stories used for examining the teams and codes are as below:

Theme: Livings and Life

Code: (Growth and development in humans)

“...We grew up together but you couldn’t come today. You are a grown up, a spirited, reckless girl.”

Theme: Livings and Life

Code (Growth and development in plants)

“... Pomegranates were both sweet and juicy. Pomegranate seeds were blood red and beautiful.

“... Days passed by. Lady Sultan, vizier’s wife and the servant’s wife were all loaded like a ship. Nine months and ten days passed. The day and hour they have been waiting for came. The people in the palace were all in a rush. After the sound of a push or two came the cries of the babies.

Table 1: Distribution of the Teams and Codes Determined

Teams	Number of Codes (f)
The Earth and the Cosmos	6
Physical Events	13
Matter and Change	24
Livings and Life	25
<b>Total</b>	<b>68</b>

#### 4. Discussion and Suggestion

It is evident that there are many scientific elements in the samples selected amongst the Turkish Cypriot Folk Tales. These folk tales, which are one of the major products of the folk literature, are created based on few areas; therefore, there are few things that feed these tales. Some of these areas are society, the individual, nature, philosophy and the relation established with the universe.

When examined from a scientific perspective, it is revealed that these tales are not merely stories that exist in oral literature with the aim of entertainment but they also include many scientific facts. Our aim in this study was to emphasize this fact. There are many fascinating examples of this pattern especially in terms of science. Folk

tales, which sometimes describe a young girl growing up by being more spirited sometimes tell the growth and development of animals and sometimes give information about plants and animals. However, the important thing is to realize this fact, classify these information and try to contribute to interdisciplinary studies in education area.

In this research, some examples within science have also been examined Boratav (1969) has stated that Turkish fairy tales to have motives that are very similar to reality to be very distinctive. In this regards, it is a necessity to examine the scientific elements in folk stories along with fairy tales. There are few studies conducted on the scientific truth behind lullabies and proverbs in some disciplinary researches (Karaöz, 2009; Güneş, 2012, Atmaca ve Kayhan, 2013).

It is believed that the results of this research will help Turkish, literature, science-technology and classroom teachers who are looking for interdisciplinary integrations with regards to teaching science and will help them gain a different point of view.

# Embodiment cognitive science in educational field

Filippo Gomez Paloma<sup>a\*</sup>, Cristiana D'anna<sup>b</sup>, Laura Rio<sup>b</sup>, Nicolina Pastena<sup>a</sup>

<sup>a</sup> *Department of Human, Philosophical and Education Sciences – University of Salerno (Italy)*

<sup>b</sup> *Faculty of Education Sciences – University of Salerno (Italy)*

## Abstract

Recent researches conducted in neuroscientific field emphasizes the hard link between the mind and the body: mental performance are incorporated. The founding fathers of this vision are Damasio, LeDoux and Edelman. In all mental experiences the body is involved, more or less directly. In this regard, Damasio observes how perceptual experience is constantly followed by changes at the physiological level.

LeDoux emphasizes how the body is essential to emotions. “The feedback of the body, is also essential for the brain to process the conscious level.”

According to the theory of Embodied cognition of Vittorio Gallese, that is the theory of embodied mind or situated, the mind dwells in a particular body. In this perspective, the cognition proves to be dependent from the experience body, a body that is characterized by its particular perceptual and motor skills. Cognition, therefore, arises from bodily interactions with the world. “The thought is on the ability of an organism to act as part of its environment”.

The prospect of embodied allows more to overcome the mind / body dualism, noting that organisms have a body and a brain and that cognitive processes are based on sensor-motor processes. In recent years the neuroscience describes cognition not as information processing (according to a cognitive approach), but as a movement and action. Cognition is not only embodied but also situated in a context that strongly determines and conditions. And our body is our first context, our first item of determination.

**Keywords:** pro-active body; mirror neurons; emotion learning; neuroscience;

## 1. Introduction

The emergence and dissemination of neuromythologies is linked to the differences and the prejudices between "hard" sciences and "soft" ones, the first characterized by the objectivity and the possibility of measuring and, then, from an experimental setting; the second, instead, characterized by an interpretive and a circumstantial approach.

An effective alternative that overcomes this dichotomy, these prejudices is the neuroscientific paradigm, which providing a common language to doctors, biologists and scientists joins human disciplines, promoting integration, dialogue and collaboration. This paradigm is perfectly suited to the needs expressed by our company, in which it is appropriate to refer to “thought that interconnects” Morin. Where we can link to the "principle of dialogue" is necessary to use the terms that seem in contrast but that actually, at different times, they are complementary (Chiosso G., 2004).

It is therefore an epistemological revolution. The research of Michael d. Gershon (1998), neurobiologist at Columbia University in New York, on the existence of a second brain, demonstrate this profound change of

\* Corresponding author. Tel.: +39089963441; fax: +390898803.

E-mail address: fgomezpaloma@gmail.com

perspective. The intestine can control its behavior using an autonomous system, called enteric nervous system. The intestine, although with a few neurons, working independently, helps to secure the memories connected with emotions and plays an important role in the "visceral decisions", spontaneous and unconscious ones (Gamelli I., 2005).

The concept of mind, therefore, is much broader and includes the thought, the body and the environment (Clark, 1997). For a long time in the analysis of mind/body relationship has preferred to make a "body epochè" (Barile E., 2007) to understand the mind easier. The importance of representation or perception of the body resulted in a return to mind/body dualism.

The psychological and neurobiological literature lacks a model explaining the transition from body to mind. However, The efforts of major neurobiological, as Damasio, whose thesis contends that "the representation of the body is the primordial and is constituted through the interoception and proprioception" are noteworthy. This type of representation is presented in image format and uses another type of representations defined by Damasio "dispositional productions" (Barile E., 2007).

Piaget clarifies the relationship body/mind. HE gives great importance to the action, as a tool to enable every human being to know and interact with the surrounding environment. This action corresponds to the sensorimotoric (0-2 years): the child growing up is characterized by psychomotor gestures, to constitute his first approach. According to Piaget thought is "an internal action", since every mental act is originally derived. With Piaget begins an educational and therapeutic movement, psychomotor, defined at the Centre of the relationship and the child's cognitive activity, the body approach. From Piaget onwards we discuss action and thinking in terms of a recursive and systematic nature (Gamelli I., 2005). Since there is no comprehensive and clear model of explanation of the relationship between body and mind, we can recognize the importance of an interdisciplinary approach, which could explain the relationship between neural events (biochemical reactions, synaptic connections, neural networks etc.) and mental events (thoughts, emotions, forms of communication).

Recent research conducted in context neuroscientific underlines the close link existing between the mind and body: mental performance are "incorporated". The fathers of this vision are LeDoux and Damasio, Edelman (1999). LeDoux stressed that the body is important for the emotions. "The body's feedback is also essential because the brain should process at a conscious level" (1996).

## 2. Objective

The objective of this work is to understand if and how the theory of Embodiment Cognitive Science can be used in teaching. As mentioned in the introduction, the recent research on Neuroscience, enhancing dialogue between body and mind, suggest new interpretative keys to understand phenomena related to education.

Considering this cultural philosophical revolution, supported by Neurobiology and Biopsychology, didactic puts the study of corporeality in relation with the environment.

## 3. Method

This study started from the theory of Embodied cognition by Vittorio Gallese, considers cognition as a movement and an action, the result of interaction with the environment. The discovery of mirror neurons and how these cause within teacher-learner relationship the necessary enhancement of corporeality and the communicative function of the teacher and the learner's cognitive function is very interesting.

According to the theory of Embodied cognition, cognition depends on bodily experiences, from a body that is characterized by its particular perceptual and motor skills (1998). Therefore, cognition comes from bodily interactions with the world. "The thought is the ability of an organism to act within its environment" (Cosentino E., Vazzano S., 2007).

The prospect of embodied allows to overcome the dualism mind/body, pointing out that organisms have a body and brain and cognitive processes are based on sensory-motor processes. In recent years cognition is no longer described as information processing (according to a cognitive approach), but as a movement and action (Jeannerod M, 2007). Cognition is not only incarnate but also situated in a context. And our body is our first context, our first element of determination.

The prospect of the incarnation thinks that mental activity and the underlying brain activity can be understood only within the context of body activity. Cognition arises from interactions with the world and, to this end, it can be defined incarnate. The thinking is the result of the ability of an organism to interact with its environment. Basic movements and behaviors are required for developing cognitive abilities. Basically, when an organism is able to control his movements and actions, develops an understanding of basic perceptual skills based on motility, i.e. its capacity to change its position in relation to the environment (Cosentino E., Vazzano S., 2007).

The thesis of embodied cognition theorists is that the formation of categories and concepts is given and subject to the constraints of senso-motor experiences of the organism (Cosentino E., Vazzano S., 2007).

Therefore, the neuroscientific research offers a unified vision of man, attempting to join mind and brain. Cognitive psychology and neuroscientific research reconsider the idea that the sensory and motor areas are separate.

The recent discovery of mirror neurons enables us to understand how we perceive and understand others in a new way. This discovery has revealed a fundamental aspect of our social dimension of reciprocity that allows us to establish relationships with others.

One of the most important consequences is a possible redefinition of the learning process and, therefore, of teaching. Mirror neurons underline the importance of practical experience in the process of knowledge acquisition. Additionally, these neurons refer to a concept of intelligence as something deeply relevant to the interaction and imitative learning.

Rizzolatti writes: "the activation of mirror neurons is able to generate an internal motor representation (potential) of the act, which would depend on the ability of learning by imitation" (2006). The most fascinating experiments are related to the ability to understand another's emotional state, to perceive what we perceive each other. Recent experience shows that observing a person's face expressing an emotion, stimulates in the observer the same brain centers activated with an emotional reaction. Each of us is able to perceive the pain of the other but sharing empathetic to this pain is different from one individual to another.

Therefore, the operating mechanism of mirror neurons play a key role for the understanding of the construction of social identity: we are able to recognize each other as similar, since we share the same experiences, and that's because we share the same neural mechanisms.

Learners are no longer seen as persons to whom knowledge is transmitted, but as individuals who, in their individuality and specificity, require understanding and relational integration. It is the synergy between neuroscience and education, the sharing of knowledge and mutual collaboration in the study of common problems, even if respects the specific identity, allow us to reach a deeper understanding of the functioning of the mind. Neuroscientists "humanists" combine bio neuroscientific knowledge and experimentation with literary, historical, philosophical, psychological and pedagogical backgrounds. The knowledge of the functioning of mirror neuron determines a new vision and new ways of interactive learning, which can be obtained by units and personalized study plans based on pluri-disciplinary sharing of knowledge.

#### **4. Results**

Teacher function does not end in the formation of skills, it is not only related to the disciplinary skills, to the amount of content to be transmitted, but develops into a relationship where you need to grasp and understand the emotions, feelings, experiences that determine the learning way of the students.

Teachers are asked to approach more and more the "feel" of pupils and to "make alive and stimulate learning"(Gomez Paloma F., Nicodemo M., Sgambelluri R., Ambretti A., Di Tore S. & Sibilio M., 2010). The experience of feeling is not exclusive of the emotional dimension, constitutes just one aspect and "seems to start from the body and, more specifically from a biological body, organic in nature" (Barile E., 2007).

"Emotions involve the body, the entire body, and may be due to external (sensory) inductors as internal (memory) images and their outward expression can be modeled according to social and environmental factors. [...] The "low" plan, which involves the most primitive and subcortical areas that "high" of cortical processing, cognitive, conscious intersect constantly "(Barile E., 2007).

It is evident, therefore, the dimension of our learning conditions and cognitive processes. Biological standpoint, in fact, seat of emotion is the limbic region, which is connected to the environment via the afferent nerve pathways, which convey to the brain sensations and perceptions and is integrated into the cerebral cortex ". Affections, therefore, are the building blocks of his identity "because they dominate the subject and structure. Between emotional processes and learning there is a deep connection, because it "always develops within a emotional relationship ". The educational relationship means existential presence of the educator for the student (Goleman, D., 2000).

The educator should have an empathetic capacity, as facilitator of learning. Vittorio Gallese defines empathy the implied dimension of intersubjective capacities to transfer meanings from one person to another by using the body as a vehicle for this transfer (Gallese V., 2007).

Empathy, or *Einfühlung*, . the ability to enter another, is "a mirror that allows the learner to understand just what are the attitudes or behaviors that push him to do or say certain things or to live in certain behaviours". The purpose of teaching, then, is to give every student the tools to drive learning. These tools are in each of us, in our awareness that corporeality/learning helps us to bring them out "(Gomez Paloma f., 2009).

Laura Boella presents an interesting reflection about empathy in her book " To hear each other. To know and practice empathy". Boella, crossing the thought of Husserl, Edith Stein, defines empathy as the way which allows us to access the whole other person, as a form of access to the reality experienced by another human being with the creation of a co-shared reality.

A decisive role in the emotion of the match is represented by the body, because it is the whole body that resembles the experience of the other person, who has all the intensity of feeling, that is driven entirely by experienced, which follows the course, assumes the contents. The whole body makes possible to "put yourself in the shoes of the other" (Bollea L., 2006).

As Welsh says, one of the main goals of the research of contemporary cognitive neuroscience is the "naturalisation of cognition or social intelligence, consisting in the understanding of the nature of the neural processes that regulate interpersonal relations, intersubjectivity. The problem is to understand the neural mechanisms that allow us to communicate with our fellow, to transfer our desires, our beliefs, our intentions, and at the same time to understand what others do and why they do it. The goal of this project is to clarify the connection between the mechanisms of brain and our social cognitive skills (2013).

The methodology that is more appropriate is that of "emotional laboratory", which is characterized by two assumptions:

- Excite
- Get excited.

All those who live the learning/teaching process are placed in an "emotional affair" because a mind teaching cannot evade from a teaching from the heart, because the feel of the mind is the feeling of the heart.

Gallese believes that cognitive neuroscience are able to give an answer to the questions of Husserl's Phenomenology.

A naturalization project of phenomenological research, also in the contribution of Francisco Varela, who, by analyzing the role of body-environment interaction in cognitive processes, formulates a new approach to the study of consciousness and cognitive processes called neuro phenomenology. According to Varela, neuro

phenomenology perspective is able to combine empirical methodology of Neuroscience with the proper scan of Phenomenology. We can overcome the mind/body dualism, putting at the centre of the empirical investigation the Leib, the "live experience" (Gallese V., 2013).

A deeper dialogue between neuroscience and phenomenology is necessary and Gallese actually notes that cognitive neuroscience are starting to investigate the neural components related "embodied" the experience of the world. "We are seeing the development of a neuroscientific approach that puts at the center of their investigation the living body and its neural related sense-engines" (Gallese V., 2013).

The body is alive, "is not, therefore, an object, a thing or a fact [...]. Whether it's the body of others or of my own body, there is only one way to know the human body: living it, that is let our drama that crosses "(Merleau-Ponty m., 1945).

Using the expression of Merleau-Ponty we speak of a "body" who lived "not only the way we have actively taken upon the world, it is also our opportunity to be involved and to live" (1979).

"A teacher, an educator or a therapist becomes sensitive to bodily aspects of the report will certainly be a more attentive observer how bodies have and move in space, their" dancing "(rhythms), various relational body configurations (including his own, of course) unfold. It will isolate more individual behaviors, with the inevitable task of judges which springs from and, consequently, will use those results as operational resources. [...] A pedagogy of gestures and movements is a pedagogy of listening and presence, an attitude that legitimates a different attitude and a different placement in relation to the other, which transforms regular patterns and propose "settings" for learning. [...] Suspending judgment, the habit of wanting to immediately intervene, to hear what passes through the body opens us to a continuous stream of meanings (as I'm breathing? How my heart beats? How does my muscle tone? And my voice? Which quality express my gesture, my eyes, my face?).

"To Know what we can do through my body won't let us to figure out what the other test, but above all to generate naturally an effective tuning, and appoint emotions and feelings that inform his relationship with that particular child, teenager or adult "(Gamelli I., 2005).

The teacher should pay attention to the skills of the students, recognize them and try all strategies to enhance his learning styles.

Each educational relationship between teacher and student must meet exchange, participation and alliance. The educational relationship builds daily, starting with the mutual feeling and consolidates its position thanks to the sharing of educational experience. It is important that between teacher and pupil creates a relationship of trust and esteem, which will consolidate in a direct and personal dialogue.

The school is not only the place where you learn, but also the environment in which you enter the emotions and experiences of each participant in the educational process. The school context is the place where, thanks to the constant attendance between faculty and students, there are situations that stimulate reflection, you learn to take positions, to confront, to express opinions and judgments.

The teacher creates learning opportunities being involved firsthand in the teaching/learning process as an expert connoisseur of discipline; recognizes the intellectual, affective characteristics and interaction among students in order to offer learning opportunities according to their own peculiarities. It follows that the teacher must be an expert connoisseur of teaching methodologies to be implemented following an elaborate plan, reflecting on his own experience, confronted with the gentlemen, looking back and correcting the design a more functional aspect to learning of students.

Learning comes through a process that is at the same time, cognitive and affective and therefore only an authoritative and anti-authoritarian teacher, who has got, in addition to concepts and values, an open mind and a critical capacity, allows its learners, through active participation, to joint responsibility and cooperation, to develop interests and mental structures (knowledge, skills, beliefs).

The analysis of education, led by neuroscience, often referred to "Neuroeducation", explores some of the basic processes involved in learning processes. The results of the research show that, with the commitment of all students, teachers, parents and policymakers, the impact of this emerging discipline could be highly beneficial.

As Buber argues the use of "complementarity and contain (Gegenseitigkeit und Umfassung)" has created between teacher and pupil a profound dialogue from which stems a feeling of profound trust and commitment "to be and to continue to be for each other" (Buber M., 1993).

The student asks the teachers to be heard and understood, and not be just stressed and assessed cognitively. He also asks to take the initiative, responsibility and his real involvement in the learning process. The context in which learning takes place is the organization of meaningful activities for and to each student, ensuring the expression of all dimensions of the person: will, intelligence, operation, motricity, social morality.

## 5. Discussion/Conclusion

A good teacher should have the ability of involvement. The teacher prompted cultural and educational skills, which are essential to enable the staff of conquest by the pupils, both competences are necessary to interact successfully with peers, parents and pupils, and in particular to establish educational, significant and effective relations. In the teaching process, therefore, is crucial the relationship established between teacher and learner, which must not be confined to a "giving" and "receive".

Didactic communicative action must not neglect non-verbal signals that indicate presence, dominance, competition, testing, anger, denial, acceptance, friendship and much more. We must, therefore, do critical self-analysis effort making more aware of some metacommunicative intentions. A reflective educator should ask what is the effect of gestures, body scenarios where he works on the mental environment of the learners (Gamelli I., 2012).

The teacher must accompany the action of subject learning, respecting the stages and the goals of the other.

Every relationship is also made of unfortunate episodes, of wrong answers: the important thing is that these behaviors are chronic, which does not represent the way through which structurally we relate to another. It is essential that the teacher reflects on her answers, the attention to his behavior must also become attention to his ability to interpret situations. Unfortunately the teacher may often, for various factors, incur the error. First, the teacher's work is directed to more people and the number represents an obstacle to intersubjective action.

We must remember also the institutional tasks that a teacher is called to fulfill (audits, evaluations, performance of a program at certain times and a series of operations that represent the everyday life of a teacher).

The teacher should role without leaving stereotyped behaviors. The teacher must take into account the personal and social conditions of students and encourage their learning, through custom programming to facilitate group work. The teacher must pay great attention to the way the student relates to others and the way they work in groups.

School context still dominates a dualistic vision of psyche-body and often teachers overlook sensomotor aspects. Interesting indications are provided by neurodidactic, where the mode of transmission of knowledge uses physical education as a discipline related to the emotion and pleasure to acquire knowledge or methods in other fields of knowledge.

I fully support the ideas of my colleague Chiara D'Alessio when she writes that the most effective solution to address the development and education, in a time of crisis of values, is the use of the body, understood as organic experience significant (Leib) and not as a mere object (Körper) (2010).

More and more studies show the importance of education in the processes of learning. Nowadays Italian school spreads a "new culture of sports science, bioethics that places motor scope as a particular area of human learning. Educate the body, but above all through the body, is this the prospect of a real "neuro" activities teaching motor skills ... " (Sibilio M., Gomez Paloma F., 2003).

Learning becomes an active part of the body. The body represents "the construction of a system to know highly personal and unique that is inscribed in our hands, our legs, our eyes, our physical stamina to daily stress, in our cardiovascular system and motor coordination in our ability and mature control that participates in our act in space" (de Mennato P., 2006).

Physical education is not limited to knowledge of what and how to teach, but how especially the subject learns and what are its cerebral mechanisms that allow an adequate motor response to the same context.

The research in the field today are neuroscientific to pedagogy by promoting and supporting this value in the field of education, where the teacher's task is to foster in each student, the progressive control of motor behavior.

The physical activities to achieve objectives relating to sense-perception, visual, auditory, tactile, and kinesthetic.

The child, therefore, since the early years, must develop the skills of perception, analysis and processing of the information.

The involvement of body dimension in the construction phase of its image, in recognition of the functions of the body and its perceptual capacity, expressive and relational, allows the child to participate actively with the world around him, the perception of its limitations and especially awareness of their potential.

In learning the focus to the body, emotions, non-verbal signs not only affects the physical and functional aspects of the body, but "the ability to build their sense of self through actions, the research directions hearing on Visual, tactile, that drive the movement inside of spaces and materials of everyday life" (de Mennato P., 2006).

This perspective has strongly influenced the teaching of sciences, stressing the close relationship between body and mind. Even psychoanalysis has contributed to the development of this vision by supporting the active role of the body experience in construction of the ego. Psychoanalysis with his closes a long period characterized by the reduction of the body. Freud emphasizes the fundamental importance of bodily experiences since the early stages of life; the child through movement would send out information about his unconscious processes.

The University of Milano-Bicocca established, for over ten years, the first teaching, Pedagogy at the Faculty of education. Ivano Gamelli, teacher of such teaching, defines the pedagogy of the body "an open territory, cross, available at constitutively comparison and to contamination with other sensitive knowledge, in an authentic setting topics and game to overcome language hierarchy within the educational relationship" (2012).

It is essential to invest in training and updating courses in schools and in socio-educational services, setting educational practices related to potential physical, sensorial and emotional expression of the body.

Universities should seriously engage in the organization of curricula, instituting lessons designed to impart an education through exercise of body and movement. "Body approach to knowledge and the report calls for, in fact, to get out some academic schemes, especially with regard to the traditional form of the frontal lesson [...], to discover the University a chance to" learn moving "differently, to live classrooms, sit on the floor, lie down, relax, walk and dance barefoot." (Gamelli I., 2012).

Educators must provide educational practices to the body starting from the kindergarten, in which precisely take pedagogical value spaces, practices of care, time to play, the role of the teacher, the educational experiences of pleasure and integration between the different expressive languages (Ravelli G., 2010).

Physical education is primarily aimed at teachers of each order and degree, to educators, trainers and socio-educational workers who need to acquire skills, techniques and methodologies in the field of communication, verbal and non-verbal situations of discomfort of childhood and adolescence.

The movement represents the main vehicle with which to express themselves, communicate and understand. The need, therefore, is to develop appropriate expressive ways, through the gesture which becomes communication and game that takes action and report. So the great value and essential function of the playful expression, and motor sports. The move allows to express feelings and thoughts. We must, therefore, know how to relate to others, in accordance with the rules of civil coexistence. It is through the movement that captures the meaning of existence. In the path of understanding develops the body sense, i.e. the basic sense that allows the opening and cognitive flexibility, and emotional attention and affective relationships (Mollo G., 2004).

From these basic assumptions derive some goals, intended as guidelines for the implementation of an education to corporeality.

We need to educate the acceptance of the other, the recognition of the uniqueness and diversity, valuing personal aspects and facilitating the creation of authentic relationships.

An additional goal is to live one's body as the relational dimension. Condition of that dimension is emotional availability, intended as the opening in the presence of the other in our interiority (Mollo G., 2004).

We have to educate the liberation of sensations, always respecting and in consideration of the situation and the condition of those with whom you enter into the relationship.

The body must be experienced as a vehicle for the achievement of personal and social identity, expression of an educational paradigm that considers each person protagonist of its growth (Rossella D., 2012).

Knowledge must be translated into "embedded knowledge", which requires a body that is not only thought but also acted, live in relationship. "The body of which we speak is also the body that we live, the way we experience it personally, doing it. [...]there is a materiality of the body with which we measure constantly, through which we train, we learn to discern and articulate emotion into feelings. This dimension concerns us, touches us deeply. The body is our potential and also the awareness of our limit "(Gamelli I., 2012).

### Abstract

A great many people have already embraced the need for education and training as a key to moving the workforce and society in general toward a sustainable living process. Education bodies and employers are beginning to recognise this trend and know about the need for training in the manifold aspects of sustainable development (SD). Different actions are being set by higher educational bodies and employers are also becoming aware of the needs (competences, knowledge and skills for SD) of their employees. The aim of this paper is to give an indication of (1) the importance of SD competences, knowledge and skills according to professional practice, in Europe; and (2) whether there is a need for new jobs in the field of SD.

Keywords: sustainable development, education in life sciences, employment, competences, knowledge, skills

## 1. Introduction

In response to a growing need to move the world towards sustainable development (SD) and sustainable practices within education and daily work life, a variety of research and training activities addresses problem driven and solution oriented approaches (Grunwald, 2007; Sarewitz & Kriebel, 2010; Willard, M., Wiedmeyer, C., Warren Flint, R., Weedon, J.S., Woodward, R., Feldman, I. et al., 2010). The field's development in competences, knowledge and skills is a response to existing and anticipated complex problems including climate change, desertification, shortage of resources etc. — all featuring high degrees of complexity, damage potential, and urgency, and all having no obvious optimal solution. Indeed, the challenges towards a more sustainable life are inextricably linked. Economic growth, job creation and incomes are related to — and can degrade — natural resources and systems.

Furthermore, the global agreements on sustainability and initiatives for SD can only become reality if people support them locally. This, in turn, calls for education. It is only through education that individuals are empowered to rethink their behaviour, and to consider the idea of SD within the private and occupational environment alike. Beyond that there is little agreement. People argue about the term SD and whether or not it is sufficiently prominent in education and daily work life.

Since economic activity includes ecological, social and financial risks and opportunities, the conviction that SD is an open guiding principle, or orientation target, in this perpetual process is becoming increasingly established within the economic sector. Employers around the world are becoming aware of the role of education and training as a key to moving the workforce and society in general toward a sustainable living process. For many employers, the path to a sustainable future for their employees – and citizenry in general – begins with greater access to basic higher education. Accordingly, aspects of SD are being integrated into the educational profiles expected of employees. The EU and many European countries have already embraced the need for education in achieving SD (e.g. SD strategies).

The principles of SD call for a holistic approach within the education offered by Higher Education Institutes in the field of life sciences (HEIs) and the requirements of employers, one such practical example is Green Pedagogy (Hochschule für Agrar- und Umweltpädagogik, 2013). In the long run education alone cannot ensure the full integration of SD into our professional life if insufficient progress is made regarding what competences, knowledge and skills are required at the workplace.

The implementation of SD in educational programmes in the field of life sciences presupposes that the market-relevant competences, knowledge and skills related to SD have already been identified. However, an extensive review of literature indicated that, although, there is a rich and converging debate going on, such information is not available in the European or international context. So this work researches (1) how can the needs of the labour market on competences, knowledge and skills for SD be clarified in order to adjust higher education; and (2) whether there is a need for new jobs in the field of SD.

## 2. Theoretical background

Through an extensive analysis of the international literature this chapter places the research in its contemporary context. The theoretical background clarifies the context in which this study finds itself, starting by defining SD and education for SD and outlining those competences, knowledge and skills for SD examined in the questionnaire.

### 2.1. Sustainable development

There are many definitions of SD which are influenced by people's values and culture. The most common and best known is the United Nations (UN) definition of SD, now commonly referred to as the "Brundtland definition", which states: "*Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs*". (UN 1987).

This definition contains within it (i) the concept of needs, in particular the essential needs of the world's poor, to which overriding priority should be given; and (ii) the idea of limitations, imposed by the state of technology and social organisation on the environment's capacity to meet present and future needs. Furthermore, this definition is founded on the consideration of the value 'respect' – in the sense of (i) respect for others, both present and future generations, (ii) respect for the planet and what it provides to us (e.g. resources, fauna and flora). (Quendler, van der Luit, Monteleone, Aguado, Pfeiffenschneider, Wagner et al., 2013).

In theory, development that is sustainable and not damaging to the planet is very possible. Of course though, in reality there are a lot of (man-made) issues present in our daily life (cf. Shah 2012). While there are many complex issues that influence SD, certain main key issues, which have increasingly become matters of concern over the last decade, are outlined in table 1.

## 2.2. Education for SD

The UN has declared the decade from 2005 to 2014, the Decade of Education for SD, because education has been recognized internationally as fundamentally important to addressing the critical global challenges we all face. Education for SD\* challenges us all to adopt new behaviours and practices to secure our future and emphasises the important role of education in shaping future development options and choices. If SD is about values and choices, and if SD is the 'supreme political issue of the century', then it would follow that education for SD is learning about new value orientations, new choices and new political decisions (including those we make in the home and community). Education for SD would seem to be about ethical and equitable ways of caring for, using and distributing the Earth's finite resources. (cf. UN, 2011).

Promoting SD requires that individuals and organisations acquire the competences, knowledge, skills, values, and motivation to respond to the complex SD issues (table 1) they encounter in their personal and working lives. From the perspective of the person 'learning', sustainable education, as the successful transfer of knowledge, is defined as when the learner is able to apply his/her profile of competences, knowledge and skills in a variety of situations (cf. Weinert, 1996). Through education and lifelong learning, we can achieve a lifestyle based on economic and social justice, food security, ecological integrity, sustainable livelihoods, respect for all life forms, and strong values that foster social cohesion, democracy and collective action, i.e. a more sustainable living approach and society. (cf. UNESCO, 2010).

At the UN level there is a common notion that HEIs play a key role in the awareness-raising of SD issues, mainly: "*Since Higher Education Institutions educate and train decision makers, they play a key role in building more sustainable societies and creating new paradigms. As educational institutions, they have the mission to promote development through both research and teaching, disseminating new knowledge and insight to their students and building their capabilities. Given the objectives of Rio+20†, Higher Education Institutions have a special responsibility to provide leadership on education for sustainable development.*" (UN, 2011).

\* Education for Sustainable Development (ESD), Sustainability education (ES), and Education for Sustainability (EFS) are interchangeable terms describing the teaching, disseminating new knowledge and insight to trainees for the achievement of sustainable development.

† Earth Summit Rio+20—officially named the United Nations Conference on SD from June 20<sup>th</sup> to 22<sup>nd</sup> 2012 in Rio de Janeiro, Brazil. It took place twenty years after the first historic summit in Rio de Janeiro in 1992 and ten years after the 2002 Johannesburg summit. For further info see <http://rio20.net/en/on-the-road-to-rio20>.

In the words of the UN (2011) we should highlight that promoting SD requires high level knowledge and skills in various combinations of employees resulting in a level of competence. *“Education for sustainable development aims at enabling everyone to acquire the values, competences, skills and knowledge necessary to contribute to building a more sustainable society. This implies revising teaching content to respond to global and local challenges. It should also promote teaching methods that enable students to acquire skills such as interdisciplinary thinking, integrated planning, understanding complexity, cooperating with others in decision-making processes, and participating in local, national and global processes towards sustainable development.”* (cf. Green Pedagogy).

### 2.3. Competences, knowledge and skills for SD

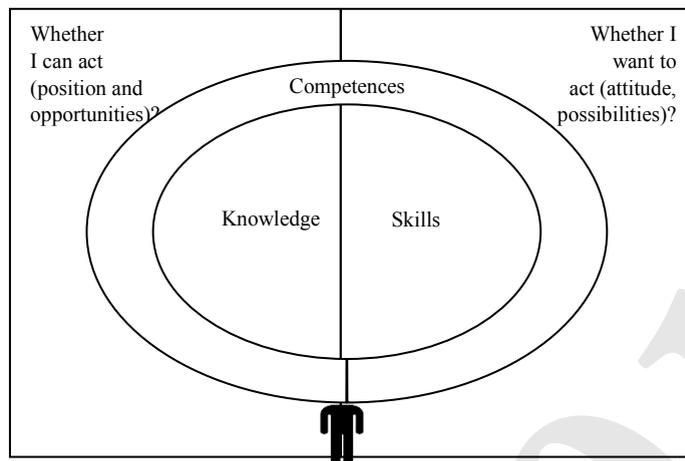

The challenge of meeting the development of human needs while protecting the earth's life support systems confronts scientists, technologists, policy makers, and communities from local to global levels. While a variety of research and training activities addresses the concepts and practise of competences, knowledge and skills for SD, much of this information is fragmented and is often not available in a form that is convenient for professionals. The definitions of the ideas of competences, knowledge and skills for SD are outlined below as they are understood in this paper.

*“Knowledge means the outcome of the assimilation of information through learning. Knowledge is the body of facts, principles, theories and practices that is related to a field of study or work. In the European Qualifications Framework, knowledge is described as theoretical and/or factual.”* (Grün, Tritscher-Archan & Weiß, 2009). Furthermore, *“SD knowledge refers to enabling the competences to be applied for SD in daily working life”* (Quendler, van der Luit, Monteleone, Aguado, Pfeiffenschneider, Wagner et al., 2013).

*“Skills mean the ability to apply knowledge and use know-how to complete tasks and solve problems. A distinction is made between cognitive and practical skills.”* (Grün, Tritscher-Archan & Weiß, 2009). This notwithstanding, *“SD skills indicate an ability to be able to do something in order to contribute to and/or achieve SD. Moreover, they are the foundation of flexibility, employability and further learning throughout life”* (Quendler, van der Luit, Monteleone, Aguado, Pfeiffenschneider, Wagner et al., 2013).

*“Competence is defined as the proven ability to use knowledge [and] skills. It is also described in terms of responsibility and autonomy.”* (Grün, Tritscher-Archan & Weiß, 2009). Precisely, *“competences for SD identify characteristics based on knowledge and skills that all employees are expected to demonstrate to carry out the mission and goals of the company under consideration of the idea of SD. Employees have the understanding, knowledge and skills they need to enable them to grasp the right opportunities and innovations for SD in their workplace in a rapidly changing and interconnected world of market-places, communications, and social and environmental challenge.”* (Quendler, van der Luit, Monteleone, Aguado, Pfeiffenschneider, Wagner et al., 2013).

It is easy to fall in love with the concept of competences, knowledge and skills for SD, to appreciate it and train it. But are we in the position to act according to our opportunities contributing to SD and do we have the attitude that we want to act using our possibilities to make our world more sustainable. Opportunities and possibility involve endeavours that not only smack of potential failure, but also require us to do something although we are not sure about the outcome. After all, we often stop surprising ourselves (and the market) not because are not skilled, but because we do not have the opportunity and do not see the possibilities. So it is not enough to keep competences, knowledge and skills for SD with us, it is also a matter of position and opportunities as well as attitude and possibilities, as shown in figure 1.

3. Figure 18 Conceptual Framework for SD performance enablers: competences, knowledge and skills.

The literature reveals a broad range of competences, knowledge and skills and their characteristics (cf. Fermilab n.d.; National Centre for Workforce Development, 2003; OECD, n.d.; OECD, 2009, Wiek, Withycombe & Redman, 2011; Willard, M., Wiedmeyer, C., Warren Flint, R., Weedon, J.S., Woodward, R., Feldman, I. et al., 2010). The issue of how company-specific human resource competences, knowledge and skills are and how competences, knowledge and skills (for SD) are considered is a controversial point. Boon & Van Klink (2001) argue that many organisations possess very fixed and rather broad listings of competences and do not engage in efforts to produce a set of company-specific descriptions or take proactive steps to develop competences, knowledge and skills for SD. Effective, comprehensive work for SD requires proficiency in several cross-disciplinary skill and knowledge areas. The selection of competences (c.f. table 2) enables a SD professional to analyse the cross-disciplinary nature of SD issues (table 1). Drawing from the key disciplines in the field of life sciences, these competences define the essential knowledge and skills of an effective SD professional and include, but are not limited to, the knowledge areas and skill sets listed below (table 3 and table 4, respectively). (Quendler, van der Luit, Monteleone, Aguado, Pfeiffenschneider, Wagner et al., 2013).

#### 4. Method and data

This research is meant to contribute to a better understanding of the complexity of competences, knowledge and skills for SD required by the labour market and to be taught at HEIs. By deepening our insights into the context of competences, knowledge and skills for SD we hope to shed light on whether new jobs for SD need to be created. As we have argued in the literature review, there is a lack of information about competences, knowledge and skills for SD (required by labour market). The following section details the data collection, statistical analysis and interpretation used to answer the research questions.

##### 4.1. Questionnaire and data collection

Selected data of a given data set from two surveys which were collected by the ISLE network partners serves as a basis for analysis. The company survey<sup>‡</sup> was launched from May 10th to June 10th 2011. The total number

<sup>‡</sup> The company survey aimed to map genuinely and comprehensively the tasks, functions and opportunities of education in SD in daily working life as already perceived by employers. (Quendler, van der Luit, Monteleone, Aguado, Pfeiffenschneider, Wagner et al., 2013).

of replies in the raw database was 2,937 students and 852 academics. The education survey<sup>§</sup> was kept active from August 1st till October 7th 2011. The total number of replies in the raw database was 959. For both surveys neither the sampling size nor the responses were checked. Readers are reminded that results indicate a trend for Europe, the accuracy of which depends, inter alia, upon the sample size and the number of collected answers.

To evaluate and compare responses obtained from the HEIs coherently (education survey: data on SD competences taught at universities or colleges) and those obtained from the employers (company survey: data on SD competences requested), the two data-bases had to be rearranged to allow a joint data-set with a good matching between the variables. The comparison of competences, knowledge and skills taught and need in daily work is based on the calculation of regression. (Quendler, van der Luit, Monteleone, Aguado, Pfeiffenschneider, Wagner et al., 2013).

#### 4.2. Statistical analysis and interpretation

The statistical analysis of ANOVA, “Chi Square” statistical test and the calculation of correlation coefficient were run, using the Statistical Package for Social Sciences (SPSS 19.0). For all analyses the level of significance was set to 0.001 \*\*\*, 0.01 \*\* and 0.05 \*.

Thus an ANOVA experimental model was carried out considering one SD “dimension” at a time (competences, knowledge and skills) and three factors (country, category and size of the company) in factorial combination. The model has the following mathematical structure (according to the “general linear model” approach),

$$Y_{ijkm} = \bar{Y} + \alpha_i + \gamma_k + \chi_m + \delta_{ij} + \phi_{ik} + \lambda_{im} + \varepsilon_{ijkm} \quad (1)$$

where

$Y_{ijkm}$  is the “score” observed;

$\bar{Y}$  is the “grand” mean score of the considered SD “dimension” (i.e. “knowledge”);

$\alpha_i$  defines the score effect of the “i” attribute related to that “dimension” (i.e. “environmental justice”, “ecological economics”, “globalisation”, “human rights”, etc.);

$\alpha_j$  is the score effect of the modality “j” of the first factor (i.e. “country”);

$\gamma_k$  is the score effect of the modality “k” of the second factor (i.e. “category of the company”);

$\chi_m$  is the score effect due to the modality “m” of the third factor (i.e. “size of the company”);

$\delta_{ij}$ ,  $\phi_{ik}$  and  $\lambda_{im}$  are the score interaction components between one of the SD dimensions (“i”) and one of the three factors (“j”, “k” and “m”, respectively), i.e. a specific combination between a SD dimension and a factor. Finally, the term

$\varepsilon_{ijkm}$  represents the experimental error (the residual variability not explained by the model); this term is essential in order to judge the statistical significance of each effect.

The degree of association or, in other words, the measure of dependence between the two quantities (scores assigned by ‘company’ and by ‘education’) was determined by calculating the correlation coefficient (also known

<sup>§</sup> The purpose of the education survey was to collect data from students, professors, staff and relevant partners in each of the network’s member institutions, in order to identify the current status in the integration of SD into the institutions and studies, related to the field of life sciences. (Quendler, van der Luit, Monteleone, Aguado, Pfeiffenschneider, Wagner et al., 2013).

as Pearson coefficient). The Pearson correlation is +1 in the case of a perfect positive (increasing) linear relationship, -1 in the case of a perfect negative (decreasing) linear relationship and some value between -1 and +1 in all other cases, indicating the degree of linear dependence between the two variables. A Pearson coefficient close to zero identifies the absence of correlation. (Quendler, van der Luit, Monteleone, Aguado, Pfeiffenschneider, Wagner et al., 2013).

## 5. Results

### 5.1. Competences, knowledge and skills required by the labour market

To make Europe's labour markets function better and to deliver the right mix of competences, knowledge and skills in HEIs the specific needs have to be known. Which competences, knowledge or skills for SD are considered to be important for their employees, are presented in this section.

The statistical analysis (ANOVA, table 5, 6 and 7) showed no significant relationship between SD response indicators (competences, knowledge or skills) with the other experimental factors (country, category and size of the company, respectively). In this way, results can be simply analysed considering one factor at a time. (Quendler, van der Luit, Monteleone, Aguado, Pfeiffenschneider, Wagner et al., 2013).

Considering SD knowledge, table 8 shows that highly significant positive deviations from the average score ( $P < 0.01$ ) were found for the categories of 'environment' (K3.8), 'efficiency' (K5.22), 'natural resources and biodiversity' (K2.16); while significant positive deviations ( $P < 0.05$ ) were observed for 'ecosystems' (K2.13) and 'ecological integrity' (K2.7). On the other hand, highly significant negative deviations from the average score ( $P < 0.01$ ) were found for the categories of 'gross national product' (K5.10), 'niche markets' (K5.2), 'business models' (K5.4); while significant negative deviations ( $P < 0.05$ ) were observed for 'environmental justice' (K7.11) and 'human rights' (K7.15). (Quendler, van der Luit, Monteleone, Aguado, Pfeiffenschneider, Wagner et al., 2013).

Table 8. Mean deviation in SD knowledge as a consequence of ANOVA. The values are expressed as deviations from the average score of  $3.46 \pm 0.02$ .

Insofar as the SD skills are concerned, results from table 9 show that the most important skills (positive deviations from the average score for  $P < 0.01$ ) are: 'efficiency' (S4.15), 'leadership skills' (S7.19), 'sustainability planning' (S6.18), 'effective communication' (S5.14) and 'analysis of environmental problems' (S1.2). For  $P < 0.05$  the positive deviation is 'system thinking' (S1.6). Negative significant deviations ( $P < 0.01$ ) were found for the skills 'cap and trade' (S3.3), the '4 P's (product, price, place and promotion) of marketing' (S5.9), 'pollution prevention programme likes P2' (S2.1), 'pollution trading' (S3.5), and 'economic restructuring' (S4.13); for  $P < 0.05$  the negative deviation is that of 'socially responsible investing' (S6.4). (Quendler, van der Luit, Monteleone, Aguado, Pfeiffenschneider, Wagner et al., 2013).

Table 9. Mean deviation in SD skills as a consequence of ANOVA. The values are expressed as deviations from the average score of  $3.47 \pm 0.02$ .

## 5.2. Matching competences, knowledge and skills supply with labour market needs

Generally, HEIs need to deliver the right mix of competences, knowledge and skills both to meet student needs and to match the requirements of the labour market. By comparing competences, knowledge and skills for SD at employers' level to responses from the educational side we found out (figure 2) that companies attribute more importance to all SD competences, knowledge and skills than universities do in their education. This is substantiated by a significantly higher average score of company (3.52) compared to education (HEIs) (2.79) results. Furthermore, 'future orientation' (C3) and 'social responsibility' (C1) are considered the most important competences in general, both by education (HEIs) and companies. Companies also consider 'system orientation' (C2) and 'analysing environmental impacts' (S1) as very important. In contrast, skills like 'pollution trading' (S3) or 'reducing environmental impacts' (S2) are not considered very relevant. From the side of 'education', 'analysing environmental impact' (K3), closely followed by 'social aspect of SD' (K7) are the most important

ones; while 'general SD knowledge' (K1) and 'reducing environmental impacts' (K4) are the least relevant. (Quendler, van der Luit, Monteleone, Aguado, Pfeiffenschneider, Wagner et al., 2013).

KNOWLEDGE (K): K1. GENERAL SUSTAINABLE DEVELOPMENT KNOWLEDGE, K3. HOW TO ANALYSE ENVIRONMENTAL IMPACTS, K4. HOW TO REDUCE ENVIRONMENTAL IMPACTS, K5. ECONOMICS, K6. VALUE OF NATURE, K7. SOCIAL ASPECTS OF SUSTAINABLE DEVELOPMENT

SKILLS (S): S1. ANALYSING ENVIRONMENTAL IMPACTS, S2. REDUCING ENVIRONMENTAL IMPACTS, S3. POLLUTION TRADING, S4. ECONOMIC OPTIMIZATION, S5. COMMUNICATING, S6. IMPLEMENTING SUSTAINABILITY, S7. LEADERSHIP AND TEAMWORK

Source: Quendler, van der Luit, Monteleone, Aguado, Pfeiffenschneider, Wagner et al., 2013

Clearly employers are in a strong position to judge what mix of competences, knowledge and skills is optimal for particular occupations (like farming). The interests of employers depend on the level at which they are expressed. While locally employers may not wish their apprentices to have strong transferable skills, collectively employers have an interest in a flexible and adaptable labour force in their sector. Further on, if the principle of SD is to be implemented successfully in daily work life, there is also a need for education and training in higher education in order to be well prepared for work life. Professionals in SD will require new ways of thinking as well as certain competences, knowledge and skills to be able to contribute to the achievement of the goals of SD. This will also require changes in the training in life science of HEIs; furthermore, 'education and training' and 'work' will no longer be two separate entities. They will be much more integrated into a single lifelong learning process, open to innovation and accessible to everybody (cf. Green Pedagogy). (Quendler, van der Luit, Monteleone, Aguado, Pfeiffenschneider, Wagner et al., 2013)

### *5.3. Future job creation*

Considering the companies' expectations regarding the creation of new jobs related to SD activities or productive implementations, we have to stress that the 59 % of respondents do not believe in these kind of opportunities (table 10.A): this proportion is statistically significant ( $P < 0.01$ ) as compared with the starting hypothesis of equal partition between respondents. Italy showed a significantly higher level of trust in job creation (table 10.B) than other counties (+27 %,  $P < 0.01$ ), together with Greece (+39 % but not statistically significant due to the limited number of samples). The opposite was displayed by Estonia (-25 %,  $P < 0.01$ ) and Hungary (-41 %,  $P < 0.05$ ). The sector of 'education' (table 10.C), again, is to be considered more oriented to the opportunity that SD can contribute to job creation (deviation equal to +16 %,  $P < 0.05$ ), while 'agriculture' and 'administration' displayed the opposite character (deviations equal to -18 and -11 % respectively, with a significant P level). Finally, 'small' companies (table 10.D) were confirmed to be less confident in the creation of jobs compared to larger companies (deviation -13 %,  $P < 0.05$ ). (Quendler, van der Luit, Monteleone, Aguado, Pfeiffenschneider, Wagner et al., 2013).

Table 10. Expectations of European companies on the creation of new jobs related to SD. Responses (“Yes” or “No”) were processed by total (A), country (B), company category (C) and size of the company (D).

Nevertheless, there seems to be an overall consensus that in the future, the number of new jobs created in connection with SD will only be marginal. Mostly because SD would probably be a concept included within competences, knowledge and skills already present in actual jobs. Moreover, currently only 26 % of the respondents are already looking at SD criterion when recruiting new employees. This notwithstanding 71 % of participants in the survey agreed that it is important that graduates have an excellent scientific/technological knowledge in their field of expertise. (Quendler, van der Luit, Monteleone, Aguado, Pfeiffenschneider, Wagner et al. 2013).

## 6. Conclusion

Our prosperity, today and tomorrow, depends on how many people are in work and how they handle SD issues in their daily work life. The correct competences, knowledge and skills for SD are the best guarantee of our ability to sustain our life and secure lasting prosperity.

This empirical study shows that there seems to be an overall consensus that in the future, the number of new jobs created in connection with SD, will only be marginal. Mostly because SD would probably be a concept included within competences, knowledge and skills already present in actual jobs. Nevertheless, this paper responds to the growing need for developing a converging set of key competences, knowledge and skills that reflect the requirements of employers and their staff and can be guidance for the design of courses and teaching techniques at HEIs. We can say that there is a special need for knowledge in the field of 'environment', 'efficiency', 'natural resources and biodiversity' and 'ecological integrity' and for skills in the field of 'efficiency', 'leadership skills', 'sustainability planning', 'effective communication', 'analysis of environmental problems' and 'systems thinking'. Companies attribute more importance to all SD competences than HEIs do in their education. 'Future orientation' and 'social responsibility' are considered the most important competences, both by HEIs and companies.

Nevertheless, the results also reveal that there are several opportunities for improvement. Firstly, we need thorough theoretical justifications as to why the proposed competences, knowledge and skills are instrumental for SD and problem solving in daily (working) life. Secondly, we need to support proposed competences, knowledge and skills with empirical evidence showing they enable successful real-world SD problem solving and development. Thirdly, follow-up studies are needed that spell out the specifics of the proposed competences, knowledge and skills including the kind of methodological expertise to which they aspire.

Yet, the results presented are not intended to cast key competences, knowledge and skills 'in stone'. All of the following are needed to ensure high quality education in SD: continuous monitoring of performances within and beyond the programs; experimenting with teaching and learning settings; reflection on achievements and shortcomings; adaptation of the competences, knowledge and skills taught at HEIs and required by employers. Once more, the most critical check for the adequacy of the competences, knowledge and skills is the degree to which graduates can contribute to SD in the world – not only at work. Adaptation is required as SD challenges and our insights on how to cope with them shift over time.

Accordingly, governments should make an effort to properly identify and conceptualize the set of competences, knowledge and skills required so as to incorporate them into the educational standards that every alumni should be able reach by the end of higher education study. Governments should realize that to be successful in this process there are two requirements to be met. On the one hand, participation of both economic and social institutions, ranging from companies to higher education institutions, is critical. On the other hand, this whole process risks being irrelevant to HEIs unless this set of competences, knowledge and skills becomes the very core of what professors and HEIs should care about, and this can only be done by incorporating them into the national education standards that are enforced and assessed by governments.

Finally, it must be stressed that overall educational efforts should be coordinated between the educational institutions, the authorities and companies. There should be a combination of regulation, which pushes companies

towards new initiatives, and new training possibilities, which meet the needs such regulation results in. The sustainable element must increasingly be incorporated gradually into curricula but not forced on companies. The indications are that, if the incorporation of the concept of SD in basic business decisions can be made both economically advantageous and a part of good business management, companies will take more initiatives in this direction.

## Contributions

The research reported in this paper draws on some of the results from Work Package 4 (WP4) entitled “Professionalization” and some from Work Package 2 (WP2) entitled “Information collection concerning sustainable development in life sciences in Europe” which was carried out in the context of an Erasmus Thematic Network project on Innovation in the teaching of Sustainable Development in Life Sciences in Europe (ISLE). Cristina Cunha Queda and Jannie van der Luit led the focus work group WP4 and Pedro Aguado was responsible for WP2. Massimo Monteleone prepared the statistical analysis. Manou Pfeiffenschneider prepared the data and Francesca Valente involved herself in the statistical analysis. Erika Quendler and Klaus Wagner wrote the paper.

## Acknowledgements

A special thank goes to Corrine Stewart and her team for organising and managing the ISLE Erasmus Thematic Network (Innovation in the teaching of Sustainable Development in Life Sciences in Europe) which is co-financed by the European Community in the framework of the Lifelong Learning Programme, as well as all ISLE network partners. Finally, we acknowledge thanks to Emilio Chiodo, Kadri Kalle, Kjartan Bollason, Mary Forrest and Nidal Shaban for their involvement in the discussions of the focus group WP4 and all partners in the participating countries for carrying out the survey.

## Appendix E.

Table 7. SD issues.

SD issues	
<p>SD issues appear in every level of (working) life and affect the prosperity and the survival of humankind. SD issues are inter-related suggesting that approaching SD requires understanding the issues from many angles, not just from an environmentalist or economic or social perspective.</p>	
SD1	<p><b>Energy efficiency</b></p> <p><i>„Energy efficiency improvements refer to a reduction in the energy used for a given service (heating, lighting, etc.) or level of activity. The reduction in the energy consumption is usually associated with technological changes, but not always since it can also result from better organisation and management or improved economic conditions in the sector ("non-technical factors").” (World Energy Council, 2012).</i></p>
SD2	<p><b>CO<sub>2</sub> neutral operations</b></p> <p><i>“The term carbon neutral refers to a zero sum calculation of carbon emissions for any process, product, business, system, person, or even country. In other words, something that is carbon neutral, also referred to as having a net zero carbon footprint or climate neutral, offsets as many carbon emissions as it emits. Carbon neutrality doesn't refer only to carbon dioxide emissions but to any greenhouse gas emission that contributes to global warming, usually measured in carbon dioxide equivalence.” (Eco Lifestyle Network Company, 2001).</i></p>
SD3	<p><b>Sustainable procurement</b></p> <p><i>"Sustainable procurement aims to integrate environmental considerations into all stages of the purchasing process with the goal of reducing the impact on human health and the environment."(Council for Local Environmental Initiatives 1995-2008).</i></p> <p>Sustainable procurement is also called eco-procurement, green purchasing, environmentally friendly purchasing and affirmative procurement. Sustainable procurement is not only about the environment, it also requires advocacy of fundamental rights of people and labour rights and delivering progress in the economy.</p>
SD4	<p><b>Reduced water consumption and water reuse</b></p> <p>Reduction in water consumption refers to a reduction in water use accomplished by implementation of water conservation or water efficiency measures. Water reuse or waste water reuse involves recycling systems that allow for the reuse of grey water for flushing toilets or watering gardens or refers to the recycling of wastewater through purification at a water treatment facility.</p>
SD5	<p><b>Efficient use of natural resources</b></p> <p><i>“Using resources more efficiently will help us achieve many of the EU's objectives. It will be key in making progress to deal with climate change and to achieve our target of reducing EU greenhouse gas emissions by 80 to 95 % by 2050. It is needed to protect valuable ecological assets, the services they provide and the quality of life for present and future generations. It will help us ensure that the agricultural and fisheries sectors are strong and sustainable and reduce food insecurity in developing countries. By reducing reliance on increasingly scarce fuels and materials, boosting resource efficiency can also improve the security of Europe's supply of raw materials and make the EU's economy more resilient to future increases in global energy and commodity prices.” (EC, 2011).</i></p>
SD6	<p><b>Renewable resources</b></p> <p>Renewable resources are any natural resource (such as biomass or solar energy or wind) that can be replenished naturally within an acceptable period of time. Renewable resources are an important aspect of SD. (Wiema &amp; Media,2009).</p>
SD7	<p><b>Organic farming</b></p> <p><i>“Organic farming works in harmony with nature rather than against it. This involves using techniques to achieve good crop yields without harming the natural environment or the people who live and work in it.” (HDRA, 1998).</i></p>
SD8	<p><b>Scarcity of raw materials</b></p> <p>Material scarcity (or any scarcity) is controlled by only two factors: the supply of the material versus its demand. “Supply” here should be interpreted as the raw material – especially non-renewable resources – that is made available to industry. It must be noted that the recycling of raw materials would be an alternative supply stream.</p> <p>The demand for a material is ultimately determined by the end users together with the effectiveness of the supply chain.</p> <p>With a growing world population which is also getting more prosperous, the demand for products increases and therefore also the demand for resources. (cf. Wouters &amp; Bol, 2009).</p>

<b>SD issues</b>	
	SD issues appear in every level of (working) life and affect the prosperity and the survival of humankind. SD issues are inter-related suggesting that approaching SD requires understanding the issues from many angles, not just from an environmentalist or economic or social perspective.
SD9	<b>Prevention of damage to biodiversity</b> Mankind is damaging nature and biodiversity in endless ways and at increasing speed. Apart from pollution, mankind causes massive erosion, builds cities, covers increasing areas with concrete, disrupts sea floors and corals, burns forests, desertifies large areas, makes land and sea radioactive, produces new organisms or transports foreign species that may overtake local nature, etc. (Oiconmy, n.d.). In order to keep the earth we have to set prevention actions – also including a better understanding of the mechanisms and effects of our pressure on nature to assess the consequences.
SD1	<b>Waste reduction</b> The Waste Framework Directive defines waste as any substance or object which the holder discards or intends or is required to discard. (Directive 2006/12/EC). Waste affects every part of society and is not only environmentally damaging but also expensive. Businesses, local authorities, government and members of the public play a part in the creation, management and disposal of waste and it is vital that they all recognise the benefits of reducing waste and the roles they must play in doing this. (Authority of the House of Lords 2008).
SD1	<b>Emission reduction</b> The act or process of limiting or restricting the discharge of pollutants or contaminants, such as by setting emission limits or by modifying the emission source. In this way companies reduce the impact of their day-to-day operations on global climate change in the form of greenhouse gases [carbon dioxide (CO <sub>2</sub> ), methane (CH <sub>4</sub> ), nitrous oxide (N <sub>2</sub> O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulphur hexafluoride (SF <sub>6</sub> )] into the atmosphere from a specified activity or over a specified area, and a specified period of time. (Bruun, 2007).
SD1	<b>Development of SD products and services for clients</b> The development of new products and services by companies and organisations that are especially aimed at helping their clients to improve their contribution to SD.
SD1	<b>Corporate social responsibility</b> Corporate social responsibility (also called corporate conscience, corporate citizenship, social performance, or sustainable responsible business/responsible business) is a form of corporate self-regulation integrated into a business model. Corporate social responsibility policy functions as a built-in, self-regulating mechanism whereby a business monitors and ensures its active compliance with the spirit of the law, ethical standards, and international norms. The goal of Corporate social responsibility is to embrace responsibility for the company's actions and encourage a positive impact through its activities on the environment, consumers, employees, communities, stakeholders and all other members of the public sphere who may also be considered as stakeholders. (Wood, 1991).
SD1	<b>Sustainable Supply chain</b> Supply chain sustainability is a business issue affecting an organisation's supply chain or logistics network in terms of environmental, risk, and waste costs. SD in the supply chain is increasingly seen among high-level executives as essential to delivering long-term profitability and has replaced monetary cost, value, and speed as the dominant topic of discussion among purchasing and supply professionals. (N.N., 2009).
SD1	<b>Rethinking the business by using SD as a principle</b> Rethinking the business is the process of examination, analysis and alteration of the existing business principles of a company or organisation by using SD as a leading principle. The objective is to maintain the existing functionality but improve on SD goals.
SD1	<b>SD as means to improve business opportunities</b> <i>“Sustainable development strategies uncover business opportunities in issues which, in earlier stages of the journey, might be regarded as costs to be borne or risks to be mitigated. Results include new business processes with reduced external impacts, improved financial performance, and an enhanced reputation among communities and stakeholders.” (IISD, 2012).</i>

Table 2. Competences for SD.

<b>Competences for SD</b>	
	Competences for SD identify characteristics based on knowledge and skills that all employers are expected to demonstrate to carry out the mission and goals of the company under consideration of the idea of SD. Employees have the understanding, knowledge and skills they need to enable them to grasp the right opportunities and innovations for SD in their workplace in a rapidly changing and interconnected world of market-places, communications, and social and environmental challenges.
G	<b>Social responsibility</b>
1	A sustainable professional takes responsibility for his/her own work: can make a stakeholder analysis, assume personal responsibility and be held accountable to society.
G	<b>System orientation</b>
2	A sustainable professional can think and work from a systemic perspective: he/she can zoom in and out, can think in details and holistically, can recognise strengths and weaknesses in systems and use their strengths.
G	<b>Future orientation</b>
3	The sustainable professional thinks and works from a future oriented perspective: he/she thinks in varying timescales, zooms in and out between a short term and long term approach, recognises and utilizes non-linear processes, thinks innovatively, and is creative outside the box, with a focus more on function than product.
G	<b>Global awareness</b>
4	The sustainable professional thinks and works from both a local and global perspective, he/she is able to take into account the global consequences of his/her local actions.
G	<b>Emotional intelligence and communication</b>
5	A sustainable professional recognises and respects his/her own values as well as those of other people and cultures, can distinguish between facts, presumptions and opinions and can collaborate in an inter- and transdisciplinary way. He/she is open-minded and able to communicate and network with internal and external stakeholders effectively. He/she works from the principle of social equity.
G	<b>Personal involvement</b>
6	A sustainable professional dedicates him/herself personally to SD: he/she can consistently involve SD in his/her own work as a professional, can work with passion on dreams and ideals, applying their own conscience as an ultimate standard.
G	<b>Action and practical skills</b>
7	A sustainable professional acts decisively and competently: He/she can weigh “unweighable” aspects and makes choices, deals with uncertainties and acts when the time is ripe. He is focused on solving problems, and can work systematically.

Source: Roorda, 2012

Table 3. SD knowledge: concepts, theories, ideas, processes.

<b>SD knowledge</b>	
SD knowledge refers to enabling the competences to be applied for SD in daily work life.	
<b>K1 GENERAL KNOWLEDGE</b>	
<b>K1.</b>	<b>Triple P bottom line/ Brundtland report /basic knowledge of SD</b>
1	Knowledge on the triple bottom line (abbreviated as TBL or 3BL, and also known as people, planet, profit or the three pillars) which captures an expanded spectrum of values and criteria for measuring organisational (and societal) success: economic, ecological, and social. With the ratification of the UN and ICLEI TBL standard for urban and community accounting in early 2007, this became the dominant approach to public sector full cost accounting. Similar UN standards apply to natural capital and human capital measurement to assist in the measurements required by TBL, e.g. the EcoBudget standard for reporting ecological footprint.
<b>K2 ECOLOGY</b>	
<b>K2.</b>	<b>Basic principle of natural systems</b>
3	Knowledge on basic principles of a system of biological classification based upon morphological and anatomical relationships and affinities considered in the light of phylogeny and embryology.
<b>K2.</b>	<b>Ecological integrity</b>
7	The quality of being honest and having strong moral principles that you refuse to change with regards to ecology.
<b>K2.</b>	<b>Ecosystem</b>
13	Knowledge on all the living things in an area and the way they affect each other and the environment.
<b>K2.</b>	<b>Natural resources and biodiversity</b>
16	Knowledge on natural resources, which are all the land, forests, energy sources and minerals existing naturally in a place that can be used by people. Biodiversity is the existence of a wide variety of plants and animal species living in their natural environment.
<b>K3 ANALYSING ENVIRONMENTAL IMPACTS</b>	
<b>K3.</b>	<b>Carbon footprint</b>
5	Knowledge on someone's carbon footprint which is a measurement of the amount of carbon dioxide that their activities generate.
<b>K3.</b>	<b>Environment</b>
8	Knowledge on the air, water and land in or on which people, animals and plants live and how people's behaviour effects natural cycles.
<b>K4 REDUCING ENVIRONMENTAL IMPACTS</b>	
<b>K4.</b>	<b>Environmental management systems</b>
9	Knowledge on the system that a company uses for making certain that it does everything possible to protect the environment and obeys all laws relating to the environment.
<b>K5 ECONOMICS</b>	
<b>K5.</b>	<b>Economics</b>
6	Knowledge on the way trade, industry or the flow of money is organized.
<b>K5.</b>	<b>Gross national product</b>
10	Knowledge on the total value of goods and services produced by a country in one year, including profits made in foreign countries.

<b>SD knowledge</b>	
SD knowledge refers to enabling the competences to be applied for SD in daily working life.	
K5 ECONOMICS	
22	K5. <b>Efficiency</b> Knowledge on how to use time, resources and energy well, without wasting any.
23	K5. <b>Externalities</b> Knowledge on the concept of externality, or transaction spillover, as a cost or benefit that is not transmitted through price and is incurred by a party who was not involved as either a buyer or seller of the goods or services causing the cost or benefit. The cost of an externality is a negative externality, or external cost, while the benefit of an externality is a positive externality, or external benefit.
2	K5. <b>Niche market</b> Knowledge on how you can position your products in a niche market. A niche market is the subset of the market on which a specific product is focusing. So the market niche defines the specific product features aimed at satisfying specific market needs, as well as the price range, production quality and the demographics that is intended to impact. It is also a small market segment.
4	K5. <b>Business model</b> A description of the different parts of a business or organisation showing how they will work together successfully to make money.
17	K5. <b>Supply chain</b> Knowledge on the system of people and things that are involved in getting a product from the place where it is made to the person who buys it.
18	K5. <b>Value chain</b> Knowledge on the series of companies involved in the different stages of producing a product or service that is sold to consumers, with each stage adding to its value.
14	K5. <b>Globalization</b> Knowledge on the increase of trade around the world, especially by large companies producing and trading goods in many different countries.
K6 VALUE OF NATURE	
12	K6. <b>Ecological economics</b> Knowledge on the way in which trade, industry or money is organized in relation to ecology.
21	K6. <b>Ecosystem services</b> Knowledge on how humankind benefits from a great many of the resources and processes that are supplied by natural ecosystems. Collectively, these benefits are known as ecosystem services and include products like clean drinking water and processes such as the decomposition of wastes. While scientists and environmentalists have discussed ecosystem services for decades, these services were popularized and their definitions formalized by the UN 2005 Millennium Ecosystem Assessment (MEA).
K7 SOCIAL ASPECTS OF SUSTAINABLE DEVELOPMENT	
15	K7. <b>Human rights</b> Knowledge on rights regarded as belonging fundamentally to all persons as described in the Universal Declaration of Human Rights (UN, 1945).
19	K7. <b>Social responsibility</b> Knowledge on the practice of producing goods and services in a way that is not harmful to society or the environment.
20	K7. <b>Social justice</b> Knowledge on social justice as an underlying principle for peaceful and prosperous coexistence within and among nations. We uphold the principles of social justice when we promote gender equality or the rights of indigenous peoples and migrants. Social justice is advanced when we remove barriers that people face because of gender, age, race, ethnicity, religion, culture or disability. (UN 2012).
11	K7. <b>Environmental justice</b> Knowledge on how inequitable distributions of environmental burdens (such as pollution, industrial facilities, and crime) can be redressed under the general view of the environment as encompassing 'where we live, work, and play' (some definitions also include 'pray' and 'learn').

Source: Quendler, van der Luit, Monteleone, Aguado, Pfeiffenschneider, Wagner et al., 2013

Table 4. SD skills (process dynamics, tools, and methodologies).

<b>SD skills</b>	
SD skills indicate an ability to be able to do something in order to contribute to and/or enhance SD. Moreover, they are the foundation of flexibility, employability and further learning throughout life.	
S1	<b>ANALYSING ENVIRONMENTAL IMPACTS</b>
S1.2	<b>Analysis of environmental problems</b> The ability to analyse problems relating to the environment. The environment is the air, water and land in or on which people, animals and plants live.
S1.6	<b>Systems thinking</b> The ability to understand how things influence each another within a whole. In nature, systems thinking examples include ecosystems in which various elements such as air, water, soil, plants and animals interact. In organisations, systems consist of people, structures, and processes that work together to make an organisation healthy or unhealthy. Systems thinking has been defined as an approach to problem solving, by viewing 'problems' as parts of an overall system, rather than relating to specific parts, outcomes or events and potentially contributing to the further development of unintended consequences. Systems thinking is not one thing but a set of habits or practices within a framework that is based on the belief that the component parts of a system can best be understood in the context of relationships with each other and with other systems, rather than in isolation. Systems thinking focuses on cyclical rather than linear cause and effect. (Aronson, 1996).
<b>SD skills</b>	
SD skills indicate an ability to be able to do something in order to contribute to and/or enhance SD. Moreover, they are the foundation of flexibility, employability and further learning throughout life.	
S1	<b>ANALYSING ENVIRONMENTAL IMPACTS</b>
S1.8	<b>Full cost accounting</b> The ability to carry out accounting which recognises the economic, environmental and social costs of an action or decision. (BD, www.Businessdictionary.com).
S1.1	<b>Life cycle analysis</b> 1 The ability to compile and evaluate inputs, outputs and the potential environmental impacts of a product system throughout its life cycle. Life cycle covers the consecutive and interlinked stages of a product system, from raw material acquisition or generation of natural resources to final disposal (ISO, 2006).
S1.1	<b>Ecological foot print</b> 2 The ability to calculate ecological footprint/appropriated carrying capacity (EF/ACC) and interpret the results. EF/ACC is a simple yet effective tool which provides an accounting framework for the biophysical services that a given economy requires from nature. It is calculated by estimating the land area, in various categories, necessary to sustain the current level of consumption by the people in that economy, using prevailing technology. An economy's full ecological footprint would include all the land whose services this economy needs to provide necessary resource inputs and to assimilate corresponding waste outputs. The EF/ACC concept thereby demonstrates the ecological dependence of economic systems. It is both an analytic and heuristic device for understanding the sustainability implications of different kinds of human activities, and serves as an awareness tool and action-oriented planning tool for decision making towards SD. (Wackernagel, 1994).
S1.1	<b>Indicators and indexes</b> 6 The ability to calculate and interpret indicators and indexes in order to assess SD.
S2	<b>REDUCING ENVIRONMENTAL IMPACTS</b>
S2.1	<b>Pollution prevention programme</b> The ability to deal with the Pollution Prevention Act (PPA). PPA establishes a bold national objective for environmental protection: "[T]hat pollution should be prevented or reduced at the source whenever feasible."(Browner, 1993).

<b>SD skills</b>	
SD skills indicate an ability to be able to do something in order to contribute to and/or enhance SD. Moreover, they are the foundation of flexibility, employability and further learning throughout life.	
S3	POLLUTION TRADING
S3.3	<p><b>Cap and trade</b></p> <p>The ability to understand and implement ‘cap and trade’ principle. This means there is a ‘cap’, or limit, on the total amount of certain greenhouse gases or other pollutants that can be emitted by the factories, power plants and other installations in the system. Within this cap, companies receive emission allowances which they can sell to or buy from one another as needed. The limit on the total number of allowances available ensures that they have a value. (EC, 2011).</p>
S3.5	<p><b>Pollution trading</b></p> <p>The ability to understand and to be able to do pollution trading, cf. cap and trade.</p>
S4	ECONOMIC SENSE
7	<p>S4. <b>Business case</b></p> <p>The ability to create a business case. An explanation or set of reasons describing how a business decision will improve a business, product, etc. and how it will affect costs and profits and attract investments.</p>
13	<p>S4. <b>Economic restructuring</b></p> <p>The ability to be able to deal with and understand economic restructuring.</p> <p>Economic restructuring refers to the development of the economy in a country or around the world. There is an on-going process shifting from the primary sector to the secondary and tertiary one but also further on to experiences and transformation services (cf. Pine &amp; Gilmore, 1999). This development has affected demographics including income distribution, employment, social hierarchy and institutional arrangements (cf. Sassen, 1990; Noyelle &amp; Stanback, 1984; Logan &amp; Swanstrom, 1990; Musterd &amp; Ostendorf, 1998; Kalleberg 2000 &amp; Katz, 1997).</p>
5	<p>S4.1 <b>Efficiency</b></p> <p>The quality of being able to do a task successfully without wasting time or energy. It has an effect on the</p> <ul style="list-style-type: none"> <li>• <i>productive efficiency</i> which occurs when the economy is utilizing all of its resources efficiently (Fried, Schmidt &amp; Lovell, 1993);</li> <li>• <i>allocative efficiency</i>, which occurs when goods and services are distributed according to consumer preferences (Markovits 1998);</li> <li>• <i>efficiency of scale</i>, which occurs when the firms produces on the lowest point of its long run average cost and therefore benefits fully from economies of scale (Sullivan &amp; Sheffrin, 2003);</li> <li>• <i>social efficiency</i>, which occurs when externalities are taken into consideration and occurs at an output where the social cost of production (SMC) is equal to the social benefit (SMB) (cf. Lefebvre &amp; Vietorisz, 2007);</li> <li>• <i>technical efficiency</i>, which deals with the optimum combination of factor inputs to produce a good: related to productive efficiency (Kalirajan &amp; Shand, 1999);</li> <li>• <i>pareto efficiency</i>, which is a situation where resources are distributed in the most efficient way. It is defined as a situation where it is not possible to make one party better off without making another party worse off (cf. Sen 1993); and</li> <li>• <i>distributive efficiency</i>, which is concerned with allocating goods and services according to who needs them most. Therefore, requires an equitable distribution (cf. Lerner, 1944).</li> </ul>
S5	COMMUNICATION
S5.9	<p><b>The 4 P's (product, price, place and promotion) of marketing</b></p> <p>The ability to understand and work with the four major controllable factors of a marketing mix: product, price, place (distribution) and promotion.</p>
S5.14	<p><b>Effective communication</b></p> <p>The ability and quality of an information sharing process which involves one party sending a message that is easily understood by the receiving party.</p>

<b>SD skills</b>	
SD skills indicate an ability to be able to do something in order to contribute to and/or enhance SD. Moreover, they are the foundation of flexibility, employability and further learning throughout life.	
S6	<b>IMPLEMENTING SUSTAINABILITY</b>
S6.10	<b>Designing a sustainable system</b> The ability to design systems that are capable of operating continuously while meeting today's (global) economic, environmental, and social needs without compromising the opportunity for future generations.
S6.18	<b>Sustainability planning</b> The ability to plan through a process of thinking about and organizing the activities required to achieve a desired goal in SD.
S6.4	<b>Socially responsible investing</b> The ability to invest under consideration of sustainable, socially conscious, 'green' or ethical aspects. Socially responsible investing is the practice of making investment decisions on the basis of both financial return and social good (Hutton & Johnsen, 1998).
S7	<b>LEADERSHIP AND TEAMWORK</b>
S7.17	<b>Influencing the organisation</b> The ability to bring in your educational profile to influence the development of your organisation in a sustainable way.
S7.19	<b>Leadership skills</b> The ability to motivate a group of people toward a common goal.

4<sup>th</sup> International Conference on New Horizons in Education

# Environmental worldviews in higher education: a case study of Turkish college students

Nazmiye Erdogan\*

*Baskent University, Vocational School of Social Sciences, 06810, Ankara, Turkey*

---

## Abstract

This study was designed to explore the nature of Turkish college students' environmental worldviews and test hypothesized relations on environmental views, environmental course status, gender, school status and socio-economic status. A sample of 1295 undergraduate students from four Turkish universities was selected for the study and their views were measured on 25 statements. A self-administered survey questionnaire was used to collect the data. Study findings indicated that 56.5 % of students hold pro-environmental views while 24.6 % embrace views associated with the dominant social paradigm and 18.8 % have ambivalent views. Results provided partial support for the hypothesized relationships. Female students, students with low socio-economic status and first-year students have higher pro-environmental orientations. Taking a course on environment makes only slight difference in opinions. It was concluded that students' environmental orientations change varying extent according to gender, socio-economic status and education which are probably determined by the historical and cultural context and characteristics of the population under study. Results suggest that there exists a reasonable level of environmental awareness; however university policies and practices on the environmental education and issues need to be reassessed and geared toward cultivating environmental sensitivity.

*Keywords:* Environmental worldview; environmental education; New Ecological Paradigm; environmental culture

---

## 1. Introduction

Theory and research interests in environmental issues have been steadily increasing since 1970s, because it was realized that nobody is immune from the outcomes of ecological devastations and the well-being of future generations are in jeopardy (Vlek & Steg, 2007; Whitmarsh, 2011). Many researchers think that there are set of basic beliefs and values, called Dominant Social Paradigm (DSP), behind the problem of the ecological crisis (Martinez, Alonso, & Martin, 2008). It entails the belief that (a) humans are superior over nature, (b) humans are exempt from ecological constraints (c) Humans, by virtue of possessing culture and technology, are able to adapt nature to human ends, rather than adapt to the natural environment, (d) natural resources are abundant, progress is continuous and the laissez-faire economic growth is necessary, (e) science and technology can solve our problems, and (f) private property rights are sacred increasing sensitivity toward and concern for the environment have brought about a shift from the anthropocentric DSP to the ecocentric view which is based on (a) high valuation of nature, (b) generalized compassion toward other species, other people and other generations, (c) careful planning and acting to avoid risks to humans and nature, (d) recognition that there are limits to growth to

E-mail address: [nerdogan@baskent.edu.tr](mailto:nerdogan@baskent.edu.tr)

which humans must adapt, (e) new society with cooperation, openness and participation, and (f) consultative and participatory new politics emphasizing on foresight and planning.

Concurrently, environmental studies have emerged and proliferated. Using the general assumption that the nature of environmental condition depends on the prevailing character of mental and material production of daily life, studies have concerned mostly with the existing environmental conditions, environmental use, and people's dispositions toward environment (De Groot & Steg, 2007; Nooney et al., 2003), the socio-psychological and cultural aspects (DeGroot & Steg, 2007; Schultz et al., 2005). Majority of studies (Aytülkasapoglu & Ecevit, 2002; Johnson, Bowker, & Cordell, 2004; Poortinga, Steg, & Vlek, 2004; Talay, Gündüz, & Akpınar, 2004; Bodur & Sarigollu, 2005) have been based on cross-sectional analyses using various socio-demographic, educational, cultural, attitudinal and behavioral variables. Numbers of them (Bamberg, 2003; Kemmelmeier, Krol, & Kim, 2002; Davis, Green & Reed, 2009; Choi & Fielding, 2013) have focused on the differences due to the diverse structure of concerns, worldviews, values, beliefs and attitudes or on causal relationships among the various variables. Increasing number of studies (De Groot & Steg, 2007; Leung & Rice, 2002; Rauwald & Moore, 2002; Fairbrother, 2012) have been interested in cross-national or cross-cultural comparisons.

One of the commonly studied population groups in environmental studies has been college students. Students comprise of important segment of society and warrant attention in terms of studying environmental culture, opinions, attitudes and behaviors. They will be working in various sectors of society in the near future and performing important works such as managers, teachers, businessmen, industrialists and the like. The future quality and stability of life on our planet depends on youngsters developing the worldview necessary for making informed and sensitive decisions about the environment and becoming active participant in the creation of sustainable world. Students also have been the leading crusaders in the modern environmental activities and movements (Gough, 2008; Jenkins & Pell, 2006; Thapa, 2001; Rappaport, 2008). Understanding students' worldviews on environmental issues are also functional for the design of policies to enhance the environmental awareness and sensitivity and support development and use of sustainable practices, methods and products.

Environmental studies focusing on students generally are interested providing cross-sectional information on the psychological and/or socio-demographic variables and the nature of environmental concerns, behaviors, worldviews and orientations of students. Such studies (Aytülkasapoglu & Ecevit, 2002; Johnson, Bowker & Cordell, 2004; Poortinga, Steg, & Vlek, 2004; Talay, Gündüz, & Akpınar, 2004) wanted to know the nature of students' knowledge, opinions and attitudes toward environment and environmental issues. Studying undergraduate students in the United States, Thapa (2001) found that students seemed to express the importance towards environmental issues, but they lacked awareness. Some studies found significant relationship between environmental knowledge and environmental behaviors (Ridener, 1999), while others found no significant relationship (Shean & Shei, 1995). Regarding Turkish case, the 1990s and 2000s represent important changes in environmental consciousness, attitudes and behavior of Turkish people (Oğuz, Çakıcı, & Kavas, 2011; Erdogan & Baris, 2007; Talay, Gunduz, & Akpınar, 2004). It is an unquestionable fact that there is increasing need to conduct academic and administrative studies in Turkey. Thus, this article was designed to examine the environmental worldviews of Turkish university students. The primary objective of the study was to examine the nature of students' environmental worldviews and test five hypothesized relations in order to contribute to the accumulated knowledge on the issue for academicians, policy makers, field workers, organizations and other interested parties.

Studies on environmental orientation/worldviews of various sections of Turkish population generally state that people have rather conservative values (Taskin, 2009). However, the nature of Turkish population has been changing especially since 1980s. They have been watching, listening and reading a lot about the environmental issues and problems. Thus, their environmental awareness is expected to rise. College students represent the educated and advance section of society. Due to amounting information and discussion on environmental problems and felt need for environmental protection, we expect that majority of students hold pro-environmental views. Based on the above rationale, the following hypothesis was put forward:

H<sub>1</sub>: Although more students are expected to have pro-environmental views, they are not expected to embrace high level of pro-environmental orientation.

It is generally believed that education can increase an individual's ability to appreciate complex and integrative large scale problems, and thus serves to heighten environmental awareness and concern (Ewert & Baker 2001; Ruff & Olson, 2009). Environmental literacy are connected with students' sensitivity, awareness, and understanding of changing environmental issues and asserted that increased and responsible environmental action skills are developed as a result of environmental education (Bradley et al. 1999; Magtorn, & Hellden, 2007; Moseley, 2000; Woodworth, Steen-Adams & Mittal, 2011). Some researchers (Leeming et al. 1997; Tikka et al., 2000) indicate that students' participation in environmental activities is an important parameter in acquiring environmental attitudes. Hence, it is expected that taking a course on environment can make some difference, however extent of effect of taking a course in environment is expected to vary according to socio-cultural environment and personality traits:

H<sub>2</sub>: Students who took a course in environment and students who did not take any will differ in their environmental worldviews.

Generally, people gain environmental sensitivity through formal and lifelong education in society. The extent of environmental sensitivity depends on the extent of circulation of information and discussions about environment in daily agendas set by social institutions like mass media, family and school in a society. Given the fact that there is inadequate, yet somewhat increasing level of such informational environment and adaptation of environmental culture in Turkey, years spent at school is expected to influence students' existing opinions about environment and environmental issues. However, studies provide conflicting results. Some of the previous studies have found positive relationship between school grade (years passed at school) and environmental opinions/attitudes. Others found negative relations. Some studies suggest that young children had more positive attitudes toward environmental issues than did older students (Malkus and Musser, 1997; Musser and Diamond (1999). Based on these facts, the following hypothesis was extracted:

H<sub>3</sub>: First year students and fourth year students will differ in their environmental views.

Several studies found that females have more positive opinions and attitudes and greater concern toward environmental issues than do males (Tikka, Kuitunen & Tynys, 2000; Yilmaz et al., 2004; Taskin, 2009). Paradoxically, some studies found males to be more sensitive to environmental issues than females (MacDonald & Hara, 1994). Yet some others found no significant gender differences (Yilmaz et al, 2004). Females are acculturated in Turkish society in such a way that they become more sensitive to their social, cultural and physical environments. Thus, it is expected that more females hold pro-environmental views than males. Despite the conflicting finding on gender differences, it is safe to assume that Turkish female students are more environmental oriented in their worldviews as compared to males, because Turkish society is changing, but still reproduces traditional values about the gender differences:

H<sub>4</sub>: There is a gender difference in environmental views: more female than male students have pro-environmental views, while more male than female students have pro-DSP view.

Some studies have found positive relations between socio-economic status (SES) and environmental opinions/attitudes and behaviors (Yilmaz et al. 2004), while some others came up with the contrary results (Taskin, 2009; Uyeki & Holland, 2000). It is generally assumed that Turkish university students mainly come from a particular socio-economic sector of society, therefore, there is certain homogeneity of environmental orientation, awareness, opinions and attitudes among them (Talay, Gündüz & Akpınar 2004). Socio-economic-status is still expected to make some significant differences in environmental orientation, because there is high probability that they expose to differing information and activity on environmental protection in their daily life. The existing research suggests that direction of difference is dependent upon variety of cultural and personal factors like the way students evaluates the information they receive. This means that the difference is expected, but the direction cannot be predicted. Thus, the following hypothesis was put forward:

H<sub>5</sub>: There is relationship between socio-economic status and environmental views.

This article was designed to examine the environmental worldviews of Turkish university students. The primary objective of the study was to examine the nature of students' environmental views and test five hypothesized relations in order to contribute to the accumulated knowledge on the relationship between some socio-demographic variables and environmental orientations.

## 2. Method

The study population of this survey research included students from Baskent University, Ankara University, Mustafa Kemal University and Karadeniz Technical University. A sample of 145 students from Mustafa Kemal University, 107 from Karadeniz Technical University, 102 from Ankara University, and 941 from Baskent University were selected for the study. Study sample included 1295 students.

A 25 item questionnaire was developed by using the related studies and the revised NEP scale which was constructed by Dunlap, Van Liere, Mertig & Jones in 2000 and considered one of the most widely used and scrutinized methods to measure environmental orientation, attitudes and behavior (Dunlap, 2008). Socio-demographic variables included gender, school status, environmental course and socio-economic status. School status was defined as years at school and categorized under first-year, second-year, third-year and fourth-year students. Environmental course was defined any environmental related course and measured by asking if a student has taken any course on environment, and coded as "yes" (course-taker) and "no" (non-taker). SES was measured by family income and grouped as "low", "medium" and "high". Mean scores for central tendency and frequency analysis for evaluation of single item distributions were used. Besides providing the univariate distributions for every item on the study scale, summary-indexes were developed in order to determine the overall environmental orientation: Two types of summary-indexes were constructed in order to obtain average distributions from the 25 items: (1) An overall environmental orientation index was calculated by averaging the mean scores of 25 items. (2) Frequency distribution indexes for each column were calculated by averaging the column scores. These summary-indexes were calculated in order to provide (a) a general central tendency score of students on the mean distributions of the 25 items, and (b) general frequency distribution scores on each level of 5 scale ordinal measurement. This is not done in order to test the scale, but to summarize the responses of students further. Chi-square test was utilized in order to test the hypotheses. The value of Pearson's  $\chi^2$  and its probability value (p) are reported to indicate the statistical significance. Adjusted standardized residuals (R) were used to decide which levels/cells of the variables are the major contributors, but were not reported in tables. The 25 item scale theoretically included five dimensions with two major factorial orientations (the pro-environmental and DSP orientations). The principal components analysis and varimax factor rotation were carried out in order to find out the existence of (1) general dimensional structure and (2) two dimensional structure of the scale, and thus, to validate the scale by demonstrating that its constituent items load on the same two factors assigned as the pro-environmental and pro-DSP statements. Each item were measured on a scale ranging from 1 (strongly disagree) to 5 (strongly agree). All pro-environmental responses were expected to be relatively high scores and all DSP responses were expected to be relatively low score. Agreement with the first 15 items indicates pro-environmental orientation. Agreement with the remaining 10 items indicates pro-DSP orientation. Therefore, the scores were reversed for these 10 items.

## 3. Findings

### 3.1. Students' environmental worldviews

The environmental worldviews and orientations of the students were determined by providing percentage distribution, mean scores and indexes of the students' scores (Table 1). The first hypothesis indicated that more

students have pro-environmental worldviews, however they will not show high level of pro-environmental orientation. Findings supported this hypothesis: Frequency distributions of the overall orientation index (Table 1) show that 30.3% students strongly agree and 26.2% agree (56.5% overall agreement), whereas 11.5% strongly disagree and 13.1% disagree (24.6% overall disagreement). 18.8% have ambivalent views about the issues studied.

Distributions on the Pro-environmental items (items 1-15) show that three thirds of students (75.3%) agree on these statements, whereas only 10.5% disagree and 14.1% are undecided. In terms of overall mean index of pro-environmental items, general orientation of students is at 4.05 (mildly agree) level. Conversely, distributions on the pro-DSP items (items 16-25) reveal that 28.5% agree with the statements, while there are considerable numbers of disagreeing (45.7%) and undecided (25.8%) students. Regarding overall mean index of pro-DSP items, general orientation of students is at 3.31 (middle) point.

### *3.2. Difference between the environmental course-takers and non-takers*

The second hypothesis stating differences between the students who took an environment related course and those who did not take any was partially confirmed: Chi-square test results showed only six significant results at 0.05 levels. These six statements are related with environmental abuse, fast economical growth, trust in human ingenuity, nature's ability to overcome impact of modern industries, human's rule over nature and limitless usability of nature.

Agreements on items by course-takers range from 61.8 to 81.0% for pro-environmental items and 17.4 to 40.6% for the pro-DSP items. Agreements by non-takers range from 49.7 to 84.6% for the pro-environmental items and 23.2 to 39.9% for the pro-DSP items. Item 4 has an undecided percentage of 6.6 for course-takers and 6.5% for non-takers. The remaining undecided responses range from 11.5 to 39.6% for course-takers and 20.7 to 32.9% for non-takers. Distribution of agreement with the statement that humans are severely abusing the environment is 81.0% for the course-takers and 84.6 % for non-takers. 12.5% of course takers and 8.9% of non-takers disagree with the same statement. Similarly, 61.8 % of course-takers and 49.7 % of non-takers agree with the statement of "fast economical growth mostly engenders more harm than benefit." Disagreement is relatively low: It is 14.0% for course-takers and 20.3% for non-takers. More non-takers (30.0%) than course-takers (24.2 %) are undecided. Those who think that human ingenuity will insure that we do not make the earth unlivable comprise 39.9% of non-takers and 40.6% course-takers. Contrary to the expectation that there would be more anti-exemptionalist view among course-takers than non-takers, more non-takers (27.2%) than course-takers (19.8 %) do not agree with the statement. There are 32.9 % non-takers and 39.6 % course-takers that are undecided.

Disagreement between the non-takers and course-takers on the statement that the balance of nature is strong enough to cope with the impacts of modern industries are slight (46.9% and 43.9% respectively). Similarly, 24.8 % of non-takers and 25.3% of course-takers agree with the statement. There is a considerable difference between the two groups in the idea that humans were meant to rule over the rest of nature. 63.3% of course-takers and 50.3% of non-takers do not agree with the idea. Correspondingly, 17.4 % of course-takers and 30.0% of non-takers agree with it. Likewise, 68.5% of course-takers and 55.1% non-takers do not agree with the idea that resources can be used limitlessly for the development of tourism, and more undecided (20.7%) and disagreeing students 23.2%) are found among non-takers than course-takers (11.5% and 20.0% respectively).

Table 1. Frequency and mean distributions, and overall orientation index <sup>a</sup>

Item #	Statements	% Distribution					N	Mean <sup>b</sup>	Sd
		SD	D	U	A	SA			
	We are approaching the limit of number of people the earth can support	7.5	8.5	22.0	33.5	28.5	1273	3.67	1.190
	When humans interfere with nature it often produces disastrous consequences	5.2	9.3	13.9	35.4	36.2	1286	3.88	1.152
	Plants and animals have as much right as humans to exist	2.4	2.4	4.2	16.5	74.5	1291	4.58	.872
	Humans are severely abusing the environment	3.6	6.0	6.4	35.3	48.7	1288	4.19	1.043
	Despite our special abilities humans are still subject to the laws of nature	4.7	7.6	20.6	37.9	29.2	1289	3.79	1.088
	Balance of nature is very delicate and easily upset	3.1	12.0	14.6	35.7	34.6	1289	3.87	1.111
	If things continue on their present course, we will soon experience a major ecological catastrophe.	2.9	4.8	19.9	36.8	35.6	1290	3.97	1.003
	Science cause harm as much as benefit	9.4	10.9	21.7	31.2	26.8	1284	3.55	1.252
	Technological development cause harm as much as benefit	4.7	8.1	14.2	38.8	34.2	1291	3.90	1.105
	Human should live in harmony with the nature in order to survive	1.4	2.4	9.4	29.7	57.1	1290	4.39	.859
	Fast economical growth engenders more harm than benefit most of time	4.1	14.6	28.5	32.7	20.1	1293	3.50	1.091
	Environmental laws should be enforced vigorously	2.0	5.1	9.1	28.9	54.9	1291	4.30	.965
	We should take strong measures to protect resources of our country	1.4	3.1	6.9	21.0	67.6	1289	4.50	.862
	There should be control over the industry in order to prevent environmental problems	1.9	4.0	11.8	35.1	47.2	1283	4.22	.937
	Tourism should meet its responsibility to protect the environment	1.9	3.2	8.6	18.5	67.8	1292	4.47	.919
	Humans have the right to modify natural environment to suit their needs	38.6	26.5	15.1	13.6	6.2	1289	3.78	1.261
	Human ingenuity will insure that we do not make the earth unliveable	8.6	16.7	34.6	25.2	14.9	1278	2.79	1.147
	Balance of nature is strong enough to cope with the impacts of modern industries	18.3	27.9	28.8	16.6	8.4	1286	3.31	1.190
	The so-called "ecological crisis" facing humankind has been greatly exaggerated	29.3	30.0	25.5	11.1	4.1	1292	3.69	1.127
	Humans were meant to rule over the rest of nature	31.3	22.2	19.6	18.7	8.2	1283	3.50	1.320
	Humans will eventually learn enough about how nature works to be able to control it	6.4	10.2	30.0	32.1	21.3	1279	2.48	1.125
	Most problems can be solved by technological development	6.9	20.1	32.9	31.6	8.5	1291	2.85	1.055
	Environmental protection laws got too strict in recent years	28.5	26.0	22.8	13.0	9.7	1286	3.51	1.290
	Environmental laws put unfair burden on industry	26.3	23.8	30.6	13.5	5.8	1283	3.51	1.180
	Resources can be used limitlessly for the development of tourism	37.5	21.7	18.4	13.8	8.6	1286	3.66	1.330
<b>Overall Orientation Index</b>		<b>11.5</b>	<b>13.1</b>	<b>18.8</b>	<b>26.2</b>	<b>30.3</b>	<b>1286</b>	<b>3.75</b>	<b>1.100</b>

<sup>a</sup> SD = Strongly disagree, MD= Mildly disagree, U= Unsure, MA= Mildly agree, SA= Strongly agree

<sup>b</sup> Mean Likert scores after adjustment for direction. Higher score indicates pro-environmental view.

### 3.3. School status

The respondents comprised of 37.6% first year, 32.3% second year, 16.8% third year and 13.4% fourth year students. The chi-square tests provided no support on 22 items for the hypothesis (H3). There were significant differences of opinion on only three statements at .05 level (items 9, 19, 25). Frequency distributions on the three items show that there are considerable differences between first year students and fourth year students: 76.3% of the first year and 62.8 % of last year students agree with the statement that technological development cause harm as much as benefit, whereas 10.7% of first years students and 17.2% of last year students do not agree with it ( $\chi^2 = 17.3$ ,  $df = 4$ ,  $p = .002$ ). Regarding the statement "humans were meant to rule over rest of nature", 28.8% of first year students agree, while 23.1% of fourth year students agree. Undecided first year students are much more than fourth year students (22.2% and 13.6 %, respectively). Similarly, less first year students (49.0%) than fourth year students (63.3%) disagree with this statement ( $\chi^2 = 11.1$ ,  $df = 4$ ,  $p = .02$ ). Similar results were found regarding the statement that resources can be used limitlessly for the tourism development: 24.0 % of first year students and 18.5% of fourth year students agree with the statement, whereas 58.1% first year and 69.9% of the fourth year students disagree ( $\chi^2 = 17.3$ ,  $df = 4$ ,  $p = .002$ ).

### 3.4. Gender differences

Majority of students (54.7%) were females. Chi square test results showed that females and males significantly differ in 20 out of 25 items. More females than males agree with all 13 significant pro-environmental statements. On the other hand, more males than females agree with all significant pro-DSP statements. These results overwhelmingly support the hypothesis stating existence of gender difference on environmental worldviews (H4). Range on the agreement responses of females on the pro-environmental items is higher than males (55.4 to 93.5% and 49.5 to 88.0%, respectively). Disagreements on the same items range from 2.7 to 16.9% for the females and 4.9 to 24.5% for males. Similarly, there are no striking gender differences in the pro-DSP items: Agreements range from 11.9 to 52.9% for females and 19.3 to 53.9% for males, whereas disagreements range from 14.8 to 69.2% for females and 18.9 to 60.3% for males. A large majority of both female and male students agree on all pro-environment statements (statements 1-15). However, more girls agree than boys with all these statements. There is also no particularly marked difference in worldviews of males and females on pro-DSP statements. Majority of both sexes disagree that humans have the right to modify the natural environment to suit their needs, however more females (69.2%) than males (60.3%) show disagreement. Similar ranges of differences are found in their answers to statements 19, 20 and 23. The range of differences in undecided responses between females and males are also not enormous: maximum difference is 6.6%. It seems that little over one-third of both sexes have ambivalent views on the human ingenuity that we do not make the earth unlivable place (statement 17).

### 3.5. Socio-economic status

Of 1295 students, 504 (% 38.9%) declined to answer to this question. The test results showed 16 significant and 9 insignificant correlations at .05 level. These results provide partial support for the hypothesis (H5) on the existence of relationship between socio-economic status (SES) and environmental orientation. Regarding the significant relations, low SES students agree with all pro-environmental statements more than medium SES and high SES students. Expectedly, low SES students agree less with pro-DSP statements. Similar results were found in most statements between the medium SES and high SES students. Agreement responses on the pro-environmental items were in the range of 65.4% - 96.1% for low SES group, 69.0- 90.6% for the medium SES group and 59.9% - 88.2% for the high SES group. Agreement on the pro-DSP items were in the range of 12.8% - 27.1% for low SES group, 18.7% - 29.1% for the medium SES group and 20.7 % - 26.5% for the high SES

group. Findings also show that there are considerable differences in undecided responses: The lower SES group has less undecided responses than the other two groups on all items. Furthermore, there are more undecided responses to the pro-DSP items than to the pro-environmental items.

#### 4. Conclusion and discussion

The study results show that majority of students (56.5%) hold pro-environmental views. However, about one fourth of students (24.6%) have pro-DSP oriented ideas. Furthermore, there is considerably high percentage of undecided responses (18.8%). Human exemptionalist views are rather low, whereas anti-exemptionalist ones are comparably high among students (Items 17, 21, 5). Anthropocentric beliefs are slightly low (between 20-25%), while anti-anthro beliefs are quite high (Items 3, 16, 20). Only one-fourth place faith in the Earth's ability to rebound from the industrial impacts. There is a mixed opinion on the harm/benefit of the science and technological development. In the same way, majority are either skeptical (34.6%) or disagree (25.3%) on the idea that human ingenuity will ensure to solve environmental problems. These findings suggest that the students' environmental worldviews do not reflect a widespread adoption of the pro-environmental orientation.

Students' responses to some items that show higher environmentally sensitive views partially support the Bryan Norton's convergence hypothesis that both anthropocentric and non-anthropocentric ethics will recommend the same environmentally responsible behaviors and policies. Yet, the present findings and accumulated knowledge on the subject show that anthropocentric ethics legitimately raises questions about how to feel, not just about which actions to take or which policies to adopt, and undermines some of the common attitudes like love, respect and awe toward the natural world (McShane, 2007). The previous studies mostly indicate positive relationship between environmental knowledge and pro-environmental behaviors (Magntorn & Hellden, 2007; Tikka, Kuitunen, & Tynys, 2000). Finding only 6 significant relations out of 25 correlations implies at least two inhibiting conditions: (1) the nature of the courses in environment is not adequate in cultivating environmental knowledge, awareness, sensitivity and pro-environmental orientation, and (2) there is a lack of necessary supportive social, cultural and political atmosphere/practices. The findings on the relationship between the school status and environmental views can be considered as an additional indicator confirming these two conditions: It was found that first year students are more concerned about the environment than last-year students. This also supports previous studies (Malkus & Musser, 1997; Musser & Diamond 1999) that found that younger students had more positive attitudes toward environmental issues than older ones. Some studies provide conflicting results about the relationship between environmental knowledge/education and environmental opinions, attitudes, and behavior (Bradley et al., 1999; Hsu, 2004; McMillan et al., 2004; Yilmaz et al., 2004). The differences between first-year and fourth-year students in the present study lead us to question the value/nature of the knowledge obtained in and time spent at the university. All these results also suggest we should pay close attention to strong intervening variables like willingness to take proper action and environmental behavior. Furthermore, environmental policies and designs should pay closer attention to the issues such as motivational, affective and cognitive issues, content of curriculum, method of teaching, instructional design and nature of daily social practices. A proper policy and design also mean an evolution from conservational type of environmental education to education for sustainable development characterized by an awareness of the need for self-determination, democratic processes, a sense of involvement, ownership and empowerment, and of the complex relationship between environment and social equity (Gough, 2008; Van Weelie & Wals, 2002). Empirical findings about gender differences in environmental concern/view are inconsistent and inconclusive. Some studies found little if any gender differences while others found significant high level of support among females of the pro-environmental orientation (Ekici, 2005; Fernandez-Manzanal et al., 2007; Schreiner & Sjberg, 2003; Taskin, 2009; Tuncer et al., 2005; Uitto et al., 2004; Yilmaz et al., 2004). Finding of the current study implies that gender differences in environmental worldviews could have resulted from differences in students' upbringing as being "girl/woman" and "boy/man" in a society that produces

differences in gender sensitivities. Future studies should focus on factors that create gender differences in environmental views, attitudes, motivation and behaviors.

The present study found inverse relations between SES and environmental opinions/attitudes, indicating that respondents with lower socio-economic status are more pro-environment than ones with higher status. Some studies came up with the similar findings (Taskin, 2009; Uyeki & Holland, 2000; Yilmaz et al., 2004), but others (Schultz, Zelezny, and Dalrymple, 2000) found that SES are not significantly related to ecocentric environmental concerns. These inconsistent findings suggest that the future studies should try to question, at least, (1) differences within the same SES across cultures in different countries and (2) the justifications low and high SES respondents provide for their own views, attitudes, concerns and/or behaviors.

Findings of this study suggest that there is still a long way to go in creating socially and environmentally responsible worldviews, behaviors, landscape and architectural designs, product designs and uses, and capacity building in industrial relations. Although this study provides fresh information on the subject studied, additional research in different settings is needed before definite conclusions can be made about environmental worldviews and related variables.

## Abstract

IESQ (Intelegence, Emotional and Spiritual Quotient ) development are needed by all people in the world. Education at an early age is one factor that determines the quality of a person. One way that can be used to form basic character is to approach cultural values, because the value of culture will always be inherent in human beings whenever and wherever they are. Culture that values one can meet those needs is the Javanese culture. Javanese culture is an ancient culture steeped in cultural values. Thus the philosophy is suitable to be applied in the formation of character IESQ in children. In this paper, the authors also classified the philosophy of Javanese culture in the formation of IESQ to better facilitate to inculcate its values to children. The concept of development in children IESQ by phylosophy of Javaness hopes to be a solution to the social problems in Indonesia.

*Keyword: Development, Character Building, IESQ, Java Cultural, Philosophies of Java*

## 1. Main Text

Early age is an age of highly strategic for shaping the personality of children. Because an early age is the age of a person learning to recognize the start of a life around, find out who he was and so on. Education at an early age to be a factor that determines the quality of a person when he was growing up. Bad Education in early childhood will have an impact on a person's personality and poor quality. Therefore we need a balanced pattern between education education emotional, spiritual and intellectual personality and to improve the quality of children. In addition to strengthening the basic character of the child need to be instilled the values of local culture-based education. Cultural values of the area are very strong and dominant in shaping a person's character. Cultural values will be reflected in every word, action and will be ingrained in humans, including in thinking and making decisions. so the existence of cultural values inherent in human beings will form a strong foundation of character and inherent to any time.

## 2. Javaness Culture

Javanese culture is a culture that has an important role in Indonesian culture. Javanese culture has a very rich local wisdom. Local wisdom contained in all aspects of Javanese cultural life. Haryati Soebadio argues that local knowledge is an identity / personality that led to the nation's culture it is able to absorb and process is appropriate for the nature and culture of their own abilities (Ayatrohaedi, 1986). According Rahyono (2009) local knowledge is human intelligence that is owned by a particular ethnic group society gained through experience. These values will be very strongly attached to the community and has been proven through a long course of time, all the existence of the society. Javanese cultural values can be viewed through ethics or mores Spoken, folklore, Javanese folk songs, myths, traditions, ancient scriptures were believed to the truth and many other things embodied therein cultural values. In the context of child development IESQ, cultural values can support the child's development and well established IESQ personality of the child in accordance with the values of Javanese culture. So planting Javanese cultural values would be easier to be embedded in their personality.

## 3. IESQ Building in Phylosophy of Javaness

IESQ development is a necessity for all human beings. Especially those who are at an early age. IESQ the balanced development will be able to shape a person's character is ideal. If in one of these elements is not met it will be influential in the formation of one's personality. One way to develop IESQ in early childhood is through the approach of cultural values Javanese philosophy. Sedyawati (2003) said that philosophy is the foundation of life and gives meaning to life attitude a society that is usually reflected in the variety of expressions that are known in the community. In the context of the values of cultural philosophy Java Java regulate people's lives ranging from ethics, behavior, words, customs and many other rules. At its core values has a goal to create an ideal of human character as required by the community. Javanese culture has a lot of philosophy, each written in the books of the ancient Javanese who believed were correct, through folklore, myths, customs, information through elders and so on. In order to establish IESQ in early childhood according to the philosophy of Javanese culture, the author divides it into 3 categories: Emotional, Spiritual and Intellegence. Authors further explain in the description below:

### 3.1. Emotional

#### - *Alon-Alon Waton klakon (Mouthful slowly reached)*

This phylosophy means that to doing the work do not be hasty, full of patience. Another meaning of this phylosophy is hinting about vigilance, caution, constancy. Way of implementing these values to children is through experiential learning methods. That children are given the authority to gain experience in their environment by applying the values of phylosophy *Alon-Alon Waton kelakon*. For example, in studying school materials, performance goals, and wanted something more.

#### - *Tepa Slira (Introspection)*

This phylosophy means that every human being should always be introspective, fix errors that never happen again. Another meaning is always considerate to others. Do not always blame others if we do not want to find our own fault. Do not be hurt if you do not want to be hurt. Implementation of these

values is through experiential learning methods to the child. That is when the child is facing problems in the social environment, children are taught to be introspective about the events that occurred and provide guidance to not be looking for his problem maker. In this case the parents also give examples of behaviors that are associated with it.

- ***Mangan ra mangan sing penting kumpul (Togetherness)***

Literally the meaning of philosophy is not important to eat some meal but the important one is being together. But really meaning in the philosophy is about togetherness, feel the pain of others and participate happy when others are happy. In the social problems that occur at this time, the values of togetherness is indispensable for understanding the conditions that occur. So planting shared values in a child will help create a culture of togetherness and hope can help solve social problems exist. Implementation of the above philosophy is setting the example through the behavior of the parents in the child's social life and engage in these activities, although only witness. For example, when a friend congratulated're happy, so sorry if your friends are getting disaster and many more. Through which children are more likely to do the same thing in his social life as an implementation of the value of philosophy of *mangan ra mangan sing penting kumpul*.

- ***Andhap Asor (Humility)***

The significance of this philosophy is to be humble, not ostentatious, not arrogant and never segregate between people according to race, culture, religion, ethnicity, and so on. Implementation of the values that the parent gives advice and examples of behavior in the form of social life. For example, when parents are getting achievements or sustenance, it teaches parents to always be humble and not show off. Later in the mix never segregate our friends according to race, religion, ethnicity.

- ***Mikul Dhuwur Mendhem Jero (Remembering the kindness of others and forget the ugliness)***

The significance of this philosophy is to always remember the kindness of others people, the services they provide, share them with others. Philosophy also taught to forget all the ill of others, forget about it and do not tell it to others. To implementation through the advice and also the behavior of older people in social life. By instilling the values contained in the above philosophy to children at an early age then the expectation is that philosophy will stick and be able to change according to the current state of the the philosophy.

- ***Urip Iku Urup (Life is Flash)***

It is Mean that literally to life the flame, actually meaning is instilled in every human being to always beneficial for others, inspiring others of what we do, so that others will be moved to do so. To implementation through the advice and also the behavior of older people in social life. Parents provide useful and how to inspire others. Besides parental figures illustrate useful and inspiring. For example, someone who disabilities but he could provide benefits to the people in the world.

### 3.2. *Spiritual*

- ***Nrimo ing Pandum (The attitude of receiving)***

The meaning of this philosophy is sincerely accept any results of the efforts that have been done, never be complained. Endraswara (2003) said that the basic character of the Javanese is the attitude of receiving. attitude of receiving is receiving everything with the psycho-spiritual awareness, without feeling *nggrundel* (grumble of disappointment in the back). Implementation of those values is the experiential learning approach. For example, when a child receives in school exam results, the values obtained child is the result of an effort that has been made. That way parents instill the value of philosophy *nrimo ing pandum* that if you want to get maximum results then have to do business in accordance with the desired results and targets are not appropriate when the child's parents menagjarkan not to be disappointed over the outcome, but accept the sincere. By applying the philosophy of the children is expected to have a positive impact on children. Expected the child is able to become a person who only submit to God Almighty. Given these properties, it is a child who simply believe in God and not rely on other than God that will form an independent person and brave and have faith that good.

- ***Adoh tanpa wangenan cedhak datan senggolan (feel that God is so far, but the real God was in the hearth of each person)***

This philosophy in the Java community is usually used to describe the existence of God. Sometimes people feel that God is so far away, as if it is above the seven heavens into the distance can not be measured. But also so close to the real God was in the hearts of each person. Yet man can not hold it (Widayat, Afendy. 2005). Implementation of the philosophy is by giving examples such as the actions of the parents. In a state of happy or sad, parents teach children to always pray and give thanks through worship according to their religion. This is a proof that it is God who gives happy and also sad to man. So with worship God then people will feel that God is near. Above proverb teaches that God is very close to us. The first thing we have to remember where, any time is a good God in a state of happy or in sorrow. Moreover the meaning of this proverb is Javanese man must always menyuadari that God is everything - else in Nature, because she who creates, he was the almighty power over all whole hog.

- ***Sapa gawe bakal nganggo (who makes, he will responsible it)***

The adage broadly means that anyone who makes something he himself would wear. That is, that whatever a person does, he himself will be responsible. If someone is doing well, then he also who will wear the goodness. Similarly, if he did the opposite. This adage is actually a representation of belief in the law of karma or law of the balance of nature. Implementation that parents always teach children about responsibility. What is the meaning of responsibility, the benefits of responsibility and impact when not responsible. Parents also gave an example of a creative story about the implementation of the above philosophy. Above proverb teaches that one's actions will come back to the person that they do not look good or bad. Therefore it is very important maxim applied to children, so that children are accustomed to do good in his life, knowing that the impact will be and has been done.

### 3.3. Intelligence

- ***Kaya kodhok ketutupan bathok (like a frog trapped inside a coconut shell)***

Javanese proverb above literally like a frog in a shell. What is seen, known, and felt frog in the world in the shell of course only in the shell. Frog will not notice the atmosphere or the world outside the shell. This maxim widely want to say that people who thought, reference, knowledge, and experience not many would not know a lot of things. People who do not broaden his experience will only speak of things that narrow, limited to what he knew. Implementation of such values that the parents give authority to the child to seek knowledge widely through constructivist methods that children construct knowledge based sendri fact, activity, experience and theory. So that children can be summed into a new knowledge. Additionally a child is given the freedom to seek knowledge as far as possible or in other words is thus wander horizon of knowledge a child will become more widespread and certainly has the experience very much.

- ***Adigang, adigung, adiguna, adiwicara (like to show all things that owned)***

Javanese proverb can be translated as proudness or body or facial beauty boasting, bragging or insolence offspring body size, boasting science or knowledge, and boasted acumen or melodious voice talk. Implementation is advising parents not to brag child whatever he had. People who feel themselves to have something, whatever it is, indeed sometimes be forgotten that it was all a surrogate of the Almighty. Arrogance because they feel themselves more than anyone else this very often results in the person concerned applies arbitrarily to others.

- ***Tuna satak bathi sanak (friends is more meaningful than wealth)***

The Javanese proverb literally means loss of one is not (a measure of money / wad) profit brothers. This adage would like to teach the world that even the main consideration is trading for profit and profit, for the Javanese losses so money is not why the origin (still) can get sedulur 'relatives' or friends. On the other side of this proverb also teaches that sedulur (relatives) are much more profitable than the size of the money in kesesaatan. If stretched out, then friends or sedulur it in the future to provide benefits far greater than the size of the money at the time of sale and purchase transactions occur (Zulfikar, 2008). Implementation of the value above which a parent teaches that whatever we have is not worth more than a friend or relative. For example, at the time at school, When a friend who does not have the money then the child is taught to bought him a snack even though the money is mediocre.

- ***Kaya ngenteni thukule jamur ing mangsa ketiga (like waiting the mushrooms growing in the broad kemarau)***

Javanese proverb above literally growing like mushrooms after waiting broad kemarau. Secara saying if we have a hope that never materialized anticipated but it's like waiting

for the growth of fungi in the dry season. This adage can also be used for activities that wait for a very long time like waiting for something that is not clear or not lucky. Implementation is when the child has a dream, the dream is to be achieved through hard work and prayer, instead of waiting for the dream to come alone.

- ***Menang meneng nggembol kreneng (Keep silent toward bad things)***

Javanese proverb above literally means secretly pocketed Kreneng. Javanese proverb above broadly to describe the behavior of someone who on the surface (physical, outwardly) seem quiet, do not talk much but in his mind and in his heart he is actually preparing or storing something (which is generally not good). Whether it's in the form of plans or goals are not noble. Whether it's engineering manipulation, lies, and so on. Implementation that parents teach children to do no good, no good plan. Parents also describes the consequences that obtained when doing so.

- ***Ing ngarsa sung tuladha, ing madya mangun karsa, tut wuri handayani***

This is the meaning of the motto and *ing ngarsa sung tuladha* (in the front, an educator should set an example or examples of good practice). *ing madya mangun karsa* (in the middle or in between pupils, teachers should create initiatives and ideas) *tut wuri handayani* (from the back of a teacher should be able to provide encouragement and direction). Implementation in a child's life are when in school, when the child becomes class president or chairman of the group, the child must provide examples of good practice, and then when the child is between kela friends and groups of friends, children exchange ideas to solve a given problem or task . And children also contribute in giving encouragement to his friends who are lazy or lazy learning tasks.

#### 4. Conclusion

Javanese culture is the culture of old and steeped in cultural values. Javanese culture has a strategic role in developing community resources. Javanese cultural values is inherent in human beings who will be brought up whenever and wherever human beings are. The existence of Javanese cultural values can be seen from every word, ethics, behavior and way of thinking of people of Java. Planting Javanese cultural values to children early through implementation in everyday in our life to help shape the personality of the child in accordance with the needs of human resource development in today's era. Through experiential learning methods and models of a constructivist approach that transformed the values phylosophy of Javaness, it will help facilitate the formation of the character of the child and easier inherent in the child.

## Essentials of the education on democracy

Mehmet Evkuran(Prof. Dr.)\*

*Hitit University, Faculty of Divinity 19100, Corum/TURKEY*

### Abstract

Nowadays, the discussions on reconstruction of the education have improved. Organizing of education system and determining it according to demands of the industry and knowledge society are criticized. In that persons have overloaded multiple technical knowledge, it gives rise to awry mental development and cognitive dissonances in their daily lives. Thus, people could not correlate a healthy relationships with the others.

In recent years, values education does not thoroughly discussed. But cultural identities and localities come to the forefront. Every society and community refers to its particular values and existence. According to it, the values education must provide generalize and support to its values and identity. In this process, globalization has a major role in provoking localities.

Education policy does not have to ignore localities and particular values, as well. But it must not submit the conflicts of identities which is rising in the recent period. It is most important that the education considers individual, cultural values and interactions among other cultures.

In this paper I will discuss on how must be educational policy in plural and democratic societies. It will be focused on state-individual relations, pluralism, multi culturalism, risks of identity policy and ghettoization, identity and truth and values education. It will be offered suggestions on the social tolerance and culture of living together.

Keywords: Democracy Education, Ethics, Cultural Identities, Pluralism, Ghettoization, Freedom, Living together

### 1. INTRODUCTION: DEMOCRACY EDUCATION AND VALUES

Education on democracy requires comprehensive process. It is strengthened and developed through materialistic, intellectual and civil participation. Democratic initiative should be civilly dimensioned leaving aside the resolutions of the political power thus it should be transformed into a democratic mobilization. In this context, the initiation activated by the political power should be socialized. Otherwise, such steps will never be permanent and tend to be nostalgia in our political and social lives. Democracy basically relates with methods and processes. In case of any resolution, democracy does not deal with the nature of the resolution but the way the resolutions are taken. It attaches great importance on communication and dialogue. Some raise rejections against the democratic requirements making an emphasis on the conditions specific to our country and against the full implementation of the democracy based on the fact that our country is not yet mature in view of democratic and universal rights whereas democracy is the method for solving the problems. If there exists any problem, we

\* Mehmet Evkuran (Prof. Dr), Tel.: +90 535 658 25 13; fax: +90 364 234 63 57.  
E-mail address: mehmetevkuran@hotmail.com

need democracy more than ever. The idea that “we first sort out the problems and get rid of the crisis” makes the democracy difficult.

Putting democracy into practice in any society requires intensive challenge. The solidarity between efficient parties and institutions in any society and the production of constructive discussions are deemed to be a must. The steps taken solely by the political power are not sufficient. The large social segments should believe in this specific goal and make every effort to realize it (Gleaser& Ponzetto; 77-99.).

It is settled on the piers such as democracy performance, stability performance, material performance and citizenship performance. The politics within democratic perspective aims at strengthening the individual and widening the self-determination space of the individual. Autonomy is both an aim and the tool of such aim. Therefore no category wise error should be made. The individual should be attached much more importance. The future and happiness of the individuals should be targeted instead of the future of the institutions. As a consequence the institutions exist for the people not for their own selves (Heywood, 1997: 110).

Today's globe believes in the requirements for joint solutions against the common problems. The international community and numerous organizations have long been abolished the borders of the countries in political, cultural, economic and religious views. The globalization truth impelled the Muslim states to establish intense relations among each other. This sudden change has led to unearth the problems dating back to Islam history and yet not solved. It is not difficult to estimate the reflections of such a specific case on the religion. The obligatory religious education paying respect to pluralism should be incorporated in the rainbow with religions and beliefs distinct from culture and geography (Toros, Emre, 2010: 260).

Living on earth is something to load a meaning on it. Defining the problems is a part of understanding the world. Updating the language used in defining the problems forms a part of the democracy project. Democratic development is not only a matter of method but also a style. Defining the problems late and in an insufficient manner is organizational wide and intellectual wise Achilles heel. It is not only linked with lack of knowledge but also with looseness and frailty. Culture, understanding and values of the self-enclosed social structures are of course specific and fail to meet the requirements of liberal societies. Furthermore such a structure forms an obstacle in the front.

The phenomenon of globalization made everybody familiar with unexpected truths. Relations and interactions among the religions speeded up. The new conceptions and hierarchies emerged in the world of values and beliefs should be discerned and the prevalent religious trends in the world should be recognized. There currently exists a comprehensive information gap in this particular matter.

As societies develop and communication tends to increase, the relationship between the government, society and individual also changes. The people have started to watch their own selves through a relatively distinct and liberal window. In traditional societies, the ruler has always been regarded as the sacred being on earth or representative of the sacred being or implementator. The relationship between the government and the society has always been considered to be an unequal relationship between the celestial and non-celestial. In this understanding, the idea that the managing powers give account before the public would never emerge. In the world established on the societies and notions rather than individuals, the struggle for ruling power is based on many concepts. In the harsh and insecure world in which the rulers tend to change very often, it is to the share of the public to submit to the rulers. Based on this fact, conformity has always been regarded as the primary virtue. It is because the ruling parties maintained their power through the public obedience (Evkuran, 2009: pp. 53-67).

However, the suppressed and repressed individual in our contemporary world will never work and will be considered to be a problem at the very initial point. Such a model would only be a fiasco in case the state is limited and the civil societies are driven up to the front. Raising the individuals who may compete with their global competitors will be to the benefit of the states and the societies.

The developments experienced in the world make a deep impact on the relationship between the society and the state as well as the political institutions. Now what is called to be “ruler” is no longer an intense, rigid and tough phenomena fixed on a seat. Rulership is a kind of relationship. This was the nature of the rulers from the very beginning. However, this may be comprehended better today. The recent definition of the rulership is that: Ruling power is nothing overlapping us but something inside us. It is nothing repressing the people but stimulating and exciting them. The ruling powers which fail to create any sense of satisfaction and consent in the people will experience legitimacy crisis.

One of the issues which should be addressed is the attitude against the new social and global problems. Two examples shall be emphasized: The first is the environmental issues on which global concern is raised and international awareness has been aroused. We are far behind the intellectual fund of knowledge regarding the environmental issues in the world. We are not yet aware of the environmental literature already compiled in the world and the critics of the environmental activists on the societies, politics, religion and technology. It is incorrect and not true to make emphasis on the evils, destructiveness and extremities of the human nature. It is not likely to be included in the discussions concerning the environmental issues without making any reference to the suggestions of the environmentalist philosophers for the re-structuring of the society, moral and re-considerations about the environment, traditional sovereignty understanding and radical objections raised against the monotheistic religions.

Moral indifference is deemed to be an important problem. Nihilism and moral indifference are the most widespread and most common problems of the present societies. On the contrary, fanaticism never abolishes the nihilism problem but it makes it reversely evident and feeds it. The egotist structure refined from values of all type, immune, cold and locked on to personal pleasures and sorrows is one of the substantial problems not only in view of religion, morality and education but also of politics and culture.

Currently the common problems of the religions on earth are the problem of moral indifference fed through the popular culture. The thinkers who concentrate on this specific issue specify that the nihilism trend that we face and qualified as moral indifference is a kind of illiteracy (Jackson, 2007: 92).

It is essential to protect the individual rights and freedoms on one hand while the values should be protected against moral and material corruption on the other hand. It is inevitable for anybody who is willing to take part in favor of welfare and virtue to challenge against evils and judge and evaluate for this particular case (Evkuran, 2010: 47).

Moral agnosticism makes any culture extinct at the final point. Because, it obliterates the ground for values which makes the human beings stand still and makes it possible to share the things of all kind among the human beings. An irrational society is the one in which the morally neutral or coward people are included. Such societies have lost their susceptibility due to the fact that they have already been deprived of moral criteria, principles and targets. Hence, human beings should move to keep on their living and find the most appropriate direction for their spiritual life. If the individual fails to do this, then such individual is likely to be guided by others. Moral susceptibility is not only an affair of spiritual nature but also a matter of existentialism through which the individual assumes responsibility and initiative concerning his/her own life.

None of the social power may monopolize the truth. It should be adopted that democracy for the sake of which we praise tends to remain indifferent against the truth consciously. It is due to its nature to remain indifferent and insensible against the truths. The political theoreticians examining the relationship between rationality and democracy defend the idea that democratic action perspective require pragmatic attacks to establish a more comprehensible community not that of reality theorem or concepts such definitiveness and universal validity. In brief, democracy finds its existence through emotions and sympathy not through the rationality and universal ethical discourses. Therefore, the efforts to be made by the people from different faiths and ideologies to understand their sorrows, problems and pains will be the basis for social consensus of the coexistence culture.

Democracy has first emerged in the West in the form of a contemporary political thought. Thanks to its emergence and nature, it relies on indifference towards religions to some degree and therefore democracy it is not

taken as the basis in any other belief system. Democracy does not make any effort to socialize any reality and does not mind and require legalization any partial reality. However there is one point here which should not be omitted. Is the indifference of democracy or the conscious indifference of democracy against religion, philosophy and ideological realities in conflict with the principle of “politics for human beings”? For example, what is the meaning of justification of democracy by any social party through its world of values?

The boundaries of the conscious indifference / jaunties against realities should be well drawn. Otherwise, it may lead to public ethical codes are employed in lieu of individual (civil ethics. Ideological state may be criticized just at that specific point. In case the ruling power depend on individual rights and liberties rather than any ideology / truth when dealing with any social issue , this then points out to be democracy. However, on the other hand the individual’s personal world is filled with values and beliefs. The fact that these are fully related with the conscience and inner self is the product of aggressive secularism and out-of-fashion substantive understanding.

Ideologies / truths can not act as an audience to end up the social welfare and freedom dye to the excessive requirements. On the other hand, the preferences of the individuals and groups within civil – social stage should be experienced freely and this must be secured. Contemporary West excluded the religious objects within public area to get rid of fanatics and let it be experienced in one’s private life. In this regard, the social ideologies focused on the exclusions of the transcendences and values. The problems arising from being an absolute faithful individual and being faithful intermingled with each other. Thus doubts and disparagement developed against faith. A widely and frequently used metaphor is the following: The West removed the water in the container (Middle Age institutions and orders) and thrown the child in the same container (transcendence).

The truth is nothing a state affair. Searching the truth is a problem which relates with social area such as ideology, theology or philosophy (Enginer, 1995: 2722) The opinions, philosophies and beliefs compete with each other. The State is indifferent to these until any violation against basic human right. Since this is a legal issue, it should be the point of interest of the state. This is where the answer to the question “Should we give up the truths in order to defend the democracy?” is given.

The humanistic existence depends all the time on valuation and evaluation. Valuations, seeking for values, leading life as per such values etc are the inevitable humanistic preferences. Without valuation, social life becomes more and more impossible. Producing common values and making every effort to protect such values have always been the most evident case throughout the history while religion has been the most basic reference when dealing with such questions and problem all through the history. The anticipations of the positivist thinkers that the religion will not find a way in human life after developments in science have never been true. Even today

in which time the scientific and technological advances reach to a climax point, religion keeps its power. Therefore, the religion and the pheromones of beliefs and values in the broadest sense will continue to be the reality of our individualistic and social life.

What precludes politics in any society is the exclusion of the subjects and the auto decision for passivism in the absence of others' intervention. In this case, political, cultural and ethical relations are interrupted. If politics is a kind of social relationship, what makes it possible is the relationship and communication among the people and social layers. If we reverse and re-think the case, politics will be precluded on slippery slopes where the people turn into atoms and are confined with their individualistic world upon being insentient to each other. What primarily leads to this process is the problem of ethical agnosticism.

This is not only validated for politics but also ethics. The basic condition for ethics in any society is the free will of the individuals. Could politics be related with the idealistic thinking e.g. attaining to the ethical targets and building a virtuous society? If so, what shall be the level of cooperation and the nature of consensus? Then, will there be any conflict between political intervention and the principles of volunteerism and free will which form the nucleus of the ethical action? It is evident that several (religious, moral and political etc.) values will be in use in the future as in the present case to adopt such values to the society as long as politics exist as a social structure and regulating element. So, we should discuss the relationship between politics and ideology (McLellan, 1986: 15). The assumption that politics relate with public and political area while morality concerns with free will and private sphere and there exists a gap between these two, is somewhat an old way of thinking dating back to early modernist period in which time the distinction between phenomena and value is exaggerated. The new political trends have proven the fact that politics and ethics as a form of action and existentialism have never been segregated from each other.

Politics is resulted from ethics. Normative principles lie on the basis of ethics and this survives through judgment. In principle, culture is an integral part of ethics. Culture never exists in the absence of evaluation. The individuals make judgment about the events and persons included in his/her life and making an impact in his / her life and such individuals should not avoid making judgments in such cases in accordance with their rationale, values and targeted aims. There is no any other behavioral rule which destroys or exterminates any culture or human character other than ethical agnosticism.

## **2. RELATIONSHIP BETWEEN DEMOCRACY AND SECULARISM**

Failure to sort out the problem of secularism has led to syndromes in many fields in our country e.g. religious education is on the forefront. In our country secularism has developed in the form of an ideology not through the social and obligatory cases. Since it emerged in the form of a modernizing and developing ideology,

its integral aim has always been supposed to be the transformation of the society. The elite managers supporting this ideology had do shelter in secularism to protect and perpetuate their life styles and political practices. The elite managing powers who feel doubts about the beliefs, culture and life styles of the majority of the society felt worried and unsafe at all times. Therefore, the secularist approach in our country has always been aggressive, susceptible and intolerant.

Secularism should not be deemed to be a matter of dispute and problem. To do this, the first step is to define this concept clearly. Failure to make a precise definition creates double sided difficulty. The first is that, as we are all aware, the concept which has not yet been defined but deemed to be included in the basic qualifications of the state always tends to be abused or arbitrarily treated. On the other hand, in response to the elitist understanding which deems that secularism is a detailed life style and scorns the remaining part of the society, it is likely that secularism is insufficiently expressed with sole definition of freedom of religion.

Secularism depends on the principle of coexistence. For this specific purpose, it repudiates dominations focused on beliefs and religious comments. In this regard, it can be considered that secularism is the root of democracy. However, in case secularism is perceived to be belief or religion and replaces the religion, it is condemned to be perished by the beliefs it challenged. Repression or suppression on the beliefs cannot be implemented for a long time. Secularism which guarantees peace then becomes the reason for quarrels and disintegration (Urban, 2008: 25).

The perception of reality develops in line with the perception for time and location in the individuals. The perception of values stems from this particular case. History should be taught in the manner to include civilizations, philosophy, culture, art and literature rather than historical terms, wars, agreements, establishment and demolition of the states. The disputes among the civilizations should be accompanied with communications and interactions among such civilizations. Thus, the student envisages the concept of civilization and universal cultural perception in general terms.

It is evident and justified by observations by everybody that prayerfulness is now on the rise. However, this specific case is not good news per se. If we do not wish to experience another version of Medieval Ages, we should take the religion affair seriously. Illumination in the field of religion has always been a priority. Efficient and qualified education on religion with historic, social, traditional and existentialist dimensions is a must within the process of piety in all through the world. The discourse mannered to exclude the references of the religion will fail to maintain the required illumination and consciousness. Needless to say, not only the content but also the style is the nucleus of education. Leaving aside the traditional methods used in religion education

fully is not a realist approach at all. However, new methods should absolutely be developed in the world of visualization with different individualistic perceptions and images.

The globalization process has increased the depressions driven by the difficulties led by the hushed up and not seriously taken problems. Besides, these should be raised courageously and the requirement to sort out such problems should be voiced. The cynical and passive individual and efficient and ruling government formulated as per the political requirements of the past fail to provide any benefit both to the government and the society. The traditional authorities fed by the obedient citizens do no longer work. Today, the institutions retreat while the models encouraging the individuals and civil initiatives remain to be on the agenda. We should study and study to create competitive, highly poised individuals and formations for completion purposes with the global competitors. The education system should be re-structured in line with the logic of this process and discover the individual which has always been lost in our history. The intellectual synergy which includes civil contribution should be caught in order to systemize the education focused on individual not on ideologies and realities in view of language, tone, contents, attainments and methods.

### **3. RESULTS AND SUGGESTIONS**

**1-** We should re-discover the individual and read our culture both theologically and politically. The repressive approach which narrows the life and activation area of the individual and the political methods legalized by such repressive approach should be queried.

**2-** The idea that the public and social things of all type surround everything tightly makes the civil society understanding difficult ontologically. Civil society is the source of the fractional will. The fractional will shows itself at any location and space reserved for it. The larger the said space is and the wider and the most developed the civil society understanding is.

**3-** The opinion that the Islam religion is excessively interruptive should be queried in non-defensive manner. In this context, the relationship between the social and individualistic demands of the people in Islam and the communitarian and communal understanding in the historical period of Islam should be criticized while the individualistic freedom space should be encouraged and strengthened.

**4-** The traditional discourse regarding the status of the mankind is proven to be insufficient in view of following up and protection of the individual rights. Discourse prioritizing the human rights and dignity and value of the human being should be brought to the fore in lieu of the discourse emphasizing the superiority of the human being among the species and the difference of human being from the other living creatures in the nature. The ontological honor and dignity concepts used in the previous ages should be integrated with the contemporary civil rights and individual dignity.

**5-** Further to the individual rights, women and children rights, environmental susceptibility, respectfulness to the distinct ethnical, cultural and theological preferences should be provided with sound base theologically. The theological validity and value of the former restrictive terms such as freedom of worshipping or vice versa of the apostate, public rights of the women etc should be queried and the problems arising in connection with the social, political and cultural structure should be brought to the attention.

**6-** The negative consequences of the political submissiveness supported and promoted by traditional abidance culture and the cultural reflections of the same should be evaluated. In particular, the relationship between the political submissiveness and the ethical indifference should be queried. The behaviors such as obedience, auto suppression, repression and patience as frequently emphasized in political sciences eliminate the bases on which the ethics provide support. The obstructed ethical consciousness gets worsened and intensified on particular areas (virtue, sexuality, chastity). This unguided case is the result of the political obedience culture. The individuals thus obstructed to be the subject cannot develop free and responsible ethical actions.

**7-** The intellectuals should discover the individual lost in our history due to political and cultural priorities. In particular, it is of great importance for the Muslim theologians to develop susceptibility against the individual in the manner not to sacrifice the individual when questioning the relationship between society-religion and individual within the context of contemporary religion understanding. It will be the correct action to focus comprehensively on the society, values and culture in lieu of focusing on the continuity and re-structuring the ruler scheme acting as if it were the theoretician of the authority. The authority, regimes and rulers come up from the behind but the perceptions forming the basis of the political culture are continuous.

**8-** Tolerance and coexistence culture should be discussed, strengthened and settled in all dimensions. Whatever the belief and ideology is, it is evident that the absolute believers do not enjoy the concept of tolerance. For them tolerance is a sort of relaxation, concession or waiver from the principles whereas, tolerance is a requisite stemming from philosophical, religious and social reality.

**9-** There are 196 states at the present time. 46 of such states is managed through monarchy while 150 of such states is through republic. The concept of democracy takes precedence over republic due to its emphasis on individual rights and freedoms. Strengthening the democratic culture is not the thing to do only with the political power. Society should participate in this process in an active manner.

**10-** The developments experienced in the fields of religion education and religion and conscience are to mean an indispensable value for the sake of the strength of the democracy. Freedom for religion is a must in order to reflect and protect the religious plurality in our geography apart from the correct narration of the Islam religion.

# Evaluating the effectiveness of students' active learning in chemistry

Vesna Ferk Savec<sup>a\*</sup> And Iztok Devetak<sup>b</sup><sup>a</sup> University of Ljubljana, Faculty of Natural Sciences and Engineering, Ljubljana, Slovenia<sup>b</sup> University of Ljubljana, Faculty of Education, Ljubljana, Slovenia

---

## Abstract

The paper presents an evaluation of the effectiveness – from the perspective of both knowledge and motivation – of an active learning approach to 8<sup>th</sup> grade chemistry. The effectiveness of the learning approach has been evaluated using a chemistry content knowledge pre/post test protocol and the Motivational Learning Environment (MoLE) instrument. A total of 171 students from four Slovenian primary schools participated in the investigation, divided into a control group (regular chemistry classes) and an intervention group (our treatment courses with PROFILES modules). PROFILES modules, as used in the treatment group, promote inquiry-based science education in the socio-scientific context and support science teachers in developing more effective ways to teach students. The results obtained underline the advantages of the treatment courses in comparison to regular chemistry classes, but indicate that students need some time to adapt to an innovative teaching-learning strategy.

*Keywords:* Continuous Professional Development (CPD), Inquiry-Based Science Education (IBSE), chemistry teaching, student gain

---

## 1. Introduction

Classroom practice in many countries still seems to be dominated by teacher-centered teaching, with low student activity in both minds and hands. In many countries over the last decade, a great deal of effort has therefore been invested in making science education more interesting for students and more effective in terms of the context of subject matter learning, while also increasing the potential of such education for the promotion of a broad range of cognitive and non-cognitive skills. The PROFILES project – “Professional Reflection-Oriented Focus on Inquiry-Based Learning and Education through Science” – is one such attempt. It is a European FP7-funded project in the field of “Science in Society” that aims to promote IBSE through raising the self-efficacy of science teachers to take ownership of more student-relevant ways of teaching, supported by stakeholders' views. Slovenia is one of the participating countries (PROFILES in Slovenia, 2010). The present paper focuses on the preliminary results of 171 8<sup>th</sup> grade students from four Slovenian primary schools, evaluating the effectiveness of learning using a chemistry content knowledge pre/post test protocol and the Motivational Learning Environment (MoLE) instrument.

PROFILES evaluation focuses on students' cognitive and affective learning, as well as on the teaching methods, approaches and materials used within PROFILES intervention lessons (Bolte et al., 2011). PROFILES project evaluation is designed as a pre-post-intervention-and-control-group study. Before the start of long-term professional development intervention, data should be collected from the participating teachers' classes (pre-test;

\* Corresponding author. Tel.: +386 1 251 43 26, Fax.: +386 1 425 86 84

E-mail address: vesna.ferk@ntf.uni-lj.si

intervention group) and from classes of teachers who are not participating in the PROFILES teachers' continuous professional development program (control group). At the end of the school term, both groups should be retested with the same instruments (post-test; in the intervention group and the control group classes) (Bolte, 2006; Streller, 2009).

PROFILES pays a great deal of attention to student motivation for the learning of science, both in terms of intrinsic motivation (relevance, meaningfulness, as considered by the students) and extrinsic motivation (teacher encouragement and reinforcement), in an attempt to make school science teaching more meaningful. While IBSE has already been introduced as a major feature of PROFILES, this project goes further, recounting the need for IBSE to be 'student-motivationally' driven (*involving the student population as a whole*). Thus, while IBSE is student-centered (both in terms of the *thinking involved* by the students, as well as the *carrying out of the processes*), major additional components ensure that students appreciate why IBSE is being undertaken, and that they feel they want to be involved. Stimulating the '*wanting to*', as opposed to '*doing it because it is in the curriculum*', is a unique feature of PROFILES, and is effected by an introductory scenario illustrating a familiar need for learning, and by guiding students towards wanting to learn science so as to better understand the situation posed by the scenario. The scenario is further described under the section on the three-stage model (Bolte and Streller, 2011).

## 2. Method

### 2.1. The context of the study and the research questions

The research was undertaken from October 2011 to July 2012 by a group of chemistry teachers in collaboration with the PROFILES team at the University of Ljubljana. The modules were implemented in school practice with a pre-post-intervention-and-control-group study, accompanied by completing MoLE questionnaires throughout the learning process.

The following research questions were posed:

1. Will 8<sup>th</sup> grade Slovenian primary school students attending regular chemistry classes attain significantly higher achievements in chemistry than those who have taken part in our treatment courses?
2. Do 8<sup>th</sup> grade Slovenian primary school students attending regular chemistry classes assess their lessons in general in a significantly different way to those who have taken part in our treatment courses?
3. Does student perception (in the treatment and non-treatment groups) of the aspects of the Motivational Learning Environment change significantly during the school year?

### 2.2. Sample

A total of 171 8<sup>th</sup> grade Slovenian primary school students (13-14 years) participated in the research. The students' achievements during the implementation the PROFILES modules were monitored using a pre-test and post-test protocol with the control group (regular chemistry classes; CC) and the intervention group (our treatment courses with PROFILES modules; TC), whereby 88 pupils participated in the control group and 85 in the intervention group.

### 2.3. Instruments

#### 2.3.1. Motivational Learning Environment Instrument - MoLE (Bolte 2008; 2011, 2012)

The MoLE questionnaire consists of two parts: the MoLE REAL version and the MoLE IDEAL version. The MoLE in the REAL version collects data by focusing on the students' perceptions and assessment of the learning environment in their science classes in general. In the IDEAL version, the students are asked to think about their expectations in terms of how they would like the motivational learning environment in their science lessons to be. Both versions of the MoLE questionnaire allow data collection regarding the following seven "dimensions of the motivational learning environment" (Bolte 2006): (1) satisfaction, (2) comprehensibility/requirements, (3) subject orientation, (4) relevance of the topics, (5) students' opportunities to participate, (6) class cooperation, and (7) individual students' willingness to participate.

Every dimension of the questionnaire contains only two items, which are evaluated using a seven-point rating scale. The statements that correspond to our ideas about a "good" science lesson are coded with high numerical values ("7" to "5"), negative statements receive low numerical values (between "1" and "3"), while the scale value "4" corresponds to a "neither-nor estimation"; for example: "The topics in chemistry lessons are... very difficult for me to understand / very easy for me to understand" (REAL version) and "I would like the topics in chemistry lessons to be... very difficult for me to understand / very easy for me to understand" (IDEAL version).

#### 2.3.2. Pre- and post-knowledge tests

The paper-and-pencil pre- and post-knowledge tests (Pre-Test of Chemical Knowledge 1, Test of Chemical Knowledge 1, Pre-Test of Chemical Knowledge 2, Test of Chemical Knowledge 2) comprise 13–20 items on different topics.

In the *Pre-Test of Chemical Knowledge 1*, four items were multiple-choice answers, and eleven items required reading and writing in solving the chemistry problems. The test included three different content areas: physical and chemical changes (8 items), chemical reactions (5 items) and chemical nomenclature (2 items). The test showed satisfactory internal consistency (Cronbach  $\alpha = 0.66$ ). Discriminate indexes for every item vary between 0.20 and 0.61; all statistically significant.

In the *Test of Chemical Knowledge 1*, eight items were multiple choose, eleven items required reading and writing, and one item required drawing figures in solving chemistry problems. The test included four different content areas: pure substances and mixtures (2 items), physical and chemical changes (5 items), chemical reactions (6 items) and energy changes in chemical reactions (7 items). The test showed satisfactory internal consistency (Cronbach  $\alpha = 0.77$ ). Discriminate indexes for every item vary between 0.27 and 0.56; all statistically significant.

In the *Pre-test of Chemical Knowledge 2*, two items were multiple-choice answers, and eleven items required reading and writing in solving the chemistry problems. The test included four different content areas: metal and non-metal oxides (1 item), chemical reactions (1 item), water solutions (4 items), and acids and bases in our environment (7 items). The test showed satisfactory internal consistency (Cronbach  $\alpha = 0.78$ ). Discriminate indexes for every item vary between 0.14 and 0.68; all statistically significant.

In the *Test of Chemical Knowledge 2*, three items were multiple-choice answers, and sixteen items required reading and writing (mostly filling in the blank) in solving the chemistry problems. The test included six content areas: metal and non-metal oxides (1 item), chemical reactions (1 item), water solutions (2 items), acids and bases in our environment (8 items), acids and bases chemistry (6 items), and chemical nomenclature (1 item).

The test showed satisfactory internal consistency (Cronbach  $\alpha = 0.53$ ). Discriminate indexes for every item vary between 0.16 and 0.68; all statistically significant.

### 2.3.3. PROFILES modules used in teaching with the treatment group

In the present paper, the evaluation of two PROFILES modules is presented: “Will it Cool Down or Heat Up?” (topic: Chemical Reactions), and “Indicators - Chemical Detectives” (topic: Acids, Bases and Salts).

Table 1: Brief description of the PROFILES modules evaluated (Šket et al., 2012)

Module 1: “Will it Cool Down or Heat Up?”	Module 2: “Indicators - Chemical Detectives”

Section from Module 2: “Indicators - Chemical Detectives”

kislota      nevtralno      bazično

Indikator iz rdečega zleže: pri tem indikatorju se indikator pri viski pH vrednosti obarva drugače. Glej spodnje slike.

pH 1 2 3 4 5 6 7 8 9 10 11 12 13 14

PHLESTVICA

pH vrednosti naraščajo od 0 do 14. Za raztopine, ki imajo pH od 0 do 7, rečemo, da so kisline. Za raztopine, ki imajo pH od 7 do 14, rečemo, da so bazične. Čim manjša je pH vrednost, bolj je raztopina kislota. Čim večja je pH vrednost, bolj je raztopina bazična. Če imajo raztopine pH vrednost 7, pravimo, da je nevtralna.

KISLO OBRNOČJE      NEVTRALNO OBRNOČJE      BAZIČNO OBRNOČJE

## 3. Results

The research results are presented with regard to the research questions posed.

### 1<sup>st</sup> research question

*Will 8<sup>th</sup> grade Slovenian primary school students attending regular chemistry classes attain significantly higher achievements in chemistry than those who have taken part in our treatment*

*courses?*

After Module 1, there was no significant difference in the test scores for the control group ( $M = 14.20$ ,  $SD = 4.87$ ) and the intervention group ( $M = 15.54$ ,  $SD = 4.88$ );  $t(171) = 1.803$ ,  $p > 0.05$ . However, after Module 2, a significant difference in test scores was obtained between the control group ( $M = 11.05$ ,  $SD = 3.67$ ) and the intervention group ( $M = 13.68$ ,  $SD = 4.05$ );  $t(168) = 4.448$ ,  $p < 0.05$ . The results indicate that students needed some time to get used to the innovative PROFILES approach, which then – when the PROFILES module was implemented for the second time – contributed to students' higher achievement scores in chemistry.

## 2<sup>nd</sup> research question

*Do 8<sup>th</sup> grade Slovenian primary school students attending regular chemistry classes assess their lessons in general in a significantly different way to those who have taken part in our treatment courses?*

Figure 1 provides an insight into the overall assessment of the Motivational Learning Environment in chemistry classes, showing how students assessed the MoLE items regarding the PROFILES approach after the implementation of Module 1. It is obvious that students assess their chemistry lessons positively overall. The mean scores of all seven dimensions of the learning environment are in part clearly above the theoretical mean value, i.e., the “neither-nor estimation” (theoretical mean: 4.0 proposed by Bolte and Streller, 2012). The following dimensions of the learning environment are assessed particularly favorably by the students: “opportunities to participate” ( $mean_{CC} = 5.4$ ;  $mean_{TC} = 4.8$ ), their “own willingness to participate” ( $mean_{CC} = 4.8$ ;  $mean_{TC} = 5.0$ ), “class co-operation” ( $mean_{CC} = 4.8$ ;  $mean_{TC} = 4.8$ ), “relevance” of the lessons ( $mean_{CC} = 4.7$ ;  $mean_{TC} = 5.0$ ), “comprehensibility of the topics” ( $mean_{CC} = 4.7$ ;  $mean_{TC} = 4.6$ ) and “satisfaction” ( $mean_{CC} = 4.5$ ;  $mean_{TC} = 5.0$ ). The differences in students' perception of aspects of the Motivational Learning Environment between the treatment classes and conventional classes after Module 1 are not statistically significant ( $t(171) =$  from 0.054 to 1.021,  $p > 0.05$ ).

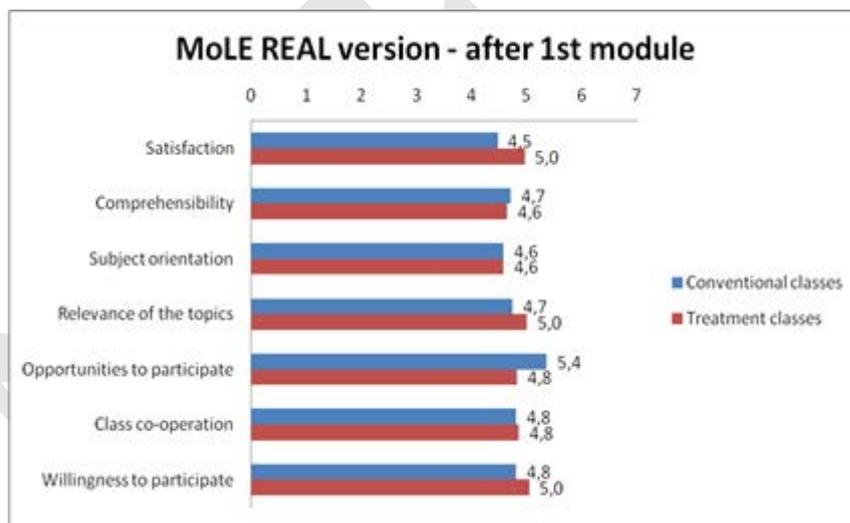

Fig. 1. Mean scores of the students' MoLE assessments (MoLE REAL version, after the 1<sup>st</sup> module)

## 3<sup>rd</sup> research question

*Does student perception (in the treatment and non-treatment groups) of the aspects of the Motivational Learning Environment change significantly during the school year?*

A comparison of Figures 1 and 2 indicates that some changes did occur in the students' perception of various aspects of the Motivational Learning Environment, both for the treatment classes and the conventional classes. The mean scores of all seven dimensions of the learning environment remain in part above the theoretical mean value. However, changes were observed in the following dimensions of the learning environment: "opportunities to participate" (mean<sub>CC</sub>: 5.4 to 5.2; mean<sub>TC</sub>: 4.8 to 5.4), their "own willingness to participate" (mean<sub>CC</sub>: 4.8 - same; mean<sub>TC</sub>: 5.0 to 5.5), "class co-operation" (mean<sub>CC</sub>: 4.8 to 4.0; mean<sub>TC</sub>: 4.8 to 4.0), "relevance" of the lessons (mean<sub>CC</sub>: 4.7 to 4.8; mean<sub>TC</sub>: 5.0 to 5.8), "comprehensibility of the topics" (mean<sub>CC</sub>: 4.7 - same; mean<sub>TC</sub>: 4.6 to 5.4) and "satisfaction" (mean<sub>CC</sub>: 4.5 to 4.3; mean<sub>TC</sub>: 5.0 to 5.6). In comparison to Module 1, the change in perception of "class co-operation" is statistically significant ( $t(171)=3.531$ ;  $p<0.05$ ), whereas other changes are not statistically significant ( $t(171)$ : from 0.060 to 1.663,  $p>0.05$ ).

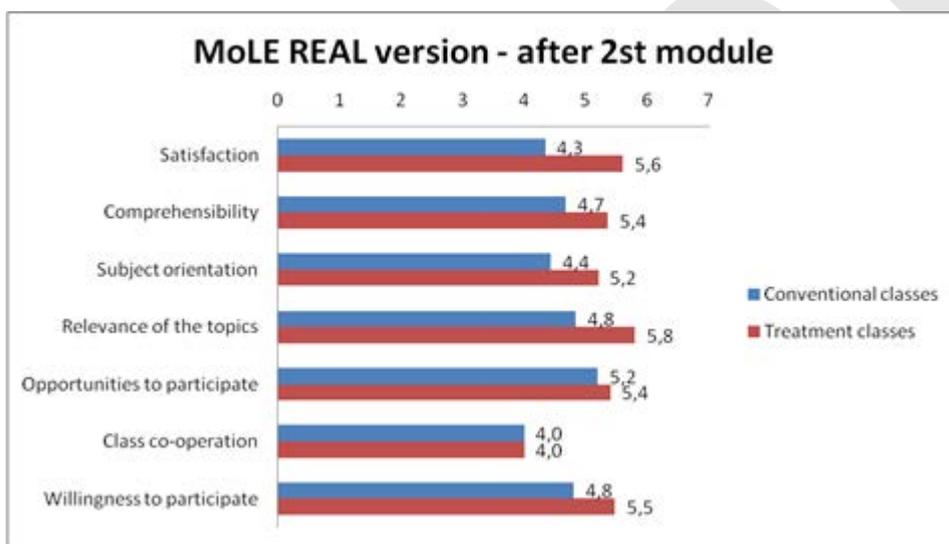

Fig. 2. Mean scores of the students' MoLE assessments (MoLE REAL version, after the 2<sup>nd</sup> module)

The differences in the perception of aspects of the Motivational Learning Environment between the treatment classes and conventional classes after Module 2 are again not statistically significant ( $t(171)$  = from 0.139 to 2.623;  $p>0.05$ ). However, Figure 2 indicates that students from the treatment group assessed six out of seven aspects more favorably than their peers in conventional classes.

#### 4. Conclusions

Preliminary results indicate that there were significant differences in achievements in chemistry between the control and treatment groups of students after the completion of Module 2, whereas significant differences were not observed after Module 1.

Students of both groups (treatment and control group) assess their chemistry lessons positively overall. The mean scores of all seven dimensions of the learning environment after Module 1 and Module 2 were above the theoretical mean value, i.e., the “neither-nor estimation”. Despite the fact that differences in perception of aspects of the Motivational Learning Environment between the treatment classes and the conventional classes after Module 1 and Module 2 were not statistically significant, it can be observed that after Module 2 students from the treatment group assessed six out of seven aspects more favorably than their peers in conventional classes.

The results from cognitive and motivational aspects indicate that the pupils needed some time to adjust to the PROFILES approach, which then eventually contributed to their better achievements in chemistry. However, it is likely that the students’ better achievements were also due to the teachers’ adaption to the PROFILES approach, as reported in their reflections.

The project is currently approaching the end of the second cycle and further results will confirm whether or not our assumptions are correct.

### Acknowledgement

The authors of the article would like to acknowledge the particular schools, pupils and teachers who participated in the collection of data and the development of the teaching materials: Šket, B., Petrica Ponikvar, P., Klopčič, S., Mesojedec from Log-Dragomer Primary School, Šmartno pod Šmarno goro Primary School, Stična Primary School and Sostro Primary School.

## Abstract

The purpose of this study is to determine the scientific process skills of teacher candidates who will be teaching Science, and to define how their skills vary depending on the level of their classes and branch. The participants of the research are 125 teacher candidates currently studying at Dokuz Eylül University Faculty of Buca Education. Survey model is applied and the data is obtained via the "scientific process skills test". According to the data obtained it is concluded that the scientific process skills of teacher candidates are found to be at a medium level, and that there is not a meaningful difference amongst branches in terms of scientific processes. It is also noted that the scientific process skills of senior students are significantly higher than that of new recruits.

Keywords: scientific process skills, teacher candidates, branches, class levels

## 1. INTRODUCTION

The development of science and technology along with the data acquired in our age has reached a massive scale. Today human beings are facing the reality that they cannot learn everything that exists (Cambazoğlu, 1984). Due to the availability of this massive array of data, the concept of Education should not be about delivering the data but about getting the students to learn the method of attaining this data, which is possible through the development of scientific process skills (Şahbaz, 2010: 5). These skills according to Gagne (1965) are the bases of scientific questioning. Meanwhile Ostlund (1992) describes these skills as the strongest material necessary to produce and organize data about our world.

When related literature is studied, a variety of different classifications on scientific processes by a huge number of researchers are observed. It is also noted upon a study on Science curriculum of countries that they utilize these skills in their curricula starting from pre-school period. In SAPA (Science-A Process Approach) curriculum developed between the years of 1963 and 1974, these skills are divided into two groups as basic (observing, classification, measuring, communicating, predicting and inferring) and integrated (formulating hypotheses, interpreting data, formulating models, experimenting, operationally defining and identifying and controlling variables). These skills and their functioning are presented in Table 1 by compiling from studies of Padilla (1990), Martin (1997) and Bagci-Kilic (2006).

Table 1. Classification of scientific process skills

<b>Scientific process skills</b>
<b>Basic process skills</b>
<i>Observing:</i> Observation of the environment by use of sense organs
<i>Classification:</i> grouping events, objects and opinions by certain characteristics
<i>Measuring:</i> Expressing the characteristics of objects or materials numerically
<i>Communicating:</i> Expressing a motion, object or event with oral, written and visual communication tools
<i>Predicting:</i> Coming to a conclusion relating to the event or situation analyzed before experimentation
<i>Inferring:</i> Coming to a conclusion relating to an event or situation
<b>Integrated process skills</b>
<i>Formulating Hypotheses:</i> Making an assumption about the event or situation analyzed based on pre-observation and tests
<i>Interpreting Data:</i> Interpreting about data grouped or tabulated
<i>Formulating Models:</i> Achieving mathematical expressions and designs based on available data
<i>Experimenting:</i> Examining hypothesis by studying effects of independent variables on dependent variables
<i>Operationally Defining:</i> Measuring variables which cannot be measured directly by use of observable variables
<i>Identifying and Controlling Variables:</i> Determining all variables affecting an event or situation and determining the effect on the results by changing one of these variables and keeping the others fixed

(Padilla, 1990; Martin, 1997 and Bagci -Kilic, 2006)

According to Arthur (1993) the significant thing for science education is how the knowledge is obtained rather than learning the subject. Because, scientific knowledge is true with only facts, it can develop and change as a result of putting forward new opinions and testing them (Çepni, Ayas, Johnson and Turgut, 1997). The science involves trial-and-error-failure and trying again. It advises to the individual being doubtful about what is done,

changing the model if necessary in line with the findings obtained or setting new models, in other words, having a perspective for the scientist man and using scientific process skills (Arthur, 1993).

Having the perspective of scientist of the students means that they are curious like him, ask questions, develop positive attitude towards science, question events critically and by thinking in a versatile way and produce solutions for the problems via scientific methods (NRC, 1996). Gagne (1965) thinks that subjects which are taught to students should be similar to the acts of a scientist. Because scientific thinking and researching is not specific to the scientists (Harlen, 1999). Students use scientific processes for obtaining knowledge by asking questions, observing and measuring, collecting data, interpreting them, predicting the effects of a variable, hypothesizing and testing them and experimenting (Renner and Marek, 1990). The purpose is to make every student think like a scientist rather than bringing him up as a scientist (Monhardt and Monhardt, 2006: 68).

The most significant aim of the education should be teaching students how the knowledge will be acquired and processed. Teaching the scientific process skills is emphasized to achieve this aim. These skills should be used at every stage of daily life to increase life quality and standard by every individual. Development of scientific process skills is really important for education and business lives of the individuals in other words, for the entire life (Rillero, 1998). Students these skills of whom are developed can have the characteristics of a) presenting the research question, b) developing a hypothesis and testing it, c) designing researches, e) experimenting, g) collecting, analyzing and interpreting data, h) coming to the conclusion via available data, i) expressing findings orally or reporting (Burns, Okey and Wise, 1985; Carey, Evans, Honda, Jay and Unger, 1989; NRC, 1996). For this reason, teacher candidates at faculties of education should acquire these skills by themselves and should be qualified enough to guide students. Especially, laboratory classes are very significant for teacher candidates to serve in sciences (physics, chemistry, biology and science teacher) to develop the proficiency in this sense. Because these skills are known as the laboratory skills at the same time (Burns, Okey and Wise, 1985). While students perform experimentations in laboratory environment, they definitely use these skills. While following the steps of an experiment for a certain purpose, they use the scientific skills. For this reason, it is thought that process skills of teacher candidates studying in the final year will be higher than the teacher candidates having enrolled in the university recently because of the laboratory experiences gained at the university.

Determination of scientific process skills of teacher candidates to serve in the sciences and how these skills vary by the level of class and branch is aimed in this study carried out in the light of this information.

### *1.1. Participants*

Participants of the study are 125 teacher candidates studying at Dokuz Eylul University, Faculty of Buca Education. Distribution of teacher candidates by the branches is presented in Table 2.

Table 2. Distribution of teacher candidates by branches

Branches	<i>N</i>
Physics teaching	32
Science teaching	31
Chemistry teaching	30
Biology teaching	32
Total	125

### 1.2. Assessment Tool

“Scientific process skills test” (SPST) developed by the researcher was used in the study. This test comprises of multiple-choice 35 items assessing the integrated process skills of the students at the university level. Validity, reliability and item analysis of the test was carried out by use of data collected from 407 teacher candidates studying at Dokuz Eylül University, Faculty of Buca Education. Cronbach’s Alpha reliability coefficient of SPST is .797. Mean difficulty of the test is .604 and it comprises of items the discrimination indices of which varies between .311 and .776.

Moreover, criterion validity of the SPST content and face validity of which were determined with specification table and expert opinions was established with the test original name of which is “The Test of Integrated Science Process Skills II (TIPS II) developed by Burns, Okey and Wise (1985) and adopted in Turkish by Geban, Askar and Ozkan (1991). TIPS II comprises of multiple-choice 36 items assessing the integrated process skills of students at the level of university. Correlation coefficients between the scores of SPST and TIPS II applied to 76 teacher candidates in two-week interval are presented in Table 3.

Table 3. Correlation between SPST and TIPS II scores

Test	Integrated process skills	Number of item	M	SD	r
SPST	Formulating Hypotheses	7	3.42	.64	.79*
TIPS II		9	6.21	1.31	
SPST	Interpreting Data	5	1.64	.84	.75*
TIPS II		3	2.64	.63	
SPST	Formulating Models	3	1.35	.63	.66*
TIPS II		3	1.92	.61	
SPST	Experimenting	4	2.71	.82	.70*
TIPS II		3	2.42	.75	
SPST	Operationally Defining	4	2.21	.69	.79*
TIPS II		6	3.64	1.39	
SPST	Identifying and Controlling Variables	12	1.12	2.78	.80*
TIPS II		12	2.12	6.28	

## 2. FINDINGS

Mean and standard deviation values of the scores of SPST were calculated to determine the scientific process skills of the participant teacher candidates (Table 4). Considering that maximum score is 35, it can be said that process skills of teacher candidates at all branches are at medium level.

Table 4. SPST results of teacher candidates by their branches

Branches	N	M	SD
Physics teaching	32	24.41	3.99
Science teaching	31	25.00	4.23
Chemistry teaching	30	24.36	3.97
Biology teaching	32	23.83	4.43

Variance analysis was carried out to determine whether the difference between arithmetic averages of scores of SPST of teacher candidates was statistically significant by the branches or not. Results are presented in Table 5.

Table 5. Results of Anova test by the branches of teacher candidates

Source of variance	Sum of Squares	df	Mean Square	<i>F</i>	<i>p</i>
Between Groups	22.86	3	7.62	.40	.74
Within Groups	2267.93	121	18.74		
Total	2290.80	124			

It was determined that there was no significant difference by the branches between SPST scores of teacher candidates to serve in science education upon examining Table 5 [ $F_{(121)} = .40$   $p > .05$ ]. Accordingly, there is not a significant difference between the scientific process skills of teacher candidates studying at four different branches.

Teacher candidates were grouped by the classes to solve another sub-problem of the study, and arithmetic averages and standard deviation values of the scores of SPST were determined. However, departments of physics, chemistry and biology education are 5-year undergraduate programs and department of science education is four-year undergraduate program. For this reason, teacher candidates of science at grade 4 are included in the group of grade 5.

Table 6. Distribution of teacher candidates by the level of grade

Level of Grade	N	M	SD
Grade 1	23	22.08	4.14
Grade 2	27	24.11	4.00
Grade 3	23	24.17	4.02
Grade 4	24	25.37	3.90
Grade 5	28	26.08	4.72
Total	125	24.36	4.29

In Table 6, it is seen that scores of SPST of teacher candidates increase as the level of grade increases. Accordingly, while grade 1 candidate teachers have the lowest average, averages of candidate teachers at the final grade are the highest averages. ANOVA was conducted to determine whether the difference between arithmetic averages of SPST scores of the participants was a significant difference by the grades or not. Analysis results are presented in table 7.

Table 7. ANOVA test results by the level of grade of teacher candidates

Source of Variance	Sum of Squares	df	Mean Square	F	p	Significant difference
Between Groups	214.74	4	53.68	3.10	.018	
Within Groups	2076.05	120	17.30			1-5
Total	2290.80	124				

It was found out that the difference between teacher candidates of grade 1 and 5 was statistically significant in the analysis. Accordingly, final year teacher candidates have higher scientific process skill levels than the grade 1 teacher candidates.

### 3. CONCLUSION

It was determined that the scientific process skills of teacher candidates to serve in the branch of science were at the medium level. When studies in the relevant literature are examined, it is seen that different researches obtained the similar result. Türkmen, Ercan and Süren (2006) and Yıldırım, Yalçın, Şengören, Tanel, Sağlam and Kavcar (2011) determined that scientific process skills of final class teacher candidates were at the medium level and Korucuoglu determined that scientific process skills of physics teacher candidates were at the medium level. Similarly, in a study conducted by Ozgelen and Tuzun (2006) it was found out that science teacher candidates at grade 4 did not have sufficient knowledge about the scientific process skills in the new curriculum and they did not include these skills in the teaching plan they prepared adequately. Cecen (2012) determined in his study that scientific process skills of university students did not develop adequately.

According to German, Haskins and Auls (1996), the most significant way to develop scientific process skills of students in science education is the experimentation. While steps necessary for the experimentation are followed in line with a certain purpose, scientific skills are used. However, the point to be noted here is that research-based experiments should be used. Research-based experiments require the students to define the problem and develop hypothesis for the solution, collect data to test them, to determine variables and to come to the result by assessing data collected (Büyükkaragöz and Çivi, 1999; Domin, 1999). By this means, students use and develop scientific process skills. The reason of the fact that scientific process skills of the teacher candidates in this study is at the medium level is thought to arise from non-inclusion of research-based experiments in the laboratory classes throughout the university education.

Another finding of the study is that scientific process skills of teacher candidates do not vary by the branches. Yıldırım, Yalçın, Sengoren, Tanel, Sağlam and Kavcar (2011) compared scientific process skills of teacher candidates at final class of departments of physics, science, chemistry and biology education and determined a significant difference between process skills in favour of students of department of physics education in their study. However, similar to this study, a statistically significant difference was not found out between the teacher candidates at other branches.

The last finding of the study is that teacher candidates at grade 5 have higher scientific process levels than teacher candidates at grade 1. When related literature is studied, it is seen that similar results are obtained in a study conducted by Turkmen (2006). In the study conducted by Aydođdu, Yıldız, Akpınar and Ergin (2007), it was found out that skills of hypothesizing and determining the variables of science teacher candidates were lower at grade 1 and 2 and higher at grade 3 and 4.

Scientific process skills are the laboratory skills. While students experiment at laboratory, they use these skills and develop them in time. For this reason, it is thought that scientific process skills of the teacher candidates receiving laboratory class throughout their university education are higher than teacher candidates at grade 1.

This study is limited to data collected from 125 teacher candidates at departments of physics, chemistry, biology and science education. Studies to be carried out with data collected from teacher candidates being high in number are very significant for generalizability of the findings. Moreover, reaching teacher candidates studying at the same branches of different universities will allow us to reveal the general situation of the faculties of education relating to the subject.

# Evaluation of Student Surveys Based on Lectures

**Başak Zengin<sup>a\*</sup>***<sup>a</sup>Istanbul Gelişim University, Vocational School,34310, "İstanbul", Turkey*

---

**Abstract**

The most important component of innovation and accreditation in education and training is participation of the students who are the stakeholders in the process. This participation increases the options in education and training and directs the operation of the course. Participation of the students in the course and the quality of the course direction which is provided by a faculty member can be determined using course and student surveys. For this reason, student surveys should be done regularly and these surveys must have questions about the content of the course, the laboratory work and the function of the lecturer as well the knowledge, perception and values of the professional ethics gained by the student. But more important than this surveys are the objective responses of students. In this study, to understand the relationship between survey responses and success rate, surveys were carried out in different course groups between the years 2005-2012 in the Civil Engineering Department of the Yıldız Faculty of Civil Engineering at Yıldız Technical University. Finally, the objectivity of the students was determined by evaluating the survey responses from different perspectives.

Keywords: renewal, survey, objectivity

---

**1. INTRODUCTION**

The information era is accelerating the collection of and access to information. Providing information and knowledge are needed to produce and remodel. The nature of knowledge and learning has become the fundamental basis of constructivism (Brooks ve Brooks, 1993). Constructivism is a theory about knowledge and learning, not about teaching. This theory is based on establishing knowledge from the start (Demirel, 2000). In essence, the learned knowledge should be structured and put into practice (Perkins, 1999).

Nowadays, producing information is expected from individuals, rather than consuming resources. Individuals who are accepted by the modern world are effective participants in the process of creating meaning from information; not people who accept every piece of information that is given (Yildirim ve Simsek, 1999). Constructivist learning is a process that occurs by the learner's own abilities, motivations, beliefs, attitudes and experiences. Individuals are selective, constructive and effective in the learning process (Ulgen, 1994; Şaşan, 2002).

Constructivist views of students with the lecturer are important for correction of the deficiencies in education and training in order to provide better quality in education. The most effective methods in the stating of students' views are interviews, assessment of observations and surveys.

The survey method was used to obtain the views of the students in the Department of Civil Engineering, Faculty of Civil Engineering at Yıldız Technical University. Yıldız Technical University, which is one of the oldest institutions of higher education in our country, Turkey, was founded in 1911 initially with the name Kondüktör Mektebi Alisi. Then it took other names: Nafia Fen Mektebi, Teknik Okul, İstanbul Devlet Mühendislik Mimarlık Akademisi and finally Yıldız Üniversitesi. The Department of Civil Engineering is one of the two oldest departments in the university, and since 1911 a large number of the students have been trained as engineers (Aköz at al. 2004).

The Department of Civil Engineering is divided into six major areas of science which are Construction, Building Materials, Hydraulics, Geotechnical, Transportation, and Construction Management. In this study, in seven different courses (based on these six major areas of the science course selected), the percentages of students passing and students' survey responses are compared to determine the objectivity of the student surveys.

## **2. Method**

### *2.1. Sample of the universe*

The research population consisted of 9,897 students who were in seven different courses, in different groups, in the Civil Engineering Department, Faculty of Civil Engineering at Yıldız Technical University, during the 2005-2012 academic years. The research sample was taken as the whole universe, as this universe could be reached.

### *2.2. Collection of Data*

In the data collection phase of this study, a survey form was created with reference to the literature and expert opinion, to investigate the objectivity of students which were designed to improve the quality of 7 different lectures for students

The questionnaire used in the study has two main parts: one about the lecture and the other about the faculty member. There are 24 different questions in total. The number of students that make up the sample of 14 academic terms is 9,897. All of the students agreed to participate on a voluntary basis.

### *2.3. Preparation of attitude phrases*

The sentences about the faculty members and courses were prepared to determine positive or negative behaviour. The first item pool has 24 sentences about behaviour with the options: definitely agreed, agreed, undecided, disagreed, or definitely disagreed, which are like a rating sample.

## 2.4. Analysis of Data

It is known that simple statistics are used for analysis of surveys by the frequency found and percentages. In this study, student responses were graded and averaged.

## 3. Results

There were 14 different academic terms, fall or spring, between 2005 and 2012. The average of the responses to the applied surveys for each academic term is given in Table 1. The general average of all responses according to this table is 78.9. This shows that generally, the decisions of students were between *agree* and *undecided*. The highest score of 87% is given to the question “Knowledge and skills in the course of the faculty member is sufficient”. The lowest score of %75 is given to the question “Lecture contributes to abilities of mine like as identifying and problem-solving”. Generally, high scores are given to the faculty members who concerned about course. Students are undecided about the provision of courses. For a more detailed evaluation of the students' attitudes towards classes, the survey results were compared with the passing scores of seven different courses.

Table 1. The distribution of answers given by students

Q. NO	Question	1	2	3	4	5	Average*	Average**
Questions about faculty member	1	The lecturer processed the course in accordance with the course description form declared at the beginning of the semester.					4.24	84.8
	2	Resources proposed by the faculty member related to the course are sufficient.					4.11	82.2
	3	The course instructor entered the lectures on a regular basis.					4.30	86.0
	4	The knowledge and skills of the lecture's instructor is sufficient.					4.35	87.0
	5	The instructor came to lectures prepared.					4.31	86.2
	6	Communication between students and faculty member was positive.					4.21	84.2
	7	The instructor told lessons in a clear and understandable manner.					4.09	81.8
	8	The instructor used board and other visual tools effectively.					4.13	82.6
	9	Instructor encouraged students to participate in the course.					3.94	78.8
	10	Instructor encouraged students to conduct research (library, internet, etc. ).					3.75	75.0
	11	Instructor's assessment is fair.					3.92	78.4
	12	I would like to take the course again with the same faculty member.					3.98	79.6
Q. NO	Question	1	2	3	4	5	Average*	Average**
Questions about lecture	13	The course has enabled students to use basic science and engineering.					3.92	78.4
	14	The course contributed to abilities of design and to conduct experiments, analyze and interpret.					3.93	78.6
	15	The course has improved my ability to design.					3.84	76.8
	16	The course has contributed to teamwork skills.					3.75	75.0
	17	The course contributed to ability of problem-solving.					3.67	73.4
	18	The course has improved me professionally and ethically.					3.76	75.2
	19	The course has improved my ability to communicate effectively.					3.76	75.2
	20	Course enabled me to learn about the global and social effects of this					3.69	73.8

	profession.		
21	The course helped awareness of lifelong education.	3.70	74.0
22	The course provided opportunities to learn topics of contemporary professions.	3.83	76.6
23	The course provided opportunities to choose modern engineering tools and methods.	3.69	73.8
24	Course gave a chance to learn a large amount of information about application areas of the department and how to implement information in these areas.	3.81	76.2

\* Average of the student answers, which were given in 14 academic terms

\*\* Percentage of Average of the student answers which were given in 14 academic terms

1-Definitely Disagree

2- Disagree

3-Undecided

4-Agree

5- Definitely Agree

### 3.1. Evaluation of Courses

Seven different courses were determined for each department between the 2005-2012 academic years and these courses are coded as “I, II, III, IV, V, VI and VII”. Each term courses are opened in different groups according to student numbers. Each group is coded as a different letter (A1, B1, C1 etc.). Passing scores between 1 and 5 are converted to percentages to compare with the results of the surveys. Results of the surveys are coded by course codes A, B, C and also passing percentages are coded as AA, BB, CC etc.

### 3.1.1. Course I

Course I was opened by 4 different faculty members (AA, BB, CC and DD) in 7 terms between the years 2005-2012. The average score of the survey results is 79% and the average percentage of success on the course is 69%. As can be seen from Fig. 1, for group A, while the average success is 67%, the average score of the survey is 79%; for group B, while the average success is 76%, the average score of the survey is 79%; for group C while the average success is 65%, the average score of the survey is 81%; and for Group D while the average success is 56%, the average score of the survey is 83% (Table 2).

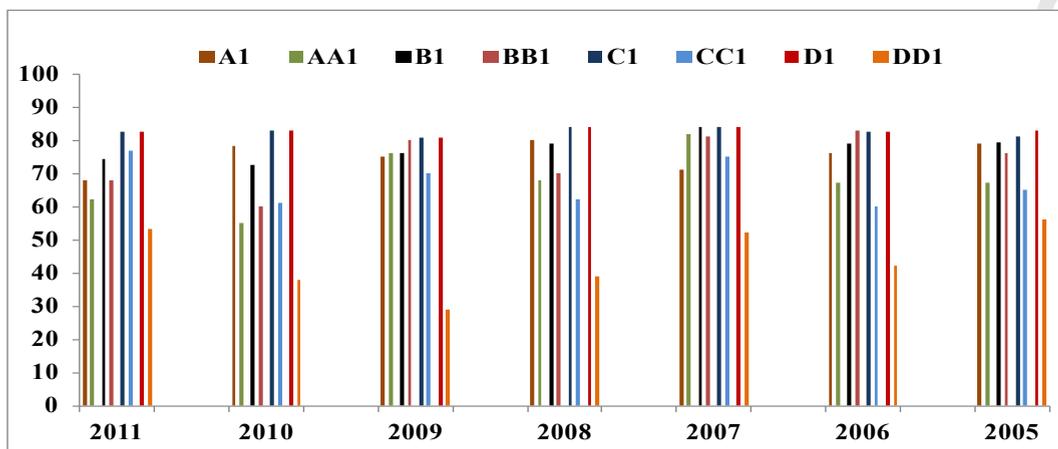

Fig. 1. Survey results and course success percentages for Course I for 7 years.

Table 2. Success percentages and average of survey results for Course I

Terms	A%	G%	A%	G%	A%	G%	A%	G%
	A1	AA1	B1	BB1	C1	CC1	D1	DD1
2011	67.8	62.0	74.2	68.0	82.4	76.7	82.4	53.4
2010	78.2	55.0	72.6	60.0	83.0	61.0	83.0	38.0
2009	75.0	76.0	76.0	80.0	80.6	70.0	80.6	29.0
2008	80.2	68.0	79.0	70.0	84.0	62.0	84.0	39.0
2007	71.0	82.0	84.0	81.0	84.0	75.0	84.0	52.0
2006	76.0	67.0	78.8	83.0	82.4	60.0	82.4	42.0
2005	79.0	67.0	79.4	76.0	81.0	65.0	83.0	56.0
A%; survey percentage, G% passing percentage					A, B, C, D group of lecturer			

Group D has the lowest success rate but it is still above the average percentage of the survey results. Group B has the highest success rate but the average score which is given in the survey is the average.

### 3.1.2. Course II

Course II was opened by 2 different faculty members (A2 and B2) in 6 terms between the years 2005-2012. The average score of the survey results is 77% and the success average on the course is 69%. As can be seen from Fig. 2, for group A2, while the average success is 67%, the average score of the survey is 77%; and for group B2, while the average success is 71%, the average score of the survey is 78% (Table 3).

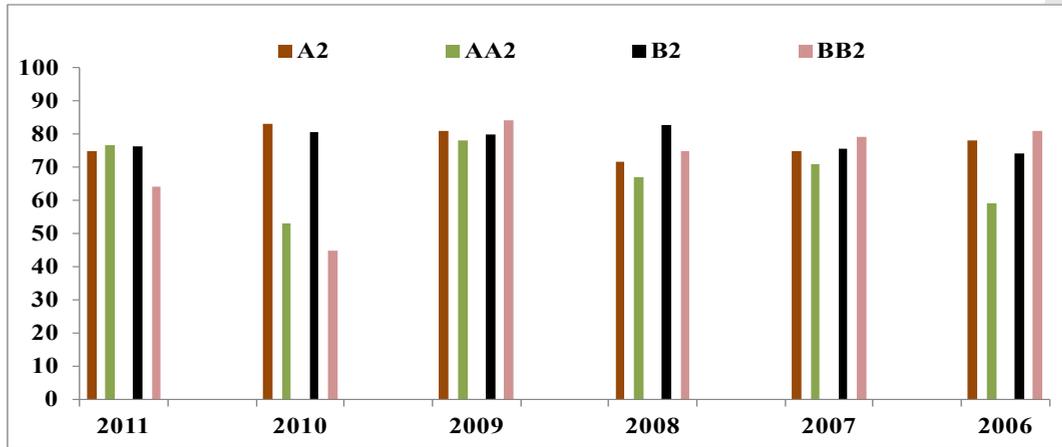

Fig. 2. Survey results and course success percentages for Course II for 6 years.

Table 3. Success percentages and average of survey results for Course II

Terms	A%		G%	
	A2	AA2	B2	BB2
2011	75.0	76.7	76.2	64.0
2010	83.0	53.0	80.4	45.0
2009	81.0	78.0	79.8	84.0
2008	71.6	67.0	82.6	75.0
2007	75.0	71.0	75.6	79.0
2006	78.0	59.0	74.0	81.0

A%; survey percentage, G% passing percentage  
A, B group of lecturer

Group A2 has a low success rate and its survey results are close to the average score, but group B2 has the highest scores for both the success rate and survey results.

### 3.1.3. Course III

Course III was opened by 3 different faculty members (A3, B3 and C3) in 9 terms between the years 2005-2012. The average score of the survey results is 83% and the average success on the course is 64%. As can be seen from Fig. 3, for group A3, while the average success is 52%, the average score of the survey is 71%; for group B3, while the average success is 69%, the average score of the survey is 94%; and for group C3, while the average success is 71%, the average score of the survey is 84% (Table 4).

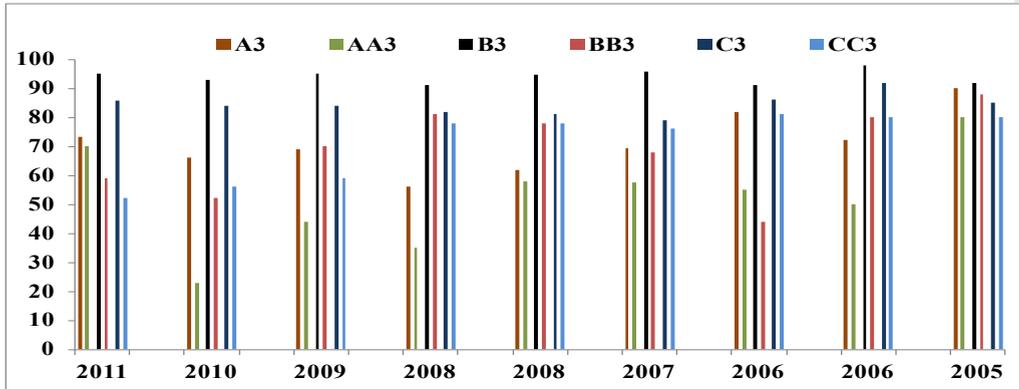

Fig. 3. Survey results and course success percentages for Course III for 9 years.

Table 4. Success percentages and average of survey results for Course III

	A%	G%	A%	G%	A%	G%
Terms	A3	AA3	B3	BB3	C3	CC3
2011	73.2	70.0	95.2	59.0	85.6	52.0
2010	66.0	23.0	92.8	52.0	84.0	56.0
2009	69.0	44.0	95.0	70.0	84.0	59.0
2008	56.0	35.0	91.2	81.0	82.0	78.0
2008	61.8	58.0	94.6	78.0	81.2	78.0
2007	69.2	57.5	95.6	68.0	79.0	76.0
2006	82.0	55.0	91.2	44.0	86.0	81.0
2006	72.2	50.0	98.0	80.0	92.0	80.0
2005	90.0	80.0	92.0	88.0	85.0	80.0

A%; survey percentage, G% passing percentage

A, B, C: group of lecturer

A3 group has the lowest success rate and the lowest percentage of success. B3 group has the highest success rate and the highest survey success results.

3.1.4. Course IV

Course IV was opened by 4 different faculty members (A4, B4, C4 and D4) in 9 terms between the years 2005-2012. The average score of the survey results is 78% and the average success on the course is 76%. As can be seen from Fig. 4, for group A4, while the average success on the course is 73%, the average score of the survey is 75%; for group B4, while the average success is 68%, the average score of the survey is 70%; for group C4, while the average success is 82%, the average score of the survey is 88%; and for Group D4, while the average success is 80%, the average score of the survey is 78% (Table 5).

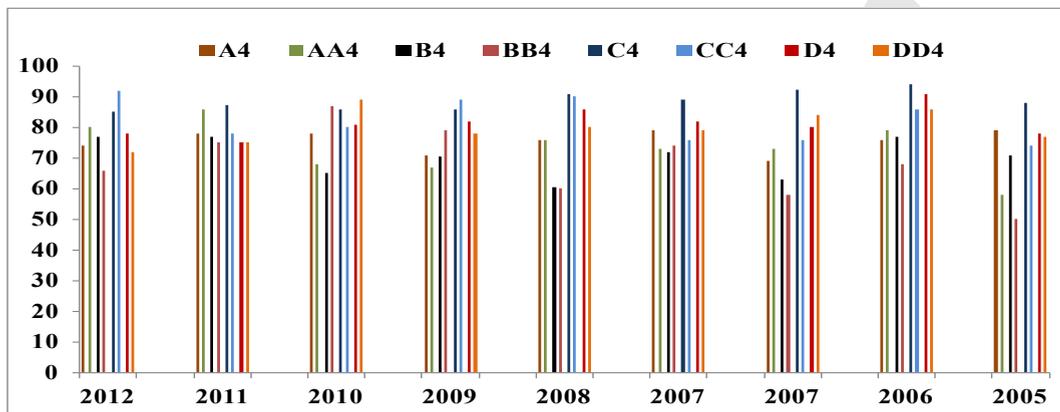

Fig. 4. Survey results and course success percentages for Course IV for 9 years.

Table 5. Success percentages and average of survey results for Course IV

Terms	A4	AA4	B4	BB4	C4	CC4	D4	DD4
2012	74.0	80.0	77.0	66.0	85.0	92.0	78.0	72.0
2011	78.0	86.0	77.0	75.0	87.2	78.0	75.2	75.0
2010	78.0	68.0	65.0	87.0	86.0	80.0	80.8	89.0
2009	71.0	67.0	70.6	79.0	86.0	89.0	82.0	78.0
2008	76.0	76.0	60.6	60.0	91.0	90.0	86.0	80.0
2007	79.0	73.0	72.0	74.0	89.0	76.0	82.0	79.0
2007	69.0	73.0	62.8	58.0	92.2	76.0	80.0	84.0
2006	76.0	79.0	77.0	68.0	94.0	86.0	91.0	86.0
2005	79.0	58.0	71.0	50.0	88.0	74.0	78.0	77.0

A%; survey percentage, G% passing percentage

A, B, C, D : group of lecturer

B4 group has the lowest success rate and lowest survey results while the other groups are close to the average.

### 3.1.5. Course V

Course V was opened by 3 different faculty members (A5, B5 and C5) in 7 terms between the years 2005-2012. The average score of the survey results is 79% and the average success on the course is 65%. As can be seen from Fig. 5, for group A5, while the average success is 59%, the average score of the survey is 75%; for group B5, while the average success is 77%, the average score of the survey is 80%; and for group C5, while the average success is 60%, the average score of the survey is 80% (Table 6).

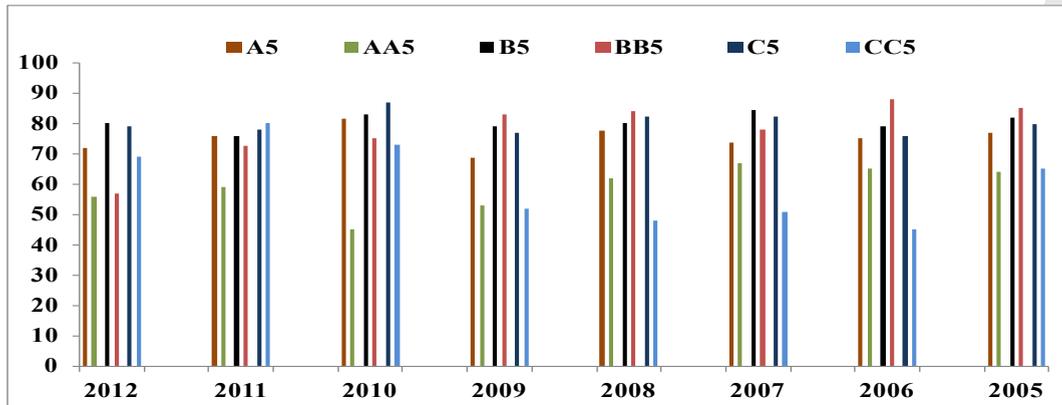

Fig. 5. Survey results and course success percentages for Course V for 8 years.

Table 6. Success percentages and average of survey results for Course V

Terms	A%	G%	A%	G%	A%	G%
	A5	AA5	B5	BB5	C5	CC5
2012	72.0	56.0	80.0	57.0	79.0	69.0
2011	76.0	59.0	76.0	72.5	78.0	80.0
2010	81.4	45.0	83.0	75.0	86.8	73.0
2009	68.8	53.0	79.0	83.0	77.0	52.0
2008	77.6	62.0	80.0	84.0	82.2	48.0
2007	73.6	67.0	84.4	78.0	82.4	51.0
2006	75.0	65.0	79.0	88.0	76.0	45.0
2005	77.0	64.0	82.0	85.0	79.6	65.0

A%; survey percentage, G% passing percentage

A, B, C, D: group of lecturer

A5 group has the lowest success rate and the lowest score of the survey. In Group C5, the success rate is below the average but the score of the survey is higher than the average. Group B5 gave positive points for survey and also had high success rate on the course.

### 3.1.6. Course VI

Course VI was opened by 3 different faculty members (A6, B6 and C6) in 7 terms between the years 2005-2012. The average score of the survey results is 81% and the average success on the course is 93%. As can be seen from Fig. 6, for group A6, while the average success is 96%, the average score of the survey is 81%; for group B6, while the average success is 87%, the average score of the survey is 70%; and for group C6, while the average success is 96%, the average score of the survey is 91% (Table 7).

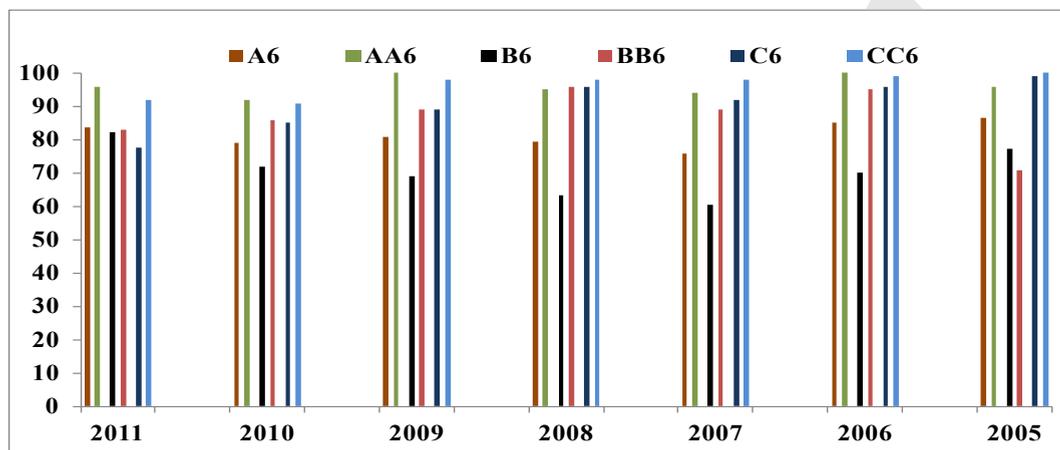

Fig. 6. Survey results and course success percentages for Course VI for 7 years.

Table 7. Success percentages and average of survey results for Course VI

	A%	G%	A%	G%	A%	G%
Terms	A6	AA6	B6	BB6	C6	CC6
2011	83.8	96.0	82.2	83.0	77.8	92.0
2010	79.0	92.0	71.8	86.0	85.0	91.0
2009	81.0	100.0	69.0	89.0	89.0	98.0
2008	79.4	95.0	63.2	96.0	95.8	98.0
2007	76.0	94.0	60.6	89.0	91.8	98.0
2006	85.0	100.0	70.0	95.0	96.0	99.0
2005	86.6	96.0	77.2	71.0	99.0	100.0

A%; survey percentage, G% passing percentage

A, B, C, D: group of lecturer

Despite the high pass rates in the course, three survey groups score low. B6 has the lowest score which belongs to a group survey.

### 3.1.7. Course VII

Course VII was opened by 3 different faculty members (A7, B7 and C7) in 6 terms between the years 2005-2012. The average score of the survey results is 82% and the average success on the course is 87%. As can be seen from Figure 7, for group A7, while the average success is 86%, the average score of the survey is 78%; for group B7, while the average success is 93%, the average score of the survey is 85%; and for group C7, while the average success is %92, the average score of the survey is 85% (Table 8).

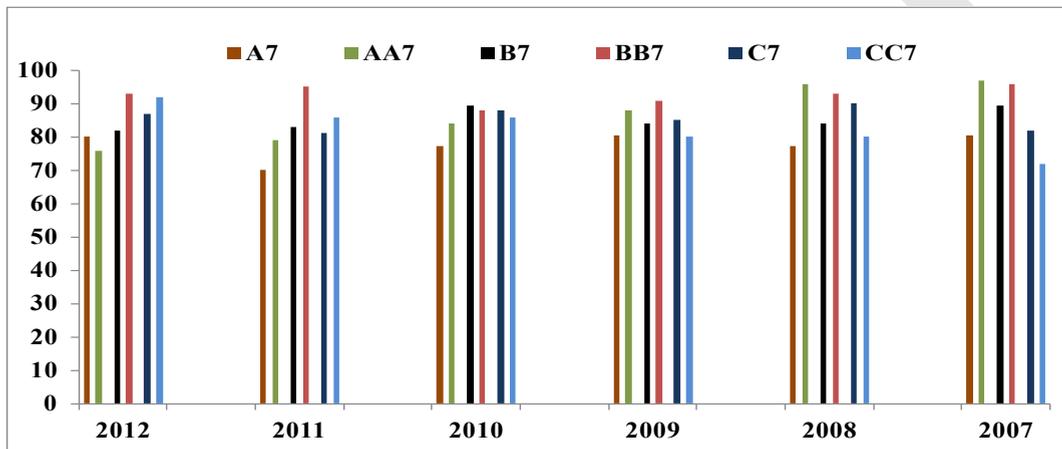

Fig. 7. Survey results and course success percentages of Course VII for 7 years.

Table 8. Success percentages and average of survey results for Course VII

	A%	G%	A%	G%	A%	G%
Terms	A7	AA7	B7	BB7	C7	CC7
2012	80.0	76.0	82.0	93.0	86.8	92.0
2011	70.2	79.0	83.0	95.0	81.2	86.0
2010	77.2	84.0	89.4	88.0	88.0	86.0
2009	80.6	88.0	84.0	91.0	85.0	80.0
2008	77.2	96.0	84.0	93.0	90.0	80.0
2007	80.6	97.0	89.4	96.0	82.0	72.0

A%; survey percentage, G% passing percentage

A, B, C, D : group of lecturer

The success percentage of the course in group C7 is lower than the percentage for the result of the surveys. Also the success percentages of the course for Groups A7 and B7 are higher than those for the survey results.

#### 4. Conclusion and Recommendations

##### 4.1. Conclusion

The success rate of the course and the survey results, based on an assessment of the faculty member and the course, are compared for 7 different courses and departments between the 2005-2012 academic years.

According to these results;

- Course I: The success rate of Course I is 69% and the result of the survey is 79%. The passing percentages and survey results are close together. Only Group D has a remarkably high survey percentage and low passing percentage. According to these course results, students think about the relationship between them and the faculty member of the course while they are filling in the survey.
- Course II: There are two faculty members who give this course. Despite the fact that the average of the success for 2010 is low, the survey results are close to each other. Generally the success rate and the survey results are close to each other for two faculty members.
- Course III: This course has the lowest success percentage of all course results (64%) but still, the highest survey results were achieved in this course too (94%). At the same time the survey results and success percentages are evaluated in parallel manner.
- Course IV: There were four groups in this course and the results of the survey (78%) and success percentage (76%) are close to each other. While the success percentage (80%) of group D4 is higher than the survey results (78%), other groups have higher survey results than success percentages.
- Course V: General survey results are higher than success percentages of the course. It is observed that the students didn't complete the survey due to the course grades that they achieved.
- Course VI: The course VI success results are the highest compared with the others (93%). Group B6 has the lowest survey results. It can be said that students didn't complete the surveys due to their lack of success on the course.
- Course VII: The survey results (82%) and success rates (87%) of the course are high and close to each other. The survey results are lower than the success rates so the survey results have been affected by the success rates.

As a result,

- Despite students participating in the survey voluntarily, the survey results are higher than the success percentages which means that the students moved away from objectivity while filling in the forms.

- While the results about faculty members are high, the results about the courses are average. It can be concluded that the courses couldn't help students properly because most of the answers are *undecided* or *agree*.
- Students give high scores to faculty members who they could communicate with directly.
- According to the survey there are no problems about course content and lecture capability of the faculty members. Students' expectations of faculty members led them to do research and practice how they will use the course information in real life.

#### 4.2. Recommendations

In constructivist education, it is important to form and reshape information. Teaching is just not enough. Students should contribute to education, not only participate in information transfer. The survey results show that students favour constructivist education. Students give higher survey results to the teacher who is concerned about their success even when their success is low. According to the results, all percentages are high but most of the students also rate favorably. Even though students completed these surveys voluntarily, the surveys should not be taken into account when these courses are organized in future.

#### Acknowledgement

Thanks go to the Department of Civil Engineering, Faculty of Civil Engineering, Yıldız Technical University for providing the survey results for this journal.

## Abstract

This study aims to evaluate the secondary school mathematics curriculum renewed in 2013-2014 education year in Turkey from the point of mathematical models and mathematical modeling. The old and new mathematics curriculum were compared for all class levels by researches and discussed the changes within the group. The report of researchers shows that the following is stated in the 2009 curriculum vision: "Mathematical concepts are abstract in nature. Given the developmental level of children, these concepts are hard to conceive directly. Hence, mathematical concepts are addressed using concrete and finite life models." Whereas in the general purposes section of the new curriculum, it's emphasized that information and communication technologies should be effectively used in mathematics education, such technologies should be implemented to create the environment for children to improve their skills such as problem solving by modeling, communicating, and reasoning. Moreover, the addition of improvement of problem solving skills by modeling into the program objectives shows that the new curriculum considers modeling important. Considered in general, the new curriculum is found to be simplified, subjects and gains are reduced, and course hours are increased. As it stands, this curriculum is more beneficial and flexible both for students and teachers.

Keywords: model, mathematics, mathematical modeling, education and training

---

## 1. INTRODUCTION

Mathematics is an important part of our daily lives just like it plays a great role in the scientific world, and it constitutes the basis for various fields such as physics, chemistry, astronomy and engineering. Therefore, in modern life, as science and science-related technology changes rapidly to the point of being re-shaped, the value of mathematics has become an unquestionable subject. In today's world, it will not be hard to say that the rapidly changing technology transforms the whole living style of society from culture to economy, and also influences learning habits. We discover many unknown events as we continue to make researches, and we move towards different horizons as we share our knowledge. So, educational institutions are also obliged to change their conditions in order to adapt to the ongoing knowledge revolution. The aim is to teach students knowledge, skills

and behaviors they may need throughout the rest of their lives. One of the most significant changes in mathematics education has been on curriculums.

Curriculums foster students' conceptual learning, fluency in operations and communication through their mathematical knowledge stressing the development of their problem solving skills and orienting them to value mathematics. Moreover, curriculums also consider it important that students generate mathematical meanings by means of concrete experiences, and perform abstraction and association. That's why it is a requirement to create learning environments enabling students to consider mathematics as "perceivable, functional, and a field worth the effort" and helping them to study "with diligence and perseverance". On the other hand, learning mathematics also covers mathematical thinking, apprehension of problem solving strategies, and recognition that mathematics is an important tool in real life along with acquiring basic concepts and skills. (Ministry of National Education, [MEB] 2013). Within this context, mathematical models and mathematical modeling play a significant role in creating such environments.

In mathematics courses, delivering a concept directly makes it hard for students to learn and internalize the concept (Van de Walle, 1998). Concepts should be taught to students with mathematical models instead. According to Blum and Niss (1989), mathematical model is a type of real model created by means of mathematics. Which means, mathematical model is an act of transforming real world events into mathematical objects or operations, and real objects are included in this process. According to a study by Lesh, Carmona, Hjalmarson and Mason (2006), models are conceptual and visual tools helping students, teachers, researchers and instructors to learn, explain and grasp subjects better in applications related to mathematical concepts (Lesh and Doerr, 2003; Lesh, Doerr, Carmona and Hjalmarson, 2003). According to Olkun and Ucar (2007), mathematical concept model is an image, a drawing, a symbol or a concrete tool containing the relation within the concept. Modeling is defined as the whole of actions to clarify a target by use of current sources, and resulting products are known as models (Harrison, 2001; Treagust, 2002).

Van Driel and Verloop (1999) have described the common characteristics of models as follows:

- A model is always related to the target or targets represented by itself. The target can be a system, an object, a phenomenon or a process.
- A model is a research tool used to obtain information about a target that is not directly observable or measurable. Hence, a different scale copy of an object (such as house, and bridge models) is not accepted as a scientific model.
- A model does not directly interact with the target it represents. Therefore, a photograph or a spectrum cannot be considered as a model.
- A model always shows distinct characteristics compared to the target. Generally, models are simplified as much as possible.
- While creating a model, similarities and differences between the target and the model should help researchers in making predictions about things represented by the model.
- A model is developed as a result of interactive processes.

Mathematical modeling is the process of dealing with daily life problems (Keskin, 2008). In general terms, problems related to every part of mathematics under daily life conditions can be called as daily life problems (Blum and Niss, 1989). According to Kapur (1998), mathematical modeling covers models that act as an interpreter to daily life problems, and turn mathematical problems to real life problems. Which means, expressing a situation with a mathematical form such as a formula, an equation, a graph, a table or a figure is called a mathematical model, and the process applied to develop this model and the process of interpreting the problem solution are known as mathematical modeling.

Models can help us in recognizing how an object is structured or how a process occurs. A model is not a real thing and it can change (Harrison, 2001). It can be used to facilitate greater understanding of the subject in the learning environment and to test concepts. Harrison (2001) emphasizes that use of models in learning environments facilitate envisioning complex abstract concepts, objects and processes, and make it easier to understand complicated abstract subjects with a deeper grasp. According to Yildiz (2006), models are not real and they don't reflect reality. However, they are guiding in development of ideas and transfer of knowledge to a higher step. It should be kept in mind that no model represent a target hundred percent accurately. Otherwise, the model becomes the target itself, and there would be no need for a model (Sagirli, 2010).

As stated by Blum and Kaiser (1997), different sub-skills are important for mathematical modeling studies. According to Maab (2004), modeling skills consist of the following:

- Ability to understand daily life problems and create models according with reality.
- Ability to create mathematical models out of real models.
- Ability to solve mathematical problems featured in the mathematical model.
- Ability to interpret mathematical results in line with daily life.
- Ability to confirm the solution.

Given the general objectives of education, mathematics plays a significant role in helping students to develop themselves under the light of their skills, acquire knowledge and skills in their fields, and contributes to their creative thinking (Ciltas 2012). Mathematics education aims to train individuals who could generate effective solutions to real problems, use mathematical effectively in their daily lives, recognize the close relation between mathematics and the real world, and therefore love and enjoy mathematics rather than being afraid of it (Doruk and Umay, 2011). In the secondary school mathematics curriculum developed and revised by the Ministry of National Education in 2013, the aim is to teach mathematical thinking system, and develop basic mathematical skills and abilities related to such skills. The program was reviewed and updated in order to realize this aim. This study aims to analyze the secondary school mathematics curriculum renewed in the 2013-2014 academic year in terms of mathematical models and mathematical modeling. Moreover, the old and the new mathematics curriculums are separately compared among different class levels by researchers and the changes are discussed within the group.

## **2. Method**

### *2.1. Research group*

The research group consists of three teachers and three academicians totaling six people.

### *2.2. Data collection*

Research data consists of reports written after reviewing the secondary school curriculum updated in the 2013-2014 academic year.

### *2.3. Data analysis*

Qualitative descriptive analysis method is employed to analyze the research data.

### 3. Findings

The updated secondary school mathematics curriculum is evaluated under two stages. First, the curriculum was subjected to a general assessment. Another assessment was performed to evaluate the curriculum on class-basis.

Upon performing a general assessment on the curriculum, the following findings are found as a result of the reports of researchers. The 2009 curriculum vision reads: "Mathematical concepts are abstract in nature. Given the development levels of children, it is hard for them to apprehend these concepts directly. Therefore, mathematical concepts are discussed using concrete and finite life models. In the general objectives of the new curriculum, there is an emphasis on effective use of information and communication technologies in mathematics education, it is stated that proper environment should be created to develop the problem solving, communicating, and reasoning skills of students through modeling. Moreover, addition of developing the problem solving skills by means of modeling to the program objectives shows that the new curriculum prizes modeling. 6 items are taken from the general objectives list in the new curriculum. The study-related "Can develop models, and associate models with verbal and mathematical expressions" item draws the attention. Besides, about the mathematical process skills, the new curriculum states: "Along with abstract symbolic expressions, verbal expressions, written and visual expressions and if necessary, models are important in mathematical communication." The old curriculum also states the following in relation to communication skills: "Verbal and written expressions, images, graphs and concrete models should be used throughout mathematical efforts and also following this process." The new curriculum addresses the association skill from among the mathematical process skills as follows: "Environment should be created to facilitate association between concrete and abstract representation modes (tables, graphs, equations, figures, concrete models, real life situations etc.). Virtually the same expression is uttered in the old curriculum.

Upon evaluation of the curriculum on class basis, the following findings are found as a result of the reports of researchers. It is stated that models should be used in arranging fractions, and converting mixed fractions to compound fractions and vice versa. The old curriculum also shows that such subjects are handled with models. Comparison of natural numbers and compound fractions, abbreviation, expansion, equivalent fractions, arranging fractions with equal or solid denominators, finding the proper fraction of a quantity are among the subjects taught using models in the old curriculum, but not expressed in the new curriculum. While the old curriculum suggests teaching the subject of fractional operations with models, the new curriculum doesn't separately state that models should be utilized. While the old curriculum taught the subject of fractional multiplication by means of modeling, the new curriculum omitted this from the fifth grade subjects. Decimal notation of fractions, a subject of fourth grade, is given as a subject of fifth grade, and it is recommended to teach the subject using models. In addition, both curriculums suggest teaching certain concepts such as finding the specified percentage of a quantity and decimal fractions using models.

It is also recommended to teach the distributive property of natural numbers, a subject of sixth grade, using models, and the old curriculum teaches the same subject with decimal base blocks. Moreover, while four operations with natural numbers is a subject suitable for modeling, and while the old curriculum uses tables for addition and multiplication with natural numbers and shows different models to students about the properties of these operations, the new curriculum doesn't involve anything about how this subject should be taught. On the other hand, while the old curriculum teaches multipliers, prime numbers and prime multipliers using models, the new curriculum makes no mention of this subject. Fractions and fractional operations are recommended to be taught using models in both the old and the new curriculum, yet decimal notations are handled with models in the old curriculum, but again, the new curriculum makes no mention of this subject.

Analysis of the updated secondary school mathematics curriculum on class basis yielded the following data: While the old curriculum taught multiplication and division of natural numbers by using number pieces, patterns, and numerical axis, the new curriculum suggests using models for the subject. The old curriculum teaches the

subject of rational numbers using fraction cards, while the new curriculum makes no mention of this subject. However, the subject of rational numbers, and particularly four operations in rational numbers is a subject suitable for the modeling method. Besides, the old curriculum uses polygon models for the subject of interior and exterior angles of polygons, while the new curriculum gives no data about this subject.

Lastly, analysis on eight grade shows that both the old and the new curriculums suggest using square models to define the relation between perfect squares, natural numbers and their roots. In multiplying algebraic expressions, and explaining identities, both curriculums suggest the use of models. But while the new curriculum doesn't mention it, the old curriculum uses models for factoring algebraic expressions. Slope models are suggested in both curriculum for the subject of slope of a line. Both curriculums suggest using models to explain equality-similarity, prism, pyramid and cone.

#### 4. Conslision and discussion

As a whole, the new curriculum is simplified, the number of subjects is reduced, and course hours are increased. The new curriculum is more practical and flexible for both students and teachers. Moreover, subjects are divided among grades with a certain order, while the old curriculum had some difficulties with this issue. For example, while the subject of prisms was taught in the fifth grade, the subject of angles was instructed in sixth grade. The curriculum has no big changes in terms of modeling. The new mathematics curriculum also suggests teaching certain subjects using models just like the old curriculum. Tough problem solving with mathematical modeling is situated among the objectives of the new curriculum, the subject was not elaborated while describing attainments. Generally, use of concrete models was referred, however modeling and modeling skills of students were not mentioned. It is particularly emphasized that students should develop their problem solving, communicating, and reasoning skills with the use of technologies. Therefore, only a minor difference can be found between two curriculums in terms of modeling.

While the old curriculum teaches fractional operations in fifth grade using models, the new curriculum does not particularly state the need for models. The old curriculum teaches multipliers, prime numbers and prime multipliers in sixth grade using models, but the new curriculum doesn't mention about it again. In seventh grade, multiplication and division of whole numbers is taught using number pieces, patterns and numerical axis. And the new curriculum also emphasizes employment of models. Lastly, in eighth grade, both curriculums suggest using models to multiply algebraic expressions, and explain identities. While the new curriculum denotes nothing about it, the old curriculum employs models to facilitate understanding of factoring algebraic expressions. In the old curriculum, Pythagorean relation is taught using right triangles, but there is no such method given in the new curriculum.

Today, scientists express everything with mathematical terms in order to get a better grasp of the world around us, and to find solutions to technical problems. Thus, it is important for mathematics education that math teachers use real life problems and perform mathematical modeling in their courses. It is necessary to develop the modeling skills of students, helping them to think creatively, performing cognitive activities, and adopting an effective and student-based approach to improve the mathematics-oriented conceptual understanding of students, and to present the relation between mathematics and real life situations. Formulating, analyzing and interpreting a daily life problem means solving the problem in half. It is possible to consider mathematical modeling as a complex mathematical activity, and mathematical thinking, teaching, learning and many aspects of life can be found in mathematical modeling.

The new mathematics curriculum also encourages effective use of information and communication technologies in mathematics education. A special emphasis is put on information and communication technologies that make it possible to find out different representation methods for concepts and relations between them, and also help students in discovering mathematical relations. Environments, where students can develop

their problem solving, communicating, and reasoning skills using the method of modeling, should be designed with the help of such technologies (MEB, 2013).

# Evaluation of the music workbook and teachers' guide books' of the 4<sup>th</sup> grade of the primary school from the perspective of the ability of creative thinking by the opinions of the classroom teacher candidates

Asist. Prof. Dr. Ayşen Arslan

*Department of Elementary Education, Atatürk Faculty of Education, Marmara University, Goztepe, 34722, Istanbul, Turkey*

## Abstract

Music is the one of the factors which helps the person to express himself. Research indicates that music has an important role in the developmental stages of the children. From the early childhood, the music education contributes to the increase of success in many different areas for children. That's why the music education books which serve this area are needed to be capable of serving to the goals of education.

The goal of this research is to analyze the 4th grade music workbook and teachers' guide books from the perspective of ability of creative thinking with the candidates of classroom teachers. The research shows the contribution of the interrelated usage of the music workbook and teachers' guide books and its importance for the future candidates of classroom teachers.

The research is conducted to 185 candidates of classroom teachers as part of the music education class and the results are evaluated based on the qualitative research procedure.

**Keywords:** Music education, music workbook, creative thinking.

## 1. INTRODUCTION

In 2012-2013 educational year a new educational system was accepted and the system was organized as 4+4+4. The school starting age of primary schools was lowered from 7 to 5 and half. That's why, there should be new arrangements which are appropriate for the developmental stages of the children in the system.

In today's world the fast changes and developments in the field education with the usage of interactive whiteboards, ability to access the new information quickly, fast renewal and consumption draws attention to the importance of learning. "Learning is an art, more than a science and it is a kind of development. In this development, slow but continuous changes take place starting with the beginning of the individual's life. Learning is a product, produced by connecting mental connections between various senses and reactions" (Telman, 1988).

The development of the children who starts the primary school education in such an early age with a heavy burden of lectures. Primary school's academic timetable and the implementation of these timetables should be prepared according to the developmental stage of the children. That's why, schoolbooks should be prepared with the aim of helping the children express themselves better and improving the ability of creative thinking.

The ability of creative thinking is constructed with the different interpretations of an existing ideas, products, projects, with achieving original ideas in different environments and with the thinking

and interpreting differently. “Creativity is a strategy developed by Gordon and his colleagues to find creative solutions to the problems in the industrial organizations” (Açıköz, 2002).

“Creativity is a way of thinking and it is closely related to the imagination. We can find creativity in most of the emotional and mental activities, work and occupations. Power of creativity is the basis of the all human life and development. In the last 50 years, creative thinking which has significant scientific research conducted, is a mental ability. When a person has this mental ability he is rewarded. When a person does not have this ability, special educational programs executed for this person to develop this mental ability” (Aslan, 2002). Developing this ability is quite important to prepare the individual to his life and give him the ability to think sophisticated.

Sometimes it is inevitable to go out of a frame of mind which is accepted as normal to be able to solve the problems in the life. When an individual stays in the boundaries of a given thinking pattern, he/she cannot perceive the problems correctly and cannot find solutions. To be able to thinking creatively, a person should avoid the limitations of his mind. An individual will be able to think comfortably, perceive the events better and evaluate the relationships better as he let his subconscious to rise to the surface (Özden,1997).

The musical education which is received from the beginning of the early childhood contributes to the increasing success of the child in different areas. The music lecture books which contribute to this area should be prepared accordingly to this aim. That’s why, the contents of the academic schedule and the lecture books which are the practice tools of the academic schedule should be prepared in way to develop the ability of creative thinking of the students with the help of the experts’ opinions.

There are the students’ workbook and teachers’ guide book to apply the music lecture. There is no textbook in the educational system. “Teachers’ guide book helps teachers to conduct a series of activities, shows how to conduct the activities and helps the teachers to guide to the students. It provides a good preparation. It helps the teacher for a more planned lesson” (Kılıç, Seven, 2002).

In this research process, the topics in 4<sup>th</sup> grade music workbook and teachers’ guide book are analyzed and implemented with different teaching methods.

## 2. CONTENTS OF MUSIC WORKBOOK AND TEACHERS’ GUIDE BOOK

The 4<sup>th</sup> grade music workbook is organized with twelve topics. Here is a list of the topic’s headings and numbers of guidance by teachers.

1. Sing the Independence March (the Turkish national anthem) right: Explanations about the topic and an activity.
2. Let’s show the sounds with graphic: An activity.
3. Let’s learn the basic musical writing and units: Four activities.
4. Sounds and their basic characteristics: Four activities.
5. Let’s create rhythms and tunes: An activity.
6. Different rhythmic compositions: Two activities.
7. Let’s dance: An activity.
8. Speed changes in music: Two activities.
9. Volume changes in music: An activity.
10. Special days and weeks: Three activities.
11. Different genres of music: Four activities.
12. Ataturk and music: Six activities (Yaşar, Çelik, Şendağ, 2012)

In addition, 4<sup>th</sup> grade teachers’ guide book of music contains the notes of 27 songs.

**Problem:** Are the activities in the 4<sup>th</sup> grade music books prepared in the manner that support the ability of creative thinking?

**Purpose:** The purpose of this research is to perform an analysis of the 4<sup>th</sup> grade music workbook and teachers guide book by the classroom teacher candidates who have the lecture of music teaching in the academic year of 2012-2013 from the perspective of the books' capability of improving creative thinking.

**Significance:**

- To improve the creativity of the children with music.
- To help the development of personality and self-confidence of the children with music.
- To draw the attention to the importance of the music workbook and teachers' guide book's impact on the development of the creative thinking.

**Premises:** In research, classroom teacher candidates are asked questions to show that music books' capability of creative thinking. Teacher candidates gave frank answers.

**Constraints:** The research is conducted on the classroom teacher candidates who have the music education class in 2012-2013 academic year.

### 3. METHOD

**Research Model:** This research is conducted with survey method. It is an analysis of qualitative data.

**Group of Participants:** Population of the research is consists of the students of Marmara University, Department of Classroom Teaching. Sample consists of 185 teacher candidates who study in the 4<sup>th</sup> term.

**Data Collection:** Data is collected by survey.

**Data Analysis:** Frequency and percentage analysis is performed.

### 4. RESULTS

		Certainly Agree	I agree	Partially Agree	I don't Agree	No idea
1. Let's get to know our book page is designed well for the usage of the book.	Frequency	21	102	44	8	10
	Percent	11.4	55	23.8	4.3	5.4
2. The notes in the workbook are organized orderly and systematically.	Frequency	26	115	30	4	10
	Percent	14.1	62.2	16.2	2.2	5.4
3. Activities in the workbook and teachers' guide book are good enough and organized well in order to sing the Independence March correctly.	Frequency	37	80	46	6	16
	Percent	20	43.2	24.9	3.2	8.6
4. "Let's show the sounds with graphic" topic contains appropriate activities for improving the ability of creative thinking.	Frequency	20	69	59	16	21
	Percent	10.8	37.3	31.9	8.6	4.4
5. "Let's learn the basic musical writing and units" topic contains appropriate activities for improving the ability of creative thinking.	Frequency	22	59	62	19	23
	Percent	11.9	31.9	33.5	10.3	12.4
6. "Sounds and their basic characteristics" topic contains	Frequency	27	81	49	16	12
	Percent	14.6	43.8	26.5	8.6	6.5

appropriate activities for improving the ability of creative thinking.						
7. "Let's create rhythms and tunes" topic contains appropriate activities for improving the ability of creative thinking.	Frequency	46	63	48	18	10
	Percent	24.9	34.1	25.9	9.7	5.4
8. "Different rhythmic compositions" topic contains appropriate activities for improving the ability of creative thinking.	Frequency	35	70	55	15	10
	Percent	18.9	37.8	29.7	8.1	5.4
9. "Let's dance" topic contains appropriate activities for improving the ability of creative thinking.	Frequency	27	69	59	11	19
	Percent	14.6	37.3	31.9	5.9	10.3
10. "Speed changes in music" topic contains appropriate activities for improving the ability of creative thinking.	Frequency	23	81	49	24	8
	Percent	12.4	43.8	26.5	13	4.3
11. "Volume changes in music" topic contains appropriate activities for improving the ability of creative thinking.	Frequency	34	61	56	22	12
	Percent	18.4	33	30.3	11.5	6.5
12. "Special days and weeks" topic contains appropriate activities for improving the ability of creative thinking.	Frequency	26	77	49	20	13
	Percent	14.1	41.6	26.5	10.8	7
13. "Different genres of music" topic contains appropriate activities for improving the ability of creative thinking.	Frequency	23	81	54	15	12
	Percent	12.4	43.8	29.2	8.1	6.5
14. "Ataturk and music" topic contains appropriate activities for improving the ability of creative thinking	Frequency	26	75	53	18	13
	Percent	14.1	40.5	28.6	9.7	7
15. Topics in the student workbook and teachers' guide book supports each other well enough.	Frequency	37	71	53	18	13
	Percent	20	38.4	25.4	5.4	10.8
16. Songs in the student's workbook are chosen with taking the children's age into account.	Frequency	52	75	33	15	10
	Percent	28.1	40.5	17.8	8.1	5.4
17. Topics in the student's workbook are organized well enough to help children to perceive, understand and practice music.	Frequency	36	74	57	12	6
	Percent	19.5	40	30.8	6.5	3.2
18. Student's workbook and teachers' guide book are organized in a way to let teachers use and practice them easily.	Frequency	34	84	44	9	14
	Percent	18.4	45.4	23.8	4.9	7.6

## 5. FINDINGS AND COMMENTS

Here is the answers given to the scale:

1. Let's get to know our book page is designed well for the usage of the book. 102 participants out of 185 answered as "I agree" to this statement.
2. The notes in the workbook are organized orderly and systematically. 26 participants answered as "Certainly agree", 115 participant answered as "I agree" and 10 participants answered as "no idea" to this statement.
3. Activities in the workbook and teachers' guide book are good enough and organized well in order to sing the Independence March correctly. 80 participants answered as "I agree", 46 participants answered as "partially agree", but 16 participants answered as "no idea".
4. "Let's show the sounds with graphic" topic contains appropriate activities for improving the ability of creative thinking. 69 participants answered as "I agree", 59 participants answered as "partially agree" to this statement.
5. "Let's learn the basic musical writing and units" topic contains appropriate activities for improving the ability of creative thinking. 59 participants answered as "I agree", 62 participants answered as "partially agree", 19 participants answered as "I don't agree" and 23 participants answered as "no idea" to this statement.
6. "Sounds and their basic characteristics" topic contains appropriate activities for improving the ability of creative thinking. 27 participants answered as "certainly agree", 81 participants answered as "I agree", 49 participants answered as "partially agree" and 16 participants answered as "I don't agree".
7. "Let's create rhythms and tunes" topic contains appropriate activities for improving the ability of creative thinking. 63 participants answered as "I agree", 18 participants answered as "I don't agree".
8. "Different rhythmic compositions" topic contains appropriate activites for improving the ability of creative thinking. 70 participants answered as "I agree", 55 participants answered as "partially agree" and 15 of the participants said that they do not agree.
9. "Let's dance" topic contains appropriate activities for improving the ability of creative thinking. 69 participants answered as I agree, 59 participants answered as "partially agree", 19 participants answered as "no idea" to this question.
10. "Speed changes in music" topic contains appropriate activities for improving the ability of creative thinking. 81 participants answered as "I agree", 23 participants answered as "certainly agree. In total, 32 participants answered as "I don't agree" or "no idea".
11. "Volume changes in music" topic contains appropriate activities for improving the ability of creative thinking. 34 participants answered as "certainly agree", 61 participants answered as "I agree", 56 participants answered as "partially agree", 22 participants answered as "I don't agree" and finally 12 participants answered as "no idea".
12. "Special days and weeks" topic contains appropriate activities for improving the ability of creative thinking. 77 participants answered as "I agree", 20 participants answered as "I don't agree".
13. "Different genres of music" topic contains appropriate activities for improving the ability of creative thinking. 81 participants agreed, 54 participants agreed partially and 15 participants said that they do not agree to this statement.
14. "Ataturk and music" topic contains appropriate activities for improving the ability of creative thinking. 75 participants answered as "I agree", 53 participants answered as "partially agree", 26 participants answered as "certainly agree". 18 participants said that they do not agree and 13 participants answered as "no idea".

15. Topics in the student workbook and teachers' guide book supports each other well enough. 37 participants answered as "certainly agree", 71 participants answered that "I agree", 47 participants answered as "partially agree". 10 of the participants answered the question as "I don't agree" or "no idea".
16. Songs in the student's workbook are chosen with taking the children's age into account. 32 participants answered that "certainly agree", 75 participants answered as "I agree", 33 participants answered as "partially agree", 15 participants answered as "I don't agree" and 10 participants answered as "no idea".
17. Topics in the student's workbook are organized well enough to help children to perceive, understand and practice music. 36 participants answered as "certainly agree", 74 participants answered as "I agree", 57 participants answered as "partially agree", 12 participants answered as "I don't agree" and 6 of the participants answered as "no idea".
18. Student's workbook and teachers' guide book are organized in a way to let teachers use and practice them easily. 34 participants answered as "certainly agree", 84 participants answered as "I agree", 44 participants answered as "partially agree", 9 participants answered as "I don't agree" and 14 participants answered as "no idea" (Yaşar, Çelik, Şendağ 2012).

In addition to the answers given to the survey, candidates of classroom teachers said that the number of activities in the guide book should be higher. They also claimed that the teachers who don't have a habit of practice the features structuralist education can have a hard time practice the activities in the music books.

When the answers given to the survey analyzed, teacher candidates answered closer to the idea that music books are well organized to develop the creative thinking. I think that, this is because of structuralist model is practiced in the academic program. In the process of teaching music teaching class, different music teaching methods were practiced independently from the guide book.

In research, teacher candidates mainly agreed certainly to the statements "songs in the student's workbook are chosen with taking the children's age into account" and "topics in the student's workbook are organized well enough to help children to perceive, understand and practice music". In 2012-2013 academic year, 4<sup>th</sup> grade primary school students are started to the school in age 7. However with the new system, the 4<sup>th</sup> grade students will be in age 9 in the future. That's why the songs and topics in the music books should be reviewed and they should be compatible to the student's age in the future.

## 6. CONCLUSION AND SUGGESTIONS

As a result to the research classroom teacher candidates mostly think that music workbook and teachers' guide book are improving the creative thinking. However, because the starting age to the school is changed, the music books should be reviewed and reorganized. The topics like teaching song teaching, rhythm studies and composing tunes should be supported with the usage of educational and creative plays. The songs which children will dance and can be performed with motions, also the songs with easy melodic structures should be included. Students can create activities with writing new lyrics to the melodies they know. With these activities educational lyrics could be written from interdisciplinary areas to help student to learn from both music and other areas.

Music lecture has a structure which helps students to express themselves better. Therefore, classroom teachers should not see this lecture as an area of talent, but they need to make music attractive as a area of pleasure with the activities.

## Abstract

In expert article we devote to evaluation of environmental consciousness and the impact of education Veľká Fatra National Park to young people aged 15 – 25 years in the region, where the National Park is located. Research was conducted by exploratory method through a scientific method of research, which was the questionnaire. The questionnaire was distributed to target groups (students of grammar schools and secondary schools in the cities of Martin and Žilina), in the Žilina self - governing region in which is situated the Veľká Fatra National Park. The results of the level of environmental consciousness and environmental education will be further used to project and implementation activities to consolidation and streamline of environmental education and consciousness of public in the region as well as proposals to improve environmental education and its focus on specific target groups in the Veľká Fatra National Park.

Keywords: environmental education, Veľká Fatra National Park, protected area, students, Slovak Republic

## 1. Introduction

Veľká Fatra National Park is one from four parks in Žilina self - governing region. In this expert article we will discuss the issue of the impact of Veľká Fatra National Park the environmental consciousness of the target group of students grammar and secondary schools in this region. Healthy ecosystem is essential for human well-being, and protected areas (especially national parks) play a central role in their long - term maintenance (Sabo, et al., 2011).

Protected areas in Slovakia are last localities where we can find the original nature. In Slovakia divided protected areas by local jurisdiction to: 9 national parks, 14 protected landscape areas and 1 094 small - scale protected areas, 1 protected landscape element, 172 protected areas, 388 nature reserves, 219 national nature reserves, 254 natural monuments, 60 national natural monuments. Total area of national parks represents 6,5 % from land of Slovakia (Act No. 543/2002; Klinda, Lieskovská, et al., 2010; Anděra, 2011).

Most protected area organizations have significant communication capacities, but normally these are targeted at protected area visitors, particularly students. Targeting them rather differently can be very effective in bringing about societal change more broadly. However, identifying the key targets can be challenging. Consciousness and education are key tools for shifting attitudes and behaviours of society as a whole in ways that can improve protected area management - or, more particularly, can eliminate bottlenecks to such improvement (Lockwood, Worboys, Kothari, 2006). Secondary level environmental education has extremely important position, which is related to the overall status of secondary schools in the educational system and is related to reached level of mental maturity of young people. In this developmental period giving out to the maturing of the intellect of this age group and markedly is expressing its differentiation. It is possible to allege that is improving ability to acquire a greater range of knowledges, recognizing the essential characteristics, principles and sense of events and actions, understand relationships and very often receive the feedbacks. Increases the level of aesthetic perception surroundings, and is stabilizing ethical opinions. (Fazekašová, Manko, et al., 2007). A specific of environmental education that is going on in a particular environment and is using the specific conditions of this environment accordly to protect him, and that through its values to influence to the public with the goal to raise their environmental consciousness. Environmental consciousness in this context is understood as an ability of individual's to realize the cases and problems of environment in the context of their own value orientation, personal experience, but also knowledge of the wider sequences, and is reflected in the willingness to voluntarily correct their behavior in favor of conservation biological diversity of nature and ecological stability of country. National parks as a territory seeking to preserve the original nature, take the information and educational function of natural values. The role of national parks and protected areas is to find a suitable method for the education of visitors and the local population, in acceptance of protected areas (Haas, Ondrová, Švajda, 2008). The school as an educational institution has in the field of education and formation of approach of the company specific situation. It works comprehensively and areal to the population of pupils, in primary and secondary education. Systematically affects the formation of a pupil's personality from the perspective of knowledge, skills, but also from the perspective of creating its attitudes and lifestyles. Through children and youth school can affect the general public, including parents and grandparents and contributes to raising the level of consciousness of the entire population (Švecová, Sásiková, 2008). In protected areas environmental education has to take into account not only the objectives of protected areas, but also global and environmental issues. Environmental education has effective employ natural heritage of protected areas for proximate contact with nature. Next task is to bring near to people the nature, as something aesthetically pleasing, what necessarily needs protection. Environmental education should be organized by the participants and target groups to what are methods and language adapted. To participants are presenting ways of introducing new attitudes into their daily lives and thus change the way

their proceeding (Haas, Ondrová, Švajda, 2008). The effective environmental consciousness of public to promote and appeal to her also several experts. (Demo et al., 2007, Švecová, 2008).

## 2. Methodology

We used in the article exploratory method which instrument was the questionnaire consists from 20 questions. The questionnaire was distributed to target groups of young people aged from 15 to 29 years (mostly deal with students of grammar and secondary schools) in region of Žilina self – governing region, where is the Veľká Fatra National Park situated. For production of questionnaire were used as an input data information gained through working out SWOT analyse in the field of management Veľká Fatra National Park. For defined weaknesses identified by SWOT analyse of Veľká Fatra National Park in the field of environmental education and consciousness was aimed questionnaire research. Research was realized at the sample of 269 respondents. Questionnaire was by its questions aimed at exploration evaluation of level of environmental consciousness of target groups. Within questionnaire research was also evaluated influence of Veľká Fatra National Park to target groups in the field of raising of environmental consciousness and education. Within questionnaire research we evaluated also attitude of respondents to the Veľká Fatra National Park and their perception of meaning of park for region of Žilina self – governing region. Based on the results gained from questionnaire research will be suggest steps, which will be aimed at minimizing or completely eliminating defined defections in the field of environmental education and consciousness of Veľká Fatra National Park. Steps will be aim also at reinforce of position of Veľká Fatra National Park as an institution and streamlining its advertising within region of Žilina self – governing region and outside this region.

## 3. Conclusions and discussion

In the part of conclusions a discussion we are describing analysis and synthesis gained knowledges from the questionnaire research. Absolute and relative multiplicity mention in Tables number 1. – 20. Purpose of the each item will be shortly characterized together with the most essential determinations.

Table 1. Evaluation of the first question in questionnaire

Sex	Summary	Percent
Women	205	76 %
Men	64	24 %
Total	269	100 %

The second question in the questionnaire was the question of identification type. The question aimed at the investigation of age structure of respondents. That age structure of respondents was relatively equal.

Table 2. Evaluation of the second question in questionnaire

Years	Women	Percent	Men	Percent
15 years	25	9,29 %	4	1,49 %
16 years	36	13,38 %	16	5,95 %
17 years	55	20,45 %	17	6,32 %
18 years	56	20,81 %	20	7,43 %
19 years	30	11,15 %	5	1,86 %
20 years	2	0,74 %	2	0,74 %
29 years	1	0,37 %		
Total	205	76,19 %	64	23,79 %

Question number three was aimed at the investigation place of home respondents (see Table number 3.).

Table 3. Evaluation of the third question in questionnaire

Sex	Women	Percent	Men	Percent
House	121	45 %	38	14 %
Flat	84	31 %	26	10 %
Total	205	76 %	64	24 %

In the question number 4 we asked respondents about the amount of national parks in Slovakia (Table number 4.). The correct possibility was possibility c. This possibility ringed (answered) 132 respondents of female sex and 43 respondents of male sex from all number 269 respondents. At this question answered correctly 65 % asked respondents basically what we can allege that common environmental consciousness is at very good level.

Table 4. Evaluation of the fourth question in questionnaire

Answers	Women	Percent	Men	Percent
Answer a	20	7,43 %	6	2,23 %
Answer b	30	12,26 %	10	3,72 %
Answer c	132	49,07 %	43	16 %
Answer d	1	0,37 %	2	0,74 %
Answer e	19	7,06 %	3	1,11 %
Total	205	76,19 %	64	23,8 %

We asked respondents within the question number 5. what symbolize logo of Veľká Fatra National Park (Table number 5). The correct answer was possibility b. This possibility presented 17 respondents of female sex and 7 of male sex what did together only fewer than 9 %. We conclude that logo of Veľká Fatra National Park isn't well known to public. That were examination respondents from the region where is national park situated we can allege that is necessary strengthen publicity of national park as an institution within region and also outside region. Increasing of consciousness about Veľká Fatra National Park is possible through strengthen environmental activities organized by Veľká Fatra National Park Administration aimed at target groups of young people and students of secondary schools also at different target groups.

Table 5. Evaluation of the fifth question in questionnaire

Answers	Women	Percent	Men	Percent
Answer a	76	28,25 %	20	7,43 %
Answer b	17	6,32 %	7	2,62 %
Answer c	25	9,26 %	10	3,72 %
Answer d	21	7,81 %	5	1,85 %
Answer e	66	24,53 %	22	8,18 %
Total	205	76,17 %	64	23,8 %

We asked respondents within the question number 6. what natural heritage is possible to see at territory of Veľká Fatra National Park (Table number 6.). Correctly identified natural heritage from the territory of Veľká Fatra National Park 141 respondents of female sex and 37 respondents of male sex what is together 66 % of respondents. This question was question of inspection type and its result confirm to us that common environmental consciousness is at very good level at watched respondents. Percentage evaluation of this question was very similar as in question number 4. which had similar orientated in character.

Table 6. Evaluation of the sixth question in questionnaire

Answers	Women	Percent	Men	Percent
Right answer	141	52,4 %	37	13,8 %
Incorrect answer	64	23,8 %	27	10 %
Total	205	76,2 %	64	23,8 %

We asked respondents within the question number 7. what form they gained present information about Velká Fatra National Park (Table number 7.). From the investigation result that the most respondents of female sex more than 33 % gained information about Velká Fatra National Park in the school and respondents of male sex fewer than 10 % gained information at home. The last the most frequented resources of information are in our investigation mentioned media what are TV and radio. Within increasing education and consciousness of target group should aimed Velká Fatra National Park Administration at her advertisement at the realization of talks, exhibitions and different activities intended for target groups and families, schools and also for outputs to media such as local journals and radios in the region.

Table 7. Evaluation of the seventh question in questionnaire

Answers	Women	Percent	Men	Percent
Answer a	45	16,73 %	26	9,67 %
Answer b	90	33,46 %	18	6,69 %
Answer c	37	13,75 %	6	2,23 %
Answer d	22	8,17 %	6	2,23 %
Answer e	11	4,09 %	8	2,97 %
Total	205	76,2 %	64	23,79 %

We asked respondents within the question number 8. what is possible to realize at the territory of Velká Fatra National Park (Table number 8.). The most often respondents present tourism, sport, walks and recreation. Argument in this question we verify in next question.

Table 8. Evaluation of the eighth question in questionnaire

Activities	Women	Percent	Men	Percent
Hiking	55	20,45 %	9	3,35 %
Sports	43	15,99 %	15	5,58 %
Winter sports	11	4,09 %	5	1,86 %
Cycling	6	2,23 %	3	1,12 %
Climbing			3	1,12 %
Spa			4	1,49 %
Culture heritage	2	0,74 %	2	0,74 %
Recreation	8	2,97 %	7	2,60 %
Walking	72	26,77 %	12	4,46 %
Crop of increases			2	0,74 %
Photography			1	0,37 %
Cleaning of nature	5	1,86 %	1	0,37 %
Natural heritage	3	1,12 %		
Total	205	76,22 %	64	23,8 %

We asked respondents within question number 9. what are they using the most often during the visit of Velká Fatra National Park (Table number 9.). From investigation result that the most often are respondents visiting national park in order to visit tourism trails, sport institutions and visits of cultural heritage at the territory of national park the same women and men. It is necessary to retrace existing educational trails and expand net of educational trails in Velká Fatra National Park. As well as we recommend improve conditions for realization of sport and recreation in park for all target groups in zones with lower level of protection where it is possible and it won't be at the expense of protection. Especially it is necessary to aim at propagation and improvement availability of cultural heritage existing at the territory of national park.

Table 9. Evaluation of the ninth question in questionnaire

Answers	Women	Percent	Men	Percent
Answer a	98	36,4 %	32	11,90 %
Answer b	37	13,75 %	13	4,83%
Answer c	8	2,97 %	1	0,37 %
Answer d	29	10,78 %	11	4,09 %
Answer e	33	12,27 %	7	2,60 %
Total	205	76,17 %	64	23,79 %

We asked respondents within question number 10. what activities are useful to realize in national park from the perspective of the protection of nature (Table number 10.). Respondents presented the most often possibility a - what was protection ecosystems of plants and animals. This possibility presented 68 % respondents of female sex and 21 % respondents of male sex. As the second the most important activity within protection respondents presented education and consciousness (possibility b) and the last area was scientific research (possibility c).

Table 10. Evaluation of the tenth question in questionnaire

Answers	Women	Percent	Men	Percent
Answer a	185	68,77 %	58	21,56 %
Answer b	2	0,74 %	4	1,49%
Answer c	10	3,72 %	1	0,37 %
Answer d	4	1,49 %		
Answer e	4	1,49 %	1	0,37 %
Total	205	76,21 %	64	23,79 %

We asked respondents in this question. what protection of plant and animal are there (Table number 11.). Between respondents are from animals the most frequented lynx and from the plants is *Leontopodium alpinum*.

Table 11. Evaluation of the eleventh question in questionnaire

Activities	Women	Percent	Men	Percent
Lynx	93	34,57 %	18	6,69 %
Bear	25	9,29 %	17	6,31 %
Eagle	2	0,74 %	1	0,37 %
<i>Rupicapra rupicapra</i>	46	17,10 %	6	2,23 %
Salamanders	13	4,83 %	3	1,11 %
<i>Leontopodium alpinum</i>	6	2,23 %	3	1,11 %
<i>Carlina acaulis</i>	1	0,37 %	1	0,37 %
<i>Gentiana sp.</i>	5	1,86 %	2	0,74 %
<i>Galanthus nivalis</i>	3	1,11 %		
<i>Crocus sp.</i>	3	1,11 %	1	0,37 %
Wolf	3	1,11 %	1	0,37 %
<i>Pulsatilla subslavica</i>	2	0,74 %		
<i>Cyclamen fatrense</i>	2	0,74 %	4	1,49 %
Marmot	1	0,37 %		
Beaver			1	0,37 %
<i>Lilium sp.</i>			1	0,37 %
<i>Tulipa sp.</i>			1	0,37 %
Wood - pecker			2	0,74 %
<i>Taxus baccata</i>			1	0,37 %
Viper			1	0,37 %
Total	205	76,17 %	64	23,75 %

We asked respondents within question number 12. (Table number 12.) whether are at the territory of Velká Fatra National Park localities where we can find species of organism of European significance (possibility a), species of national significance (possibility b) and endemic species (possibility e). Respondents the most frequented knew localities where we can find species of European significance up to 37 % of women and 15 % of men.

Table 12. Evaluation of the twelfth question in questionnaire

Answers	Women	Percent	Men	Percent
Answer a	101	37,5 %	41	15,2 %
Answer b	65	24,2 %	13	4,8 %
Answer c	8	2,9 %	2	0,7 %
Answer d	13	4,8 %	3	1,1 %
Answer e	18	6,7 %	5	1,9 %
Total	205	76,1 %	64	23,7 %

We asked respondents in question number 13. (Table number 13.) according as the deficit (loss) some of the mentioned species in the question number 12. will affect species biodiversity in Velká Fatra National Park. "Yes" (possibility a) present 26 % of women and 6 % of men. "I don't know" (possibility c) presented almost 38 % respondents of female sex and 17 % respondents of male sex. Based on results we can allege that target group don't realize sequences in the protection of the nature. It is necessary to aim and strengthen education realized by employees of Velká Fatra National Park Administration in this area.

Table 13. Evaluation of the thirteenth question in questionnaire

Answers	Women	Percent	Men	Percent
Answer a	70	26,02 %	15	5,57 %

Answer b	33	12,27 %	2	0,74 %
Answer c	102	37,92 %	47	17,48 %
Total	205	76,21 %	64	23,79 %

We asked respondents in question number 14. (Table number 14.) what activities aimed at protection of animals or plants are realizing employees of Velká Fatra National Park Administration. The most often respondents present monitoring of animals (possibility b). This possibility present almost 43 % of women and 14 % men. The second the most often present activity is operating of emergency station for injured animals (possibility c) and the last the most often presented activity was (possibility a) transfer of amphibians. Based on determined we can say this area is well known to public as a result that some of these activities were promoted in local but also in national media.

Table 14. Evaluation of the fourteenth question in questionnaire

Answers	Women	Percent	Men	Percent
Answer a	25	9,29 %	12	4,46 %
Answer b	115	42,75 %	37	13,75 %
Answer c	31	11,52 %	5	1,86 %
Answer d	16	5,95 %	4	1,49 %
Answer e	18	6,69 %	6	2,23 %
Total	205	76,2 %	64	23,79 %

We asked respondents in question number 15. (Table number 15.) if were they helpful engage in environmentally beneficial activities organized by Velká Fatra National Park Administration. The most respondents said "I don't know" (possibility c), 30 % of women and almost 10 % of men. "Yes" (possibility a) presented almost 26 % of women and almost 8 % of men, "No" (possibility b) presented almost 21 % of women and 7 % of men. Based on percentage evaluation of this question we suggest to strengthen motivation of visitors to participate to these activities by form of increased propagation of these yearly activities and also by presentation of the value these activities for all people in the region.

Table 15. Evaluation of the fifteenth question in questionnaire

Answers	Women	Percent	Men	Percent
Answer a	69	25,65 %	20	7,43 %
Answer b	56	20,82 %	19	7,06 %
Answer c	80	29,74 %	25	9,29 %
Total	205	76,21 %	64	23,78 %

We asked respondents in the question number 16. (Table number 16.) whether they agree with protection of Velká Fatra National Park. "Yes" (possibility a) presented more than 70 % female and almost 22 % male respondents. From presented result that watched target groups realize the importance of protected area.

Table 16. Evaluation of the sixteenth question in questionnaire

Answers	Women	Percent	Men	Percent
Answer a	190	70,63 %	58	21,56 %
Answer b	6	2,23 %	3	1,12 %
Answer c	9	3,35 %	3	1,12 %
Total	205	76,21 %	64	23,8 %

We asked respondents in the question number 17. (Table number 17.) whether cancel Velká Fatra National Park as an institution would damage to Velká Fatra National Park? More than 50 % respondents of female sex and almost 18 % respondents of male sex presented “Yes” (possibility a). More than 19 % respondents of female sex and more than 3 % respondents of male sex presented they don't know to say (possibility c). From presented result it is necessary to strengthen education in the field of importance of protection area and also outputs to the media. This influence public to incline to protection in this area and expressly report for this opinion.

Table 17. Evaluation of the seventeenth question in questionnaire

Answers	Women	Percent	Men	Percent
Answer a	138	51,30 %	48	17,84 %
Answer b	15	5,57 %	7	2,61 %
Answer c	52	19,33 %	9	3,34 %
Total	205	76,2 %	64	23,79 %

In the question number 18 (Table number 18.) express respondents their opinion that the Velká Fatra National Park is the most frequently polluted through pollutants and emissions from the air (possibility b). This opinion express 30 % of women and 8 % of men. Polluting through tourism present in possibility a – almost 24 % respondents of female sex and almost 5 % respondents of male sex. Polluting by wastage (possibility c) presents more than 20 % respondents of female sex and almost 8 % respondents of male sex. This question was formulated that we find if respondents realize threats of national park from the side of human. We can evaluate that knowledges in this area are at very good level.

Table 18. Evaluation of the eighteenth question in questionnaire

Answers	Women	Percent	Men	Percent
Answer a	64	23,79 %	12	4,46 %
Answer b	81	30,11 %	22	8,18 %
Answer c	56	20,82 %	21	7,8 %
Answer d	4	1,49 %	8	2,97 %
Answer e			1	0,37 %
Total	205	76,21 %	64	23,78 %

We asked respondents in the question number 19. (Table number 19.) whether will be changes in ecosystem of Velká Fatra National Park influence people in surrounding regions and in European region. More than 27 % women and almost 8 % men answered “Yes” (possibility a), almost 10 % women and almost 12 % men answered “No” (possibility b). The most respondents – almost 40 % women and almost 12 % men didn't know to express (possibility c). Based on percentage evaluation we can say that target group don't realize influence of Velká Fatra National Park to the surroundings regions also to whole European region. It is necessary to aim Velká Fatra National Park Administration to strengthen of this area of environmental consciousness and so by form of lectures and events where will be this issue presented.

Table 19. Evaluation of the nineteenth question in questionnaire

Answers	Women	Percent	Men	Percent
Answer a	73	27,14 %	21	7,8 %
Answer b	26	9,67 %	12	4,46 %
Answer c	106	39,40 %	31	11,53 %
Total	205	76,2 1%	64	23,79 %

We asked respondents in the question number 20. (Table number 20.) how they can contribute to sustainable development of Veľká Fatra National Park. The most often presented the same women and men way to sustainability: education, protection of environment, cycling and don't polluted environment.

Table 20. Evaluation of the twentieth question in questionnaire

Activities	Women	Percent	Men	Percent
Protection environment	53	19,7 %	53	19,7 %
Don't produce trash	1	0,37 %	1	0,37 %
Cyclotourism (cycling)	53	19,7 %	1	0,37 %
Consciousness	57	21,19 %	3	1,12 %
Don't pollute	38	14,13 %	5	1,86 %
Financial assistance	3	1,12 %	1	0,37 %
Total	205	76,21 %	64	23,79 %

By questionnaire research we discovered more strong but also weaknesses in the realized consciousness and education of Veľká Fatra National Park Administration applied to the target groups that focused our research. Strengths is necessary develop and defined weaknesses in environmental consciousness of target groups is necessary eliminate. One from the possible ways how to achieve this is to develop Concept of public relations of Veľká Fatra National Park, where will be defined all target groups and concrete areas of problems and limitations what is need to solve. There also will be present way of solution of these problems and also dates admission of defined aims.

## Abstract

PISA (Programme for International Student Assessment) is an international programme which is conducted every 3 years to assess 15 years old students level of proficiency. PISA contains three different cognitive tests: mathematic literacy, scientific literacy and reading literacy. Every year that PISA is conducted, the numbers of cognitive test items vary in each test. Therefore it is difficult to develop a standardized procedure for comparison. However, there are some identical items that can be used as a criteria for comparison. The aim of this research is to examine academic achievement of mathematic literacy common items in PISA 2003, PISA 2006 and PISA 2009 applications with respect to mathematical content area and item format. This research is a survey and quantitative study which is conducted by secondary data base. The population of this research is all of the 15 years old students who are attending to schools in 2003, 2006 and 2009 academic years. 15 years old students who participated in PISA 2003, PISA 2006 and PISA 2009 applications and solved the questions regarding mathematic literacy common items are the sample of the research. Relevant statistical analysis was conducted based on research and sub-research questions by using the secondary data base that was prepared by rearranging the national data base of PISA 2003, PISA 2006 and PISA 2009. The findings of the research study demonstrated that the students have poor performance in 'space and shape' that is one of the mathematical content area. They have better performance in 'multiple choice' items while have poor performance in 'open-constructed' items. In general, it was seen that Turkish students have better performance in PISA 2003 and poor performance in PISA 2006.

Keywords: PISA, mathematic literacy, student achievement, mathematical content area, item format.

## 1. INTRODUCTION

PISA is an international study repeated every three years. The study aims to evaluate education systems worldwide by testing the skills and knowledge of 15-year-old students. PISA is generally a survey exam. Survey exams are used to evaluate curriculum and instruction in all system (Baykul and Turgut, 2010). The participating countries' educational systems, curriculums, profiles of student, parents and teacher are revealed in PISA. Cognitive abilities in reading, science and mathematics literacy areas are assessed with cognitive tests in PISA. A cognitive domain is determined as the main theme in every implementation years. The main theme of PISA 2003 is mathematic literacy. In PISA 2003, 84 (%50,9) of total 165 cognitive test items measures mathematic literacy (OECD, 2003). The main theme of PISA 2006 is science literacy. In PISA 2006, 48 (%26,8) of total 179 cognitive test items measures mathematic literacy (OECD, 2006). The main theme of PISA 2009 is reading literacy. In PISA 2009, 35 (%15,9) of total 219 cognitive test items measures mathematic literacy (OECD, 2009).

E-mail address: mustafakose43@gmail.com

PISA/OECD (2003) defines mathematical literacy as “an individual’s capacity to identify, and understand, the role that mathematics plays in the world, to make well-founded judgments and to use and engage with mathematics in ways that meet the needs of that individual’s life as a constructive, concerned, and reflective citizen”. According to this definition, there is no single spot for an individual which he/she is mathematical literate anymore. PISA/OECD (2003) lays out items mathematical literacy with that steps:

- (I) Beginning with a problem situated in real world,
- (II) Organising it according to mathematical concepts,
- (III) Gradually trimming away the reality through processes such as making assumptions about which features of the problem are important, generalising and formulising,
- (IV) Solving the mathematic problems and,
- (V) Making sense of mathematical solution in terms of the real situation.

Mathematical content area is defined as overarching-ideas by PISA. Overarching-ideas is divided dimensions that pattern, dimension, quantity, uncertainty, shape, change, counting, reasoning and communication, motion and change, symmetry and regularity, and position (Steen 1990; Devlin, 1994). PISA uses dimension of space and shape, change and relationship, quantity and, uncertainty (EARGED, 2005). PISA uses five item format: multiple choice, complex multiple choice, open-constructed, closed-constructed and short response (OECD, 2009).

The main theme of PISA 2003 is mathematic literacy which has 84 mathematical literacy items. PISA 2006 has 48 mathematical literacy items which used all of them before in PISA 2003. PISA 2009 has 35 mathematical literacy items which used all of them before in PISA 2003 and PISA 2006. In this research, common mathematical literacy items are used which are all items in PISA 2009. Thus, its aims to identify the percentage of success cleaner and more exact of the 15 years old generation 2003, 2006 and, 2009. The research importance is at all these three study work with mathematical literacy items which are common. Where by it can be identified the percentage of success with the different questions unrelated. There is no research which is used the common items of mathematical literacy. According to purpose of the research these problems will be answered;

- (I) How is the percentage of success take into account the common items of mathematical literacy according to “mathematical content area” at PISA 2003, 2006 and, 2009?
- (II) How is the percentage of success take into account the common items of mathematical literacy according to “item format” at PISA 2003, 2006 and, 2009?

## **2. METHOD**

### *2.1. Research Design*

In this research, if the percentage of success identified by according to the answers of the questions of mathematical common items then the research is descriptive research. A research which is used the numerical data generally they are quantitative research (Buyukozturk et al., 2010). In this research, the success is identified by points in PISA studies thus the research is quantitative research. The secondary data base is made by as a

result of existing primary data bases in this research. As a result the research is a survey and quantitative study which is conducted by secondary data base.

## 2.2. Population and Sample

In this research, the aim is identified the success position of 15 years old generation in Turkey according to common items of mathematical literacy in PISA 2003, 2006, and, 2009. The population of the research is the students who are 15 years old at the year of 2003, 2006 and 2009. The method of the student selection is used stratified sampling in Turkey. In Turkey 4855 students who are from seven different geographical area and from 12 primary and 147 high schools, joined to PISA 2003 (EARGED, 2005). The students who are joint PISA 2006 are selected with two level selection methods. Initially schools are selected then students are selected from these schools. 4942 students from 160 schools are selected and sample is generated in PISA 2006. 4996 students from 170 schools are selected for the sampling of PISA 2009. 15 years old students who participated in PISA 2003, PISA 2006 and PISA 2009 applications and solved the questions regarding mathematic literacy common items are the sample of the research.

## 2.3. Data Collection

Generally, data collection instruments used in this research are PISA 2003, PISA 2006 and PISA 2009 cognitive tests.

Table 1. Distribution of Mathematical Literacy Common Items in PISA 2003, 2006 and 2009 According to Mathematical Content Area

Mathematical Content Area	Number of Items	%
Space and Shape	8	22,9
Change and Relationships	9	25,7
Quantity	11	31,4
Uncertainty	7	20,0
Total	35	100

When Table 1. is examined will see that; mathematical literacy common items are distributed well balanced according to mathematical content area.

Table 2. Distribution of Mathematical Literacy Common Items in PISA 2003, 2006 and 2009 According to Item Format

Item Format	Number of Items	%
Multiple Choice	9	25,7
Complex Multiple Choice	7	20,0
Open-Constructed	8	22,9
Closed-Constructed	3	8,6
Short Response	8	22,9
Total	35	100

When Table 1. is examined will see that; Mathematical literacy common items are distributed well balanced except closed-constructed items according to item format.

#### 2.4. Analyze of Data

The process to prepare the data:

- (I) Mathematic literacy items with same code and name (35 items) are identified with helping codebooks which were downloaded from PISA website ([www.pisa.oecd.org](http://www.pisa.oecd.org)) belonging to PISA 2003, PISA 2006 and, PISA 2009.
- (II) PISA 2003 data was downloaded from website was not scored so researchers turned it to scored data with help of PISA 2003 codebook. PISA 2006 and PISA 2009 data had scored data file (scored cognitive item response data file) so turning process is not necessary for these data.
- (III) "The re-grading items": mathematical literacy common items were given new points (Full credit: 2, partial credit:1, wrong and empty: 0 points).
- (IV) After the re-graded items, three secondary data base was acquired belonging to PISA 2003, 2006 and 2009.
- (V) These three secondary data base were split according to mathematical content area and item format (for mathematical content area: 4, item format: 5 new data base). In this step, 27 new data base were acquired (for PISA 2003: 9, PISA 2006: 9...).

The process to analyse data:

- (I) Frequencies of "Full credit", "partial credit", "wrong" and "empty" answers were taken for each item with SPSS.
- (II) Total points were calculated for each item. Formula;  

$$\text{Total point for each item} = \text{Count of Full credit} \times 2 + \text{Count of partial credit}.$$
- (III) "Total points for each item" were added each other to acquiring Item Characteristic (math. content area and item format) Total Points (ICTP) for the same characteristic item.

(IV) Count of total students who answered items were calculated for each item. Formula;

*Count of total students who answered items = count of students who answered full credit + count of students who answered partial credit + count of students who answered wrong + count of students who left empty.*

(V) Maximum points (MP, can be taken) were calculated. Formula;

*MP = Count of total students who answered items x 2.*

(VI) Success percentages were calculated. Formula;

*Success percentage = (ICTP/MP) x 100*

### 3. FINDINGS

#### 3.1. Success of Mathematical Literacy According to Mathematical Content Area

Table 3: Success of Mathematical Literacy According to Mathematical Content Area

	Mathematical Content Area	Dist. of Items		Distribution of Answers				Average Point	Success (%)
				Full Cr.	Partial C.	Wrong	Empty

		%	22,9	25,0	0,5	72,2	2,3		
Uncertainty	n	7	4006	0	6451	187	0,75	37,6	
	%	20,0	37,6	0,0	60,6	1,8			
Total	n	35	16690	293	35216	981	0,63	31,6	
	%	100	31,4	0,5	66,2	1,8			
PI SA	Change and Relationships	n	9	4290	310	9036	132	0,65	32,3

	%	25,7	31,1	2,2	65,6	0,9		
Quantity	n	11	6518	0	10115	220	0,77	38,7
	%	31,4	38,7	0,0	60,0	1,3		
Space and Space	n	8	3501	81	8483	177	0,58	28,9
	%	22,9	28,6	0,7	69,2	1,4		
Uncertainty	n	7	4184	0	6396	136	0,78	39,0
	%	20,0	39,0	0,0	59,7	1,3		
Total	n	35	18493	391	34030	665	0,70	35,0
	%	100	34,5	0,7	63,5	1,2		

According to Table 3, Mathematical literacy common items were classified according to mathematical content area in PISA 2003; ‘quantity’ (%44,3) has the highest percentage of success in Turkey. ‘Space and shape’ (%30,1) has the lowest percentage of success in Turkey. Mathematical literacy common items were classified according to mathematical content area in PISA 2006; ‘uncertainty’ (%37,6) has the highest percentage of success in Turkey. ‘Space and shape’ (%25,1) has the lowest percentage of success in Turkey. Mathematical literacy common items were classified according to mathematical content area in PISA 2009; ‘uncertainty’ (%39,0) has the highest percentage of success in Turkey. ‘Space and shape’ (%28,9) has the lowest percentage of success in Turkey. Turkish students who joint PISA 2003 are most successful in all mathematical content areas. Turkish students who joint PISA 2006 have worse performance in all mathematical content areas.

### 3.2. Success of Mathematical Literacy According to Item Format

Table 4: Success of Mathematical Literacy According to Item Format

	Item Format	Dist. of Items		Distribution of Answers				Average Point	Success (%)

		%	20,0	35,7	0,0	63,5	0,73	0,71	35,7
	Open-Constructed	n	8	2367	391	9339	141		
		%	22,9	19,3	3,2	76,3	1,2	0,42	20,9
	Closed-Constructed	n	3	1461	0	3026	91		
		%	8,6	31,9	0,0	66,1	2,0	0,64	31,9
	Short Response	n	8	3768	0	8301	177		
		%	22,9	30,8	0,0	67,8	1,4	0,61	30,8
	Total	n	35	18493	391	34030	665		
		%	100	34,5	0,7	63,5	1,2	0,70	35,0

According to Table 4, mathematical literacy common items were classified according to item format in PISA 2003, 'multiple choice' (%50,5) has the highest percentage of success in Turkey. "Open-constructed" (%26,3) has the lowest percentage of success in Turkey. Mathematical literacy common items were classified according to item format in PISA 2006, 'multiple choice' (%48,0) has the highest percentage of success in Turkey. "Open-constructed" (%16,6) has the lowest percentage of success in Turkey. Mathematical literacy common items were classified according to item format in PISA 2009, 'multiple choice' (%51,2) has the highest percentage of success in Turkey. "Open-constructed" (%20,9) has the lowest percentage of success in Turkey. Turkish students who joint PISA 2003 are the most successful in all mathematical content areas except "multiple choice" (the students who joint PISA 2009 is the most successful in this format). Turkish students who joint PISA 2006 have worse performance in all mathematical content areas.

Mathematical literacy items are examined without classified; PISA 2003 has the highest success percentage. PISA 2006 has the lowest success percentage.

#### 4. RESULTS AND RECOMMENDATIONS

Different countries recognize to their success about mathematics, science and, main language educations owing to PISA studies from the year of 2000 which are repeated every three years. Turkey is joint PISA studies since 2003. Turkey prepares national report about PISA and examines the success at international area. However this reports is not included comparing of PISA implementation years. The students who joint PISA 2003 mathematical literacy average point is 423. The students who joint PISA 2006 mathematical literacy average point is 424. The students who joint PISA 2009 mathematical literacy average point is 445. These points difference may not become the real success difference. They could be other reasons:

- (I) In PISA studies, counts of mathematical literacy items differentiate according to years. PISA 2003 has 84 items. PISA 2006 has 48 items. PISA 2009 has 35 items. The success could be changed by difference of counts of items.
- (II) In PISA studies, students points are calculated with help international average point. According to international area, a student average point is 500 (EARGED, 2005). Counts of countries and counts of students are increased from PISA 2003 to PISA 2009 thus items points are changed between studies.

These success differences are exterminated by using common items and giving unrelated points from each implementation years to each item.

At this research results are; students' correct answers of mathematical literacy common items are changed according to mathematical content area and implementation year in Turkey. The high level percentage of success is got in "uncertainty" content area in PISA 2006 and PISA 2009 while this situation changes in PISA 2003. The low level percentage of success is got in "space and shape" in all three implementation. At this research results are; students' correct answers of mathematical literacy common items are parallel according to item format and implementation year in Turkey. The high level percentage of success is got in "multiple choice" item format in all three implementation. This situation may base on that Turkish students recognize "multiple choice" item format from national student selection exams.

Turkish students show worse performance in "space and shape" content area. Space and shape is known as geometry in traditional content area. Geometry curriculum is may revised in Turkey according to this research results. Turkish students show worse performance in "open-constructed" item format. According to this, In

national student selection exams may have open-constructed items. Thus, Turkish students recognize this item format.

## Abstract

Every individual may come across some problems in his/her daily life. These encountered problems can be solved by taking correct decisions that lead to a solution and successfully implementing these decisions, thereby reaching a result. Scientific process is one of these methods. A number of skills are required in order to implement the scientific process in the best manner. These skills are the skills that are used by scientists during their studies, and they provide great benefits in terms of students knowing themselves and actualize their efficient learning. The aim of this study was to examine the 7<sup>th</sup> grade students' scientific process skills in terms of their demographic features. Data collection tool was used Scientific Process Skills Test. It is observed that female students are better than male students in observation, classification, measurement and model formation skills. It can be generally stated that the students, whose families have high level of education, will have more acquisitions in scientific process skills. There was no statistically significant difference between the 7<sup>th</sup> grade students' hobbies that they perform in their spare time, their selection of occupation, the programs that they watch on television and their scores on scientific process skills test.

Keywords: **Scientific Process Skills**, Demographic Features, Secondary School Students

## 1. INTRODUCTION

Every individual may come across some problems in his/her daily life. These encountered problems can be solved by taking correct decisions that lead to a solution and successfully implementing these decisions, thereby reaching a result. Some methods can be followed in order to fulfill the aim in this process. Scientific process is one of these methods. A number of skills are required in order to implement the scientific process in the best manner. These skills are the skills that are used by scientists during their studies, and they provide great benefits in terms of students knowing themselves and actualize their efficient learning.

Students can reach the information that they require on their own using their scientific process skills in today's world where it is not possible to transfer all information from teachers to students. In this regard, scientific process skills constitute a tool for students to learn the methods of reaching information and to understand scientific studies. On the other hand, they constitute an important objective that is aimed at students in science education (Saraçoğlu, Büyük and Tanık, 2012).

E-mail address: fulyabasaran@hotmail.com

Scientific process skills are defined as the skills that facilitate learning; acquire research ability; make students active in learning environments; develop their sense of responsibility in their learning; and increase retention (Akdeniz, 2005). Scientific process skills are the ways and methods that are used by scientists in reaching information and processing information (Temiz and Tan, 2003).

According to Harlen (1999, 2000) scientific process skills constitute the basis of being able to conduct scientific research. These abilities contain the abilities that can be used by every individual in every stage of life in order to become literate in science and increase quality of life and standards of living by perceiving the nature of science (Bozkurt and Olgun, 2005). These abilities were defined in a science and technology lesson plan as follows: "The skills of thinking that are used by scientists in generating information, contemplating problems and formalizing results" (MEB, 2005). They were defined by Çepni, Ayas, Johnson and Turgut (1996) as follows: "The basic skills that facilitate learning, make students active, help them to acquire responsible awareness in their learning, increase retention in learning, and acquire ways and methods of research". Helping students acquire these important skills will help them understand their own world and learn throughout their lives (Türkmen and Kandemir, 2011).

When the literature is examined (Afacan, 2008; Akdeniz, 2005; Batı and Kaptan, 2013; Yök-Dünya Bankası, 1997), it is observed that the scientific process skills are studied in 3 main sections.

- 1) **Basic Skills:** Observation, measurement, classification, recording the data and forming number and space relationships.
- 2) **Causal Skills:** Prediction, determining the variables, interpreting the data and inference.
- 3) **Experimental Skills:** Hypothesizing, using the data and forming a model, conducting an experiment, changing and controlling the variables and making a decision.

Student acquisitions are given in teacher guidebooks for Secondary Science and Technology courses of the Ministry of National Education in terms of the classification of scientific process skills (MEB, 2012). These skills are as follows:

**1. Observation:** They observe objects (items, entities) and situations using their sense organs or observation tools. They determine sensorial properties of an object such as shape, color, size and surface. They select appropriate tools for observation, and they use these tools skillfully.

**2. Comparison-Classification:** They determine qualitative and quantitative properties that will be used in classifying the objects. They detect evident similarities and differences between objects or situations. They perform comparisons according to one or more properties on the basis of observations. They perform classifications in the form of groups and sub-groups according to similarities and differences.

**3. Inference:** They make statements about the reasons for situations that have occurred on the basis of observations.

**4. Guessing:** They suggest ideas about potential results for the future on the basis of observations, inferences or experiments.

**5. Prediction:** They suggest ideas about approximate values by stating the appropriate units for quantities such as mass, length, time, temperature and quantity for situations and objects.

**6. Determining the Variables:** They determine one or several most evident variables in a given situation or relationship. They determine the dependent variable in a given situation. They determine the independent variable in a given situation. They determine the controlled variables in a given situation.

**7. Hypothesizing:** They state the effect of the independent variable on the dependent variable in a given situation in the form of a testable hypothesis.

**8. Designing an Experiment:** They suggest an experiment to test the hypothesis that they formed.

**9. Recognizing and Using Experiment Materials and Tools:** They select the required materials and tools in simple researches, and they use them safely and effectively.

**10. Establishing an Experiment Mechanism:** They establish a mechanism for conducting the experiment that they designed to test the hypothesis that they formed using the given materials.

**11. Controlling and Changing the Variables:** They fix the variables other than the ones about the hypothesis. They determine the effect of the independent variable on the dependent variable by changing the independent variable.

**12. Functional Definition:** They conclusively define the variables appropriate to the aim of the research (hypothesis) along with the measurement criterion in cases where the variables may have more than one meaning and boundaries of which have not been fully drawn.

**13. Measurement:** They recognize measuring tools such as ruler, thermometer, scale and timer. They determine the magnitudes using appropriate measuring tools. They express magnitudes with their units.

**14. Information and Data Collection:** They collect information by utilizing different sources (conducting observations and experiments in the surrounding area and classroom, using photographs, books, maps or information and communication technologies). They collect qualitative or quantitative data to test the hypothesis that they have formed.

**15. Recording the Data:** They record the data, which has been obtained with observation and measurement and which is appropriate to the aim of the research, via various methods such as written statements, figures, tables or drawings.

**16. Data Processing and Model Formation:** They show the data obtained from the experiments and observations in different forms such as observation frequency distribution, bar chart, table and physical models by compiling and processing this data. They implement the rules about drawing graphs.

**17. Interpretation and Deduction:** They interpret the processed data and the formed model. They reach patterns and relationships from the obtained findings.

**18. Presentation:** They present and share their observations, researches and the results that they have obtained in appropriate forms using verbal, written and/or visual materials.

## 2. Method

The aim of this study was to examine the 7<sup>th</sup> grade students' scientific process skills in terms of their demographic features (gender, mother's educational status, father's educational status, number of siblings, hobbies performed in spare time, programs watched on television, frequency of reading books and selecting a future occupation).

### 2.1. Research Problem

Is there a relationship among the 7<sup>th</sup> grade students' scientific process skills in terms of their demographic features (gender, mother's educational status, father's educational status, number of siblings, hobbies performed in spare time, programs watched on television, frequency of reading books and selecting a future occupation)?

### 2.2. Population and Sample

The universe of this study is composed of the 7<sup>th</sup> grade students who are studying in the secondary schools located in Erzurum province. The sample of the study is composed of the 7<sup>th</sup> grade students who are studying in two secondary schools located in Erzurum province.

### 2.3. Data Collection Tool

"Scientific Process Skills Test", the original of which was developed by Kathleen A. Smith and Paul W. Welliver and the Turkish translation of which was provided by Başdağ (2006), was used in this study. This test measures a total of 13 scientific process skills, namely observation, classification, inference, guessing, prediction, measurement, recording the data, forming number-space relationship, functional definition, hypothesizing, conducting an experiment, determining the variables, interpreting the data, and model formation. The test is composed of 40 questions. The reliability of the test was determined as 0.81 by Başbağ.

## 3. Findings and Interpretation

When Table 1 was examined, it was observed that there was a statistically significant difference between the genders of the 7<sup>th</sup> grade students and the scores that they achieved on the SPST in favor of female students ( $t=2,205$ ;  $p<0,05$ ). It was observed that the average score of female students was 30.46 in the SPST whereas the average score of male students was 27.87.

Table 1. Independent t-test results of the 7<sup>th</sup> grade students' scores on the SPST in terms of gender

Gender	N	X	S	t	p
Female	65	30,46	6,36	2,205	0,029
Male	67	27,87	7,13		

When Table 2 was examined, it was observed that there was a statistically significant difference between the genders of the 7<sup>th</sup> grade students and their scores on observation, classification, measurement and model formation skills ( $p<0,05$ ). It was observed that the score averages of female students were higher than the score averages of male students. It was observed that female students were better at observation, classification, measurement and model formation skills than male students.

Table 2. Independent t-test results of the 7<sup>th</sup> grade students' scores on the scientific process skills in terms of gender

Skills	Gender	N	X	S	T	p
Observation	Female	65	1,68	0,56	2,789	0,006
	Male	67	1,33	0,84		
Classification	Female	65	2,12	1,21	2,041	0,043
	Male	67	1,70	1,17		
Measurement	Female	65	4,89	1,29	2,346	0,020
	Male	67	4,39	1,18		
Model Formation	Female	65	0,78	0,41	2,719	0,007
	Male	67	0,57	0,50		

When Table 3 was examined, it was observed that there was a statistically significant difference between the educational status of the mothers of the 7<sup>th</sup> grade students and the scores that they achieved on the SPST ( $F_{4,131}=3,504$ ;  $p<0,05$ ).

Table 3. One-Way ANOVA results of the 7<sup>th</sup> grade students' scores on the SPST in terms of the educational status of their mothers

Source	Sum of Squares	df	Mean Squares	F	p

Within Groups	5555,125	127	43,741		
Total	6168,265	131			

When Table 4 was examined, it was observed that there was a statistically significant difference between the educational status of the mothers of the 7<sup>th</sup> grade students and their scores on measurement, hypothesizing and data interpretation skills ( $p<0,05$ ). It was observed that the score averages of the students whose mothers were graduates of elementary school, secondary school, high school and university ranged from 4.84 to 4.64 in measurement skills whereas the score averages of the students whose mothers were only literate was 3.68. It was

observed that the score averages of the students whose mothers were graduates of elementary school, secondary school, high school and university ranged from 1.45 to 1.32 in hypothesizing skills whereas the score averages of the students whose mothers were only literate was 0.84. It was observed that the score averages of the students whose mothers were graduates of elementary school, secondary school, high school and university ranged from 4.33 to 3.47 in data interpretation skills whereas the score averages of the students whose mothers were only literate ranged from 2.78 to 2.32.

Table 4. One-Way ANOVA results of the 7<sup>th</sup> grade students' scores on the scientific process skills in terms of the educational status of their mothers

When Table 6 was examined, it was observed that there was a statistically significant difference between the educational status of the fathers of the 7<sup>th</sup> grade students and their scores on guessing, measurement and variable determination skills ( $p < 0,05$ ). It was observed that the score averages of the students whose fathers were graduates of elementary school, secondary school, high school and university ranged from 5.06 to 4.19 in measurement skills whereas the score averages of the students, whose fathers were only literate was 3. It was observed that the score averages of the students whose fathers were graduates of elementary school, secondary school, high school and university ranged from 2.52 to 2.5 in variable determination skills whereas the score averages of the students whose fathers were only literate was 0.5. It was observed that the score averages of the students whose fathers were graduates of elementary school, secondary school, high school and university ranged from 4.44 to 4.11 in guessing skills whereas the score averages of the students whose fathers were only literate was 2.

\*Students marked more than one option.

#### 4. Results

When we look at the genders of the 7<sup>th</sup> grade students and the scores that they achieved on the scientific process skill test, it is observed that female students are better than male students in observation, classification, measurement and model formation skills. The effect of the educational status of their mothers on their measurement, hypothesizing and data interpretation skills are clearly observed. It is observed that the students, whose mothers were only literate, generally achieved lower scores on these skills. The effect of the educational status of their fathers on their measurement, guessing and variable determination skills are clearly observed. It is observed that the students whose fathers were only literate generally achieved lower scores on these skills. It is observed that the educational status of the families of the students is very important for the education of these students. It can be generally stated that the students, whose families have high level of education, will have more acquisitions in scientific process skills. It is observed that the scores of the students generally decrease in measurement, variable determination and guessing skills when the number of siblings increases. A general decrease was observed in the scores of the students who have four or more siblings. It is known that a general decrease occurs in family's paying attention to the condition of the student at school when those families have a high number of siblings. This condition can cause a failure for students in fully overcoming their insufficiencies. It was observed that there was no relationship between students' frequency of reading books and their scientific

process skills. However, it is considered that the students did not sincerely answered the question, “How often do you read books?”. It was observed in the researches conducted in the literature that the students who have a habit of reading books will be better at scientific process skills (Aydođdu, 2006). There was no statistically significant difference between the 7<sup>th</sup> grade students’ hobbies that they perform in their spare time, their selection of occupation, the programs that they watch on television and their scores on scientific process skill test.

# Examining secondary school students' perceptions of computer self-efficacy in terms of gender and class level variables

Tamer Kutluca<sup>\*a</sup>, Burçin Gökçurt<sup>b</sup><sup>a</sup>*Ziya Gokalp Faculty of Education, Dicle University, Diyarbakır, 21000, Turkey*<sup>b</sup>*Kazım Karabekir Faculty of Education, Atatürk University, Erzurum, 25240, Turkey*

---

## Abstract

The aim of this study is to examine the computer self-efficacy perceptions of secondary students and examining of gender and grade. The study was designed with survey model and conducted with 302 students enrolled in secondary education. The data were collected via the "Self-Efficacy Perception Scale in relation to Computer" developed by Işıksal and Aşkar (2003). The data were analysed through standard deviation and mean value as well as independent t-test and One Way ANOVA for group comparison, besides to find which group causes the difference in the group comparison, a Post Hoc test was employed. At the results of study was found that secondary primary students' have high level self-efficacy perceptions related to computers. Additionally it was obtained that the self-efficacy perceptions about computer do not differ according to gender. Conversely it was found that there was a significant difference for grade.

*Keywords: Computer Self-Efficacy, Student, Gender, Grade*

---

## 1. Introduction

Self-efficacy is one of the important variables of social learning theory. According to Bandura (1995), self-efficacy is the belief in one's capabilities to organize and successfully perform the activities required to show one's performance. In other words, self-efficacy belief is the individuals' belief of "I can do it" or "I can not do it" while performing a certain activity (Siegle, 2003). Students' self-efficacy beliefs, which affect their motivation and performance, need to be high (Cantürk-Günhan & Başer, 2007). That is because the individuals having high self-efficacy perception exert great effort to succeed in something, and when they come across adversities, they act insistently and patiently in order to overcome those adversities (Aşkar & Umay, 2001). When the related literature is examined, it is observed that self-efficacy, which is a concept that was developed in the field of social psychology, has been implemented in many fields and how it changes in terms of different variables has been researched (Aksu, 2008; Alabay, 2006; Duatepe-Paksu, 2008; Ekici, 2008; Üstüner, Demirtaş, Cömert, & Özer, 2009; Hacıömeroğlu & Taşkın, 2010; Seferoğlu & Akbıyık, 2005; Usluel & Seferoğlu, 2003). For instance, Compeau and Higgins (1995) set forth the perception of computer self-efficacy by implementing the self-efficacy concept into field of computers, and they defined it as the "judgment regarding the individual's skill of using computers". In addition, many studies focused on the relationship between self-efficacy with respect to using computers and a variety of computer behaviors (Hill, Smith, & Mann, 1987; Webster & Martocchio, 1992; 1993).

\* tkutluca@hotmail.com

<sup>b</sup> burcingokkurt@hotmail.com

The studies conducted on computer self-efficacy perception show that the individuals with high computer self-efficacy are more willing to participate in computer related activities (Usluel & Seferoğlu, 2003). Furthermore, the individuals having high perception of computer self-efficacy resist to technological developments less and adapt to technological developments more quickly than the individuals having low perception of computer self-efficacy. An important aspect of computer self-efficacy is that it affects individuals' interests, their use of computers and their interaction with computers (Gürcan, 2005). Educational institutions, which take the responsibility of raising individuals that fit the human profile required by the society, are expected to raise individuals that can reach information, use technology and learn on their own (Akkoyunlu & Kurbanoglu, 2003). It is aimed to make education widespread and increase its quality in our country as the period of study was changed into 4+4+4. For that purpose, information technology classrooms were established in at least two schools in every province and district (Milli Eğitim bakanlığı [MEB], 2008). It is stated that eleven millions of these students are computer and internet users. To raise individuals with this quality lays serious responsibilities on the educational institutions. Therefore, it has become necessary for the educational institutions to arrange the learning environments of the students in accordance with existing conditions. In this regard, to determine secondary school students' computer self-efficacy holds importance since it contributes in determining whether or not the educational institutions succeed in fulfilling the responsibility that they took.

When the studies conducted on computer self-efficacy were examined, it was observed that the majority of these studies focused on prospective teachers (Akkoyunlu & Kurbanoglu, 2003; Aşkar & Umay, 2001; Gürcan, 2005; Özden, Aktay, Yılmaz, & Özdemir, 2007), and then, the studies on teachers were conducted (Akkoyunlu & Kurbanoglu, 2004; Seferoğlu & Akbıyık, 2005). However, not many studies on students were encountered (Ekici & Uzun, 2008; Işıksal & Aşkar, 2003). Thus, to determine secondary school students' computer self-efficacy will be significant for taking the necessary precautions for the students of lower educational levels before they enroll higher education institutions.

### *1.1. Purpose*

The aim of this study is to determine 5<sup>th</sup>, 6<sup>th</sup>, 7<sup>th</sup>, and 8<sup>th</sup> grade students' perceptions of computer self-efficacy and to examine these perceptions in terms of gender and class level variables.

## **2. Method**

### *2.1 Research Model*

This research was conducted using the survey model. Survey model is to try to describe a previous or existing situation the way that it is or it was (Karasar, 2011). Thus, it was considered appropriate to use the survey model in determining secondary school students' perceptions of computer self-efficacy in terms of gender and class level variables.

### *2.2 Sample*

The study sample consists of 302 students who study in a secondary school located in a province of South Eastern Anatolia Region in the 2012-2013 academic years.

## **3. Data Collection Tool**

### *3.1 Computer Self-Efficacy Scale*

Computer Self-Efficacy Scale, which was developed by Işıksal and Aşkar (2003), was used in the study in order to determine secondary school students' perceptions of computer self-efficacy. The scale is of 5-point

Likert type and contains 10 items. The scale is composed of two dimensions, namely as general information on computers and special computer skills. Cronbach's alpha value was calculated as 0.86 for the overall scale. Cronbach's alpha reliability coefficient, which was calculated for the reliability of measurements, was found as 0.86 in this study.

#### 4. Data Analysis

The items in the computer self-efficacy scale were graded from 5 to 1 ranging from "Completely Agree" category to "Completely Disagree" category. The lowest possible score is 10 and the highest possible score is 50 in the scale. If the score obtained in the perception scale ranges from 10 to 18, it corresponds to "Completely Disagree" category; it corresponds to "Disagree" category if the score ranges from 19 to 26; it corresponds to "Undecided" category if the score ranges from 27 to 33; it corresponds to "Agree" category if the score ranges from 34 to 42; and it corresponds to "Completely Agree" category if the score ranges from 43 to 50. SPSS 16.0 program was used in analysing the obtained data. Arithmetic mean and standard deviations were calculated in terms of variables and they were analysed using t-test, one-way analysis of variance and LSD test.

#### 5. Findings

The data obtained in the study, which was conducted in order to examine the level of secondary school students' perceptions of computer self-efficacy and whether or not there was a difference among their perceptions of computer self-efficacy in terms of gender and class variables, was presented as tables. The equality of variances belonging to the designated groups were tested with Levene's test, and it was presented that the variances were homogeneous.

**Table 1**

	<b>N</b>	<b>Min</b>	<b>Max</b>	<b>Mean</b>	<b>sd</b>
<i>Perception Scores on Computer Self-Efficacy</i>	302	11	50	39.77	6.77

*Distribution of Secondary School Students' Perception Scores on Computer Self-Efficacy*

As seen in Table 1, students' average perception score on computer self-efficacy is 39.77. Standard deviation is 6.77. The highest perception score is 50 whereas the lowest perception score is 11. Students' perception of computer self-efficacy is at a "good" level ( $\bar{x}=39.77$ ). In view of these values, secondary school students' perceptions of computer self-efficacy correspond to "Agree" category. This finding shows that the secondary school students' perceptions of computer self-efficacy are positive and they are self-confident. Independent t-test was conducted on the scores obtained from the scale in order to determine whether or not secondary school students' average perception scores on computer self-efficacy differed in terms of gender. The results were given in Table 2.

Variable	Gender	N	$\bar{X}$	sd	df	t	p
<i>Perception Scores on Computer Self-Efficacy</i>	Female	142	39.54	7.09	300	1.27	.563
	Male	160	39.99	6.48			

**Table 2**

*Independent t-Test Results of Students' Perception Scores on Computer Self-Efficacy in Terms of Gender*

As seen in Table 2, average perception scores of female students and male students on computer self-efficacy are 39.54 and 39.99 respectively. In the conducted t-test, it was observed that the perception scores of male students on computer self-efficacy were a little higher than those of female students. However, no significant difference was found between scores of female students and male students on computer self-efficacy [ $t_{(300)}=1.27, p>.05$ ].

This finding shows that secondary school students' perceptions of computer self-efficacy did not change in terms of gender. The data obtained from secondary school students' computer self-efficacy scale was analysed in terms of their class levels. The results were given in Table 3.

**Table 3**

*Distribution of Students' Perception Scores on Computer Self-Efficacy in Terms of Their Class Levels*

Variable	Grades	N	$\bar{X}$	sd	Std. error of Mean	Min.	Max.
<i>Perception Scores on Computer Self-Efficacy</i>	5 <sup>th</sup> grade	97	39.09	6.81	.692	14	50
	6 <sup>th</sup> grade	77	38.58	7.55	.861	11	50
	7 <sup>th</sup> grade	67	41.88	6.14	.750	26	50
	8 <sup>th</sup> grade	61	40.05	5.88	.753	27	50
	Total	302	40.98	6.44	.465	17	50

Levene Test  $F= .672, sd= 298, p=.570$

Whether or not the average differences among students' perception scores on computer self-efficacy were significant were analysed with One-Way analysis of variance. The results are given in Table 4. It was observed that there was a significant difference among computer self-efficacy perception scores of the groups that were formed in accordance with class levels ( $F_{(3-298)}=3.391, p<.01$ ).

INTE 2013

**Table 4**

*ANOVA Results Regarding the Significance of the Difference Among Students' Perception Scores on Computer Self-Efficacy in Terms of Class Levels*

	Average	Sum of Squares	df	Mean Square	F	Sig.
The average of Perception Scores on Computer Self-Efficacy	Between Groups	455.925	3	151.975	3.391*	.018
	Within Groups	1335.763	298	44.815		
	Total	1381.689	301			

\*  $p < .01$

LSD test was conducted in order to find the source of this difference. According to LSD test, it was observed that there is a significant difference in favor of 7<sup>th</sup> grade students in their average perception scores on computer self-efficacy when compared to 5<sup>th</sup> and 6<sup>th</sup> grade students. However, no significant difference was observed between 8<sup>th</sup> grade students and 5<sup>th</sup>, 6<sup>th</sup> and 7<sup>th</sup> grade students (Table 5).

**Table.5**

*Tukey HSD Results Regarding the Significance of the Difference Among Students' Perception Scores on Computer Self-Efficacy in Terms of Class Levels*

Grade I	Grade J	Mean Difference (I-J)	Std. Error	Sig.
5 <sup>th</sup> grade	6 <sup>th</sup> grade	.508	1.022	.619
	7 <sup>th</sup> grade	-2.788*	1.063	.009
	8 <sup>th</sup> grade	-.956	1.094	.383
6 <sup>th</sup> grade	5 <sup>th</sup> grade	-.508	1.022	.619
	7 <sup>th</sup> grade	-3.296*	1.118	.003
	8 <sup>th</sup> grade	-1.465	1.147	.203
7 <sup>th</sup> grade	5 <sup>th</sup> grade	2.788*	1.063	.009
	6 <sup>th</sup> grade	3.296*	1,118	.003
	8 <sup>th</sup> grade	1.831	1.185	.123
8 <sup>th</sup> grade	5 <sup>th</sup> grade	.956	1.094	.383
	6 <sup>th</sup> grade	1.465	1.147	.203
	7 <sup>th</sup> grade	-1.831	1.185	.123

\* The mean difference is significant at the 0.05 level.

## 6. Conclusion and Discussion

In this study, it was determined that secondary school students' perceptions of computer self-efficacy were at a "good" level. This condition signifies that the students consider themselves adequate in terms of computers. It can be stated the fact that the Ministry of National Education established computer laboratories in schools was effective in the emergence of this result. However, in their study, Ekici and Uzun (2008) argue that the students' perception scores on computer self-efficacy are at a "medium" level and that they do not have self-efficacy in using computers. The results obtained in the study do not show parallelism with the result of the study of Ekici and Uzun. In view of the study, it was observed that the perception scores of male students on computer self-efficacy were a little higher than those of female students. However, no significant difference was found between students' perception scores on computer self-efficacy and their genders. This result of the study shows parallelism with the results obtained by (Özden et al., 2007; Seferoğlu, 2005; Torkzadeh, Pflughoeft, & Hall, 1999) in their studies. Apart from this, in some researches, it was found that there was a significant difference in favor of male students among computer self-efficacy of female students and male students (Ekici & Uzun, 2008; Işıksal & Aşkar, 2003; Miura, 1987). In his meta-analysis study, Whitley (1997) examined 82 studies. In his study, he states that male students are more adequate than female students in computer technologies. The results of that study contradict with the result of this study. This condition can be explained as the fact that gender is not an effective factor on perceptions of computer self-efficacy. Another results obtained from the study is that there is a significant difference among secondary school students' perception scores on computer self-efficacy in terms of their class levels. This result coincides with the result obtained from the study of Ekici and Uzun (2008). Similarly, Torkzadeh, Pflughoeft, and Hall (1999) stated that students' beliefs of computer self-efficacy increase during their education. Therefore, contribution must be made for the improvement of low-level students' computer self-efficacy by organizing computer activities also in other disciplines of elementary programs apart from computer courses in computer laboratories.

## Experience And Existence Revisited Something Essential On A Philosophical Education In Film Art

Matti Itkonen\*

*University of Jyväskylä, Department of Teacher Education  
PO Box 35, FI-40014 University of Jyväskylä*

---

### Abstract

The film, the living imagery, traces out its legend before the eyes of the viewer seated there in the darkened space, and in his consciousness becomes a lived spectacle, an interiorised impress of experience. It takes up its abode in him and he falls in step with its movement, merging with the stream of its narrative. In this there evolves an aesthetic-existential situation – of one, many; of one, a qualitative multiplicity is born, and with it the experienced essence of the unique, the inimitable.

On this same, the critic pronounces judgement – as often as not his verdict – on this spectacle which he – and another – has beheld; that individual, original experience is thus now couched in words, petrified on paper. Whose judgement is the right one? whose wrong? Who is entitled, who in duty bound to pronounce a final word on this? Who or what can speak as if for a collective audience? And who then is being silenced, who makes himself heard? And if in this some faceless, nameless nobody is to be imagined viewing, experiencing the scene, then who – or what – has played the decoy, and who has been bamboozled? And what of the film itself – is there anything left of it?

Something of the essence must indeed be said by way of inculcating a more philosophical appreciation of film. Or does even this carry in it a seed of that same totalisation, a burgeoning aspiration to erase whatever is unique? He who reads will know, will feel it.

## 1. Opening: A Memory

”This story is not true. This is no lie. This is a tale.” (See for example Ahonen, 2000, p. 16.) Thus “writes” the Finnish film director Markku Pölönen in the opening moments of his “Badding”. I am sitting in the Fantasia cinema in Jyväskylä and I am trembling: all within me is music, my consciousness ablaze. Before my eyes something unfolds which I have never seen before. I have now a model for the language in which experience of the world – the vortex of existence, the maelstrom of being – can be described. The subjective quality of an experience can never be rendered truly intersubjective – all talk of commonality of experience is sheer nonsense. Nor is the ‘we’ form ever to be defended in phenomenological philosophy – at least not ontologically. The notion of lived language, of the primacy of the mother tongue, is the poetry of being: a unique prospect onto the existential milieu. The possibility that it can never be verified is ever present; existence is always prior to essence. Being is and endures, the living creature vanishes – is that ontological difference by any measure linguistic? (See especially Itkonen, 2001; 2004a; 2010; 2011.)

## 2. Words of Experience

One often hears of someone being overtaken by an access of ecstasy which he refers to as an aesthetic experience. The philosopher Roman Ingarden, however, would see the matter otherwise; for him an aesthetic experience is not a momentary onset of pleasure or displeasure born as a reaction or response to some object of perception – a lake view, say, and the beholding of it. An aesthetic experience is rather a combinative process involving a diversity of phases and a characteristic development of heterogeneous elements. The duration and complexity of this sequence depends of course upon whether the experiencing subject is confronted with a complex or a simple aesthetic object. Sometimes a shade of colour or a quality of sound suffices in itself to evoke such a response; yet even though the passage of the aesthetic experience may be equally fleeting, it is for all that no momentary “fit”. (See esp. Ingarden, 1961, p. 295; Itkonen, 2004b; 2004c; 2005b.)

The aesthetic situation consists in two basic elements: (1) the formal structure of the (artistic) object, and (2) the subjective consciousness of the observer. The conjunction of these, their coincidence, gives rise to an

aesthetic constellation. Subjective awareness constitutes a new kind of reality which is not to be reduced to any one of its components. Each such element acquires a new identity in the aesthetic process. How does this take place? In what sense? (See Mitias, 1986, p. 164.)

By way of an answer here I would propose the following:

(1) Prior to experience of it the artistic nature of, for example, some artefact – the totality of its aesthetic qualities – is not given as a ready content. The composite of its properties subsists rather as a possibility awaiting realisation. It is as it were incumbent upon the observer to actualise – to bring to life – this artistic potential.

(2) Furthermore, prior to the envisaged experience the observer's consciousness is – in general – undefined. It too exists as a potential capacity for the intuition of meaning. Consciousness is actualised – that is, becomes active awareness – only in the apperception of some object. The peculiar nature of that awareness – what consciousness is at that given moment – is determined by the nature of the object perceived. What is accessible to understanding in it is interpreted in consciousness as a living content which has meaning. In the aesthetic situation perception and object, as a work of art, are fused in a separate, private reality. This individuality is defined on the one hand in terms of the characteristic properties of the object, on the other by the observer's profundity, sensitivity and personal propensities. In short, the aesthetic situation subsists in the living stream of aesthetic experience. (See *op.cit.*, pp. 164-165; see also Dufrenne, 1979; Itkonen, 1999b; 2009; 2012.)

Once again I visit the Fantasia cinema – Saturday December 12<sup>th</sup>, 2002. The previous day the film “Frida” had had its premiere. The modern virtuality might have provided me with advance information – address «[www.miramax.com/frida](http://www.miramax.com/frida)», «[www.fridamovie.com](http://www.fridamovie.com)» and «[www.egmont-entertainment.fi](http://www.egmont-entertainment.fi)», only I preferred to avoid being trapped into conceptualised, petrified experience. All that was in my mind at that moment was what the film advertisements had conveyed – Salma Hayek-Frida Kahlo and red, colour redolent of life. The rest awaited realisation, the possibility as yet un-lived.

At least two desiderata might of course be envisaged as some sort of yardstick of genuinity, some experiential guarantee; loss of awareness of being a spectator and surrender to the narrative stream, participation in the process of creation. Now the lights go out, the adventure begins.

### 3. Words of Being

#### 3.1. Fragments of media reality

There are positive and there are negative values. Criticism awards its object some mark, some grade. For whom in fact are such pronouncements written? Is there, always and everywhere, some identifiable average spectator – myself, for example? So who am I? A faceless nobody, just any Tom, Dick or Harry? That I refuse to be – I want more than simply to be, I want an active part in things.

Now what is needed is a seed-bed, a linguified substrate in which existential words of being can be set. A polyphonic media reality must be devised in which a diversity of voices make themselves heard simultaneously, yet distinct, each for itself.

Let the chorus of critics be heard.

The paper *Aamulehti*: “When Rivera conquers New York, Frida sees her husband as King Kong and the reflection of a skyscraper as her own leg. Taymor fuses the best of theatrical effect with cinematographic thinking, making of the experience of seeing Frida a fascinating mystery. [...] The aesthetic of the film is reinforced as it were surreptitiously by the eruptive ethnic music at the hands of genuine interpreters.” (Välinoro, 2002, p. B 29.)

*Demi*: “The epochs in Frida Kahlo’s life are presented through the medium of electronic animations and pastiches which look like newspaper cuttings. By her own unusual narrative means Taymor succeeds in penetrating deep into the main character’s life-course. [...] The spectator is drawn into the tale of this woman avid for life and is released only with the film’s closing text.”

(Paavolainen, 2002, p. 80.)

*Ilta-lehti*: “This biographical film, focusing as it does on entertaining romance, is enlivened by the beautiful trickery with Frida’s paintings. The works come to life, and in one old photograph collage the living images of Frida and Diego are humoristically inserted by manipulation. Equally admirable is the placing of the couple within the film “King Kong”, in which Diego is of course given the role of the giant ape. Such pictorial play is something we could have more of.” (Kangassalo, 2002, p. 26.)

*Ilta-Sanomat*: “As a production American but filmed mainly in Mexico, “Frida” is a remarkable combination of the superficial allure of Hollywood entertainment and the serious poetry of the European art film. [...] Taymor and Hayek content themselves with recounting the most familiar elements in Kahlo’s life without being able to introduce a viewpoint of their own. Following the film is like flipping through a well-thumbed picture-book: there’s that scene, this is where this or that person comes into the picture...” (Poussu, 2002, p. 30.)

*In*: “With its technical innovations and excellent acting performances the film offers a basic course for anyone concerned to learn something of Kahlo. In all its plenitude of colour the portrait constitutes a work of its own, something different from the usual stolid “likeness”.” (Häkli, 2002, p. 80.)

*Katso*: “The tale of this fascinating artist is nevertheless reduced to banality by the people about her. All of this woman’s agonies and afflictions are obscured behind her various relationships; her fate is defined above all by love, jealousy and the men in her life.” (Laurila, 2002, p. 24.)

*Keskisuomalainen*: “The actress in the main role, Salma Hayek, was also co-producer of the film. She aspires to the fullest possible empathy with Frida and seeks thus to bring her close to the viewer. Against the background of her own career such an undertaking is of course an enormous step forward, but Kahlo’s emotionality and feverish passion, her dignity and her deeply agonising soul place an unmistakable strain on the resources available to the traditional actor.” (Valkola, 2002, p. 21.)

*Nyt*: “The acting in the film is uneven. Salma Hayek does her utmost in the formidable role of Frida, but leaves the impression of a very beautiful model girl who has indeed talent, only not enough. There is something almost

inane in the way we are first told of the numerous serious operations Kahlo underwent, then confronted with Hayek's perfect body bearing one carefully made-up scar." (Avola, 2002, p. 47; see also Ahonen, 2003, p. 17.)

*Savon Sanomat*: "The part of Kahlo is played by the shapely Mexican ex-soap opera star Salma Hayek, who also produced the film. Her Frida is a beautiful and courageous, politically and sexually revolutionary woman. She has relationships with women as with men – among these the Russian Lev Trotsky – and downs tequila after tequila into the small hours." (SS, 2002, p. 23; see also Jäntti, 2002, p. 8; Niemi, 2003, p. 4.)

*Suur-Jyväskylän Lehti*: "The film "Frida" is like a photograph album which offers snapshots of the culminating points in its subjects' lives. The essentials are recounted impressively and entertainingly, but anyone looking for fuller enlightenment and analysis would do better to visit a library." (Pynnönen, 2003, p. 17; see also Pentikäinen, 2003, p. 84.)

*Tv-maailma*: "Over the years many have aspired to this role; among them Madonna and Jennifer Lopez have been eager to trick themselves out in Frida Kahlo's exotic garb. [...] The film does not perhaps move in the true depths of human agony but must nonetheless take its place as one of the most sensual experiences of the year. Taymor directs courageously and trusts in an interestingly oblique mode of conception which the puritans of the film world will hardly find attractive." (Lindqvist, 2002, p. 70.)

### 3.2. Existential self-appraisal

Questing now after the nature of openness – the unconcealed, *alêtheia*. At the same time I would also assess the concept of freedom in terms of an indwelling luminescence. In a word, I shall take a step towards the radiance of our being in this world and lay myself open to the revealing power of an existential exercise in the expression of being. (See e.g. Heidegger, 1992a, pp. 148-149; Kockelmans, 1984, pp. 9-10; of Heidegger studies also Itkonen 2005a; Lehtinen, 2002; Passinmäki, 1997; Varto, 1993.)

I shall adopt an evaluative approach and take up a discourse with both the text and myself and my experience of this film. The following counterpointed monologue – alternating between self-appraisal and existential contemplation – draws upon a lived poetics derived from a notion of filmaticity experienced in corporeal terms.

I may avail myself here of the philosopher Martin Heidegger's lecture 'Der Begriff der Zeit' (1924), where he analyses the temporality and the basic structures of Dasein – being-in-the-world. The interpretations are my own, drawing upon the German and English edition. Let this exercise in self-illumination then commence.

*Existential a:* Dasein – being-here – entails the entity definable as being-in-the-world; in-der-Welt-sein. Human life does not constitute a subject's performing some trick or other in order to gain a place in the world. Being-here, being-in-the-world, is to be conceived of as 'having-to-do-with-the-world', being involved in it; dwelling in it, having being in its bosom, concomitant with it, doing and accomplishing, bringing to completion – but also as contemplation, questioning and defining as is the customary procedure in deliberation and analysis. Characteristic of our being-in-the-world, so conceived, is Sorge, concern.

*Counterpoint a:* For the sake of clarity – in a spirit of reader-friendly concern – it is perhaps appropriate first to elucidate Heidegger's terms. With 'existential', namely, he envisages some kind of essence or apodictic nature of being on whose basis or in whose medium each of us experiences the world in absolutely unique terms. (See also Van Manen, 1990, pp. 101-105.)

Then a number of items to do with the film: (1) title: Frida, (2) direction: Julie Taymor, and (3) the cast: Salma Hayek – Frida Kahlo; Alfred Molina – Diego Rivera; Geoffrey Rush – Lev Trotsky.

The critic writing for the Helsingin Sanomat extra is male, Pertti Avola. This one could assume from the very content of the review. Mr Avola would not appear to have the least concern for his own competence in the business of being-in-the-world; he scarcely pauses that long in it – has no time for existence as contemplation of it. He apparently sees in Salma Hayek nothing beyond a Latino entity capable of presenting herself as a figure of beauty, the quality of her Dasein being defined in advance – a model girl out of whom no magician could conjure

up anything like a convincing Frida Kahlo. One is indeed left with the impression that in the existential sense Hayek and Kahlo are as far removed from each other as it is possible to be; their respective worlds would never attain to the goal of mutual interaction.

Avola would seem to be anxious to put the finishing touches to his definitive version, to establish his kingdom of critique as expeditiously as possible. He apparently sees himself, along with the paper he writes for, as a representative of the whole of masculine Finland. As if one is supposed to regard Salma Hayek's body as perfect on the sole merit of a fulsome bosom – or by merit of what? Hayek as Frida Kahlo has in her being anguish and the passion of living flesh. My own concern is for Avola's arrogant incapacity for self-appraisal, his complete lack of – or neglect of – the dimension of questioning in our being. True Dasein entails a retreat which lets things be – in this case a humility before the experience of a film; it means seeing Salma Hayek in the unique essence of her own existence. Perhaps then the cosmetic scar on her body would not adequately represent the entire masculine burden of the apperception of her.

*Existential b:* At the same time as Dasein consist in being in a locative sense, it is also a Mit-einander-sein – being with others, sharing, possessing a common world. It means encountering others, each meeting each in confluent lives, living as if one for the other. Yet this being-here in this way is at the same time being present to others – being there like a stone which lacks a world and lacks concern for it.

*Counterpoint b:* The reviewer in Katso, this time a woman, would appear to have completely overlooked the element of coexistence essential to our being in this world. In her critique I find neither myself nor my experience of the film – evidently I do not possess a world in common with Johanna Laurila. The account of the artist's life is in no way banalised – Hayek gives living and moving expression to the being of Frida Kahlo in all her pain, her loves and her disappointments.

What we see here is a failure to encounter, a failure on many levels; both Hayek's role figure and the real reader or viewer lie beyond Laurila's reach. This was surely not the main objective of the paper she writes for. I am made to feel as if as a man I exist as a mere presence, an external shell devoid of inwardness; as if I lacked completely all living experience of the world. What is Laurila the critic aspiring to accomplish with this

technique of jellification or petrification? She lacks all awareness of the need to be for others. I fail to see what critiques such as this are for – unless to turn the male viewer to stone.

*Existential c:* Being together with others in the world, possessing this world as a being-together is a unique ontological choice. The world's basic mode of Dasein – possessing the world here, Dahaben – each with the other – is a conversation. In the last analysis conversation, dialogue, entails one subject addressing another directly, genuinely, sincerely. For the greater part being-in-the-world consists in precisely this – something which Aristotle was well aware of. And while being here in one's world speaks of one's way of having dealings with that world, "keeping company with it", the function of self-analysis – Selbst-auslegung – is also given. This function evinces the way Dasein explicitly – as appropriate precisely to itself – understands itself, how it conceives itself. In speaking one to another – in what is unfolded in that process – resides the actual self-interpretation of the present moment. This, this presence, preserves itself, abides, in such dialogue.

*Counterpart c:* The critiques in *Ilta-Sanomat* and *In* would seem for all their differences to emanate from some kind of kinship of spirit – is this in consequence of, or by merit of, the superficiality of the forum and the male gender of the writer? If the basic mode of dwelling in the world is speech, the use of words should involve a certain seriousness lived in the flesh, a sincerity of intent, of ideation. If such a precept were observed, the viewer or the reader would never be quite simply taken for granted – words must always be addressed to somebody, or conversely, each party should find in those words something of himself. This requires of the critic a profound existential self-understanding, an 'I' apperception; he must be able to answer the questions of being: Who am I? How do I exist and why? First, of course, he must learn to ask himself these questions.

A reasonable measure of self-insight in a critic would indeed entail a conception of being-for-others, a realised idea of the self in the role of an interpreter for others. The allusions of Tarmo Poussu of *Ilta-Sanomat* to the superficial attractions of Hollywood entertainment may be seen to contain a certain unwitting (self)-irony; on the other hand the observation on the poetic quality of the European art film prompts the reader, too, to a re-appraisal of his own prior conceptions. The same may be said of the critic Vesa Häkli in the magazine *In*, referring as he does to the divergences from mere likeness in the portrait. The result is the emergence of an original interpretation illuminated by a genuine inwardness.

In the passage immediately following that alluded to, however, Poussu shatters the illusion of depth of insight, and I heave a sigh of relief: “There you are, I knew Ilta-Sanomat is hardly likely to come up with anything truly profound!”

The film contains nothing one could predict – at least nothing I could have predicted. Does that make me a cultural vacuum who knows less than (even) the critic? And are technical insights also something beyond my grasp?

A bout of feverish self-searching has brought me to the following conclusions: “As a viewer prepared to let things be I must indeed strive to encounter the film as a boundless void – apprehending it without the eye of petrified foreknowledge. This is precisely what the filmatic unravelling of the experience entails.” One must be momentarily present in the dialogue between oneself and one’s fellow-beings.

*Existential d:* Dasein means a being which crystallises itself in the property ‘I am’. The particularity, the specificity of this element is essential to our being-here. While Dasein consists primarily in being in this world, it also comprises *my* being here. It is, in every discrete case, of itself and precisely its own. If this being is to be defined as to its ontological quality, then there must be no abstraction, no separation of its particularity as in every given instance explicitly mine. *Mea res agitur* – I am all that in which I have a part in myself at this precise moment of my being. Every basic quality must thus make for confluence in particularity – and this every given case – as my own.

*Counterpoint d:* How does Jarmo Valkola of Keski-Suomalainen justify his claim that Salma Hayek’s performance in her role fails to fulfil the requirement of an ‘I am’ quality? How can a critic see into the core of Frida Kahlo’s being-in-the-world? Whose existence is in fact involved here? How am I supposed to accept the insolence of someone who takes it upon himself to do my thinking for me?

I do concede that as co-producer of the film Salma Hayek has been in a position to expand her territory somewhat more than is usually possible; for all that, I see no problem here, rather the contrary. As I sat there in

the Fantasia cinema, losing awareness of myself and my surroundings, the distance between me and Hayek-Kahlo also disappeared; for a moment we were one and the same being, living through the same experience, loving and deeply suffering. I could no longer have said whose particular existence this was. *Mea res agitur* – I was all that Hayek-Kahlo's intense nature possessed of its own existence. I was part of the yearning spirituality the film exuded. Hayek-Kahlo took up her abode in me, and I in her. Is it possible to bring Frida any closer to a viewer than this?

Clearly it is not. In the particularity of that moment of being-in-the-film we became one; I ceased to exist as my ordinary everyday self. After such an experience all humming and hawing about whether Hayek succeeded or not seems utterly fatuous. Even with the actor's traditional means the realities may be transcended – only the blasé critic seems to have forgotten this.

*Existential e*: Insofar as Dasein entails the existing entity which I am, and at the same time is defined as a being-together one with another, then I myself am for the most part not – not even on the average – my own Dasein. It is precisely those others who constitute my being-here. I am with them, just as they in turn are with yet others. No one of us in his Alltäglichkeit – his everyday existence – is his own self. What anyone is, and the way he is, is 'niemand' – nobody; nobody, and yet everybody, anybody at all – 'das Man'. We have this and that to say, we listen, we are on this or that side, we are concerned for something or other, and in the persistent primacy of the 'anybody' lie the potentialities of my being-here. On precisely this basis, this road laid down, the 'I am' element is possible. The entity which entails the possibility of that specifically personal dimension is as such for the most part the entity which means everyone, anyone at all.

*Counterpoint e*: Savon Sanomat purchased its text from – ultimately – Reuters. As neither the name nor the gender of the writer is given, the "entity" which confronts me constitutes no actual presence; by the same token the being of the writer entails no communality with any fellow-being, since the writer is here represented by the text and the forum it appears in, the paper Savon Sanomat. The being of such an entity can mean anything and everything I choose to read into it. One might perhaps imagine that this mundane being has become part of my everyday – in which case one must ask who of us is the original Mister Nobody.

All the writer brings out in Salma Hayek comprises two completely trivial attributes: her ample bosom and her former connections with the world of kitsch. At the same time, it would seem, I myself as a putative male reader am damned forever to masculine nonentity. I need no name, certainly no face. In that capacity of a mere cipher no-one can exist as his own self. Here I am something in the passive form, ever lost, lost over and over. As to Frida Kahlo's life the reader is treated to the odd allusion to her beauty, her (supposed) bisexuality and her (manly?) prowess in downing tequilas far into the night. Not a hint of her Schopenhauerian will or her interest in Hegel's philosophy. Why not? The answer surely lies once more in the fact that I, as an assumed male reader, am being treated as some sort of masculine nobody; the possibility of my being an 'I' is either deliberately – consciously – or unwittingly – thoughtlessly – relegated to oblivion. Any and every male 'I' is presumably regarded as a thing quite self-evident; know any one of them and you know the lot. In this same context, however, there would obtain a manifest potential for the attainment of selfhood; the subject, personal, bearing a name, might breathe life into himself, in which case the text should convey something of Kahlo's artistic and philosophical deliberations rather than her dallies with Lev Trotsky. Who knows, that might entail making an entirely different film.

*Existential f.* A being in his particular everyday existence means – so conceived – something for which that existence is meaningful, important. As any talk of the world involves a direct expression of being-here – for example the evocation of a quality apperceived – so too all concerned intercourse entails concern for the existence of our being-here. Up to a point I am that which I am concerned with – that is, what I work with and what my profession involves me with; and it is in precisely these contexts that my being-in-the-world proceeds. Concern for Dasein has in each and every particular case placed being “in care” – being as we know it, as something familiar and understood in the prevailing construal of it.

*Counterpoint f.* The papers Aamulehti, Demi and Iltalehti may well be regarded as mutually very different publications. The first-mentioned doubtless considers itself the most objective of the three – this in spite of its conspicuously Rightist past. Of the critics in question only the one writing for this same paper is a woman – Anne Välinoro. Nonetheless all three reviews are akin in that the notion of the specificity of being is conserved as something of significance. The dialogue the text conducts with reader and role figure clearly reflects a concern for the possibility of being-in-the-world to constitute a unique existence – in other words a concern that the critic writing, myself the reader, and Hayek-Kahlo be each permitted to evince – be enticed into manifesting – their own peculiar quality of being. At the same time the narrative filmaticity of the work comes into its own. Of

particular merit in these reviews – and particularly thought-provoking – are the observations on pictorial manipulation and the symbolic intertextuality of the King Kong elements.

The writers succeed in establishing themselves in their own particular contexts; they are reviewers recounting for intelligent readers their own thoughts on phenomena they have encountered. In this way I too as reader may at least partly exist in my own right, as my own actual self. The text, too, speaks of the same film I went to see – I recognise that film in those texts, I recognise myself in them, and I recognise Hayek-Kahlo in all her profound experience of life. The concern for my being-in-the-world unfolds in the familiarity of the interpretation the reviewers convey, in the tactful deference with which the reader is here addressed.

The trio includes the teenage magazine *Demi* and the reputedly superficial *Iltalehti*. Am I surprised? Indeed I am. Perhaps this was a much-needed lesson – perhaps I may someday rid myself of that generalising tendency which evidently mars my thinking. True, the critic Olli Kangassalo does toss me one morsel of consolation in once getting his spelling wrong – at least that was as I had expected.

*Existential g*: In the average of everyday being there is, there dwells, no reflection of the ego or the self; nonetheless Dasein possesses a selfhood. It finds itself alongside its own self, as something existing concomitant with it. Dasein encounters itself in everything with which it is in any way involved.

*Counterpoint g*: The critic Tuomas Pynnönen writes for the *Suur-Jyväskylä Lehti*, a free-distribution weekly appearing for some decades now. The critique in this case bears the stamp of its forum's own mode of being-in-the-world; unreflective mediocrity. The writing finds itself in a coexistence with the affairs of its home town and satellite conurbations, mirroring in miniature the whole reality of its existence. The film review itself indeed resembles a photograph album of its own being and non-being. I too as reader am realised in it once more as a faceless man-in-the-street. The quester after more profound material will do better to look elsewhere. Perhaps nevertheless honesty is a positive element; the paper takes up its place in the world as precisely what, at bottom, it is – what more can one require?

*Existential h:* Being-here cannot be proved to be an existing entity; it cannot even be demonstrated. The original primary relationship to Dasein is not of an inquiring nature, not contemplative; it is 'es sein' – mere being. Experience of the self, like speaking of the self, interpreting the self, comprises but one particular form of it in which Dasein possesses itself in any and every given case. In the general run of things Dasein is a mundane affair marked by the quotidian humdrum traditionally referred to as human life – the tradition of Everyman. (See on all the above existentials Heidegger, 1992b, pp. 7-9.)

*Counterpart h:* Antti Lindqvist writes for the Tv-maailma which appears with Suomen Kuvalehti. Why such a context? Is it that it constitutes a part of, an adjunct to that all-encompassing 86-year-old fatherland fixation? Is the world of TV equally dominated by that ubiquitous heritage of anonymity?

It may be that the history alluded to, a kind of experiential memory trace, is not amenable to demonstration or proof. What if that is indeed the intention; one is supposed to be no more than an extension of, an increment to a given line of historical development by being explicitly what one ought to be. No reflection or self-scrutiny. Any contemplative experience of the self or talk of such belongs elsewhere; existence in the world is existence as given.

Lindqvist writes of the aspirations of Madonna and Jennifer Lopez to doll themselves up as Frida Kahlo. One is left with the impression that Salma Hayek is just one more of the same bunch of superficial, talentless dilettante actresses; it behoves them to confine their interest to clothes – the deep waters of anguish lie beyond their scope. How far is the reader assumed to attain in such ramifications of thought; at least there is no call to explain to him the interesting obliqueness of the producer's conceptions. As to evidence of sensuality, a mere mention of the names of well-known and proclaimed sex symbols will surely suffice – this is how it has always been, it is already tradition.

Here the critic's arrogance would appear to reach its zenith; the writing makes of Hayek-Kahlo and of me the reader a foreknown nameless nonentity. Is this modus operandi, too, a part of human life? Apparently I do not belong among the crypto-puritans of the film world. Perhaps, however, I need have no fear on this score. I am but

one emanation in the endless series of average readers or viewers, part of the common run of everyday experience. With this I must content myself; the male critic Antti Lindqvist has spoken.

INTE 2013

#### 4. Close: Waiting

In the context of aesthetics one also frequently speaks of empathy (for a more detailed analysis see e.g. Itkonen, 1999a; 2002a; Stein). Wilhelm Dilthey also writes of this “feeling oneself into things”. In his view it is in this foundation in transference, transposition, that the highest form of understanding – that in which the life of the mind is totally engaged – takes its origin. What this in fact entails is re-creation, re-living. Understanding as such proceeds converse to the actual order of events. Full empathy, in contrast, is bound up with a mode of understanding which follows events as they evolve – it falls in step with life, and precisely thus opens up, expands. The process of re-experiencing follows the sequence of events unfolding, and we evolve as the given span of history plays itself out, in tandem, as it were, with the mental processes of our fellow-men or with the events themselves as they transpire. This process of experiencing anew comes to fulness when events are sifted in the consciousness of the poet or painter and confront us in a static, enduring artefact. (See Dilthey, 1986, p. 159.) Analysis of this calls for great precision and profundity.

“After that night their paths converged almost every evening, and the summer played itself out before they knew it” – thus Onni Halla in his first novel ‘Mustat loimet’ (p. 15) from the year 1925. In their joint dedication work *Tulenkantajat* Lauri Viljanen writes of this piece by his contemporary and co-publisher: “This elegantly written little tale is anything but a detached account of a people; it is throughout a prose poem pervaded by subjective lyricism.” (Viljanen, 1926, p. 61.) I share Professor Viljanen’s view; the passage from Halla’s work comprises a poetic depiction of being, of dwelling within a moment, at its very core. The significance of that existential participation one recognises only when one has lost it. What we see here is a filmatic attitude which lets be, which preserves the momentary experience ever in the raw; a capacity to encounter the world ever new, in all its freshness. Only in this way can the aesthetic situation endure and the film assume the actuality of its own being-in-the-world. (On the critique of criticism, metacriticism and philosophical education in film see esp. Itkonen, 2002c, pp. 33-34.)

The truth is nonetheless brutal. Thursday January 9<sup>th</sup>, 2003 is – or was – ladies’ day in all Finnkino cinemas; simply because they are women ‘Frida’ (and ‘My Big Fat Greek Wedding’) are open to them at a lower price than what I have to pay to see them. Is the film in its actual, its true being feminine? And I, simply because I am a

man, incapable of appreciating it? Who decided this for me as well without as much as by your leave? Is the whole of reality divided by sex at the decree of Finnino? Where did I get lost? Or did somebody lose me?

### **5. Supplement: Poetic Film or Filmatic Poem?**

25.7.2003

The heartland of Finland

high-summer green.

Sun blazing down –

yet a hint of dusk descending;

the nightless night bends its step to the dark.

A night at the films.

I take my place and scan

the print-out in my hand:

«[www.farfromheavenmovie.com](http://www.farfromheavenmovie.com)»

Julianne Moore in a headscarf stares back.

The lights are dimmed

and the paper image comes to life.

Colours smouldering red.

The landscape seems to weep

last glow of setting sun.

We are in the fifties,  
the days of MegaTech TV,  
the multimedia age;  
all seems so innocent –  
sinless virtuality?  
Or poetic fake-real –  
where real people still dwell,  
living, experiencing in the flesh?

Far from Heaven?  
Far from the everyday,  
or close to the earth, the ground of being?  
The lights go up.  
I leave – it is already dark.  
The green is gone:  
before me the gaudy neon ads.  
I am close to the earth  
and far from heaven.  
Yet I am.

Translated by Robert MacGilleon

<sup>b</sup>Douglas College, Psychology, Faculty of Humanities and Social Sciences, New Westminster, BC, CANADA, V3L 5B2

## Abstract

This paper contemplates the outcomes of exploratory research on the impact of diversity-infused content on students' attitudes towards marginalized groups. The research revealed low levels of intolerance among students in both structurally diverse and structurally non-diverse groups. The results suggest that transformative change among students is likely to occur over the longer term. Future research with the same cohort will explore the longer term aspects of transformative learning.

Keywords: sociology, structural diversity; diversity-infused content, attitude change

## 1. Introduction

Research indicates that educators, especially those concerned with issues related to diversity, human rights, and social justice, often have faith in the transformative nature of their educational efforts (Stamp, 2001; Westerman & Huey, 2012). Educators across discipline areas often assume that including diversity-infused content in courses will lead to a reduction in measured prejudice among participants in such courses. Some studies have indicated that classroom education about minority groups can reduce prejudicial attitudes in students (Harris, 2003; Kernahan & Davis, 2007). In order to test this assertion, Hussey, Fleck, and Warner (2010) undertook a quasi-experimental study at the University of New Hampshire to measure changes in students' attitudes toward a number of different minority groups. In their study the authors compared, via pre and post-test data, changes in attitudes in two different first year Psychology courses over one term: one that included diversity content and one that did not. Their research revealed a reduction in levels of prejudice among the students exposed to diversity-infused course materials and methods.

Hussey et al.'s study was conceptually replicated in the current study to test attitude change among first year Sociology students in two different institutions: one that is structurally diverse and one that is not. Educators often also assume that students in more structurally diverse classrooms and institutions will be more open to challenging prejudices and confronting stereotypes because they are exposed to members of social groups that are dissimilar from their own. Studies have demonstrated that structural diversity has positive effects on student attitudes (Kowalski, 2000). However, other research indicates that contact with minority groups is not enough (Gurin, Dey, Gurin, & Hurtado, 2003). Therefore, structural diversity in combination with diversity infused course content may have a great impact on student attitudes toward minority groups.

For the purposes of the research, *diversity* is defined as variance and a range in characteristics including race, social class, ethnicity, sexual orientation, ability, religion, etc. within a particular group, population, or setting (Banks, 2002, as cited in

\* Corresponding author. Tel 00-1-604-376-4156  
E-mail address: westermanm@douglascollege.ca

Hussey et al., 2010). A *structurally diverse* institution is deemed to represent such variety. *Diversity-infused* modules or courses involve course content and pedagogy that are more inclusive of traditionally marginalized groups. The level of inclusion of diversity issues used by the instructor on the project is referred to by Hussey et al. (2010) as the transformation approach, in which the instructor “offer[s] each course topic through multiple, non-dominant perspectives. Teaching methods and materials foster understanding and tolerance of other cultures as well as critical evaluation of monocultural perspectives” (p. 86). For example, students in the current study explored topics such as racism, sexism, and classism by analysing statistics and research studies that challenge prejudices and encourage students to view the world from the perspective of members of marginalized groups. Video excerpts were also used to introduce narratives from members of marginalized groups.

It was expected that students in the diversity-infused learning condition would see a greater reduction in intolerance compared to those in the non-diversity infused learning condition. It was also expected that participants from a structurally diverse institution would experience less of an impact from diversity-infused teachings compared to an institution that is less diverse.

## 2. Procedures

The current study was a quasi-experimental design that tested the impact of diversity-infused course content on student attitudes by systematically measuring and comparing attitude changes toward minority groups in post-secondary students. Participants were either exposed to diversity-infused modules in a first year Sociology course, or not exposed to diversity-infused modules in a non-Sociology course. Participants from two different institutions were used, allowing the comparison of two student populations: one that is structurally diverse (a college in a major metropolitan area in Canada) and one that is not structurally diverse (a university in small city in the United Kingdom). The dominant culture in both societies is white British.

Data collection occurred in the first and last weeks of classes at both institutions. Both institutions' semesters lasted 15 weeks. Courses were chosen on the basis of the first year status of the course. Therefore, the most important issue with regard to the sample is that the students had little to no experience in Sociology prior to taking the courses under study, which can be assumed, although not guaranteed, by the choice of an introductory course. While factors such as age may have an impact on student attitudes, these factors cannot easily be controlled for under the circumstances (i.e. instructors do not normally have control over who enrolls in a first year course based on demographic factors).

The *Intolerant Schema Measure (ISM)* (Aosved, Long, & Voller, 2009) was used to collect data on student attitudes towards minority groups in all four conditions. The 54-item ISM is a measure of intolerance toward six constructs, and is a reliable scale (Cronbach's alpha = .96). Demographic data were collected in order to analyse whether differences in age, gender, etc. have an impact on attitude change in either or both institutions.

## 3. Results

### 3.1 Participants

A total of 58 participants from the structurally diverse institution and 81 participants from the non-diverse institution took part in this study. As seen in Table 1, participants in both samples were relatively the same age, and had roughly the same breakdown of gender (there were more females in both samples). The structurally diverse sample had a wider variety of self-identified ethnicities. Note that the table below only displays 65% of that diverse sample; the other participants' ethnicities were quite varied. In both samples, participants were primarily single or not in a relationship. In both groups, over 90% of the participants had no children.

In the diverse group, most participants identified as not being a member of a religious group (34.5%), while 22.4% identified as Christian, 13.8% identified as Catholic, and 10.3% identified as Sikh. About 40% noted rarely attending any religious services, but over half of the participants occasionally or often attended religious services. In the non-diverse group, most (37%) identified themselves as Christian, 14.8% noted no religious affiliation, 9.9% identified as Catholic, and 7.4% identified with the Church of England. However, over half noted rarely attending any religious services.

There was a significant difference in occupation categories between the two institutions,  $\chi^2(6, n = 116) = 36.88, p = .000$ , Cramér's  $V = .56$ . The diverse group had more participants in higher ranked positions. Most of the participants in the non-

diverse group were not employed outside the home (25.9%), followed by a skilled manual worker (14.8%) and causal or lowest grade worker (12.3%). In the diverse group, the most frequently identified occupations were both intermediate managerial, administrative or professional work (22.4%) and skilled manual worker (22.4%), followed by higher managerial, administrative or professional work (19%). None of the participants in the diverse group reported themselves as unemployed.

Table 1. Demographic Information

Diverse Group (n =58)				Non-Diverse Group (n = 81)			
Age	M = 22.2	SD = 8.1		Age	M = 23.4	SD = 8.5	
	n	%			n	%	
Gender				Gender			
Male	17	29.3%		Male	17	21.0%	
Female	40	69.0%		Female	64	79.0%	
Ethnicity				Ethnicity			
Caucasian-Canadian	15	25.9%		White	35	43.2%	
Chinese	7	12.1%		White British	19	23.5%	
Indo-Canadian	4	6.9%		British	10	12.3%	
Asian	3	5.2%					
Canadian	3	5.2%					
Filipino	3	5.2%					
Indian	3	5.2%					

### 3.2 Overall ISM Scores

The overall ISM scores for all participants show relatively low levels of intolerance, with average scores around 2 out of a scale of 5 (with 5 being the highest level of intolerance). For all participants, a paired samples t-test showed no significant changes were detected in the overall ISM scores, although the averages did actually increase somewhat in both conditions from the start to the end of the term. Furthermore, there was no significant difference in the pre-semester ISM scores between the diverse group (M = 1.89) and the non-diverse group (M = 1.84). This was also true for the post-semester ISM scores; there was no significant difference in the post-semester ISM scores between the diverse group (M = 1.91) and the non-diverse group (M = 1.90) (See Table 2).

Table 2. ISM Means and Standard Deviations for all participants (n = 139)

	Structurally Diverse		Non-Diverse		p-value
	Mean	SD	Mean	SD	
Pre-ISM	1.89	0.48	1.84	0.49	ns
Post-ISM	1.91	0.57	1.90	0.55	ns

ns= not significant

Again, for both institutions, the experimental condition received diversity infused content, and the control condition did not. Within the structurally diverse institution, there was no significant difference between in the ISM means between the control group and the experimental group at the start of the semester, or at the end of the semester. No significant changes were identified in either condition from the start to the end of the semester, although the diversity infused content course did see a decrease in ISM scores (See Figure 1).

The same comparisons were made within the non-diverse institution. Similar to the structurally diverse institution, there were no significant changes found from the start of the semester to the end of the semester for either type of learning environment (diversity infused vs. not) for overall ISM score (See Figure 2.).

Figure 1. Overall ISM Means for Structurally Diverse Group (n = 58)

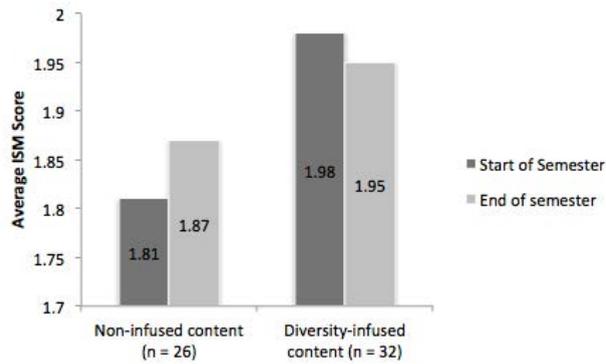

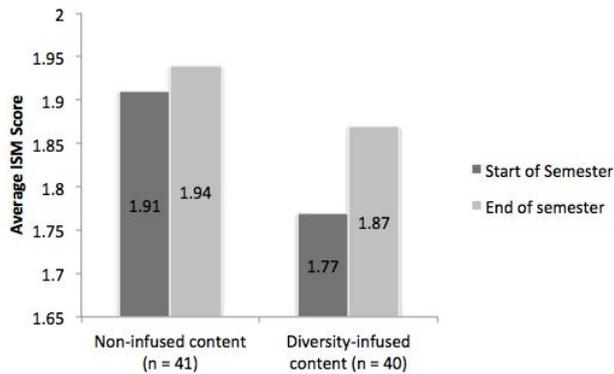

Figure 2. Overall ISM Means for Non-Diverse Group (n = 81)

### 3.3 ISM Subscale Findings

The ISM is composed of six subscales, of nine items each, covering the following issues: sexism, racism, sexual prejudice, ageism, classism, and religious intolerance. Again, scores range from 1 to 5, with 5 being the most intolerant. There were no significant differences found between the two institutions in their subscale scores, either at the start of the semester or at the end of semester.

In the structurally diverse institution, there were no significant changes from the start of the semester to the end of the semester in any of the subscales for all 58 participants. (See Table 3.) Within this group, the two conditions (i.e. experimental, receiving diversity infused content, and control, not receiving diversity infused treatment) were compared. A chi-square test revealed significantly more females in the control condition.  $\chi^2(1, n = 57) = 4.763, p = .029$ . At the start of the semester, the 32 participants in the experimental condition were significantly more sexist ( $M = 1.71$ ) than the 26 participants in the control condition ( $M = 1.43$ ),  $t(56) = -2.11, p = .039$ . This significant difference did not appear at the post-test, suggesting the groups had more similarity in responses by the end of the semester. The only significant difference between males and females was found in the control condition: males were significantly more sexist at the start of the semester ( $M = 1.78$ ) compared to females at the start of the semester ( $M = 1.36$ ),  $t(24) = 2.14, p = .043$ . Interestingly, this significant difference did not exist at the end of semester, and this was due to increased variability in responses to items measuring sexism by both males and females at the end of the semester.

Table 3. Subscale ISM Means and Standard Deviations for Structurally Diverse Group (n = 58)

	Pre-scores		Post-scores		p-value
	Mean	SD	Mean	SD	
Sexism	1.58	0.53	1.62	0.65	<i>ns</i>
Racism	1.92	0.64	1.89	0.62	<i>ns</i>
Sexual Prejudice	1.84	0.80	1.85	0.87	<i>ns</i>
Ageism	1.68	0.49	1.65	0.58	<i>ns</i>
Classism	2.37	0.69	2.37	0.80	<i>ns</i>
Religious Intolerance	2.00	0.59	2.09	0.69	<i>ns</i>

*ns* = not significant

In the non-diverse group, there were significant changes for all 81 participants in three of the subscales from the start of the semester to the end of the semester. Measures of sexism, racism, and religious intolerance all significantly increased by the end of the semester, but with small effect sizes (see Table 4). Within this institution, the experimental condition participants were significantly older ( $M = 26.31$ ) than the control condition participants ( $M = 20.68$ ),  $t(78) = -3.103, p = .003$ . At the start of the semester, the control participants were significantly more intolerant of lower class ( $M = 2.72$ ) compared to those who were exposed to diversity content ( $M = 2.36$ ),  $t(79) = 2.517, p = .014$ . This difference was not significant at the end of semester, suggesting greater similarity in classist beliefs between the two learning conditions. Additionally, within the control condition, the subscale of racism was found to increase significantly from the start of the semester ( $M = 1.78$ ) to the end of the semester ( $M = 1.98$ ),  $t(40) = 2.309, p = .026$ . There were no other significant differences or changes between the two conditions.

Table 4. Subscale ISM Means and Standard Deviations for Non-Diverse Group (n = 81)

	Pre-scores		Post-scores		p-value	d
	Mean	SD	Mean	SD		
Sexism	1.43	0.53	1.62	0.69	$p = .001$	0.40
Racism	1.73	0.62	1.88	0.69	$p = .013$	0.28
Sexual Prejudice	1.73	0.84	1.71	0.75	<i>ns</i>	
Ageism	1.52	0.55	1.50	0.50	<i>ns</i>	
Classism	2.54	0.68	2.47	0.81	<i>ns</i>	
Religious Intolerance	2.08	0.67	2.22	0.71	$p = .030$	0.25

*ns* = not significant

d = effect size: |0.2| = small, |0.5| = medium, |0.8| = large

In both institutions, classism had the highest scores of all subscales. These values did not significantly change from the start to the end of the semester for either type of institution.

At the non-diverse institution, participants in the experimental condition were involved in a focus group after the semester was over. Discussion with the course instructor revealed information that was helpful to interpreting results (see Section 4.2 below).

#### 4. Discussion

##### 4.1 Current Study

The results of this study suggest that diversity infused content, whether delivered in a structurally diverse setting or not, had little effect over changing levels of tolerance toward minority groups over the period of one semester. Overall, levels of intolerance, as measured by the Intolerant Schema Measure, did not significantly decrease at either institution. The overall ISM values for both groups were fairly low, indicating low levels of intolerance in both groups. This may be a factor in the results that suggest little change. Participants were arguably not intolerant to begin with, so it is possible that their opinions of minority groups overall were unlikely to experience significant change toward more acceptance. There was a slight and non-significant drop in the overall ISM scores in the structurally diverse experimental group; however, this change is too small to support the notion that the content of the Sociology course had a direct impact on the ISM score.

However, the expectation that the structurally diverse student population would not be impacted as much by diversity-infused content compared the non-diverse institution was supported. The changes in this non-diverse institution were greater, although not in the anticipated direction.

The subscale information is potentially more interesting. Both groups were least tolerant of lower classes, suggesting that classism is a particular area of interest when building diversity-infused course materials. This is especially true given the significant differences in occupation of the participants between institutions. While there were no significant changes in the ISM subscale scores in the diverse group from the beginning to the end of the term, the scores on three of the subscales increased in the non-diverse group over the course of the term, indicating a rise in intolerance. This may represent some

resistance to the information on the part of the students of the non-diverse group, although only the experimental group was exposed to explicitly diversity-infused material. The work of authors such as Lake and Rittschof (2010) demonstrates that some students exhibit resistance and show signs of becoming more deeply entrenched in their intolerant attitudes when exposed to diversity-infused content. The ISM scale used for this study tested students' attitudes to marginalized groups only, and not their reflections on the learning experience in the course, so we cannot say with certainty that the increased intolerance scores are related to course content.

Further, there appears to be a gendered dimension to this resistance, with males being less open to diversity than females (see Pascarella et al., 1996). Both Hussey et al.'s (2010) research and the current study showed higher levels of sexism in males in some groups. Whitt et al.'s (2001) longitudinal study of undergraduates through 3 years of college also noted that male students tended to be less open to diversity and challenge than female students, suggesting that "a higher average level of openness to diversity among peers [may have] created a threatening climate for men who, in response, clung to behaviours and ideas that felt comfortable" (p. 196). Directly challenging student's beliefs under the wrong circumstances may cause students to disengage from the course; Bowman and Brandenberger (2012) noted that the level and form of the challenges presented to the student should be appropriate to the student's level of experience with diversity. Lake and Rittschof (2012) suggest that the reasons for students' resistance should be explored in order to improve diversity education. They also suggest that consistent attitude change and increased empathy for others among students result from a) direct challenges to misinformation about groups through b) the use of personal narratives in a c) non-threatening classroom environment. These suggestions will inform the pedagogical choices made in the future. While providing a safe space of discussion and challenging misinformation about marginalized groups is central to the content of the Sociology course, further efforts to engage students with personal narratives could enhance the structure of the course in the future.

#### *4.2 From Attitude Change to Transformative Learning*

The scale of this study was small and its purpose exploratory. Furthermore, the sample sizes for these two groups are not large, and may not be representative of both institutional populations. There are limitations with generalizing beyond these samples. Rather than making generalizations, the authors' thoughts on the study for purposes of moving this research forward are below.

Our study seems to indicate that simple exposure to structural diversity does not guarantee lowered intolerance (see also Gurin et al., 2003), nor does it support the notion that major attitude change is likely to occur over one single course. Learning and change regarding attitudes towards those different from ourselves may not happen as a single "a-ha" moment, nor over the process of a single course. Rather, it is more likely that such changes occur as part of the process of growth, maturity, and knowledge development that evolve over several years of post-secondary education. As a result of our preliminary research, we have chosen to explore this longer-term learning. We are particularly interested in transformative learning, as defined by Mezirow (1997): "the process of effecting change in a frame of reference...when circumstances permit, transformative learners move toward a frame of reference that is more inclusive, discriminating, self-reflective, and integrative of experience" (p. 5). Mezirow argues that transformative learning is central to adult education as it aids the individual in becoming an autonomous thinker. The teacher/facilitator models critical reflection and openness to diversity for the learners, rather than simply focusing on being a content expert or authority figure.

Facilitating openness to diversity and critical reflection can be encouraged through unexpected encounters related to diverse groups of people. Such encounters can challenge the individual's belief system and belief challenge is associated with attitude change (Bowman & Brandenberger, 2012). This type of encounter is referred to in Mezirow's work on transformative learning as a "disorienting dilemma" or an experience that does not fit with an individual's previous belief or value system. According to Brock's (2010) research, the most prevalent precursor step to transformative learning was a disorienting dilemma. The disorienting dilemma can set a student on a path to critical reflection, self-evaluation, and new

patterns of thinking and acting. The process of transformative learning is not communicated by the teacher and absorbed by the student: it is an active process in which the student encounters a situation that challenges him/her and causes him/her to become dissatisfied with his/her value system and then critically reflect upon it. Personal narratives can be used to engender the experience of a disorienting dilemma, as illustrated by Lake and Rittschof (2012).

Brock's (2010) research supports the notion that discussing a disorienting dilemma with peers contributes to the critical reflection that is central to the transformative learning process. The dissatisfaction and will to change resulting from a disorienting dilemma can be reinforced by interactions with peers who also share the dissatisfaction. The importance of peer interaction is reinforced in several studies on the longer-term transformation of students with regard to issues of diversity and social justice. Whitt et al. demonstrate that students who converse with one another about personal and cultural differences and controversial subjects, such as social problems, tend to become more open to diversity over the course of their college experience (2001). Interactions that challenge previously held ideas and beliefs were associated with an increase in openness to diversity and challenge. Pascarella et al.'s study of transformative change over the first year of college also demonstrates that "the more students interact with diverse peers and the greater the extent to which such interactions focus on controversial or value-laden issues that may engender a change in perspective or opinion, the greater one's development of openness to diversity and challenge" (1996, p. 188).

Preliminary interviews with members of the non-diverse experimental group cohort at the end of the second year of their program revealed that discussing controversial issues with their peers, both inside and outside of the classroom, was a key element in their learning. Participants generally agreed that a significant impact of participating in the program was becoming more open minded, as well as considering the opinions of others and why they are held. Considering the opinions of others is part of the maturation process and contributes to transformative learning. The participants noted the importance of interactions with other members of their cohort in their development of self-confidence and critical thinking about social problems, because many different and controversial topics were discussed with peers with various opinions. For example, one student interviewed at the end of the second year her program described the influence of peer-group discussions on her own evolving learning process: "I think that is the biggest thing for me and I think it has come from learning more about the different [marginalized] groups [through lectures] because obviously that then gives me the information to form an opinion but also meeting all these different people who have their own opinions." When asked which aspect of her program thus far had the most influence on her learning process, the same participant replied "Talking to peers, definitely. Because we get the information from the lectures but it's through the discussions that we have, in person, on Facebook, through confrontations with each other, through talking to each other, that has given me more of a sense of understanding".

Although transformative learning may be a process that takes several years to develop, factors that may contribute to openness to diversity and difference could be introduced in individual classes in order to support the transformative learning process. As Brock notes, "in looking back over a semester, learners can be surprised that life lessons have been learned. Sharing these with classmates can cement this change and stimulate others to see the world in a new way" (2010, p. 137). Providing experiences that may contribute to the development of a disorienting dilemma in the form of personal narratives, films, guest speakers, or other methods of exposing students to belief challenge seems central to the development of transformative learning. Coupling such experiences with exercises in which students interact with one another can also contribute to the process. Encouraging students to share their perspectives on controversial topics in a safe environment can help them to appreciate different perspectives. Discussing beliefs, disorienting dilemmas, and belief change with peers can encourage critical reflection.

## **5. Conclusion**

The data provided in the first phase of the project do not support the notion that structural diversity contributes significantly to lower levels of intolerance in post-secondary Sociology students. Attitudes towards marginalized groups may

be less likely to change significantly over a single term. The findings, however, have alerted the researchers to several areas that might require special attention in future teaching and to developing the conditions necessary to limit resistance to diversity information. This study highlights the advantage of following students through a multi-year program in order to examine transformative learning.

---

### Abstract

Presented paper is aimed at the area of e-Accessibility which is an integral part of the involvement in modern educational platforms in university environments. The theoretical basis of e-Accessibility in the Czech and Slovak Republic is defined in the context of applicable legal norms. Results of research focused on e-Accessibility in both countries showed that only one third of the universities in Czech and only one fifth of the universities in Slovak Republic meet requirements on e-Accessibility. In the conclusions authors present recommendations for more effective elimination of the discrimination of the students with visual impairment at universities.

*Keywords:* e-Accessibility; Student with Visual Impairment; University

## 1. E-Accessibility

The term “e-Accessibility” (also used as “*eAccessibility*”) is directly linked to the term “*accessibility*”, which according to Špinar (2004) represents a condition when a given matter presents its users with no significant obstacle in use. An accessible building, for example, can be visited by people in wheelchair and an accessible electronic environment by the people without visual perception. Accessible in the given concept means barrier-free access. Letter “e” signifies the aspect of accessibility of the wide range of electronic processes for individual with disabilities. The term e-Accessibility can be classified and can have various levels defined accordingly as “the extent to which information is available” (Ho, 2004, p. 85). The state of the matter is not static; in contrary it is rather dynamic in nature, because electronic environment is subjected to the development and continuous change.

The character of accessible electronic information respects the specific limitations of persons with visual impairment. The term “accessibility”, in the context of electronic information, is most frequently related to the internet, especially to web browsing and to working with electronic documents in various formats, such as web pages and text files (txt, html), text documents (odt, doc, docx, rtf), spreadsheets (ods, xls, xlsx) and PDF files. The contents, functions, services or possibly the individual elements of electronic documents should be accessible to the largest possible range of users, regardless of age, health impairment, or technical limitations at the user-end (Regec, 2010b).

In presented paper we use the term “*e-Accessibility*” in context of visual impairment, which determines the students in the area of inclusion to the electronic environment of university.

## 2. E-Accessibility in the context of visual impairment

E-Accessibility for the students with visual impairment is “a fundamental requirement to allow for participation, independence and inclusion” (Miesenberger, Corradi, Mele; 2012, p. 197). In this context, we agree with Sopczyk & Viggiani’s definition of a visual impairment “as some form and degree of visual difficulty which includes a wide spectrum ranging from partial vision to total blindness” (2011, p. 343). Categories used to describe students with visual impairment in the educational environment are according to Pierangelo & Guiliani (2007) “partially sighted, low vision, legally blind and totally blind” (p. 331). Access to electronic educational environment is generally through a graphical user interface and therefore not easily accessible to legally blind and totally blind users (Hersh & Johnson, 2008). Appropriate means of processing and converting to audio or tactile form is essential for these students (Finková, 2012). For individuals with low vision or partially sighted is e-Accessibility primarily focused at appropriate adjustment of visual representation of information (contrast, text style, text size, ease of navigation etc.). Assistive technology (e.g. screen reader software, screen magnifier software) is fairly well developed, but can only be used if “documents are appropriately designed” (ibid, p. 386).

Finková, Regec & Růžičková (2012) defined following basic rules for creating the accessible electronic documents:

- Text information in a document is provided as a text (not in a graphical form).
- All “non-text” elements (e.g. pictures, animations, photographs) are provided with text equivalent.
- A document does not provide such information that its comprehension would require correct color perception.
- Text information is provided with adequate contrasts.
- Document structure is semantically organized and correctly described (especially headings, lists etc.).
- Font size and typeface used are defined in accordance with the requirements of an individual with visual impairment.
- Tables are readable and understandable even in linear arrangement.

### 3. E-Accessibility in the realm of Czech republic

Fulfillment of the national plan for equal opportunities for citizens with health impairment included stipulating the conditions for publishing information on public administration in an accessible form. This was carried out in the form of rules compiled in accordance with Act No. 365/2000 Coll., on public administration information systems and on change of other selected laws, with the last amendment to the Act amended by Act No. 81/2006 Coll. Information pertaining to the issue of accessibility from the aspects of individuals with visual impairment is specifically stipulated in the legal rules (public notice) as well as in the relevant guideline. The quoted public notice No. 64/2008 Coll. currently includes 33 mandatory and conditionally mandatory rules (the original number of rules was 37), divided into six logical units:

- 1) A website content must be accessible and readable.
- 2) Working with a website is controlled by its user.
- 3) Information must be comprehensible and transparent.
- 4) Controlling a website must be clear and comprehensible.
- 5) The code must be technically competent and structured.
- 6) Website accessibility declaration.

Individual rules were created according to Blind Friendly Web materials “Documentation of websites accessibility principles for users with severe visual impairment” and the set of rules Web Content Accessibility Guidelines 1.0 from 1999, as well as new aspects concerning accessibility from Web Content Accessibility Guidelines 2.0 (Finková, Regec & Růžičková, 2012).

In accordance with § 21 Section 1, Act No. 111/1998 on Higher Education Institutions and on the amendment and supplement to some other Acts (The Higher Education Act) a public higher education institution is obliged to make all possible provisions for ensuring equal opportunities for study at the higher education institution” (under letter e). The code however does not specify extent of these provisions nor other, more detailed circumstances in the electronic environment. In this context, it is important to point out also § 62 which states that a student has the right to “use equipment and information technology required to study in a degree program in accordance with the rules established by the university.” (Section 1, letter g). Moreover Act No. 198/2009 on Equal Treatment and Legal Protection Against Discrimination (Anti-discrimination Act) in § 2 states that “direct discrimination is understood as means of such conduct, including omissions thereof, where one person is treated less favorably, than other person is, used to be treated or would be treated in a comparable situation because of race, ethnicity, nationality, gender, sexual orientation, age, disability, religion, faith or belief” (Section 3). In addition to the above we must note that legal framework still does not guarantee that the level of e-Accessibility at universities in the Czech Republic and is, or will become satisfactory.

In research conducted in 2012-2013 focused on visually impaired students in the realm of Palacký University Olomouc, for 25 % of the websites belonging to individual departments and institutes the determined level of accessibility was “very low” (Rezek, 2013). Author (ibid) further notes that for another 25 % of departments the determined level of accessibility was “lowered” or “low”. The findings showed that overall half of the departments (respondents) had a major barrier for people with visual impairment in their electronic environment and only one fifth of workplaces has reached a high level of accessibility.

Our pilot research conducted during May 2013 on 21 main web portals of public and private universities did not produce positive results about the overall level of e-Accessibility. Evaluation was conducted manually on title pages and on other publicly accessible content including electronic documents, forms, tables etc.

As a background for quantification of the overall accessibility level we used calculation model developed by Regec (Regec, 2008; Regec, 2010a; Regec 2012).

The following table and chart present overview of the results based on the achieved levels of e-Accessibility.

Table 1. Distribution of e-Accessibility levels of universities' web portals in 2013 in the Czech Republic.

Level of e-Accessibility	<i>Absolute frequency</i>	<i>Relative frequency in percentage</i>
Fully accessible	1	4.76
Good	6	28.57
Insufficient	10	47.62
Poor	3	14.29
Not accessible	1	4.76

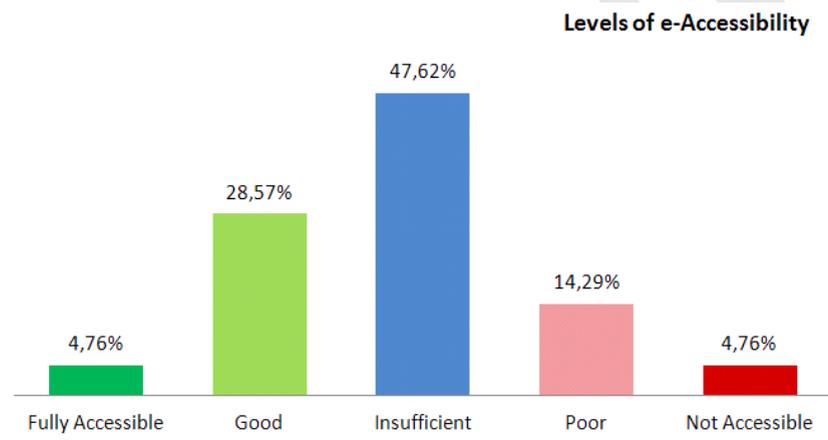

Fig. 1. Chart depicting the distribution of universities' web portals e-Accessibility levels in 2013 in the Czech Republic.

The results show that only one third of the universities' main portals does not contain any substantial barriers in e-Accessibility (presented as the levels "Fully accessible" and "Good"). On the other side about one fifth of the portals (19 %) have real deficiencies that directly worsen access to the electronic information or make it totally inaccessible for the visitors with visual impairment (presented as the levels "Poor" and "Not accessible"). The remaining 50 % of web sites technically violates multiple accessibility rules, these violations however do not have any serious impact on the real level of e-Accessibility for the visually impaired user.

On the account of the presented results it must be noted that within this pilot study we have evaluated only publicly accessible information on the universities' main portals. E-Accessibility levels thus do not reflect accessibility of other web publishing systems utilized at individual faculties and departments, learning management systems, academic information systems etc.

#### 4. E-Accessibility in the realm of Slovak republic

The first binding code that determined compulsory requirements for accessibility was the Act No. 275/2006 Coll. on Public Administration Information Systems. Edict No. 1706/M-2006 defined requirements for e-Accessibility of public administration. As compulsory requirements for accessibility we listed selected WCAG 1.0 guidelines (Web Content Accessibility Guidelines 1.0) and Blind Friendly Web 2.3 guidelines. Currently in force is the Edict No 312/2010 Coll. on standards for public administration information systems, which lists compulsory requirements under § 14 "Accessibility of web sites". More detailed information on accessibility including practical examples to this legal norm is published in a document named "Methodology to Edict No. 312/2010". Similarly to the Czech Republic, also Slovakia has enacted anti-discriminatory legislation which is also applicable in the area of e-Accessibility. Act no. 365/2004 Coll. on Equal Treatment in Certain Areas and Protection Against Discrimination, and on amending and supplementing certain other laws as amended (Antidiscrimination Act) states in § 2a, that discrimination due to "disability shall also mean the discrimination due to a previous health impediment or the discrimination of a person in the event in which based on external signs of a person it would be possible to presume that the person has a disability" (Section 11). Furthermore, in the same context Act no. 131/2002 Coll. on Universities and on the amendment of certain acts as amended, in § 100 "The support of students with disability" states that: "Within the scope of its abilities university provides special support during university studies to the students with disability." In view of the provisions "within the scope of its abilities", a support system in practice is not clearly defined.

In an extensive research during the years 2007-2009 (Regec, 2010a), author came to the conclusion that only 3 out of 34 universities could be, based on the evaluated areas in the electronic environment, evaluated as highly accessible to the visually impaired persons. In contrast, electronic environment with low and very low level of accessibility was recorded in 15 (44 %) of universities (ibid.). Especially alarming was the accessibility level of the most frequently used Academic Information System, then used by over half of the subjected universities. The determined level was at very low level of accessibility. Practical implications of this were that student with visual impairment could not, without the help of an assistant, enroll in a new school term, look up his schedule, grades, sign-up for exams etc. Among other problems identified by Regec (ibid.) were also electronic study texts and other compulsory materials inaccessible to the visually impaired students or published in the form not suitable for conversion to the format accessible by the supportive technologies such as text magnifiers and screen readers.

Even worse than the results in the Czech Republic were the outcomes of the pilot study on e-Accessibility conducted in Slovakia in 2013 on 13 universities. Even though when compared to the research done in 2009 (Regec, 2010a) there is a relative 10 % decrease in the number of web sites in the "Not accessible" category, they still compose unacceptable 14 %. Only one fifth of evaluated main portals achieved "Good" level of accessibility while not even one could be considered as "Fully accessible" (Table 2).

Table 2. Distribution of e-Accessibility levels of universities' web portals in 2013 in the Slovak Republic.

Level of e-Accessibility	Absolute frequency	Relative frequency in percentage
Fully accessible	0	0.00
Good	3	21.43
Insufficient	5	35.71
Poor	4	28.57
Not accessible	2	14.29

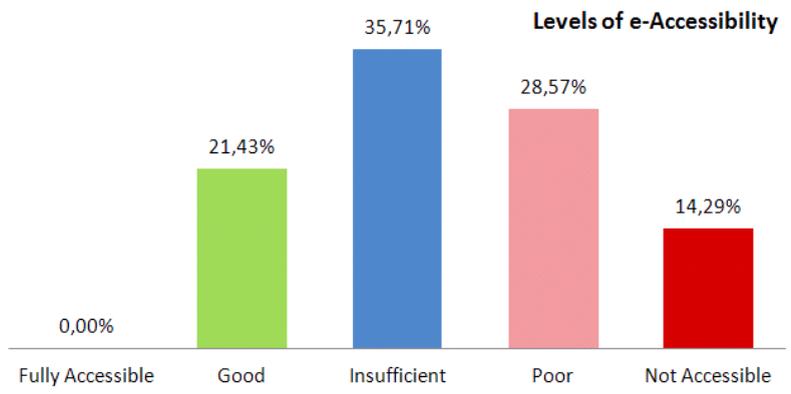

Fig. 2. Chart depicting the distribution of universities' web portals e-Accessibility levels in 2013 in the Slovak Republic.

## 5. Recommendations

**Re-evaluate current approaches and politics in the field of implementation and use of information technologies at universities.** Explicitly and clearly define universities' obligation to provide electronic information to students with visual and other disabilities in an accessible form through the adoption of legal standard that will be in accordance with international standards and directives of the European Commission.

**Increase competencies of faculty staff in the field of information technologies in order to support creation of accessible digital content.** Provide orientation and training for the faculty members responsible for the creation and development of online digital content focused on e-Accessibility best practices. Also include IT staff, special-needs educators and other related personnel in these trainings. We presume that accessibility issues are an integral part of multiple scientific fields and calls for interdisciplinary collaboration.

**Analyze e-Accessibility at universities and remove identified deficiencies and barriers.** Accessibility of electronic information is a complex phenomenon that must be addressed at multiple levels. From decision makers selecting the next publishing or information system, to personnel responsible for implementation, external providers and own IT managers, people responsible for content down to the individual contributors – to a various degree all these people must be informed about the importance of e-Accessibility and way how to achieve or to maintain it.

**Guide university students with visual impairment to achieve full autonomy when using information technologies.** Because accessible electronic environment means a great potential for improvement of the conditions in which individuals with visual impairment learn, as well as the whole process of their socialization,

it is necessary to look for the solutions that do not needlessly create barriers that would increase reliance of persons with disabilities on their surroundings.

## 6. Conclusion

In the inclusive environment principles of different approach to intact and visually impaired must not be applied. It is unacceptable for a student or other person (applicant for admission, school employee etc.) with visual impairment not to be able to fully participate in all electronic processes at the same level as another intact person in the same situation. Differentiating schools to those that take the needs of visually impaired students into account and those which do not, opposes legal standards and principles of modern education. Similarly it is incorrect to argue that university should undertake inclusive measures only upon the admission of visually impaired student, because mechanisms as e-Accessibility should be an integral part thereof.

In conclusion, we agree with the statement by Cattani (2003) on describing the basic premises of society, which transforms theoretical conditions for inclusion into reality by the means of effective measures. Cattani states that it should be a primary interest for a political system to include persons with disabilities rather than to exclude them. He points out that even though in our society there are many legal norms dealing with improving conditions of persons with disabilities, binding formulations are often changed into words like “may” and thus in interpretation and practical level they create rather moral than legal standards.

We consider it very important that the issue of e-Accessibility should not be focused at the affected individual alone or at the university department assisting with special needs. Inclusive model of university education requires mechanism of effective measures to be part of the entire education platform.

### Abstract

Recently there have been lots of development in technology. These developments create a base of information society. Especially social networks are one of the stone that help to create a base of information society. Facebook is widely used in the present century. The aim of this study to investigate the students' levels of literacy Facebook through the gender, class, having computer, how many hours spending on computers, having access internet, how many hours spending on internet, the purpose of using internet, which devices use to accessing internet, member a social network, which social networks member, how many hours spending on social networks variables. As a result of this study there have been a significant in the variable of "which social network are you member" in Facebook and Google plus and also "how many hours spending on social networks". SPSS 20 was used to analyze the data.

Keywords: Information society, Facebook, Information literacy.

## 1. INTRODUCTION

In the information society, in parallel with the development of technology concepts have gained size. The development of technology in the information society has also changed the desired features of individuals. Information society, individuals seeking knowledge, information, classify, has features that can store and evaluate appropriate environment (Numanoğlu, 1999). Information literate individual, it is necessary in the face of ever-increasing and changing information, classification of information, analysis and synthesis can be done. According to Gündüz ve Odabaşı (2004), people in the information society, knowledge of who knows how to have access to necessary information and can use the new information is required to be capable of producing individuals. Which has become the building blocks of modern society, the concept of information literacy has brought. The concept of information literacy is constantly increasing and changing the information he needs from a pile of information, classifying and sizing information, individuals can produce new knowledge can be explained in the light of new information. This concept has gained new dimensions in parallel with the development of technology (Akkoyunlu, 2008). Media literacy, internet literacy, digital literacy and etc. There are concepts in the literature of technology developments in the infrastructure. Facebook is not in the literature on the concept of literacy and education, widespread use of Facebook, because this study is expected to contribute to education.

## 2. METADOLOJI

Our study has planned with screening model and carried out research, with the blended learning students in Sakarya University Computer Education and Instructional Technology department 2nd 3<sup>rd</sup> and 4<sup>th</sup> class. The concept of literacy is examined in detail and was created on Facebook literacy questionnaire with a single factor consisting of 17 items. To carry out the work of the validity of the questionnaire was created to explore the exploratory factor analysis (EFA) were conducted. Accordingly, the value of self-developed Facebook Literacy scale factor greater than 1, only 68.06% of the total variance structure 'constituted. It is over 30% of the explained variance, is sufficient for the behavioral sciences in the development of the test (Büyüköztürk, 2004). As a result of the Cronbach's alpha internal consistency reliability was 0.97. The validity and reliability of the results of studies show that Facebook is a valid and reliable scale of Literacy. With the 5-point Likert-type data collection tool that we have developed, collected 138 blended learning students' views. According to information from the data Sakarya University official department, our research universe has been with 193 blended learning students. In this study, it is important to study achieved almost all of the universe.

## 3. RESULTS

In this section, blended learning students participating in the survey of gender, class, having computer, how many hours per day spent their time at the computer, having internet, how many hours per day spent their time on the Internet, the purpose for which they use the Internet, which devices they use to connect to the internet, membering social networking sites, which social networks they have membered and how many hours per day spend time on the social network. Demographic characteristics of the students' analyzed with t-test and ANOVA. The findings of  $P < .05$  or 5%, 95%, ignoring the margin of error was evaluated as reliable results (Büyüköztürk, 2011).

Blended learning students in terms of gender difference in the two means in order to determine the levels of literacy Facebook significance test (t-test) according to the values of literacy levels of the students on Facebook in the p-value is larger than .05. Because of that there is no significant difference according to gender ( $t = -1.745$ ,  $p = .083$ ) was found.

Blended learning in terms of students' class variable in order to determine the levels of literacy Facebook one-way analysis of variance (One Way ANOVA) according to the values of literacy levels of the students on Facebook in the p-value is larger than .05. Because of that there is no significant difference according to class ( $t = .302, p = .740$ ) was found.

Blended learning students in terms of having computer difference in the two means in order to determine the levels of literacy Facebook significance test (t-test) according to the values of literacy levels of the students on Facebook in the p-value is larger than .05. Because of that there is no significant difference according to having computer ( $t = .854, p = .431$ ) was found.

Blended learning in terms of how many hours spent time on computer per day variable in order to determine the levels of literacy Facebook one-way analysis of variance (One Way ANOVA) according to the values of literacy levels of the students on Facebook in the p-value is larger than .05. Because of that there is no significant difference according to spending time on computer ( $t = .641, p = .634$ ) was found.

Blended learning students in terms of having internet access difference in the two means in order to determine the levels of literacy Facebook significance test (t-test) according to the values of literacy levels of the students on Facebook in the p-value is larger than .05. Because of that there is no significant difference according to having internet access ( $t = .882, p = .470$ ) was found.

Blended learning in terms of how many hours spent time on internet per day variable in order to determine the levels of literacy Facebook one-way analysis of variance (One Way ANOVA) according to the values of literacy levels of the students on Facebook in the p-value is larger than .05. Because of that there is no significant difference according to spending time on the internet ( $t = 1,506, p = .192$ ) was found.

Blended learning in terms of what is the purpose of using internet variable in order to determine the levels of literacy Facebook significance test (t-test) according to the values of literacy levels of the students on Facebook in the p-value is larger than .05. Because of that there is no significant difference in reading news/books/music/radio, playing game, doing homework/studying lesson, chat, improving foreign language, having communication, watching video/tv, sending e-mail according to purpose of using internet was found.

Blended learning in terms of which devices are using to access the internet variable in order to determine the levels of literacy Facebook significance test (t-test) according to the values of literacy levels of the students on Facebook in the p-value is larger than .05. Because of that there is no significant difference according to devices in laptop, personal computer, tablet, mobile phone to access the internet was found.

Blended learning students in terms of membering a social network difference in the two means in order to determine the levels of literacy Facebook significance test (t-test) according to the values of literacy levels of the students on Facebook in the p-value is larger than .05. Because of that there is no significant difference according to membering a social network ( $t = 1,829, p = .208$ ) was found.

Blended learning in terms of which social networks are you a member variable in order to determine the levels of literacy Facebook significance test (t-test) according to the values of literacy levels of the students on Facebook in the p-value is larger than .05. Because of that there is no significant difference according to twitter and others was found. But there is a significant difference in Facebook ( $t = 7,868, p = .000$ ) and Google plus ( $t = 2,750, p = .007$ ).

Blended learning in terms of how many hours spent time on social networks per day variable in order to determine the levels of literacy Facebook one-way analysis of variance (One Way ANOVA) according to the values of literacy levels of the students on Facebook in the p-value is smaller than .05. Because of that there is a significant difference according to spending time on the social network per day ( $t= 3,282$ ,  $p=.008$ ) was found. Also to determine the differences in detail Tamhane test has used. There couldn't find a significant differences, either.

#### 4. CONCLUSION

Students participated in the study, which examined students' levels of literacy Facebook member variable of social networking sites, Facebook and Google Plus seems to be a significant difference according to the variable. This results in students spend time on Facebook, on their own, solve the problems encountered can be explained by. Blended learning courses, students are also an effective way to use Facebook, Facebook is seen that the relationship between the levels of literacy.

Facebook literacy levels of the students was how many hours per day spending time on social networks variable. The students were a significant differences according to spending time on social networks. This results in students spend time on social networks, they are looking for and finding can be explained by integration of social networking platform.

As a result of this study shows that to be member of Facebook and spent time on Facebook affects their Facebook literacy level. So that by using Facebook in the education process can help students to get the information more effectively and efficiently. After the classifying, analyzing, sorting and synthesizing the information, they can put out a new product.

# Factors and conditions impacting teacher leader influence

Kristen A. Clarke\*

*Brock University, St. Catharines, Ontario, L2S 3A1 Canada*

---

## Abstract

This study explored factors and conditions that impact teacher leaders' ability to influence colleagues in secondary schools in Ontario, Canada. Data were collected from six department heads in a suburban school board using semi-structured interviews. This student demonstrates that teacher leaders ability to influence others is affected by both external and internal factors and conditions. A framework presenting department heads as teacher leaders was developed using a constructivist lens. These results will allow boards, schools and teacher leaders to deepen their understanding of the need for collaborative environments that foster on-going learning and decrease the negative effects of external and internal factors and conditions department heads experience in their schools.

Keywords: Teacher leadership; teacher influence; teacher working conditions; teacher influence

---

## 1. Introduction

Teacher leadership is emerging as a recognized necessity in schools. Engaging multiple stakeholders for their collective capacity is increasingly being seen as fundamental to student success. As such, teacher participation in leadership allows for a ground level perspective on instruction, pedagogy, decision-making, and policy interpretation and should play a pivotal role in school leadership (Katzenmeyer & Moller, 2009). Nevertheless, secondary school department heads have consistently had a role in school leadership and can be considered teacher leaders working and influencing others within diverse educational contexts. This study explored how six department heads in a suburban school board demonstrated elements of teacher leadership and how the factors and conditions under which they worked affected their ability to influence others.

## 2. Purpose of the Study

Teachers are, given the nature of their role, in leadership positions; however, the current expectation for teachers to lead beyond the classroom is challenging many secondary school educators. This study investigated factors and conditions that secondary school department heads experience in their formal teacher leadership roles in Ontario, Canada. To explore teacher leadership, department heads were asked to discuss their perception of their role, their working conditions, and how they navigate these conditions. Teacher leaders are educators who "lead within and beyond the classroom; identify with and contribute to a community of teacher learners and leaders; influence others toward improved educational practice; and accept responsibility for achieving the

\* Corresponding author.  
E-mail address: kc05lv@Brocku.ca

outcomes of their leadership” (Katzenmeyer & Moller, 2009, p. 6). Teacher leaders have their own understanding of their roles and experiences and these roles are greatly influenced by context (Barth, 2001; Peckover, Peterson, Christiansen & Covert, 2006). As such, definitions of teacher leadership vary. And, as Ryan (2007) notes, not enough emphasis has been placed on examining the purposes and outcomes of teacher leadership as opposed to the tasks they engage in.

Four issues led to the exploration of the factors and conditions under which department heads function. First, department heads have little collective voice because of the absence of a governing body that specifically responds to their interests and concerns. Subject specific associations exist for teachers and the Ontario College of Teachers governs the entire body of educators in the province; however, support for teacher leaders and department heads is lacking. Second, there is little written about both subject-specific and cross-curricular department heads at the secondary level in Ontario. Third, there is great variety, poor role definition and extensive responsibility in the departmental headship, resulting in role ambiguity and role confusion (Hannay & Denby, 1994; Schmidt, 2000). Fourth, as schools demonstrate more distributive forms of leadership (Grubb & Flessa, 2006) and as professional learning communities flourish (Muijs & Harris, 2006), the headship is becoming more complex. In Ontario, the role expectations of the department head has been expanding while at the same time, professional development, autonomy, and resources are dwindling. It is clear that principals can no longer be expected to lead schools independently (Lambert, 2002) and a deeper recognition of the potential benefits of teacher leadership must surface. This study gives voice to department heads, fills a gap in the literature on the role from their perspective, and examines how teacher leaders navigate a changing environment where they are assuming more leadership responsibility and in turn, influencing other educators.

### **3. What is teacher leadership?**

The roles and responsibilities of both teachers and administrators are expanding, leaving many educators overburdened, but still striving to improve education and in particular, to develop coherent and positive instructional and assessment strategies for students. As such, modern approaches to leadership are appearing. Definitions of teacher leadership abound. Barth’s (2001) formative piece on teacher leadership outlines 10 essential tasks that teacher leaders can perform to demonstrate their leadership. Moving from this task-specific understanding of teacher leadership, Andrews and Crowther (2002) define teacher leadership as “behaviour that facilitates principled pedagogical action toward whole-school success. It derives from the distinctive power of teaching to share meaning for children, youth and adults. It contributes to enhance quality of community life in the long term” (p. 154). Teacher leadership is an evolving contextually and culturally defined construct (Scribner & Bradley-Levine, 2010). It is part of the sociocultural contexts of schools (Ryan, 2007). Teacher leadership, similar to other forms of leadership, involves a process of influencing others and working collaboratively toward improved student learning while engaging in student-focused teaching and learning practices. Angelle, Nixon, Norton, and Niles (2011) found that teacher leadership is an organizational construct that extends beyond individual teacher roles. In their influential meta-analysis of teacher leadership, York-Barr and Duke (2004) define teacher leadership as “the process by which teachers, individually or collectively, influence either colleagues, principals, and other members of school communities to improve teaching and learning practices with the aim of increased student learning and achievement” (p. 287-288). Clarke (2009) suggests that teacher leadership is a constantly evolving construct that is rooted in school contexts. Despite Ryan’s (2007) statement that much of the research on teacher leadership focuses on the process of teacher leadership, emphasizing the technical aspects of teaching and omitting the systemic issues such as equity and democracy, there is also a budding body of literature that explores how teacher leadership fosters democratic ideals within schools (De Villiers & Pretorius, 2010) and social awareness (Larabee & Morehead, 2010; Rottmann, 2011).

Influence is a significant concept for leaders; without it, there would be no change. Anderson (2008) identified influence as key in organizations with shared or distributed leadership processes in place. He found that mutual influence often took place between teachers and principals (p. 11). This influence transpires as a result of one of three “transformational shifts” from individualism to professional community within education (Lieberman & Miller, 2004) and these shifts support a new approach to school leadership—teacher leadership. Teacher leadership has become more relevant and needed as educators navigate this current period of accountability and as the roles for teachers become ever more complex (Valli & Buese, 2007). It is a construct that can be seen as a support to navigating these complexities. Lambert (2003) suggests that teachers have the ability to lead, but the right context must exist for their actions to have influence. Often times, teacher leadership is evident in schools with a more devolved organizational structure; studies indicate that teacher leadership can exist in schools working within a more distributed leadership framework, those which are being navigated by servant leaders, and schools that prioritize professional development (Darling-Hammond, et al., 1995).

Teacher leadership is often linked to distributed leadership, but can be seen as a narrower leadership construct in the sense that it is primarily concerned with the leadership roles of teachers, yet broader in that it allows for informal leadership roles (Muijs & Harris, 2007). A significant component of distributed leadership is the work of teachers leading innovation and change both inside and outside their classrooms (Harris & Muijs, 2004). Teacher leadership necessitates a redistribution of power, with a diffusion of power away from the principal to other educators within the school (Muijs & Harris, 2006). However, “the contested and contextual nature of ‘distributed leadership’” has been raised by Anderson (2011, p. 330), leading academics to question whether distributed leadership is truly empowering for teachers or merely a redistribution of work with little increase in power or influence. Teacher leadership is also often coupled with shared leadership (Lambert, 2002) and parallel leadership (Andrews & Crowther, 2002). Andrews and Crowther distinguish difference between parallel leadership and distributed leadership by stating that “the leadership functions of teacher leaders are equivalent in value to those of principals” (p. 155) in parallel leadership. Teacher leadership is also often connected to authentic leadership. Authentic leadership, which pushes organizational culture to the level of the community, parallels informal teacher leadership in that leaders often provide guidance, seem altruistic, act honestly and with integrity and place service over self (Pielstick, 2000, p. 111). The connections between teacher leadership and other leadership constructs that buck traditional hierarchies exist and merit further exploration.

### *3.1. Formal Teacher Leadership Roles*

The role of department head is evolving into one of teacher leadership. Based on the contention that the role of principal is too large for one person to manage, historically, department heads were designated to support school organization. Currently, the role of teacher leader is to support the overall school vision (Barth, 2001; Beachum, & Dentith, 2004; Lambert, 2002). However, as the role of department head extensive, there is concern that the role continues to be merely a distribution of tasks, as opposed to a distribution of power. Furthermore, these formal teacher leadership roles, designated as department headships, continue to exist within the traditional and hierarchical models of leadership (Anderson, 2008). These formal roles are often seen as part of a leadership ladder (Ryan, 2007), where teachers move from informal leadership roles to formal leadership roles (Searby & Shaddix, 2008) prior to moving to administrative roles. Many secondary schools in Ontario continue to be organized according to this structure despite an emergence of more distributed forms of leadership.

#### 4. Theoretical Framework

This study used a constructivist lens to examine department heads' perceptions of the nature of their leadership role and the factors and conditions that affect their ability to influence others. Constructivism, a learning theory formalized by Jean Piaget, roots knowledge to each unique individual and to their personal experiences, reinforcing the social construction of knowledge and the mediation of its construction by cognitive structures (Schwandt, 2007). Constructivism has taken on aspects of realism: the recognition that research and knowledge construction are on-going, that the researcher is an actor in the research environment and that multiple realities are at work in any given situation (Mir & Watson, 2000). An individual's personal framework, developed through their historical and cultural experiences, informs their construction of meaning. The idea of socially constructed meaning also evokes Foucault, who theorized that truth is a power-laden construct, and accordingly, knowledge identified as true knowledge would represent the limited perspectives of a small group: those with power. Furthermore, according to Desautels, Garrison, and Fleury (1998), constructivism dismantles the concept of truth as it relates to reality and focuses on the impossibility of identifying true knowledge (p. 255). Ernest von Glaserfeld, a forefather of constructivist theory, suggests that knowledge exists only within an individual and that it is redefined through on-going reflective processes. Additionally, these processes are considered to be a social endeavour with groups collectively developing ideas and individuals appropriating those ideas. Constructivist epistemology also emphasizes inquiry and the interaction between the knower and the known, with the result being the development of understanding through continued reflection and self-understanding (Razik & Swanson, 2001). In turn, constructivism informs the way educational researchers interpret what goes on in schools and has "emerged as an important educational perspective that is changing how educational researchers, writers, and practitioners view the world of teaching and learning" (Lambert, 1995, p. 28).

Constructivist leaders use inquiry within their communities to co-construct knowledge informed by their contexts (that is, the history and culture of their school, its students and its staff). They recognize their role in leading and aim to move toward more democratic approaches and reflective practices. Constructivist leadership is defined as "the reciprocal processes that enable ... participants in an educational community to construct meanings ... that lead toward a common purpose of schooling" (Lambert, 1995, p. 32). With constructivism as the overarching framework, the factors and conditions that department heads as teacher leaders work within were analyzed. Constructivist leadership emphasizes the co-construction of meaning while recognizing the mutual influence between educators within an educational setting. Therefore, constructivist leaders are leaders of change, as they shift the thinking around school improvement to relate more directly to the needs of students, resulting in leading for learning, a more humanist and democratic approach to leadership (Shapiro & Koren, 2007). As with constructivism, which focuses on teachers' ability to facilitate learning, constructivist leadership focuses on the ability of leaders to facilitate collaborative learning. Mir and Watson (2000) contend that teacher leadership, a power-laden construct, can only be constructed by those involved in the act. The teacher leader is an active participant in the construction of their role based on the experience and contexts of their school. Each teacher leader may have a slightly different construct of teacher leadership, yet there are similarities that are guided by the six assumptions of constructivism. In her work on leadership capacity and school improvement, Lambert (2003) asserts that teacher leadership does not follow the traditional hierarchical nature of school organization; teacher leadership can empower teachers who are at the bottom of the school organizational pyramid. Furthermore, Lambert suggests that leading and learning are interconnected with leading acting as the foundation to teaching (Lambert, 2003).

#### 5. Methods

This study was qualitative in nature and used a constructivist inquiry design (Guba, 1978; Guba & Lincoln, 1985). The research participants' perceptions of their role were at the core of this study, and thus semi-

structured interviews, lasting from 60 to 75 minutes, were conducted with six department heads. Qualitative research supports the use of small, focused samples, (Creswell, 2005). The sample represents department heads with a variety of professional experiences from a large school board in southern Ontario. Of the three male and three female participants, four held dual-role headships, combining two curricular areas. They ranged in age from early 30s to mid 50s, had between four and 25 years of teaching experience and had held headships for between one and 18 years. Two sampling methods were used to identify potential research participants because of the dual challenges of garnering interest in the study and identifying a range of research participants. A snowball sampling method was originally anticipated (Creswell, 2005). However, after the first research participant—whom a colleague recommended—did not suggest others, a more purposive sampling method was undertaken. Additional participants were invited to join the study by contacting department heads whose names were posted on school websites. This was in line with Merriam (1998) who suggests that purposeful sampling can be used when an investigator wants to understand a phenomena specific to a group.

## 6. Results

The department heads perceived their roles to have three consistent elements that align with the construct of teacher leadership. They considered themselves to primarily be teachers with a focus on student success. This included teaching a full course load, completing supervisory duties, doing on-call coverage for colleagues, and developing sound instructional practices and classroom management strategies. Interestingly, the department heads communicated different understandings regarding what “teacher leadership” meant and how their roles demonstrated this and several of the department heads were unfamiliar with the term. Department heads also noted their role as having both instructional leadership—leading through mentorship and collaborating on curriculum and pedagogy— and managerial facets—acting as a liaison between administrators and teachers and completing administrative duties.

Department heads discussed the context of their work and their working conditions at length. Factors and conditions affecting the influence of the teacher leaders were categorized into two groups: external conditions outside the department head’s realm of control that affected their ability to influence others and internal factors that affected their feelings about the role. At times these factors conditions interfered with the goals of the department.

### 6.1. *External factors and conditions affecting department heads*

The departmental headship is a challenging position if the goal is to develop whole school improvement and to have a broader impact on student success. Many department heads struggled to focus on improving student success and implementing district-wide initiatives within their own departments. The department heads reported five external factors that impacted their ability to collaborate with colleagues and influence teachers: relationships with colleagues; lack of time; the impact of policy on practice; school and department culture; and the leadership approaches of the administration.

The primary external challenge for department heads was demanding relationships with colleagues. Department heads noted the difficulty of dealing with some department members and administrators. Department heads with dual-responsibility roles had additional challenges because often times they were not qualified as specialists in both of areas of responsibilities; this resulted, at times, in divisive departments where some teachers felt under-supported. Lack of time was also a recurring issue for the department heads; they discussed the significant amount of time required to mentor new teachers and to complete administrative duties such as organizing book rooms, ordering materials and attending meetings. The complexities of the administrative tasks

and the number of responsibilities often took precedence over the development of instructional practices supporting student achievement. Department heads were not afforded time to fully understand new initiatives, nor were they offered sufficient professional development to be able to articulately engage colleagues. Additionally, policy, such as the policy preventing department heads from participating in hiring processes for new teachers, was noted as negatively impacting their ability to develop effective teams. All participants also described the effects of departmental culture on their efforts. They noted that to support a collaborative department, a great deal of time, skill, and effort was required to model appropriate teaching and to support others' efforts. Most importantly, the participants spoke at length about being enabled by supportive administrators working within a collaborative leadership framework. This resulted in a need for trusting relationships between department heads and administrators. Trust manifested itself in different ways: a hands off approach, an open-door policy by administration, public comments of support from administration, and recognition of effort.

### *6.2. Internal conditions affecting department heads*

Department heads were also faced with internal conditions affecting their ability to enact teacher leadership as a process processes. Frustration, powerlessness, and stress were the manifestations of role ambiguity and role conflict. Additionally, their own skill set affected their ability to influence others. Despite these struggles, department heads experienced positive internal conditions such as enjoyment, satisfaction, and engagement in their work.

Role ambiguity and role confusion were significant factors in the department heads' ability to influence others. The diversity and complexity of the role was evident when all six headships were examined. Each department head identified roles and responsibilities that were at times similar, yet individualized. They reported tension caused by misunderstanding other leaders' roles, and a hierarchy among departments based on whether their subject(s) were required for graduation, the size of department, or charisma of department heads. Additionally frustrating was the fact that none of the participants received job descriptions at the outset of their work, leading to role ambiguity. In dual-role department heads were challenged to engage all colleagues in a single focus, leading to stress and frustration. All of the research participants experienced feelings of unease as a result of the reality of their job versus their perceptions of their roles. Mayers and Zepeda (2002) note that participants in their own study experienced role conflict and role ambiguity as a result of the conflict between the experienced role and the role outlined in a faculty handbook. Schmidt (2000) notes "evidence points to the role of the department head being one of the most stressful positions in the education profession" (p. 828). All research participants' experienced role confusion and frustration.

The department heads noted how gaps in their own skills could negatively affect their ability to influence others. One participant expressed the headship as a learn-as-you-go experience, yet she also described how her teaching experiences rooted her work. Another participant sought courses from a private management institution to help him fill in gaps needed for the role. Department heads deal with a significant amount of stress, and the consequences of these effects are decreased self-esteem, feelings of inadequacy, and lack of empowerment (Schmidt, 2000). In summary, department heads feel a lack of teacher-efficacy at times.

### *6.3. How department heads influence others*

Some department heads held confidence in their ability to influence others in matters related to curriculum and instruction, but only two department heads cited their work as effecting significant change resulting in increased student success within their department. Department heads reported little success with their own initiatives because of the numerous pre-existing school and district initiatives. The ability to initiate change on a large scale or even on a department-wide scale was very challenging and for the most part not attempted. All research participants stated their role was centred on maintaining a positive climate, focused on improving student success, but they respected and even promoted individual teacher autonomy, with little emphasis on meaningful collaboration. It is this area where their role is significant. They created an environment where teachers could engage in student-focused conversations and supported teachers to the best of their abilities.

## **7. Significance of the Study**

The department head role is an example of teacher leadership and how teacher leaders can work toward influencing others. This is illustrated in the Framework of Teacher Leadership for Department Heads (Figure 1) constructed from the findings. The complexity of each participant's context allowed teacher leadership to illustrate itself in diverse ways. This is consistent with Siskin and Little's (1995) observation that each department has its own "context-specific differences" which make us aware that "the department is the singular entity that most predictably unites teachers with one another, and most deeply divides faculty groups from one another" (p. 7). Educators depend on the organization of schools into departments, but this narrows their school-wide ability to impact and influence other educators.

Many department heads and department members draw their sense of self through their membership in a department. This placement in a department forges "social identity, professional community and the social organization of the school" (Siskin & Little, 1995, p. 8). As a result, as a curricular leader in a specific department, many heads used the subject as a filter for information. They would engage their focus on their subject area and pass on relevant information to their department members. This had a detrimental effect on their ability to participate in whole school decision-making, as their own subject area often limited them. This supports Hargreaves and Fullan's (1998) ideas regarding the balkanization of departments and its detrimental effects on school culture

## **8. Recommendations**

The analysis points to several recommendations. Department heads should discuss their perceptions of the role and come to an agreement on how to navigate the role with colleagues and administrators. This would promote communication and facilitate leadership that focuses on student success. School administrators should collaborate with department heads to develop a deeper understanding of their responsibilities and the scope of their work within the department and the school. School board administration needs to be cognizant of the teacher leaders' need for training and professional development. This includes training in problem solving, conflict management, time management, leadership techniques, and issues around curriculum and instructional strategies. Boards need to provide time and opportunities for these skills to be developed.

## **9. Final Word**

Department heads are teacher leaders. They exemplify how teacher leadership is a process tasked to focus on student success and rooted in the classroom. With an understanding of their role, along with the necessary supports and positive conditions, department heads can be empowered to lead. Their role is multifaceted; it includes managing and leading. They are faced with numerous obstacles, which include role ambiguity and role confusion, the challenges that surface as a result of conflicts with colleagues, and feelings of

powerlessness, frustration, and stress. Despite the best efforts of these teacher leaders and their colleagues, they face a sometimes-difficult school culture or climate, demanding district and provincial initiatives, lack of time, foggy educational vision, and their own incomplete skill set. Much work is needed if departmental heads are to fulfill their potential as teacher leaders.

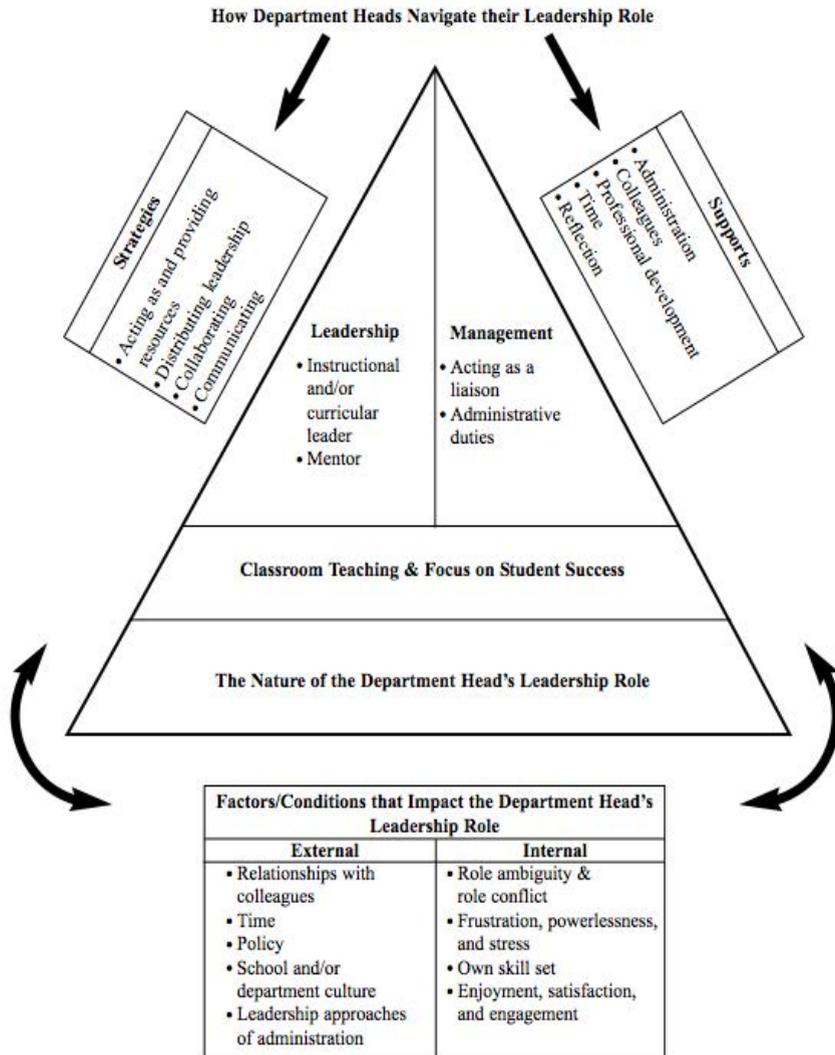

Figure 1: Framework of teacher leadership for department heads.

### **Abstract**

Portuguese science curricula acknowledge field activities as important tools for students to learn science and to relate science knowledge with the outside school world. The educational outcomes of this type of activities depend on the way they are organized and integrated into the teaching sequence. This paper presents a typology of field activities named after their main educational goal and categorized with regards to a set of educational criteria. Afterwards, it discusses the extent to which each type of field activity is consistent with problem-solving, namely with a problem-based learning approach.

*Keywords:* field activities; field work; science education; problem-solving; problem-based learning

## 1. From field work to field activities

Portuguese science curricula guidelines (DEB, 2001) acknowledge field trips as important tools for students to learn science and to relate science knowledge with the outside school world. This paper assumes that field trips, field work and field activities are related but different concepts. As a matter of fact, a review of the specialized literature reveals that over the years, several different words have been used to address the same or related entities associated with teaching outside the classroom and that they are not clearly defined and differentiated. Words like field work (Dummer, Cook, Parker, Barrett & Hull, 2008; Lock, 1998; Marques, Praia & Kempa, 2003; Schnoebelen, 1990), field activities (Dourado, 2001; Viveiro & Diniz, 2009), educational field activities (Diez, Martín & Vicente, 2008), field trips (Brusi, Zamorano, Casellas & Bach, 2011; McKenzie, Utgard & Lisowski, 1986; Orion, 1993; Scortegagna & Negrão, 2005), excursions (Compiani & Carneiro, 1993; García, 1994), and study visits (Andrade, 1991; Oliveira, 2008; Varela, 2009) are among the words commonly used to address such entities. This paper acknowledges Lock's definition of field work as the whole set of the all possible types of field activities, with diverse aims, structures, content, etc. Thus, it is conceptualized as a single entity that has encompasses all activities that students do outside the classroom, whatever they do it in open space or outdoors, to learn and develop relevant competences. However, its singular form does not enable to differentiate among field activities.

Based on Millar, Tiberghien & Le Maréchal's (2002) proposal for differentiating lab activities from lab work, this paper acknowledges that field activities differ from field work as the former have to do with a diversity of tasks that are carried outside the classroom; where the events to be studied take place; where the natural phenomena happen and can be observed as they happen, without the need of being reproduced; or in real work contexts, where technology is used for industry and production purposes. As a matter of fact, the word field in field activities suggests that there are activities that can be done outside the classroom and the plural form of activities indicates that there may be activities that are quite different from each other.

Field activities may start and/or continue in the classroom or in the school lab but they take place outside them. Therefore, in order to do field work and field activities, there is a need to do a field trip which includes going out of school and taking a journey to the place where the activities are to be performed. Preference for the word field trip instead of field visit has to do with the fact that field visit seems more leisure like and time limited than field trips are. Similarly, the word excursion activates meanings and ideas related to leisure. Although there is nothing wrong with associating learning and pleasure, it does not seem appropriate to emphasize leisure over learning. Finally, the word study in the designation study visits emphasizes the learning part but it goes together with a more time limited and leisure related word (visit) that may withdraw some seriousness from the former. However, it should be noticed that doing field work does not necessarily require a long trip (Del Carmen, 1999). In short, when one takes a field trip to do field work, one can do one, two or more activities, with quite similar or very different objectives and structures. It should also be noticed that field activities are different from a class outside the classroom, for example, in a museum or a university. In fact, in these cases, and opposite to what happens when field work is at stake, the place where the class will happen is different from the usual one but there will be no students' contact with the truly real world. If one wants students to be involved into field activities, a field trip has to be planned and organized and it can include the performance of one or more field activities which are relevant for one or more school subjects.

The objectives of this paper are: to present a reconceptualizing synthesis of the variety of field activities that can be thought of; and to discuss their relative consistency with a problem-solving perspective. The relevance of the paper lies in the fact that there are quite a lot of texts dealing with the first issue but they are written in diverse languages, do it in parts and use quite different words to name the same entities. This diversity makes it hard for the reader to make sense of all that stuff. Besides, there is no global discussion on the relationship of field activities and problem-solving in science education. This lack of discussion may impair teachers from becoming

aware of the relative strengths and limitations of the different types of field activities and consequently it may prevent students from being involved in truly problem-solving and problem-based learning of science situations.

## 2. Curriculum scope of field trips

Taking students out of school requires deciding on the scope of the field trip and setting up a set of administrative procedures as well as obtaining parents' authorizations for their children to take the trip.

As far as the scope of the field trip is concerned, it has to do with the way the field trip is integrated into the curriculum as well as with its intended educational objectives. A field trip can be organized within a single school subject or it may be planned by a few school subjects together. In the former case, the field trip is discipline-based and it focuses on places or issues that are relevant for the school subject within which the field trip is organized. In the latter case, field trips can be integrated within the diverse school subjects and this can be done in several ways, some of which may have higher disciplinary integration degrees than others do, depending on whether the field trips are multidisciplinary, pluridisciplinary, interdisciplinary or transdisciplinary in nature. Bearing in mind Costa's (2012) and Dalrymple & Miller (2006) definitions of these concepts, these types of field trips can be distinguished from each other based on the way they deal with places or issues analyzed during the field trip, as follows:

- multidisciplinary field trips: each school subject that is involved in the field trip concentrates on a place or issue, looks at it from its own perspective and makes it explicit some relationships between that place or issue and the content of the other subject(s);
- pluridisciplinary field trips: the diverse school subjects focus on the same place or issue, look at it from their own perspectives but they previously agree among them how they approach the object in order to avoid undesirable or even confusing repetitions and to save time;
- interdisciplinary field trips: all the school subjects involved in the field trip concentrate on the same place or issue, they approach it from each one's perspective although in such a way as to complete each other's point of view and to foster knowledge integration;
- Transdisciplinary field trips: all the school subjects concentrate on the same place or issue which is approached in a holistic way, so that the barriers between school subjects are vanished.

A field trip is often imagined as something that requires a long journey. However, this has not to be (Del Carmen, 1999) and is not (Howarth & Selingsby, 2006; Lock, 2010) necessarily the case, as very productive field trips can require short journeys. The local public garden, the village river, the public park pound, or the school garden or the playground wall can be relevant field trip destinations, as they can provide material to be explored in biology, geology or even physics and chemistry school subjects. Besides, the most frequent field trips concentrate on the surface of the Planet, but they can also have the underground (e.g., caverns) or on the sea (e.g., deep water sea) as their destiny.

As far as learning outcomes are concerned, a field trip can both help students to develop several different competences (Brusi, Zamorano, Casellas & Bach, 2011) and have a variety of learning goals (Braund & Reiss, 2004; Compiani & Carneiro, 1993; Lock, 1998). The latter include to serve as a way of complementing school-based activities (e.g., visit to a chemistry industry laboratory, after studying the ammoniac synthesis at school), to allow the contact with the natural world (e.g., to visit some natural caverns, in order to see stalactites and stalagmites) or with some natural (e.g., to visit a set of sand dunes, in order to understand how they are formed) or social (e.g., visit a fishermen to understand his ways of leaving) phenomena. Whatever the case, according to some authors (Braund & Reiss, 2004; King & Glackin, 2010; Lock, 1998) a field trip may be organized in such a way as to enable students to attain objectives related to:

- conceptual learning, that is objectives that focus on strengthening previously acquired conceptual knowledge, constructing 'new' conceptual knowledge, or reconstructing students' conceptual knowledge (which is especially interesting when students hold alternative conceptions on the concepts to be studied within the scope of the field trip);
- procedural learning, that is knowledge of specific purposes observation techniques (e.g., birds needing), samples collection (e.g., water from a river), conservation and transportation of materials (e.g., plants or animals) that need to be mastered by students;
- epistemological learning, that is knowledge relative to the characteristics of the scientific methodology relevant in field contexts, as well as to the (un)certainty of the science explanation and to the nature and role of models in (physics, chemistry, biology and geology) knowledge development;
- attitudes development, namely those related to respect towards the environment and towards science as well as scientific attitudes;
- interpersonal relationships, which have to do with respect to others, and cooperation with colleagues;
- contact with nature and real contexts, aiming at making students' aware of the complexity of the real world and the interactions that it comprises;
- questioning abilities, that is asking questions about nature and work contexts to understand, improve and take profit from them;
- extrinsic motivation, that has to do with fostering students' interest and curiosity towards real world work contexts.

As far as it is appropriately planned and organized, several of these objectives can be attained together within the scope of a single field trip. Success on attaining this goal depends on the activities planned to be carried out during the field trip and the way they are structured and implemented.

### 3. Types of field activities

As referred to above, field activities can help students to both attain diverse broad learning objectives and develop several competences. To succeed on doing so, they must have a structure appropriate to fitting those objectives. To differentiate among activities with diverse objectives and structure, Compiani & Carneiro (1993) use the following set of criteria:

- main learning objective to be attained through the activity;
- main teaching purpose, that can be formative (stressing the process of learning) or informative (stressing knowledge transmission or development);
- use or questioning of conceptual knowledge, as they can focus either on the use and preservation of students' conceptions and models on cognitive conflict and students' knowledge reconstruction;
- teacher's and students' roles, that can be student centered, teacher centered, student and teacher centered or guide centered teaching;
- dominant teaching logic that is, the logic that informs teaching process (that is, science or student logic).

When commenting on Compiani & Carneiro's criteria, Pedrinaci, Sequeira & García (1994) argue for the relevance of the teaching perspective for differentiating between field activities. According to these authors, the teaching perspective determines what is done and learned from a field activity. Taking together, these two sets of proposals seem to be useful although not enough to clearly distinguish among the diverse types of activities, as they do not make it explicit criteria like integration of the field activity in the teaching sequence. Hence, it seems that the different types of field activities can be differentiated from each other based on the following criteria:

- main learning focus: motivation, practical skills, and procedural, conceptual or epistemological knowledge

- underlying teaching and learning perspectives: transmission, guided discovery, discovery, constructivist, social-constructivist
- integration in the teaching sequence: before, during or at the end
- teacher's role: watch students, demonstrate, question students
- students' role: observe, perform, watch, solve-problems
- science skills and attitudes development: ignored, used, developed
- access to relevant conceptual knowledge: doesn't apply, given to students, 'discovered', constructed by the student
- role of student's previous knowledge: preserved, used, questioned
- availability of scaffold elements: no scaffold available, teacher and/or worksheet available
- acknowledged prevailing logic: science logic, student's logic
- interpersonal fostered relationships: none, student-student, student-teacher
- communication skills developed: questioning, answer, argument
- interaction with the environment: -intrusive, -non-intrusive

Table 1 shows a characterization of the types of field activities that may result from the use of these criteria and that are named after their outstanding educational objectives. In this context, outstanding objective means an objective that can be better attained through a certain type of field activity rather than through the others.

INTE 2013

Table 1. Characterization of the diverse types of field activities

Classification Criteria	Types of field activities						
	Motivating	Training	Illustrative	Guided observation	Inductive	Problem posing	Problem-solving
Main learning focus	Motivation	Practical skills	Conceptual	Conceptual	Procedural and conceptual	Procedural and epistemological	Procedural, conceptual, and epistemological
Underlying teaching and learning perspectives	Transmission	Transmission	Transmission	Guided discovery	Discovery	Constructivist	Social constructivist
Integration in the teaching sequence	Before	During or after	End	During	During	Before	Before, during, after
Teacher's role	Watch students	Demonstrate	Demonstrate or watch students	Watch students	Watch students	Watch students	Watch and question students
Students' role	Observe	Perform	Watch or perform	Observe	Observe and Perform	Observe	Solve problems
Development of science skills and attitudes	Ignored	Developed	Used	Used	Used and developed	Developed	Developed
Access to relevant conceptual knowledge	Doesn't apply	Doesn't apply	Given	Given	"Discovered"	Doesn't apply	Constructed
Role of student's previous knowledge	Preserved	Preserved	Preserved	Used and Preserved	Used and preserved	Used and (later) questioned	Accepted and questioned
Availability of scaffold elements	Unavailable	Teacher	Teacher	Worksheet	Teacher	Unavailable	Unavailable
Acknowledged prevailing logic	Student	Science	Science	Science	Science and student	Science and student	Science and student
Interpersonal fostered relationships	None	None	Student-teacher	Student-student	Student-student	None	Student-student
Communication skills developed	None	None	Answer	Answer	Argument	Questioning	Questioning, argument, answer
Interaction with the environment	Non-intrusive	Intrusive	Intrusive or non-intrusive	Non-intrusive	Intrusive or non-intrusive	Non-intrusive	Intrusive or non-intrusive

Despite the fact that an outstanding objective was associated to each type of activity it should be stressed that each activity may lead students to attain some objectives that are common to other types of activities. To illustrate this it can be expected, for example, that all types of field activities motivate students (Lock, 1998) and should promote their respect towards the environment. However, some field activities can be planned and performed just to raise students' extrinsic motivation towards science learning even though this type of activity makes more sense within a transmission, teacher centred, approach than within a student centred, constructivist, approach as the latter is more prone to generate intrinsic motivation than the former. On the other hand, although developing respect towards the environment should be an ever present issue, explicit action must be taken so that students develop respectful and protecting attitudes towards it when they do field activities.

In the whole, field activities have a diversity of main distinguishing objectives, ranging from the motivational ones to the problem solving ones, passing by the conceptual and the procedural ones. Table 2 shows the main

distinguishing objective of each type of activity characterized above, as well as a brief description of an example of each type of the activity.

Table 2. Outstanding objectives and examples of the diverse types of field activities

Types of field activities	Outstanding objectives	Examples
Motivating	To raise students' interest for an issue to be studied later on	Observe a river where dead fishes were found (before studying pollution causes and effects)
Training	To promote the learning of technics and the development of skills with diverse degrees of complexity	To learn how to use the compass in order to measure the slope and the direction of a geologic plan.
Illustrative	To strength previously acquired knowledge	Observe and analyse the types of rocks of the school surrounding to ascertain that they are those that were mentioned in the classroom.
Guided observation	To 'discover' or to ascertain something based on a worksheet.	To observe the process of industry ammoniac production based on a worksheet that makes it explicit the phases of that process.
Inductive	To observe and interpret in order to discover conceptual knowledge	To compare the types of plants that grow on sun exposed and non-exposed areas (to conclude that they depend on the exposure to sun light)
Problem posing	To develop an investigative spirit	To observe a place (e.g., an abandoned mine exploration) and to identify the issues that deserve being studied or worked out (to learn about or to solve some of them later on)
Problem-solving	To solve a problem	To find out the reason why the water from the Seven Oaks water source is turve.

#### 4. Field activities and problem-based learning of science

As it was referred to above, many people do not distinguish field work from field activities, and consequently they can hardly differentiate between potentially different learning opportunities that may arise from the diverse ways that field activities can be structured and integrated in the teaching and learning sequence. The effect of this is that they do not look critically enough to the activities that they include in a field trip, namely with regard to their probable effective learning outcomes. Besides, many people believe that having students doing whatever kind of field activity is good and means giving them the opportunity to do an investigation. This is not so as doing field work is not necessarily better than not doing it; its educational value depends on whether or not it makes a meaningful difference in terms of learning outcomes. In addition, and as it was argued above, doing activities in the field may mean carrying an investigation, consistent with a social constructivist perspective, or it may rather mean confirming what the teacher said, within a transmission and reception behaviorist educational framework.

Although it may make sense to do several different types of field activities (Scortegagna & Negrão, 2005), not distinguishing between them may nevertheless impair students from taking the chance of doing investigations. These are the most complex activities for students to do but they may lead to broader and deeper learning (Jaén & Bernal, 1993; Orion, 1993). On the other hand, they may also make the teacher feel more uncomfortable because he/she can no longer keep on 'telling knowledge' to students. In fact, if investigations are conceptualized as

problem-solving activities, then an analysis of the characteristics of field activities described in table 1, indicates that most of them do not fit that criterion. In fact, when solving a problem is at stake, the problem solver has to draw a strategy to overcome an obstacle that the problem statement faces him/her with. The obstacle may have to do with a real difficulty that has to be overcome or an immediate personal or social need that has to be fulfilled, but it may also have to do with an issue that requires deep understanding. Hence, motivating and training field activities are not consistent with the idea of problem-solving activities, as they are not organized around a problem. Illustrative activities are not consistent with problem-solving either, not only because their answers (solutions) are known beforehand but also because the strategy that should be followed to attain that aim is given and, consequently, there is no need to design a strategy to overcome an obstacle, as required by problem-solving.

Directed observation activities differs from Illustrative activities because in the former case the solution is not known in advance (opposite to what happens in illustrative activities) but the worksheet offers students the strategy to be used to get the *right* solution that is, the only possible solution. Inductive activities are more open but they still ask students to follow some general guidelines, deriving from some basic principles of scientific methodology, like observing, collecting data, draw conclusions and make a generalization. These guidelines lead students to a solution that hopefully is to be generalized. On the contrary, problem posing activities lead to problem statements rather than to problem solutions. Therefore, they fit the first student-centered phase of a PBL approach (Lambros, 2004), as they could work as a way of finding the problems to be later solved by the students, either in the field, in the lab, in the classroom, or wherever the relevant tools and resources are available. Finally, problem-solving activities require students to solve a problem to develop procedural, conceptual and epistemological knowledge. Depending on the phase of the teaching process that they are used, problems can work as starting points for learning or as tools for deeper understanding, or even as evaluation tools. If the former is the case, then problem-solving field activities are used as starting points for new learning, so that students will learn new knowledge (from their point of view) by working on a problem in order to get one or more solutions for it. In the other cases, the problem would come after new knowledge being learned and therefore, problem solving (but not problem based-learning) can take place.

Thus, both problem posing and problem-solving activities (if the latter are used at the beginning of the teaching and learning sequence) can fit a problem-based learning approach. Besides, problem posing field activities can precede the problem-solving ones, as the former can provide problems to be solved through the later, and therefore serve as scenarios for problem-based learning.

## **5. Using field activities for science problem-based learning**

Problem-based learning (PBL) has to do with learning new knowledge by solving problems (Lambros, 2004), that is by getting answers to questions. Those answers may be conceptual or procedural answers or they may be practical ways of overcoming an everyday issue. Besides, each problem may have an answer, two or more possible answers or no answer at all. In addition, problems to be solved can be given to students or students can be asked to pose them from some sort of scenario. In the latter is the case, the scenario needs to be appealing for the target students, so that they pose problems that they feel are worth being solved. In fact, afterwards, students are supposed to work on problems that they should feel worthwhile working on, in order to solve them, preferably, in small groups working cooperatively.

Thus, if PBL involving field activities is to be carried out, then two things may happen: either problems are given to students so that they can solve them through problem-solving field activities; or problems have to be posed by students, for example within the context of a problem posing field activity, and afterwards they can be solved within the context of a problem-solving field activity. In the latter case, at least two types of field activities would be carried out one after the other. However, it should be noticed that whatever the way problems 'appear', they are supposed to be solved before theory is taught, as they are tools for learning rather than tools for showing that theory is correct (Marion, 1999) or for evaluating students' learning.

When using field activities for science problem-solving is at stake, a field trip has to be organized. Due to the diversity of tasks that have to be carried out so that the aims of the field trip are accomplished, it is convenient to consider three phases: before the trip, during the trip and after the trip. Before the field trip, the place has to be selected, permissions for doing and attending the trip have to be obtained, the problem has to be understood by the students, and the activities to be carried out during the field trip have to be planned and prepared. It should be noticed that if problems come from a problem posing field activity, then this phase may require students to go out in order to perform a problem posing activity. This would enable students to pose problems to be taken back to school and worked out (analyzed, reinterpreted, etc) and then solved within the second part of the field trip. During the field trip, students are asked to carry out the activities previously planned, together with others that they may meanwhile feel as relevant to solving the problem(s) that are at stake. That may include *in loco* data collection and analysis as well as collection of sample materials to be taken to school to be studied, for example, in the lab. Collecting samples may be a requirement of the problem and a necessary condition for an appropriated study of the issue it involves. It requires the mastery of the appropriate technical procedures (that may be learned through a training field activity) so that the samples are not damaged. However, it should be taken as (an additional) opportunity for making students aware of the need to preserve the environment. Limiting the amounts of material collected may be a way of doing it. Afterwards, when back at school, students need to complete the activities done in the field and/or to do a balance of what was planned and accomplished. In addition, the solution(s) to the problem(s) have to be evaluated for their scientific, technological, environmental and/or social quality as well as for their fairness. Conclusions drawn by each small group from the activities carried out should be shared with and discussed by the class, so that not only students learn from their counterparts but also teacher can get some feedback about his/her students learning achievements. It may happen that work done in this phase reveals that a new trip is needed so that the issue can be completely understood and the problem can be solved. Thus, learning by problem solving field activities, may require a single trip, to solve the problem given to students, or it may involve two or three trips so that students can pose problems to be solved, collect the information (initially) required, and/or collect complementary information to solve the problem(s).

## 6. Final remarks

Several authors have emphasized the educational value of field activities (King & Glackin, 2010; Marion, 1999; Rebelo, Marques & Costa, 2011) but they are rarely used by teachers (Dourado, 2001; Rebelo, Marques & Costa, 2011) and when they are, the way they are structured and implemented is often inappropriate for taking most profit from them. A reason for that may lie in the fact that field trips are not distinguished from field work and from field activities and the educational diversity of field activities is not perceived either. Different types of field activities have different learning outcomes. Problem-solving activities are those that may foster the integrated development of a larger diversity of competences (Lambros, 2004) but they require competences that may be better developed within the scope of other types of field activities. In addition, they are those that give students the most active cognitive role as learners and therefore better prepare them for lifelong learning. Nevertheless, action must be taken to prevent that students learn more about the place visited than about the concepts that motivated the trip (Balci, 2010).

The argument that all types of field activities have a role to play in science education can be extended to other school subjects being Geography one of them. In fact, physical geography is similar to science, namely to geology and environmental science, as all of them share issues associated to large time scale and large dimension phenomena. They also share several curriculum themes and therefore can approach together several common problems, in an integrated way. Doing it this in this way will enable science and geography teachers to better prepare students to continue learning in the future as a citizen living in an ever changing society.

However, bearing in mind junior high school students' reactions to problem-based learning in the classroom (Leite, Dourado, Morgado, Meireles, Azevedo, Alves et al, 2013), it can be expected that students usually

classified as ‘good students’ may show negative reactions and anxiety towards problem solving field activities and that the weaker students may show a great enthusiasm towards them. Hence a balance has to be achieved so that all students keep appropriate levels of motivation and anxiety and can achieve the settled learning outcomes. Besides, teachers need to learn how to cope with their new role, of student supporters that they cannot ‘tell knowledge’ to them but that have to create conditions for students to actively learn new knowledge by solving problems outside the classroom. Besides, teachers need to select and promote the use of assessment techniques that fit the diversity of learning outcomes that is expected from the field activities carried out. As Dummer, Cook, Parker, Barrett & Hull (2008) have concluded, when field work is done, “clear assessment guidelines and assessment criteria are essential and many students do not appreciate flexibility in approach over and above detailed guidance” (p.473). Students need to know what is expected from them and teacher needs to have it clear so that he/she can provide appropriate support and promote the assessment of relevant learning issues done by the best informants, either student, peers or teachers.

4<sup>th</sup> International Conference on New Horizons in Education

# From "telling" to "engaging": a brief study of the educational role of museum in China

Jing Sun\*

*Leiden University, Leiden, 2334EX, The Netherlands*

## Abstract

Along with Chinese economic and political developments, museum in China also needs to facilitate encounters between ideas, environments and objects, so as to fulfill its fundamental role of education, for school students and also for the adults. In this article, I introduce and discuss contemporary issues and practice made in the museum education in China, such as education program and activities for student group, various cultural workshop and demonstrations for a more complete learning experience. The challenges and the changes from the old paradigm of “telling” to “engaging” with cultural, historical and scientific concepts will specifically be addressed in respect of the educational role of the Capital Museum, China.

Keywords: educational role, museum education, the Capital Museum, free-choice education

## 1. The Educational Role of Museum and Its Visitors

The first section is dedicated to the exploration of the educational role of museums in modern context, through reviewing the definition of museums, their educational function and purposes. Then I briefly discuss museum visitors, including their nature, needs and expectations. With the case study of the Capital Museum in Beijing, China, the second section discusses how the museum operates the exhibitions and activities for children education, and how the school children involve the programs and activities hosted by the Capital Museum. In the last section, the attention is paid to the adult education in the museum, especially considering the free-choice education.

The role of museum has reformed frequently due to the cultural and social structure of each era. According to the contemporary definition of museum from the International Council of Museum (ICOM), “Museum is a non-profit permanent institution in the service of society and its development, open to the public, which acquires, conserves, researches, communicates and exhibits the tangible and intangible heritage of humanity and its environment of the purpose of education, study and enjoyment”. In this definition, one of the essential roles of museums is to educate the public based on the collections and the exhibitions of objects.

Education as a crucial museum function has been recognized long time ago. As Hooper-Greenhill (1991) points out: “During the nineteenth century, education had been the prime function of the museum. The ideal museum was understood to be ‘the advanced school of self-instruction’, and the place where teachers should ‘naturally go for assistance’. Although many museums and galleries were unable to achieve this ideal, this was a firmly held view. By the 1920s this conviction, held so strongly by nineteenth-century thinkers in so many areas of intellectual and political life, was under attack. A new generation of curators was less interested in the public

\* Corresponding author. Tel.: 0031715122660;  
E-mail address: S.Jing@hum.leidenuniv.nl

use of museums, and more interested in the accumulation of collections” (Hooper-Greenhill 1991:25). In modern society, its educational purposes have become a priority and its educational goals have increased (Hooper-Greenhill 1999:3). Museums know most about history, culture, art, technology and so forth. Museums should become places of freedom allowing children and adults to discover traditions, to broaden their horizons, to enrich their minds and to develop a mature opinion of life. They are important public educational institutes that not only shape knowledge to the scientific community but also share it with all kinds of visitor with their exhibitions. In fact, sharing knowledge with the public is also an essential mission of a museum. Therefore, museum is an educational institute, “with a responsibility to create knowledge through the development and research of collections, and then to disseminate that knowledge through the provision of formal scholarly displays” (Graham Black 1999:1).

However, to provide knowledge to the visitors, it does not mean that the museums should simplify the way they exhibit the objects nor provide complicated and hidden meanings. The education function needs to be collaborated by both museums and visitors. On the one hand, by displaying the artifacts and contextualizing them, museums help visitors to get their own understanding of the collections in museums. On the other hand, while forming their own interpretation of the meaning of the artifacts, visitors learn knowledge and experience museums as well (Greenhill 2000, 124). Therefore, museums need to consider and respond visitors’ needs, demands and expectations. This has been recognized by museums. Particularly in recent decades, museums have increasing pressures for changing the approaches of presenting their collections to visitors, appealing their interests and matching their high quality requirements.

This is also an audience-centered strategy which means museums need to take into account of “the personal context of the visitor and the holistic nature of the museum visit” (Graham Black 1999:3). When planning exhibitions and programs, museum educators and planners should not only understand the different types and ages of visitors, but also know the demands and expectations of different type of visitors, and know how different visitor groups would interact with the museum, its collections and the activities.

Unlike the traditional museum audience who were used to the un-stimulating educational programs, twenty-first century visitors would prefer to participate, to learn, to question and take part as equals, rather than being “passive recipients of wisdom from on high” (Graham Black 1999:2). This means modern museums should not only provide information for education and research, but provides a much wider variety of activities including exhibitions, workshops, events and displays, to arise the visitors’ interest and match their demands (Burcaw 1997, 24).

Under this circumstance, museums have to transform their role from simply displaying objects or offering un-stimulate programs into promoting the audience’s active learning with interactive activities. This is actually a very important transition process from simply “telling” the visitors knowledge to letting them “engage” into learning, to transfer a passive study to an active learning experience. More and more museums incorporate this strategy as part of their educational purpose. In China, along with the economic development, more and more attentions have been paid on cultural development, and museums are also the important institutes to promote cultural development.

In the process to fulfill the education function, museums need to adjust their strategy according to the different type and ages of visitors and their needs. Many scholarly researches about the museum visitors have been done and there are also a lot of investigation and analysis on the targets. From the perspective of age, in this article, I prefer to generally divide the visitors into two major age-groups- school children who mainly visit museums in groups or families and adults who often visit museums by their own. On the basis of learning theories, in the following, I would like to analyze how museums in China attempt to meet these two types of visitor’s needs, demands and expectations and accomplish the educational role of the museum. For a better understanding of the development of the museums in China, I discuss these perspectives mainly through the case studies of the Capital Museum in Beijing (see figure 1).

Fig. 1. The Exterior of the Capital Museum, China, [http://www.capitalmuseum.org.cn/zjsb/content/2006-04/12/content\\_21830.htm](http://www.capitalmuseum.org.cn/zjsb/content/2006-04/12/content_21830.htm)

There are several reasons to choose the Capital Museum as example to demonstrate my arguments. Firstly, the Capital Museum is a large comprehensive museum in the Beijing area and it houses a large collection of ancient porcelain, bronze, calligraphy, painting, jade, sculpture, and Buddhist statues from imperial China as well as other Asian cultures. Although it is not the largest or most comprehensive museum in China, as a provincial and municipal-level museum, it has some characteristics which are able to reflect the current development and practices of the educational role of museums in China. Moreover, it opened in 1981 and moved into its present building in 2006. As it is housed in a newly constructed building and equipped with modern facilities for various visitors, to a certain extent, it can also reflect future development of many other museums in China.

## 2. Children Learning in the Capital Museum

Regarding to children education in museum, there is mutual communication and close connection between the museum and schools. As pointed out by Joseph H. Suina, “for school, museums serve as places where people collect, display and share fragments of the world in which we live” (Hooper-Greenhill 1999:105). The museums need to understand the different needs of different types and levels of school children so as to design programs that relate closely to that information.

This requires museum educators know learning theory about children in museums. G. W. Maxim describes that the young students learn through three modes of contact with material. The first type is through the symbolic mode. It is the most prevalent in elementary schools. But as most young children have limited experience, the symbolic mode is very abstract and too advanced for many elementary school students. The second type is the iconic mode as referred by Maxim. It involves the practice of representations of the reality through physical models, films and other means, so the students may get interaction with iconic material. The third mode is to learn from people and through events, ideas, and the use of authentic items (Maxim 1987:267-8). This is therefore an enactive form of learning experience. Students can learn best by experiencing the materials and ideas through touching, seeing, listening, smelling and tasting. So this is a quite different experience that students can rarely get from classroom where students usually passively get information and facts from textbooks. But museums which are rich with iconic and enactive learning opportunities can provide such experience for students.

This third mode has been applied by museum educators and planners of Capital Museum. They plan, arrange and inspire the activities with this purpose, while dealing with complex issues regarding the relationship between preserving and presenting the objects and the using in education. According to the degree of children's engagement into the programs and activities, I introduce and discuss some educational programs and activities hosted by the museum.

First and foremost, the Capital Museum provides many educational programs throughout the permanent collection. For example, one of the special programs and events hosted by the Capital Museum on May 18, 2013, the International Museum Day, is "The Little Pioneer Treasure Hunt". It goes like this: the children together with their parents spend a couple of minutes in the museum reception in order to become familiar with the museum spaces and get a form with instructions about the location and information of some "treasures", the valuable collections in the museum. After the children get the general idea about what they are supposed to do, their parents and the museum educators lead the children to the permanent collection. In order to find the "treasures", children are motivated to observe the objects and learn history and the related knowledge. In this leaning process, they also have lots of fun. Moreover, this activity also provides an opportunity for the parents especially those who are too busy to stay at home, to spend time with their children, to educate them, and try to broaden their horizons through the stimulating learning process.

Moreover, the Capital Museum also plans many interactive activities, such as workshops that are designed to provide children to recreate artifacts. For instance, there is a pottery room which regularly offers pottery class for children to learn how to make potteries out of clay and learn the pottery history in China (figure 2). Museum educators first show children the producing procedure, and then guide and assistant them to make the pottery objects. The process of making pottery involves knowledge of many disciplines and skills, such as Chinese traditional decoration and the firing skill. This allows children to learn Chinese cultural heritage and traditional art through learning how to produce the works by themselves, and enriched their sharing of knowledge and cooperation. Except for the pottery class, the Capital Museum also provides many other educational and interactive activities, such as making Chinese traditional fan, paper cuts and so forth (figure 3), for children regularly all year round in the museum. So this also offers children choices that they are allowed to choose to take part in those which are interesting to them and to freely attend these activities. By doing so, educators give children the feeling of power and command over their museum experience, and also increase the chances of their really understanding of the ideas behind the objects in museums.

Fig. 2. The Pottery Class at the Capital Museum, [http://www.capitalmuseum.org.cn/child/content/2011-06/16/content\\_30620.htm](http://www.capitalmuseum.org.cn/child/content/2011-06/16/content_30620.htm)

Fig. 3. The workshop for Children at the Capital Museum, [http://www.capitalmuseum.org.cn/child/content/2013-05/22/content\\_58108.htm](http://www.capitalmuseum.org.cn/child/content/2013-05/22/content_58108.htm)

Furthermore, the Capital Museum uses a very wide variety of approaches to provide comprehensive knowledge to children, not only about its collections, but also about some knowledge of its own architecture, facilities and even the moral behaviors through vivid stories which are made up by museum educators. Children can easily read them through the website of the museum. For instance, when introducing the function of the ceiling of the Capital museum, a dialogue takes place between a virtual character “Grandpa Dictionary” and two children, a boy and a girl. “Grandpa Dictionary” makes a metaphor of the ceiling as a big hat and explains to the children how the solar panels atop of the ceiling convert light into electricity. Embellished with vivid cartoons (figure 4), scientific knowledge and information of the architecture conveyed by these stories are more interesting and easier for children to learn and understand. And except for these stories, the Capital Museum also uses the Internet to provide many other interesting and stimulating programs for children, such as the on-line videos about the collections in the museum, various video games leading an archaeological expedition, the making of blue-white porcelain and so forth.

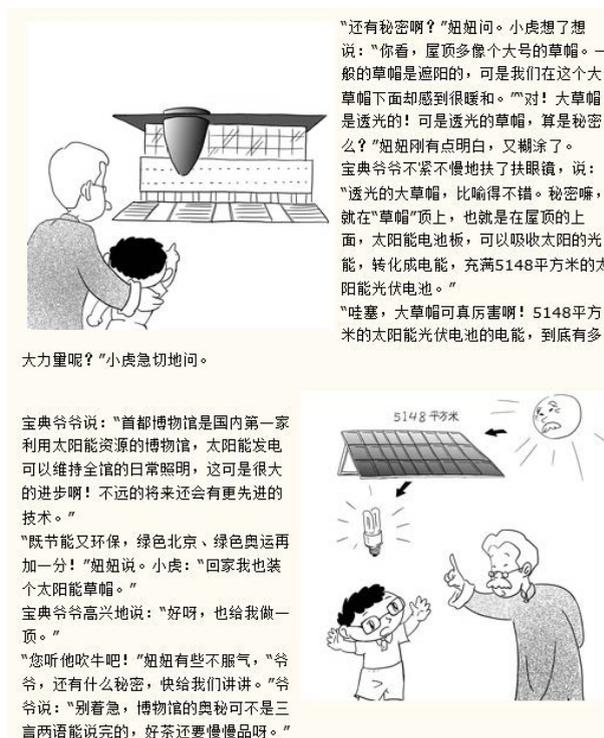

Fig. 4. Story Embellished with Cartoons on the Website of the Capital Museum, [http://www.capitalmuseum.org.cn/child/content/2008-03/13/content\\_23056.htm](http://www.capitalmuseum.org.cn/child/content/2008-03/13/content_23056.htm)

To inspire and motivate children to get involved in the activities of the museum and to engage in the collections and learning experiences, the Capital Museum also creates new exhibitions for children. An impressive example is the exhibition of school children's art works. In June 2013, "The Dancing Sprout: An Art Exhibition of Children's work in Beijing" (figure 5) is hosted by the Capital Museum, exhibiting various art works, such as calligraphy, painting, paper cuts, sculpture, masks and so forth, made by children in Beijing between age 4 and 14. It is a very creative and quite entertaining experience for children. Moreover, children get the opportunity to control the exhibition by choosing the subjects and displaying their own works. And this is a very important process of getting engaged in the museum's activities.

Fig. 5. Exhibition of Children's Art Work at the Capital Museum, [http://www.capitalmuseum.org.cn/child/content/2012-06/08/content\\_42082.htm](http://www.capitalmuseum.org.cn/child/content/2012-06/08/content_42082.htm)

Through the collections and the activities, on the one hand, museums provide knowledge and information to children; on the other hand, they also stimulate their academic and thinking skills, handing ability, understanding, values and attitude of life and the society. By participating in different programs children have the opportunity to not only obtain knowledge of the past, discover new things, but also learn to cooperate with other people and have discipline while in public spaces through the museum programs.

### 3. Adult Education in the Capital Museum

In addition to the children's education, the Capital Museum also focuses on adult education. In fact, the idea of adult learning in museums is not new. As early as mid-nineteenth century, a comment from the First Report of the Department of Practical Art, the government institution that originally ran the Victoria and Albert Museum, demonstrates this well: "A Museum presents probably the only effectual means of educating the adult, who cannot be expected to go to school like the youth" (Hooper-Greenhill 1999:137).

Adult learning is different from that of children. Compared with children, adults view and evaluate the objects according to their broader life experiences, established identity and understanding of the world, so their education is generally under a mature scope. As R. S. Grenier points out: "Adult learning has the potential to transform museum experiences into meaningful learning opportunities that occur in relation to sociocultural surroundings and stimulate the visitors' curiosity and active and reflexive learning through nonformal education, free-choice learning, and access to museum resources" (Grenier 2010:153).

Adults seek learning experience in museums related to their demands and needs, no matter for leisure time, values, education or other considerations. Adult's free-choice learning has been further interpreted that "the learner is intrinsically motivated by their desire to discover more about the world, gain information, and enhance their current understanding" (Grenier 2010:153). Therefore, museum should develop alternative approaches to respond the free-choice learning, and represent visitors with "smaller segments that are more easily processed and integrated into prior experiences and learning" (Grenier 2010:154). The Internet and other forms of new technology play important roles for adult's free-choice learning in museum. The Capital Museum provides

anytime, anywhere learning for visitors with detailed resources, information and educational material for study, research and entertainment purposes through the Internet and new technology its extensive databases.

For instance, on the website of the Capital Museum, there is an Internet forum called “Interactive Community”. Here, visitors can share their opinions on the collections and related issues, discuss the artifacts and involve into the development of the museum. And they can also download the online journals of the museum and other information of the exhibition, to choose the content they are interested and better learn knowledge. As a result, visitors interact with the objects more and better understand the concepts and the initial idea of the exhibition. In this way, the museum is not simply to present the objects to the audience but to make the audience part of the museum through the sources and learning programs. Museums as educational institutes offer opportunities for people to increase their knowledge and their experiences by combining education and entertainment.

Similarly, the Capital Museum also arranges some specific exhibitions for the adult visitors, not only limited within its own collections, but also expanding to the works made by the audience. For instance, an exhibition “The Beauty of Beijing, Beijing Spirit” (see figure 6) was held at the Capital Museum from February 5 to May 19, 2013. Like all the other exhibitions, it is also free to the public. In this exhibition, many shutterbugs’ works representing various aspects of Beijing and people living here are displayed. In this way, not only many visitors are engaged into the exhibitions with their own works, but also more and more visitors learn deeper the culture of Beijing through these works. And this also makes the museum no more a very high institute, but a public place close to the visitors’ life and they can have interaction and entertainment, and learn knowledge through participating the activities and programs of the museum.

Fig. 6. A Photography Exhibition at the Capital Museum, [http://capitalmuseum.org.cn/zlxx/content/2013-02/05/content\\_50040.htm](http://capitalmuseum.org.cn/zlxx/content/2013-02/05/content_50040.htm)

#### 4. Conclusion

As discussed above, the activities and educational programs hosted by the Capital Museum expand visitor's learning experience beyond the museum's door. From the highly structured study programs which are planned and delivered by the museum to less formal or free-choice learning experience that provided by the museum; from the simply displaying objects to the visitors' engaging including choosing and exhibiting their own works, the capital museum is taking a more sociocultural perspective which emphasizes visitors' experience in relation to its collections, museum context and the society, to fulfill its educational function. The exhibitions and programs will make visitors satisfy museum experiences and will also allow museums to maximize the inherent potential of objects to contribute to human growth and learning. By taking part in educational programs and activities in the Capital Museum and its website, the visitors, no matter children or adults, have the opportunity to learn knowledge, to share discussion, debates and social interactions. And this also expands the role of life-long learning of the museum.

# From a tourist's conception to a graphic image A case study in practice-based research

Silja Nikula\*

*University of Lapland, Faculty of Art and Design, Rovaniemi, Finland*

---

## Abstract

The focus of this article is the manifestations of the *spirit of place* and the visual narration thereof. I use woodblock printing to convey the mental images of my experience as a tourist in Prague. By setting my process within a discussion of narratology and semiotics, I divide my pictures into modes, each of which emphasizes different facets of the ambience of locality. In addition, each mode's method of visual narration differs from the others. The study evokes a discourse on the narrative possibilities of a still picture, paying special attention to symbols and metaphoric expression giving rise to connotations.

Keywords: practice-based research; still picture; graphic image; visual narration; spirit of place

---

## 1. INTRODUCTION

Place is not just a particular location in a world—it is also a connection between the location and the person staying there. Mass communication, increased mobility, and a consumerism-based society have homogenized the world. As a consequence, many places don't tell us anything about their particular locality. Still, places are advertised by images that attempt to differentiate them. Often these images are stereotypic, offering tourists the same attractions again and again.

## 2. RESEARCH QUESTIONS

What are the possibilities for an entire still picture to tell about *the spirit of place*?

By which means can meaning be constructed?

\* Silja Nikula. Tel.: +358 40 484 4395; fax: +358 16 362936  
E-mail address: silja.nikula@ulapland.fi

### 3. THEORETICAL BACKGROUND

The frame of reference entails a discourse between image creation and theory. The *spirit of place* as a starting point is a salient concept of humanist geography, with philosophical commitments to phenomenology. It draws on the personal experience of an experiencer. The spirit of place involves its topography and appearance, social activities, past events, and present situations (Relph 1976).

I am the creator of the pictures that tell about my experiments in Prague, Czech Republic. My background is in graphic design, so this research falls within the domain of visual communication design. It focuses on pictures used as a salient communicative tool by the designer. My interest is in exploring the nature of images. I see graphic images as constructed representations communicating in a certain culture (see Hall 1997). A wide variety of things are defined as the concept of image. All images are based on various similitudes, likenesses, or resemblances. Mitchell (1987) presents images as a genealogy tree. Using this approach as a metaphor, I transform my mental images into graphic images—concrete pictures that can be seen and touched (Ibid).

Meanwhile, I also see my illustration process as narration. The structuralist theory argues that each narrative has two parts: a story and a discourse. The story is the content of the narrative expression, while the discourse is the form of the expression. Narratives are structures that are independent of medium. They can be expressed in the form of different surfaces as verbal nuance, graphic design, or balletic movements. The process of expressing a narrative has been defined as “transformation” (Chatman 1978, 21.). I have taken on the challenge of expressing my narrative in only one graphic image. While poetry is the art of time and motion, a still image is the art of space, stasis, and arrested action from the perspective of narratology.

As a constructive illustrator, I understand narrating not only as telling about happenings, but more broadly as showing a state of affairs, depicting things, giving meanings, and expressing ideas (Nikula 2012). Influenced by the thinking of Yuri Engelhardt (2007), I see the constructing of my image as composing visual elements with certain properties within a meaningful space. I also ground my findings in a discussion of the grammar of visual design (Kress and van Leeuwen 2006 [1996]).

### 4. METHODS

After visiting Prague, on the basis of my experiences, I have brought out the contents of my mental images using visual means. In my illustrations, I used woodblock printing: I first carved motives in the wood, took away the areas that would remain white, and then coloured in the upper surface. Finally, the image was carefully transferred onto paper by hand. The method has many stages, which gave me time to reflect upon my experiences and to try to express them using visual means. During the process, I also produced different versions, starting with sketches and developing them into various versions—all of them not succeeded ones. These are documents that show my transformation process.

On the basis of my own material, I then produced a model of analysis to depict the structure of the pictures and the meaning they contain. For the *model for narrative layers*, I combined criteria from visual narratology and semiotics. I paid attention to the ways in which the elements refer to their target: icon and symbol. (All pictures are indexical in referring to my travel and illustration method.) I also took into consideration metonymic and metaphoric expressions. By using this model, I divided my pictures into different modes or ways of visual telling. In addition, colours and shapes carry connotative potential and expressive charge.

## 5. RESULTS

I divided the created pictures into modes as a method of visual telling. These presentation methods emphasised different facets of the experience of the ambience of locality, and their methods of visual narration also differed from one another. I present them with one example picture for each category.

### 5.1. Scenery. Space without living creatures

Fig. 1. Jewish cemetery. Scenery in Prague.

The first mode comes from the narrative theory. According to Seymour Chatman (1978), a narrative without an agent performing action is impossible. Therefore, I arranged one category of pictures with no living creatures. These are depictions of scenes or spaces where happenings could take place. In my sceneries, I refer to the town of Prague in an iconic way, showing the way things really are (Mitchell 1987). Iconicity is one positive property of images, based on a correlation with its object—at least some qualities are similar. Based on iconicity, real-world optical experiences can be imitated (Messaris 1997). For me, the images in this mode work as documents that are witnesses of my visit to Prague. But compared with realistic photographs, the illustration technique has left its mark—woodcarving adds its own connotations to the work. As an illustrator, I can take advantage of the style of lines, forms, and colours to show a variety of emotional feelings. Compared to detailed photographs,

these images are also simplified. They don't repeat all. But all the visual elements are meaningful as they are selected by the illustrator. The relationship between the meaning and the form is really a transformation, not a "registration" (Barthes 1986, 82).

Metonymy is a way of creating realistic impressions based on associations. When seeing one small part, the bigger whole can be traced (Fiske 1994, 128–129; Mitchell 1987, 27). One scene can represent the whole town or certain kind of city life. Metonymy as a rhetoric means enables tight expression. In my example picture, **Figure 1**, I have framed one scene that was interesting to me. I noticed that advertisers of tourist attractions have actually selected and presented many of the same scenes that were my favourites, but I couldn't rid these images from my mind through media presentations. My picture of a Jewish cemetery (Fig. 1) also put me thinking: Is growing grass alive—and are trees living? Because plants change the scenery so slowly, I decided to place this image in the first category. Generally, in a still picture, I can't see the border between events and non-events so strict. If I use visual elements referring to people's actions, then I can give the impression that something is happening even though we don't see any characters acting or events occurring. Still images have the ability to expand their stories outside of their frames and call forth a variety of emotional responses. In suggesting meanings, the role of the illustrator is salient.

### 5.2. Episode. People make it a happening

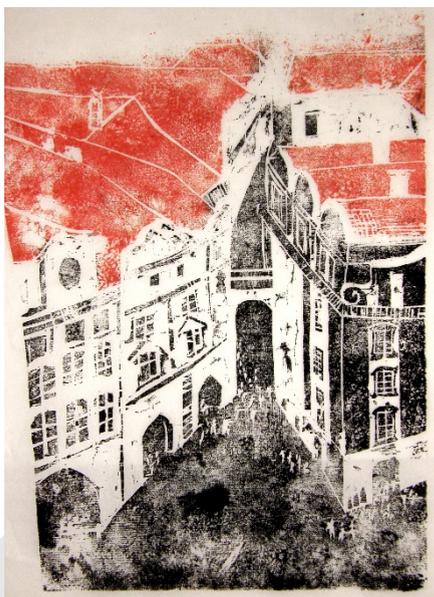

Fig. 2. Episode. I see the town on the tower.

During my first days in Prague, I got a message to my mobile phone: "Step up to the old town hall tower, so you see the scenery changing colour!" This actually happened! This moment stayed in my episodic memory and came back into my mind after the travel (see Glass & Holyoak 1986, 235). The moments in one's episodic

memory concern strong emotional feelings or are otherwise meaningful. In **Figure 2**, you can see what I saw from the town tower. Characters added to the streets reveal a chain of events (Chatman 1978, 34). The picture captures one moment of a happening and insists that viewers to interpret it so that the story before and after can also be seen. This image carries more meanings than the first one. The description in a still image, however, is based on composition in two-dimensional space, so it limits the representing of time-flow. The actions are emblematic and eternal (Goodman 1981, 106). But there are means that illustrators can use to show this, such as creating back and front areas in the picture surface. Also, a viewer's eyes can, to a certain degree, be led by arranging lines and forms of elements. By using contrasts in colours and sizes, attention is kept focused on the most important items. In my picture (Fig. 2), I used red to represent the characteristic of the roofs in the town. This colour refers to its target in an iconic way.

When I was later carving and printing this moment in paper, I compared my composition idea with the grammar of visual design (Kress and van Leeuwen 2006). In my picture, I am looking at the people on the street from high angle. But in this case, however, it doesn't mean that I am diminishing them (Ibid. 140). The angle here should be taken as a natural location. I am looking at people from far away, seeing them as a crowd. If I had taken a closer look at them, you could have seen what kinds of interactions were going on between the participants. This could be seen through vectors that show processes. Vectors are lines leading away from things, body parts, and gazes. The use of diagonal lines as vectors especially carries the idea of movement. Vectors also separate narrative images from conceptual ones (Ibid. 45–78). From this point of view, my graphic images are traditional narratives, but without time passing by as clearly as in written stories. The grammar of visual design consists of conventions for representing and interpreting pictures. I used these conventions intuitively, not by purpose, and noticed them afterwards. These conventions should still be considered as meaningful means in expressing ideas, and they carry narrative potential.

### 5.3. Etnofiction. New story comes from imagination

Fig. 3(a).

Puppets over a gothic tower.

Fig. 3(b). Kafka came to my dreams.

Whereas *episodes* call back moments that have been experienced, *etnofictions* create new reality. They have roots in real-world happenings, but in my imagination, the experiments are combined with other ingredients. Fictional elements come from history, mythic stories, literature, etc. All kinds of intertextual or intervisual material can be used (Nikolajeva & Scott 2006, 227–228). When these are combined as a part of a visual composition, a new story is born. In addition, non-existing fantasy creatures can be presented in a realistic way by using a linear perspective. They can be seen in a chain of happenings, as in the previous mode. But actually the idea of the *etnofictions* is to part from real life and approach towards imaginative world. To create the feeling of another reality, unnatural elements are part of the composition. Visual means can be used to violate the reality, such as unnatural colours and plasmatic forms, like in surrealist Dali's paintings. In **Figure 3(a)**, I changed the scale between two main elements, the tower and the characters. The puppets or historical artists, writers—whoever they even are—were placed in the upper part of the composition area. Yellow as a light colour lets them rise and shine in the sky. Kress and van Leeuwen (2006, 186–188) state conventions concerning upper and lower parts of a composition. Whereas the lower part is “real”, the upper is ideational, presenting something new. According to this statement, my composition strengthens the idea of an imaginative story. In addition, these information values carry narrative potential.

For **Figure 3(b)**, I combined ideas from Franz Kafka’s novel *Metamorphosis* with my experiments in a bar (which had a “U” in its name) in Prague. In this historical town, I often saw old uncial letters in commercial signs. I put a fly to drink in the inside of one letter. Kress and van Leeuwen (2006, 45–113) present two kinds of visual structures of representations: narrative or conceptual. My **Figure 3(b)** has much in common also with the conceptual structures, such as the flat surface in the beer glass and a lack of linear perspective.

#### 5.4. Comment. My own life involved in the story

Fig. 4. I faced challenges in my academic research.

**Figure 4** presents an event in Prague and consists of many kind of ingredients. First, there is a still scene in the back and living creatures in action in the front. One person is flying, which makes the event unnatural. This is at least an *etnofiction*. But because the flying character is me, the happening becomes a metaphor. Nelson Goodman (1976, 8) names this kind of constructing as “putting a layer of comment”. It is telling about my excitement and challenges in starting to make my dissertation. I am flying towards a statue, which symbolises a long history of cultivated civilization. I added a feeling of speed and emphasised the horizontal movement by carving direction.

I also enriched the surface with many quickly made details. That makes the expression chaotic and perhaps lets people see many meanings in it.

In this *comment* mode, the illustrator’s attitude and opinion are strongly seen. Tourists experiencing places can use their own inside stories as a part of their telling. We are actually “living our stories”, and new meanings get interfered in the previous ones (Bruner 1986). I have found metaphors to be as useful means of rhetoric in

representing personal meanings in my pictures. In the metaphorical expression, qualities are transferred from one to another by combining the usual with the unusual. Often, images of concrete physical things or situations evoke an analogous abstract concept (Messaris 1997, 9–10). Metaphorical dimension is one class of iconic signs based on similitude. Mitchell (1987, 10) classifies metaphors as verbal images in his image family, defining them as short descriptions that sometimes suggest nothing more than a recurrent abstract idea.

In my picture, there is at least one bird flying with me. This bird, the bridge, and the clouds can be interpreted as symbols. A symbol is a sign when it is used and understood as such based on convention or habit. Understanding of symbols also depends on the context; for example, colours can have symbolic meaning but often appear in the form of elements. Symbols have narrative power, giving rise to connotations. They are useful in packaging meanings. For this project, while the *episodes* came suddenly in my mind, the *comments* took more time to transform in my imagination and to find their visual form. The pictures in this mode were born last. These four pictures were presented as a part of an exhibition called “Poetic Metamorphosis” (2009).

## 6. CONCLUSIONS

Based on my own experience as a tourist, I have shed light to the concept of *spirit of place* seen from a tourist’s point of view. I found that I was unable to separate my pictures from the images used by advertisers, and they influenced my pictures in the first mode. After my travel, I presented my memories as *episodes*. In the *etnofiction* mode, old stories transformed into new ones and were enriched by my imagination. Artists are in a key position for creating new stories and refreshing the media imagery. Experimenting with places can give birth to new approaches to visual narratives, upon which the whole concept of *spirit of place* is based. Sometimes the meanings given for a trip to a particular location are more important than the place itself. In this case, the place serves only as a surrounding to personal meanings, as in my *comment* mode.

I started from the concept of *spirit of place*, and my images were developed in discussion with visual culture and theories of literature narrative theory and semiotics. I metaphorically added layers by adding more meanings stage by stage—starting from *scenery*, to *episode* and *etnofiction*, and at last to *comment*. I see this *model of narrative layers* as a part of my results. In constructing visual representations, the iconicity is a salient strength. It refers to many kinds of similarities from seeing a place with one’s own eyes to a metaphorical dimension. Many meanings are tightened in symbols. I have paid special attention to the ways in which symbols and metaphoric expression can give rise to connotations and thus increase the variety of meanings construed from a picture.

This study has evoked a discourse on the narrative possibilities of a still picture. My understanding of visual telling is very broad. I have arranged meaningful compositions by elements with certain properties. For me, visual telling is not within the limits of traditional narrative theory, such as place, characters, and events in time. Properties of elements carry potential for meanings and should be considered as the narrative potential of still images. In drawings, these meanings are further tightened because the illustrator selects all the elements. I find it easier to create metaphoric dimensions in a drawing than a photograph. The information values (Kress and van Leeuwen 2006, 186–188) concerning different parts of the composition should also be looked at as narrative

potential. These conventions effect the interpretation and way of reading pictures. When it comes to the differentiation of narrative and conceptual images, I view the border between these two very loosely. Narrative potential can also be seen in pictures without any vectors referring to events.

In my working process, I discovered that some salient concepts of narrative theory can still be adapted in visual transformation as principles of design. The first concept is coherency. As a producer of art, I create visual coherency between elements, using, for instance, colours and shapes. The second concept is thinking of gaps. Using gaps as a method of narration increases viewers' options for deciphering meanings and become more interested in the work of art. Gaps are essential and common for all narratives. I see the concept of gap as referring to the openness of images in interpretation, or, as Messaris (1997) puts it, "syntactic indeterminacy". This property puts power in images, especially those used for visual persuasion. Arguments put through images need not to be supported by words (Ibid. 219). Therefore, both composition in space and properties of elements should be taken into consideration when redefining the whole concept of "narrating" in the context of still pictures.

## 7. DISCUSSION

In this study, I do not define the communicative aspects, audience, or presentation medium of a picture. Instead, I focus on the beginning of the design process where an idea develops and begins to assume a visible form. My point of view is that of a visual communication designer, not that of a receiver or interpreter. The findings in this study are based on my own artwork and previous experiences. The graphic images in the first mode stand as documents for me, but viewers who have visited Prague would probably give their own individual meanings to them. A sketchy and rather realistic illustration style can invite viewers to fulfil my presentations with their own imagination and subjective interpretations. If the design work is very finished and detailed, then it is seen more as an input of the designer. In woodcutting the carving style and colouring allow variations in style from sensitive to rough. This illustration method adds its connotations and often pleasantly surprises me. It also enables me to simplify and thus compress expressions. Still, it is also disappointing when the printings are turned to their mirror image, such as in Figure 4, where the direction of flying was changed. In many cases, changing the left and right side of the image can be crucial for the meanings, as Kress and van Leeuwen (2006, 179–185) have stated. Regardless, the multiphase method matured my experiencing and brought out new personal meanings.

In this paper, I have concentrated on the modes presenting entirely static, still images. Placing my model of narrative layers into a discussion of the literature narrative theory, two other possible modes come to mind: *collage* and *chronicle*. They are options for future work, as *collage* actually combines many pictures gathered under the same theme from different perspectives and *chronicle* is actually a series of pictures, like comics, describing many stages of the same event. This would be closest to literary narratives of presenting happenings in time. However, by creating the feeling of metamorphosis, the idea of time passing by can still be presented in still pictures by visual means.

4<sup>th</sup> International Conference on New Horizons in Education

## From mekteb-i tibbiye-i adliye-i şahane to present day an overview to pharmaceuticals education

Adnan Ataç<sup>a</sup>, Engin Kurt<sup>b\*</sup>, Ahmet Keser<sup>c</sup>

<sup>a</sup> *Gulhane Military Medical Academy, Faculty of Military Medicine 06010, Ankara, Turkey*

<sup>b</sup> *Gulhane Military Medical Academy, Faculty of Military Medicine 06010, Ankara, Turkey*

<sup>c</sup> *Turkish Military Academy, 06581, Ankara, Turkey*

### Abstract

Pharmacy education in our country has started in 1839, with the constitution of ‘Mekteb-i Tibbiye-i Adliye-i Şahane’ in Istanbul. In the year 1909, associated with the establishment of the Darülfünun Medical Faculty in Istanbul, a School of Pharmacy, named as ‘Eczacı Yüksek Okulu’ got started the education. The courses of this school were transferred from High Pharmacy School of Paris. Since 1962, the Aforenamed School has continued its education activities as the Faculty of Pharmacy under the structure of Istanbul University.

Because of the insufficient graduation number of students from the Faculty of Pharmacy, some private institutions have received permission from the Ministry of National Education for being able to establish "Private High School of Pharmaceutics". After the first private school, established in 1964, the number of schools teaching pharmacy education has increased rapidly and the need for pharmacutists was tried to be satisfied. Today there are 26 higher education institutions teaching pharmacy in Turkey.

Keywords: Pharmaceutics, Lecturer, Mekteb-i Tibbiye-i Adliye-i Şahane, Army Pharmacutists.

### INTRODUCTION

It is generally accepted that the history of medication and pharmaceuticals has started with the first emerging humans and developed parallel to the evolving of the civilization. For centuries, pharmacutists were trained with a master-apprentice method and pharmacy was only a sub-branch of medicine until it has started to split up completely from the profession of medicine in the 18<sup>th</sup> century.

The pharmacy education in Turkey has started in 1839 with the establishment of “Mekteb-i Tibbiye-i Adliye-i Şahane” in Istanbul. The pharmacy education was conducted within the medical department of this school with a three year term. Associated with the establishment of the Darülfünun Medical Faculty in Istanbul, in the year 1909, a School of Pharmacy, named as ‘Eczacı Yüksek Okulu’ launched the education activities for the first time having been the courses of which were transferred from High Pharmacy School of Paris. The school which had been attached to Faculty of Science in 1933 with the University Reform Process was again taken under the structure of Medical Faculty in

E-mail address: enkurt@gata.edu.tr

1944. After the year 1962 it has continued its education activities as the Pharmacy Faculty of Istanbul University.

## 1. THE HISTORICAL PROCESS OF TRAINING AND EDUCATION

In a contemporary manner in Turkey, the pharmacy education has started with Dr. Charles Ambroise Bernard (1808-1844), who was appointed as the director of Mekteb-i Tıbbiye (Medical School) in 1839. When Mekteb-i Tıbbiye was first established, it consisted of Tıbbiye (Medicine); Preparation Department (1-4<sup>th</sup> Classes), Tıp (Medical) Department (5-10<sup>th</sup> Classes), Pharmacy Class, Surgery Class and Ebe (Accoucheuse) Class (Baytop, 1995). The education has started with the students transferred from Tıphane (The former outdated medical school). The distribution of these students among the departments and classes was conducted according to the results they had from an initial quality assessment exam (Baytop, 1995). The education period varied according to the departments or classes. The initial 4 years of education period was conducted as high school level. The professional education was starting after the 5<sup>th</sup> class. According to the professions, the education period was designated as follows: Medical Department (for doctors) 6 years, pharmaceutics, surgery and accoucheuse classes 3 years (Baytop, 2000; Dölen, 2003). The students who were successfully graduated after the 3<sup>th</sup> year were obtained their diplomas and employed in the Army (Kahya, 1997).

The education and training activities in pharmacy education were conducted in French as in the case of medical education (Baytop, 1995). As academic staff, the instructors coming from foreign countries such as France and Italy, who had studied pharmacy or chemistry in their countries were employed (Baytop, 2000). While the education period was 2 years initially in 1839, it was extended to 3 years in 1840 for the new admitted students (Baytop, 1995; Özçelikay & Asil, 1998 ). For a long period, boarding military students were admitted to Mekteb-i Tıbbiye-i Adliye-i Şahane (Baytop, 2000; Dölen, 2003). The alumni among those were employed in the army (Baytop, 2000). After the year 1858, the school has started to admit civilian and day time (not boarding) students named as “Harici (External)”. These students had the chance to work privately after completing the compulsory 5 year service term. In 1893, the external (harici) students were also transferred to Mekteb-i Tıbbiye-i Mülkiye-i Şahane’s Pharmacy class and continued their education here (Baytop, 2000; Dölen, 2003 ).

The first students registered to Pharmacy class of this new school were subjected to the qualification exam after 2 years of education, since they were educated for a while in Tıphane (the former school) before. Only 2 of the students taking the exam could pass it successfully and were graduated in 1840 (Baytop, 1995). The alumni, successfully graduating from the Pharmacy class of Mekteb-i Tıbbiye-i Adliye-i Şahane were certified with a kind of 1st class diploma, authorizing them to be able to perform pharmaceutics as a profession anywhere in Otoman Empire. On the other hand, the ones trained by apprenticeship and could pass the exam conducted by “Nazır-ı Mekteb-i Tıbbiye-i Şahane and Umur-ı Tıbbiye-i Mülkiye” were certified with a 2nd class “icazetname (Licence)”. The 2nd class “icazetname” bearers were only authorized to open pharmacies outside Istanbul (Baytop, 1985; Baytop, 2000). After 1879, the differences between the 1st and 2nd class pharmaceutics were canceled and all was given the right to be able to institute pharmacies anywhere (Baytop, 2000).

But the above applications brought some significant problems as well. Especially, in the pharmacies run by the master-apprentice type trained pharmacists, every kind of material or substance was sold at retail or wholesale freely. To be able to take those kind of irregularities or corruption under control, a regulation named “Beledi İspençiyarlık Sanatının İcrasına Dair Nizamname” was passed on the 3rd of February 1861 but could only come into force in 1863. After this regulation went into effect, an order was brought to the pharmaceuticals profession (Baytop, 2000).

The 5th Chapter of this regulation was related to the pharmacy students. According to this chapter, to be able to be a pharmacy master, a training had to be conducted for totally six years consisting two terms each of which was three years long. For this purpose, the possible student must have obtained primarily an admission paper from Mekteb-i Tıbbiye-i Şahane and had to work together with a pharmacy master for three years. Fifteen days before completing the three year term, a stage/internship certificate had to be prepared by the pharmacy master and given to the student. The student must have applied to Mekteb-i Tıbbiye with that certificate and taken French and Arithmetic exams. The successful students during the exams were authorized to continue the lectures for the second three year term (Baylav, 1968; Yıldırım, 1999; Dölen, 2000). Only after completing also this second term successfully and passing the final exams at the end, the students would be given the diplomas (Baylav, 1968; Dölen, 2000).

As the course content, a program similar to Paris Pharmacy School was implemented at Pharmacy Class. As the main lecture resource, the copyright owned publication of French pharmacist François Dorvault’s “L’Officine ou Répertoire Général de Pharmacie Pratique” named book was used. Consequently during this period, the Ottoman pharmacy was influenced by the French school. (Baytop, 1995). The aforementioned resource was translated to Ottoman language by Dr. Hüseyin Sabri in 1874 and published with the title of “Düstur-ül-Edviye (The Law of Medicine)”. This publication stayed as the main resource of Ottoman pharmacists for years (Baytop, 2000). Besides this, the publication titled as “Kimya-i Tıbbi (Medical Chemistry)”, authored by Kırımlı Aziz İdris full filled an important place in the history of Turkish pharmacy literature. Kırımlı Aziz İdris Bey has developed a series of etymological rules in the translation of French terms into Turkish (Dölen, 1998; Dölen, 1999).

During the mentioned period, some of the lecturers were graduated from the French Pharmacy School. As an example, Antoine Calleja (Kalya Bey (1815-1893)), who had come from French, conducted the Inorganic Chemistry course for 47 years as an instructor (Baylav, 1968; Dölen, 1999). After Kalya Bey, one of his students and assistants Halepli Vasil Naum (1855-1913) was assigned to this post (Dölen, 1999). The Pharmaceutical Chemistry course was taught by Faik Pasha, after his graduation in 1855 for 40 years (Baytop, 2000). Since the education language in Tıbbiye (Medical Faculty) was in French, Kalya Bey has also conducted his lectures in French till 1869 and after than in Turkish. Kırımlı Aziz İdris Bey (1840-1878), who had put great efforts in changing the education language from French to Turkish, taught Kimya-i Uzvi (Organic Chemistry) in Tıbbiye (Dölen, 1999). During the initial years, the Nebatat (Flora/Botany) Course, which was taught by Dr. C.A. Bernard, was performed on the live plant samples (Baytop, 1995). During this period, education was implemented in a very basic level and the students were taught only sufficient French, which would provide them to be able to write a prescription and basic level physics, chemistry, botanic and religion courses (Baytop Turhan, 1985).

The "Ensiceyi Edviye (Tissue of Medicine)" Course, which was included in the lecture program after the establishment of "Eczacı Mektebi (Pharmacy School)" in 1909 and taught at the 3rd year of the program has been accepted as the first Pharmacognosis Course in Turkey. The course which was taught only for one year at the beginning was extended to two years in 1915 and began to be taught both at the 2nd and 3rd year classes (Tanker, M. & Tanker, N.).

The studies conducted by the pharmacutists during the time of Mekteb-i Tıbbiye-i Şahane were published primarily in the journals named "Journal de la Société de Pharmacie de Constantinople" and "Revue Médico-pharmaceutique", which were issued by a community named "Société de Pharmacie de Constantinople" (Baytop, 1995).

In Mekteb-i Tıbbiye-i Şahane (The Magnificent School of Medicine), which had an advanced scope accordingly, were located differnt departments such as a botanical garden, library, physics and chemistry laboratories, collections of mineralogy, hospital and a central pharmacy (Baytop, 1993). Unfortunately, the liberary of Mekteb-i Tıbbiye (Medical School), collections, nature history museum, physics and chemistry laboratories, herbariums and the "Nebatat (botanical)" garden, which had been created by long and painful efforts of Dr. Bernard were perished after a fire on 11 October 1948, because of a fire started in Linardi Street (Former Çiçekçi Street) (Baytop, 1985; Baytop, 1995).

## 2. EDUCATION AFTER "MEKTEB-İ TIBBİYE-İ ADLİYE-İ ŞAHANE (MAGNIFICENT SCHOOL OF MEDICINE AND LAW)"

### 1. *Mekteb-i Tıbbiye-i Mülkiye-i Şahane (The Magnificent School of Medicine and Law):*

A Pharmacy Class was instituted with the establishment of Mekteb-i Tıbbiye-i Mülkiye in 1867. The pharmacy education was conducted in a three year term here. While the pharmacy students were receiving the same courses with the medical school students during the first two years, after the 3rd year, the lectures were being seperated. Between the years 1872-1896 348 pharmacists were graduated from this school (Dölen, 2003).

### 2. *Şam Mekteb-i Tıbbiye-i Mülkiyesi (Damascus School of Medicine and Law):*

To satisfy the medical personnel gap in the country, a Pharmacy Class was established in "Şam Mekteb-i Tıbbiye-i Mülkiyesi", under the structure of Mekteb-i Tıbbiye-i Şahane in 1903. The qualification exams for graduation of the students, taught in this school, were conducted by the instructors coming from Istanbul (Dölen, 2003).

### 3. *Haydari (Haydarlı) Eczacılar (Haydari Pharmacists):*

Upon the education language of "Mekteb-i Tıbbiye-i Şahane" is changed from French to Turkish, the interest of the students in medical tarining was increased and pharmacy class students were also tried to follow the medical courses in Tıbbiye for being able to receive medical doctor diplomas. As the students passed from pharmacy class to Tıbbiye (medical school), the need for the pharmacists in the army was increased. This requirement was strongly realized during the Ottoman-Russian War. After this event, with a regulation passed on 9 May 1876, it was decided to train pharmacists practically. The soldiers, talented on this subject, were educated with a practical training and new pharmacists were educated with a method by reducing the content of some of the courses. The

pharmacists educated in this way were certified with a diploma titled as “Haydarî” or “Haydarlı”. This application was continued until 1896 (Dölen, 2003).

#### 4. *Eczacı Mektebi (Pharmacy School):*

This school has started its education on 6 October 1909 and continued until September 1925 at Menemenli Mustafa Pasha Konak (Residency) (Dölen, 2003). After the establishment of Pharmacy School, the stage obligation was organized as 1 year after graduation (Yıldırım, 1999; Dölen, 2003). “Tahlilî Kimya (Chemistry Analysis)”, “Analytical Chemistry” and “Pharmacognosis” lectures were added to course program in 1914 and “Hydrology” and “Organic Chemistry” in 1926 (Dölen, 2003). With the passing of the “Regulation About the Pharmaceutists and Pharmacies” in 1927, a two year stage obligation was come into effect, instead of the former three year practical training to be conducted at the pharmacies (Yıldırım, 2009).

After the University Reform of 1933, the Pharmacy School has continued its education activities under the structure of Faculty of Science. The conditions of receiving a pharmacist diploma was stated in the Article 3 of Ordinance for Pharmacy School, which was under the structure of Faculty of Science of Istanbul University as follows: “To be successful at the visa exams after the second, fourth and sixth semesters; at the final exam for graduation after the eighth semester and to pass the qualification exam after the stage period. Similar applications were applied when the school was organized under the Medical Faculty afterwards as well (Baylav, 1968). The 3 year education period was extended to 4 years after 1938-1939 and the program organized in this period was continued until 1947. The revised program in 1947 was continued until the establishment of Faculty of Pharmacy (Dölen, 2003).

The Pharmacy School, which has accepted only the mail students until 1922, started to admit female students after this year as well (Dölen, 2003; Naymansoy, 2010). Among the first alumni of this school, Ahmet Mustafa was assigned to Çanakkale Hospital and Kadri Süleyman to Maltepe Hospital and performed their professions in those public hospitals (Baytop, 1995). Although the first female student was admitted in 1924, she left the school in a short while. Fatma Belkıs, Fatma Bedriye and Ayşe Semiha, who were the first female pharmacists, registered to the Pharmacy Class of Medical Faculty in Istanbul Darülfünun (The predecessor of Istanbul University) in 1927 and graduated in 1930 (Dölen, 2003; Naymansoy, 2010).

#### 5. *Eczacılık Fakültesi ve Eczacılık Yüksek Okulu (The Faculty of Pharmacy and Pharmaceutics Higher School) :*

Although the pharmacy education in Turkey has started in Istanbul, the establishment of first Pharmaceutics Faculty came into being in Ankara in 1960 with the institution of Pharmaceutics Faculty of Ankara University (Naymansoy, 2010). So the first pharmacy faculty in Turkey was established with the Law number 156, on 12 December 1960, with the name of “Ankara University Pharmaceutics Faculty” in Ankara. Since the number of pharmacists graduating from this school is accordingly law, some private organizations such as Barıştıran Collective Company applied to Ministry of National Education and received authorization for establishing “Private Higher School of Pharmaceutics” (Baylav, 1968). As a result, the first private pharmacy school was established in Istanbul in 1964 (According to Dölen on 1 Nov. 1963; Dölen, 2003) with the name of “Istanbul Private Higher School of Pharmacy” (Baytop, 2000). Following this school in Istanbul, other private schools have also been established and implemented the same program of this first sample (Baylav, 1968; Baytop, 2000). However with the law number 1472, passed on 9 July 1971, these private

schools were publicised and with a later law named “Higher Education Institutions Regulation”, passed on 28 March 1983, all were transformed to Pharmacy Faculties (Baytop, 2000).

## CONCLUSION

To that end, fundamental transformations were conducted in pharmaceutics area and in its education as well, as in the case of almost all other areas or disciplines during the Republic period of Turkey. The Pharmacy Faculties, the first ancestor of which is “Mekteb-i Tıbbiye-i Adliye-i Şahane (Magnificent School of Medicine and Law)” established in Istanbul in 1839, almost all around Turkey today continues to their education in a permanently modernising manner. Finally, pharmaceutics as a profession, which is dominated by male professionals at the beginning, because of the Military School established initially, has been transformed to a sector, the education of which is being preferred by females increasingly today at the Pharmacy Faculties of bachelors level (Naymansoy, 2010).

## Abstract

Starting with the concern for teachers' differentiated attention to boys and girls in the classroom, continuing with the implications of the course taking patterns in middle- and high-school years for students interested in science, and culminating with the importance of guided teaching and learning for most students, it is important to understand the quest for a fair educational policy serving scientific and technological needs of tomorrow. This paper reports results of an exploratory study examining factors that might be associated with achievement in mathematics, natural sciences and engineering determining girls' career choices. Female students' attitude in 'hard core' sciences, teachers' beliefs and schools' institutionalized practices are accounted for in understanding STEM (science, technology, engineering and mathematics) choices. Students' beliefs, teachers' recommendation and the system of tracking are all important factors in choosing an in-demand science career. The participation in advanced STEM discipline courses, students' attitudes, as well as tracking are under scrutiny for the analysis of Mathematics and Natural Sciences undergraduate major choices of more than thirty students enrolled in a four-year college in Upstate New York.

Keywords: gender gap, science career, STEM disciplines

## 1. INTRODUCTION

Under the last decade's auspices of accountability measurements, largely known as the *No Child Left Behind Act-2001*, countless efforts have been directed toward closing the achievement gap between students from different ethnic, socioeconomic and cultural backgrounds (Berends, Bodilly & Kirby, 2002). More recently, during President Obama's administration, the interest shifted toward a reduction of the achievement gap in science, technology, engineering and mathematics, the STEM disciplines. There is scholarly evidence that even though during the last decade the gender differences in mathematics and science education seems to be decreasing, male students still perform better on hard core sciences standardized tests (Mullis & Stemler, 2002). The male students are also more inclined to take advanced courses in mathematics and science at all levels, not only during the high school years. Interestingly enough, a survey conducted by the American Association of University Women suggested a high degree of correlation between the decrease in self-esteem of young girls and negative attitudes in both mathematics and science classes (Reis & Park, 2001). More recently, efforts have been made to encourage talented girls to attempt careers in mathematics and natural sciences; nonetheless the question remain if girls lag in these disciplines due to individual characteristics or external cumulative factors.

## 2. BACKGROUND

For a global perspective, the Third International Mathematics and Science Study (TIMSS) presents the international assessment outcomes and includes results of the mathematics achievement assessment and participation in advanced mathematics courses in 45 countries. Through the analysis of these outcomes, education researchers demonstrated that while gender differences in mathematics achievement were relatively minor at the elementary level, they started to increase in the final year of secondary school (Beaton, Mullis, Martin, Gonzalez, Kelly and Smith, 1996; Mullis et. al., 1997). In a similar study, the authors proved that mathematics self-efficacy and outcome expectations are predictive of students' interest in math and science courses (Lopez, Lent, Brown and Gore, 1997). The concept introduced in the aforementioned study constituted the basis for the conclusion formulated by Turner, Steward and Lapan (2004): both mother's support and father's support positively affected adolescents' math efficacy; nonetheless, only mother's support affected their math outcome expectations. In conjunction with the previously formulated conclusion another major finding was highlighted in the same study: "children who perceive that math and science careers are appropriate gender-equitable pursuits have greater math self-efficacy and greater expectations that math will be useful and valuable to them in their future careers" (p.48).

In order to understand what factors are associated with mathematics learning and achievement, from an international perspective, researchers focused on the following critical parameters: 1) personal variables, such as prior achievement, age, and motivation or self-concept; 2) instructional variables, such as amount, or quality of instruction; and 3) environmental variables related to home, teacher/classroom, peers and media exposure (Ercikan, McCreith, Lapointe, 2005, p.6). In the above-mentioned study, the authors try to answer two main questions: 1) how are the personal and environmental variables associated with achievement in mathematics for males and females in three developed countries, Norway, USA and Canada; 2) how are the personal and environmental variables associated with participation in advanced mathematics courses for males and females in the same countries. The results of the research were conducive to interesting conclusions. The factors not directly connected to schooling accounted for large (24%-39%) degrees of variability in mathematics achievement. Regarding personal variables, the confidence in mathematics was the strongest predictor of achievement for students from Canada and Norway. In the USA, parents' highest education level was the overpowering factor related to girls' success in science and mathematics courses. Student home environment was also a strong

predictor for female students' success in mathematics in all three countries. The study concludes that the strongest predictor of all of the variables for girls and boys attending advanced courses was students' attitudes toward mathematics.

Another important study addressed differential teacher attention to boys and girls in the classroom (Beaman, Wheldall, & Kemp, 2006). In an attempt to understand the gender gap in achievement the authors proposed a working model for any classroom. Under the proposed model, a more inclusive teaching environment, characterized by positive teacher interactional styles, is to be applied for testing higher levels of class engagement, which in turn may lead to greater gains in academic achievement for students of both genders. The study also concluded that under the existing circumstances of differing ways of gender response to contemporary educational contexts, it is deemed appropriate to re-engineer them in order to build equally effective teaching environments.

Another coordinate of minority student success is related to the school's ability of tracking/de-tracking (streaming). In a 2002 study, Yonezawa noticed that de-tracking attempts in any school system should be carefully implemented, in order to allow a 'selective flexibility'. Under the above-mentioned term, a teacher or counselor could recommend tracking and de-tracking of students, based on academic results. If a counselor (or teacher) thought a student belonged to a higher-level class, he/she would allow the student to transfer. Nonetheless, if the counselor would not anticipate the student's success in high-level classes, the school will deny the student's request (Mayer, 2008, p.17).

The present study analyzes the preponderance of female and male students in science oriented undergraduate majors leading to STEM careers, in connection to both internal and institutional factors.

### 3. METHODOLOGY AND RESULTS

An anonymous survey was distributed in the Department of Mathematics and Natural Sciences at a New York State College, during the 2010-2011 academic year. The content of the survey is presented in the Appendix. A total of thirty-two students (male and female) enrolled in the Physician Assistant, Physical Therapy and Chiropractor programs answered to the survey. As element of inquiry, the survey included questions such as: "How do you consider yourself in the following areas?", "Who influenced the most your current academic career?", "What is the major cause for your academic success?", "How many hours do you spend on average (weekly) for training?", "In middle/high school what was usually your teacher's perception about your efficiency?", etc. The first pool of twelve respondents, both male and female, were aspiring physician assistants. In this pool of respondents, amongst the five male students who answered the question "what is the major cause for your academic success?", three of them considered talent and luck as the major causes for their accomplishments. The other two answered the question acknowledging as a major determinant of their success the hours of preparation at key subjects in their areas of expertise. The seven female students who participated in the survey, all acknowledged as the most important cause for their accomplishments the hard work reflected in long hours of study. Among these seven female students, two also considered their success and interest toward a career in the medical field as being tightly connected to knowledge accumulated in previous courses and laboratories. In conclusion, it is important to notice that the majority of male undergraduate students attributed their academic success to talent and luck, rather than hard work and time invested in learning. Significantly, all girls considered the academic preparation and determination quintessential to their progress.

The second pool of survey respondents was comprised of twenty undergraduate students enrolled in academic programs in the areas of Chiropractic and Physical Therapy. From the eight female students, four mentioned as equally important for their academic success both the hours of weekly preparation and the courses previously taken in their areas of expertise. Significantly, none considered talent or luck as a significant factor of academic achievement. On the opposite, one fourth of all of the male respondents acknowledged luck and talent as important factors for success. Overall, the vast majority of male and female students in both pools highlighted the importance of weekly hours of training for exams and quizzes, between 15 and 18, or even more than 20. Nonetheless, female students considered that they were helped and supported by their teachers in middle school and high school only because they showed interest and dedication, and they were always well prepared for courses and laboratories. Even though almost one half of the male students work as hard as their female counterparts, they also ponder the impact of luck and talent in their professional training. Moreover, many interviewed subjects were in one way or another guided and supported through tracking (streaming) mechanisms during their middle school or high school years.

#### 4. CONCLUSIONS

The results presented in the current study support the previously stated hypothesis that in today's American education system, the student's success toward STEM careers relies mostly on the support and guidance provided by counselors and teachers. Girls' performances in STEM disciplines are preponderant in a school environment that encouraged prolonged effort in natural sciences and mathematics. In the recommendation process for advanced placement courses, many of the advantages of a biased societal mentality of innate abilities prevail in connection to performances and interest of male students manifested for the above-mentioned STEM domains. The female students that succeed in this environment usually work their way toward highly sought-after STEM careers, and their accomplishments are based on their common perception that prolonged training hours are required in order to keep up with their male counterparts.

# Good stories: using metaphors to teach philosophy

Thomas Wall\*

*Emmanuel College, 400 Fenway, Boston 02115*

---

**Abstract**

Courses that introduce students to philosophy, especially to freshmen, can be a challenge to teach. One of the problems is that while philosophical ideas are often quite abstract, beginning students are often concrete thinkers. One way to overcome this obstacle without making the course less challenging, is to introduce abstract ideas—such as those found in metaphysics, epistemology and philosophy of mind—through the use of metaphors and other literary devices that compare each abstract philosophical concept to something more concrete. For example, *reality* is discussed as air, fire, shadows; *knowledge* as dreams, blank slates, and information processing; *minds* as chariots, bundles and computers; *God* as an artist, a perfect human and belief as a wager; and the *meaning of life* as a rock, a middle path and a leap of faith. There was a total of thirty various philosophical metaphors used in this course. After the metaphorical description of the concept, and only after this, does the instructor offer a more literal explanation of the text. With their knowledge of the concrete story as a foundation, students seem to grasp more readily the underlying abstract concept when it is described literally. Assessment of this approach was through instructor observation, student self-reports and the creation of their own metaphors. Overall it appears that the use of metaphorical thinking first promoted *better* learning in this beginning philosophy course.

---

## 1.1 Introduction

Many philosophy professors find that teaching freshman philosophy courses presents a considerable challenge. For one thing, students often have little exposure to philosophical ideas before entering college. This may be less true in Europe, but is all too often quite true in the States. So philosophy seems to most beginning students to be quite unlike the courses they focused on in high school, such as history, literature or science. Unlike these fields, the philosophical search for truth is less a search for facts, and more a search for the

\* Corresponding author. Tel.: +0-000-000-0000 ; fax: +0-000-000-0000 .  
*E-mail address:* wallemanuel.edu

interpretation or meaning of facts. If scientists could build a robot that was functionally identical to a human person, for example, would this mean that it was also a person, that it had rights, that it would be wrong to destroy it? To take another example, if we are conscious of the world only after a great deal of neurological processing of sensory input, does this mean that the world we experience is simply the way that world appears to us? That the “real” world is not the world of our daily experience, that it may be quite unlike what we think it is?

While most students find such questions interesting, even fascinating, many of them struggle with the process of trying to solve them. This is not only because they have little background in philosophy. Rather, it has more to do with the type of questions that philosophers raise. The heart of it is that philosophical problems are quite abstract. Questions such as: What is real? How much can I know about the world? What kind of a being am I? Am I the same person now that I was a year ago? What should I strive for in life? These and others are not exactly the sorts of questions that arise in everyday life. While a few students arrive at college able to think abstractly, and do very well very in beginning philosophy courses, most do not. Their abstract thinking skills are often sorely underdeveloped. They may be able to understand, remember, organize and discuss facts quite easily--they are good concrete thinkers--but they are not used to thinking abstractly. It is my belief that this is the main reason why they struggle with complex philosophical ideas. It is not because the material is new to them or because they are not bright enough or because they have been poorly prepared for higher education. It is rather because they have not yet developed their abstract thinking skills.

As a reaction to this, many professors teach courses that place more importance on facts, especially courses in applied ethics. This is fine and often quite helpful in developing students' reasoning skills. Debating such issues as capital punishment, abortion, euthanasia, world hunger, and the like is extremely important. However, since many students take only one philosophy course, I think that they miss out on an essential part of a liberal arts education if they are not exposed to basic philosophical issues. So the question becomes how best to teach beginning philosophy students, the majority of whom are concrete thinkers, to understand basic philosophical ideas, the majority of which are quite abstract.

One answer, the one developed in this paper, is to make abstract ideas more concrete. One way to make them more concrete is to discuss them through stories that use models, metaphors, analogies, similes and other such forms of speech. For convenience, I will simply classify all of these literary devices under the general umbrella of “metaphors”. Through their use, abstract ideas are made more intelligible by comparing them to what is more familiar to the student. In the course that I designed about thirty of these stories are introduced, stories that may be found throughout the history of philosophy and into current times, some timeworn and some new. Their purpose is to compare the unfamiliar with the familiar, so that students have initial access to difficult philosophical notions. Once they get the general idea, once they get some sense of the problem, a more refined analysis can be introduced, one based more on literal and not metaphorical understanding.

The readings for this course are primary source materials, selections from the writings of well-known philosophers. Each selection introduces a metaphorical account of a philosophical idea. After class discussion, students are given readings that analyse the problem in a more literal way. Most of these readings come from one of my books, *Thinking Critically About Philosophical Problems*, Wadsworth, 2001. While the idea of using metaphors to discuss philosophical ideas is not new, an entire course based on so many of them is new. The goal is to examine the belief that most students will better understand philosophy if it is introduced as a collection of “good stories”.

## 1.2 Course Design

The course was divided into the following six areas, which represent standard philosophical problems that might be discussed in an introduction to philosophy course. The metaphors used in each area are listed and will be selectively discussed in this paper.

### **Reality:**

*Presocratics:* Reality is water or fire or air

*Plato's Cave:* Everyday reality is like shadows on the wall of a cave

*Descartes' Dream:* Reality could be a dream

*The Matrix:* Everyday reality is a virtual reality

*The Phone Call:* Experience of the world is like a phone call

### **Knowledge:**

*Socrates' Midwives:* True knowledge is like remembering

*Plato's Divided Line:* Knowledge is like a divided line

*Descartes' Evil Genius:* Our beliefs may be like universal deception

*Locke's White Paper:* Knowing is writing on a blank tablet

*Kant and Copernicus:* Knowing is constructing

### **Mind:**

*Plato's Chariot:* The mind is like a chariot

*Descartes "Cogito":* The mind is not like the body

*Minds and Computers:* The mind is like a computer's software

*Searle's Chinese Room:* Understanding is not like computing

*Chalmers' Zombies:* The mind is not like a machine

**God:**

*Feuerbach:* God is like a perfect human

*Paley:* God is an architect

*Stoics:* God is the mind of nature

*Newton:* God is like a watchmaker

*Campbell:* God is our higher self

**Ethics:**

*Plato's Ring:* True morality is like an invisible person

*Aristotle's Golden Mean:* Being moral is choosing the mean

*Bentham and Hedones:* Being moral is measuring pleasure

*Hardin and Lifeboats:* Morality is like a lifeboat

*Thomson's Violinist:* Abortion is like a violinist

**The Meaning of Life:**

*Hindus and The Wheel:* The meaning of life is like escaping from a wheel

*Taoism and Water:* The meaning of life is like the flow of water

*Kierkegaard and Abraham:* The meaning of life is like the choice of Abraham

*Nietzsche and the Overman:* The meaning of life is like the death of God

*Camus and Sisyphus:* The meaning of life is rolling a rock

**1.3 Metaphorical and Literal Approaches**

It may be helpful to examine a few metaphors and compare the use of them to introduce a philosophical concept with a more literal approach. Let's begin with what I call the "Phone Call" metaphor. The literal issue concerns the nature and knowledge of reality. Ever since Thales got the philosophical ball rolling, philosophers have claimed that there was a distinction between appearances and reality. The way the world is experienced by

me through my senses may not be the way it really is in itself. During the Modern period of philosophy this distinction was often argued for in the following way. What I experience through my senses is not reality itself, but my perception of reality. Today this argument is more forcefully made when cognitive scientists point out that we are not conscious of what we see, hear, taste, etc., until the brain goes through lots of processing; until reality has become part of our consciousness. If this is the case, then we cannot claim to know reality directly, but rather have to make inferences about its nature as the cause of our experience.

Not all philosophers share this perspective, however. Some, often called “Direct Realists”, have claimed that we do know reality directly through sensation. How can this be if all we get from the world in vision for example, are light waves that stimulate rods and cones on our retina, whose patterns are then encoded in our optic nerve and transmitted to the brain for considerably more processing - all of this before we become conscious of what we see. How do we know that we encode and conserve the very nature of reality through all of these changes in our central and peripheral nervous systems? It certainly seems that other species with different sensory equipment perceive the world differently than we do. What makes us believe that we alone experience reality as it is?

There are many sophisticated linguistic arguments that support this view, but they are beyond the ability of beginning students to understand without a great deal of background. So the literal defense of direct realism would be difficult. Instead, the phone call metaphor helps students at least to realize how direct realism might be the correct view by comparing what happens in a phone call to what happens in sensation. After all, grandma’s voice on the other end of my landline goes through all sorts of transformations as well, from movements in her larynx, to air waves, to vibrations in a speaker, to fiber optic encoding of her voice, to speakers on the other end and air waves, and so on. Yet the same voice that began this causal process pops out at the other end of the line, a voice conserved through all these changes. In the same way, it is argued, I am not aware of my sensations, but rather I am aware of the world through my sensations.

Another helpful metaphor comes from Camus’ discussion of “The Myth of Sisyphus”. A literal approach to the question of the meaning of life might identify several types of answers under the headings of Theism, Naturalism and Humanism. Students often find such discussions emotionally sterile and fall back on their own pet beliefs without much reflection. In attempting to explain the meaning of life as it would be for Sisyphus, however, they feel the reality of rolling that rock up the hill eternally. Sisyphus was a mythical character whose punishment by the gods was to roll a huge boulder up the mountain, only to see it then roll back down. This he repeated for the rest of his life. Like Sisyphus, students can see there lives as rolling their rock every day for no ultimate purpose (get up, go to work, watch television, have kids who do the same, and so on), or see that there is a purpose (keep the rocks on the mountain to build a cathedral), and finally to see that the meaning of life is what they make of it through their choices. In this way the question becomes meaningful to them. In fact, as part of their final exam they constructed their own metaphor about the meaning of life. We will see how they did in the next section.

#### **1.4 Student Metaphors**

Assessing student learning is always tricky business, but especially so in this course. How are we to tell if students learn better by having complex, abstract ideas first introduced metaphorically and only later in a literal manner; or whether the literal explanation alone would serve better. It would be helpful if there was a control group to teach literally, for example while another comparable group gets to use metaphorical thinking first; but there is no such group. So we are left with just my observations of how well they learn complex philosophical ideas, as well as their self-reports about how much metaphors helped them to understand. These two items will be discussed in the next section. In the meantime, there is a third element that might offer some insight into this approach to teaching philosophy, the construction of their own metaphors. This last item concerns especially an assignment in which they were to construct a metaphor which might help someone else understand an idea. They were to think creatively, as a philosopher might, and invent a metaphor about what life meant to them. We had already discussed the issue in class, so they were familiar with the myth of Sisyphus and were to use that metaphor as their guide--something to agree with or deviate from. Here are some examples of what they had to say.

One student rejected both Theism and Naturalism and found Camus to have a “terribly pessimistic outlook.” Instead, she invites us to think of the meaning of life as a “wave”. Life should be thought of “as a series of motions or a cycle of meaning-making. Creation of individualized values, goals, or purposes gives one motivation, and a desire to continue to create meaning. This constant cycle of creation and achievement is a perpetual motion that keeps meaning suspended: while we do not serve to chase a meaning outside of ourselves, it is up to the individual to create the reason for living. It is a cycle of perpetual motion that not only requires but at the same time produces happiness, motivation, purpose and meaning.”

In another metaphor a student says that life is like being a pioneer. Sounding a bit like Nietzsche, he says, “To live a meaningful life you must not be afraid to live against the norms of society, you must carve your own path and decide for yourself what is right, and you must choose to live despite the inevitable fate that all humans must face--death. In a sense, you must be like the pioneer. You must venture out on your own and travel through uncharted land, creating a new path as you go. ...He is the master of his own life.” Another student compares life to dining, especially the balance that ought to be part of the food served and the value placed on each course--some much more important than others.

Other examples include comparing life to a journey on the ocean, sometimes rough and menacing, sometimes serene and beautiful, with the rough parts just as essential to happiness as the calm ones. Another thinks of life as a box of assorted chocolates, with the freedom to choose which ones to eat. Still another thinks of life as the stages of a flower, each one to be accepted as it is, with a legacy of seeds to be left for the growth of the next flower. Then there was the infinity symbol view of life, where we might “cross and curve across each line, but always stay on the same path.” One student used the metaphor of a fully grown tree that provides benefits to others to express the meaning of her life, while another sees life as like fireworks. “Just like how the fireworks bring colors to a dark sky, bringing happiness to other people and caring for those who are significant in their life will bring happiness to them and a larger, more ‘colorful’ world around them will be visible.”

Perhaps the most thoughtful metaphor was created by a student who sides with Camus about the absurdity of life. For the “absurd” man there is no meaning to life. He is like an infant who crawls out of his house and gets lost in his own very large backyard. “Because of his struggle to comprehend the immeasurable and immense terrain that surrounds him --all of its sights, its sounds and the things he cannot yet even begin to

conceptualize--the infant begins to cry in frustration due to his own inability to understand....He has a feeling of otherness--of separation and of disconnection.” However, while finding no objective meaning to life the absurd man does accept this fate of his and goes on to live according to his own purposes and goals, infusing his own subjective meaning into his life by the choices he makes.

### 1.5 Student Comments

Clearly, in this creative thinking assignment some students were more creative than others, but all seemed to get the general idea that metaphors could be helpful cognitive tools. In fact, metaphorical thinking plays an essential role in many fields, especially the further away from observable facts the subject matter roams. Think of all the various models used in physics, for example, to help us understand things such as electrons, curved space and the speed of light. In a similar manner, think of psychological explanations of the soul or mind, that use metaphors comparing minds to such things as the state (Plato), warring parties (Freud) or computers. Even in our daily lives we use metaphors to describe abstract notions such as time (it is fleeting) and space (it is like a box). Some believe that almost all thinking is metaphorical, since everything we think about we categorize as like something else. As interesting as these broader questions are about the role of metaphorical thinking, the focus here is on the narrower issue of using metaphors to understand central philosophical ideas. The question is whether or not it is a better learning experience to introduce philosophical ideas first through the use of metaphors and only later to discuss them in a literal sense, or whether it is best to skip the metaphorical understanding and go right to the literal analysis. Mindful that students often say what they think the professor wants to hear, this is what a representative sample had to say when asked directly about this style of learning.

1. I feel having a metaphor is a great way to introduce a theory, it puts what you are about to examine into perspective.
2. Metaphors simplify the terminology that philosophers use and refer back to, so that the big idea does not get lost in the complicated nature of philosophical theories. Using metaphors adds intellectual and emotional thoughts to alter the reader’s mindset.
3. Metaphors also help when it comes to visual learners versus people who can listen to something and understand it. Some people understand things better in visual ways rather than just listening or reading. This is when metaphors come in handy. The purpose of a metaphor is to paint a picture in someone’s head so that they can better understand what is being said.
4. Within philosophy metaphors allow abstract ideas to be more concrete and readily accessible. After interpreting a metaphor one can understand a more accurate, direct interpretation of a philosophical view.
5. I think that if the writers were to just cut to the chase and give the reader the literal explanation of the meaning and purpose of life, or whatever concept is being discussed, it would not be very beneficial to anyone. I believe it would limit everyone’s thinking and people would not be as willing to expand on the concepts that are being talked about or create ideas of their own.
6. Philosophy is a very unique area of study and is often next to impossible to grasp in regards to direct interpretation of difficult texts. Because of this I feel that metaphors are an incredibly important tool to explain the controversial and abstract ideas covered and explored through philosophy. I would classify metaphors in philosophy to not only be recommended but also required when new material is introduced.
7. Metaphors might let the audience remember the philosophical idea more because it was told in a story. Stories can affect people in an emotional way and so they would remember the idea a lot more. People

seem to remember and understand things better when they are compared to something familiar or a more simple idea.

8. The use of a metaphor or story to represent an idea before explaining the literal meaning of the story can be a way for the reader to formulate the same idea that the author has managed to come up with. If the reader is able to come to the same conclusions as the author did they are more easily able to understand the idea and relate to it, then if they were given a literal explanation of the idea.
9. Metaphors are good ways to put the philosophical idea into perspective because the reader can see it in a way that makes the idea more relatable. However, a good balance of the text and the metaphor would be the best way to teach a philosophical idea because students learn differently. Some need the raw idea in front of them while others need to be exposed to the metaphorically. I sometimes liked it better when I read the literal interpretation first but in terms of stimulating critical thinking, the metaphor did a better job in the long run.
10. If the metaphor accurately and precisely conveys the concept to the reader it is appropriate to use it, but often forced metaphors do not completely do justice to the concept the writer is trying to convey. In this case, the use of metaphor only confuses the reader and pulls their focus away from the main concept. I found this to happen in the reading we had about John Locke's blank tablet theory about the nature of the mind. I thought it would have been just as effective if he just said that the mind is formed devoid of prior knowledge at birth and that we learn everything we know. I would have understood the concept just as well without the blank tablet metaphor.
11. Personally, I like to learn about the literal meaning of a concept and then get introduced to a metaphor that may be more relatable. When I hear the story I already have knowledge of the concept and usually then come to the 'Oh, I see', moment.

### **1.6 Concluding Remarks**

As is clear from the last two student quotes, using metaphors prior to literal explanations is not for everyone. These two students out of the twenty in the class preferred the more traditional approach. It was interesting that they happened to have studied some philosophy prior to this class, and were more confident in their ability to think abstractly. Most, however, found what worked best to be placing the metaphorical interpretation prior to the literal. My own experience tells me that by using this latter approach I was able to introduce more complex, abstract ideas more effectively. It is not easy to get eighteen year old students to seriously question some of their basic philosophical beliefs without doing so. Using Descartes' 'dream' metaphor, for example, allows students fairly easily to question the existence of the world, as using the 'Matrix' metaphor makes it easier to question its nature. The 'mind as computer software' metaphor allows students to learn more easily what Kant claimed about knowledge and reality, while the 'ring of Gyges' story allows them to question the purpose of morality.

If one goal of an introductory course is to teach some content, another is to teach habits of thinking, the habits especially employed by philosophers--critical and creative thinking skills and the habit of questioning basic beliefs. Most philosophy courses enhance critical thinking skills, but examining and creating metaphors also help to develop creative thinking skills. Some of the great discoveries in science, philosophy and other fields have come from comparing two seemingly unrelated areas and finding that one illuminates the other. In addition to critical and creative thinking, thinking like a philosopher also involves what may be what this course best models--identifying and questioning basic beliefs or assumptions. I believe that using metaphors to introduce philosophical ideas contributes a great deal to the development of this skill as well.

# Higher education and development: the role of private higher education institutions to accomplish fundamental purposes of the republic

Vinicius Figueiredo Chaves\*

*Master in Public Law and Social Evolution by UNESA. São José Av.35,15°, Rio de Janeiro,20010-020, Brazil*

---

## Abstract

This paper discusses the relations between higher education and development, focused on the investigation of the role of private institutions to achieve fundamental objectives of the Federative Republic of Brazil. It is analyzed the changes in the landscape of higher education in the country, as from the ascension of private institutions. It is also conducted an analysis of the powers of the Brazilian state as regulator of the sector, seeking subsidies that allow the assessment of the measure recommended intervention of the Ministry of Education, indicating some points which seem to be excessive and contrary to constitutional systematic.

*Keywords:* Higher education; private institutions; development.

## 1. Introduction

*“Education is the most powerful weapon which you can use to change the world”*  
(Nelson Mandela).

“Development” is a centerpiece issue since 70’s decade, and it has conducted Nations and international organizations overall into economic, juridical, social, historical, and cultural deep analysis, which aimed to the creation of favorable conditions to its full realization.

In Brazil, this issue was added to priorities roll, and reached specific constitutional determination level which was 1988 Constitution. Besides establishing an extensive list of rights to population, it also prescribed fundamental objectives to be achieved, of which development played leading role. However, the simple reference in Constitution seemed not to be enough to its complete consummation, which infers country was not able to promote all necessary transformations and remains branded by social stress resulting from exclusion and privation of human satisfaction means.

Undoubtedly, there are several obstacles deriving from distinct orders that make even harder development effectuation and sustainable concretization of further Republic objectives. In face of such a challenger scenario, which reveals an expressive conjunct of demand and privation, superior education plays final role for the removal of barriers aiming to the termination of actual stage on behalf of a consistent step.

The latest years were marked by some significant evolutions on Brazilian teaching, most likely related to transformation of superior education institutions, which were philanthropic at origin, into social organizations and public entities of private nature with profitable purposes. This reconfiguration occurs since public system is not capable to absorb the superior education access high demand from population, in quantity and quality perspectives. As consequence, private institutions take leading role as social actors and must be ready to absorb this demand in order to improve social inclusion.

What is the role of private superior education institutions to the concretization of fundamental objectives of the Republic? The possible answers for this question are raised from the examination of relations between superior education and development, such as the analysis of Brazilian State role before this sector. This debate transits by the discussions about its regulation. In the midst of possible fundamental questions there is one that

should be highlighted: at what degree is recommendable the intervention of Education Ministry at superior education market?

## 2. Higher education and development

“It is high time Brazil had the challenge to improve the quality of our education. Knowledge is decisive factor for the social and economic development, such as for sovereign affirmation. How many outstanding professionals Brazil misses because we did not give them proper access to education?” (Luis Inácio Lula da Silva, 2004)

It is undeniable that “the idea of development is in the midst of world vision that prevails at current era” (Furtado, 2000) and the classical conceptions (reference 4) have been replaced by humanity and social views (Locatelli, 2005). On the opposite, is equally indubitable that its promotion is a huge commitment that draws forth several hindrances from different orders. The societies are largely still incapables to appease conditions to the fulfillment of fundamental human needs. That issue maintains an unacceptable hiatus between achievable and accomplished in means of quality of life indicators. Thus, it is possible to conclude that development (or its lack) is one of biggest problems of this epoch, most likely in countries as Brazil, where its realization, by the way, turned into specific constitutional determination (Wald, 2011).

The Brazilian Constitution does not expressly determine which form of development desired and even the instruments to effective it. The interpretation of other devices merely assists the raise of relevant values by the constituent while in his pursue process (Locatelli, 2005). Thus, through a critical and systematic enshrined orders analysis on Constitution, it is possible to figure out that an adequate conception of Brazilian development indicates the need it gets social inclusion role. Also, it is required development is equally distributed between country regions, and generate qualified jobs vacancies, which will make income and welfare gut feelings to population. A development that signals a brighter future, which would be able to reduce the unacceptable gap between the realizable and achieved in the field of fundamental rights, where higher education is of utmost importance, and should be considered a priority issue as “it is not possible to think of raise of citizens that would fulfill nation needs, or even the economic and social development that it requires without taking it into consideration, regardless of the model that has been proposed as a paradigm” (López, 2011).

As per Chaves (2012) thoughts, the regrets (as per previous reference) of former President Lula in 2004, at the time of National Education Counsel Team induction ceremony, remains alive and requires public and private politics that could break loose that block sustainable evolution and qualification level of education processes in Brazil. Upon the analysis of superior education indicators of Brazil it is inferred that country has about 12,5% of workers with superior education degrees, while in South Korea and Japan it reaches 40 e 45%, respectively. It

also warns Brazil holds 6 engineers for each 100 thousand habitant while the US and Japan hold 24 and 25, respectively. Then it can be concluded “indicators are perverse and level of competition of country is quite low.”

According to Aurelio Portuguese Dictionary, to educate consists of “raising natural individual aptitude (...) developing his intellectual faculties (...), to instruct, to teach”. Thus, education, regardless of its level, as a mean to the development of psychic, intellectual, and moral capacities of a human being enlarges horizon of human knowledge and expand his potentialities. The higher education, as representat of most elevate level of education, paly main role to the promotion of development. It can be straight linked to the process raise by Sen (1999), in the meaning of dilation of real freedom that people enjoy and the elimination of restrictions that are imposed, which reduces their choices and social, politic and economic opportunities of rational actions.

Plainly, reaching higher level of superior education means progress, evolution, integration, justice, welfare, quality of life, which also signifies the achievement of fundamental objectives of the Republic. Its accomplishment is closely related to the increase of opportunities that are granted to people to access superior education on quality and quantity basis. As consequence, it will incentive the production of combined transformation that will afford people to experience dignity of life in its essence. In regards of this subject, it is stated by National Education Plan for 2001-2010 the following:

It is not possible for a country to aim to development and independence without rising up a rich superior education system. . In a world where knowledge outweighs material resources as a factor of human development the importance of superior education and its institutions is quite relevant. In order to enable them to accomplish its educational mission, institutional, and social, public support is crucially needed. (National Education Plan. 2001-2010)

In Brazil, the development will depend on the establishment of an appropriate institutional framework, which reflects the operating efficiency of the education sector, making it virtuous to achieve the common good and general interest, in order to raise a definitive factor for the success or failure of the Brazilian model. This process should be guided by the collaboration between state and community, and between state and market (Schapiro & Trubek, 2012), which demand task force for the raise of a development strategy, in order to ensure higher levels of expansion of superior education public and private so that role of private superior education institutions is widespread as well as Public intervention on this sector. It can be inferred that State and private institutions are not antagonistic or substitutes, but essentially complementary.

All in all, the expansion of superior education is absolutely essential to a sustainable development, as well as for the achievement of major objectives of the Nation. Brazil will not take standout presence in the new international order whether its levels of education do not get improved, most likely taking into consideration

superior education scenario, in which private educational institutions should be taken as one of the main actors of development. Therefore, these combined actions will generate social progress and evolution.

### **New institutions in higher education in Brazil**

It would not be possible to figure out the current state of higher education in Brazil without checking facts and statistics related to indicators of their achievements and transformations over the past decades.

In 1970's, 1/3 of the system was private, and 2/3 was public. In 1980's, the reality changed to 77% covered by private sector, which reached over 78% in 1998 (by INEP / MEC data). The numbers for 2001 showed that 86.8% of the institutions were private, which reached 88.3% in 2010.

The quantity of higher institutions between 2001 and 2010 had a significant increase: 71%. This increase is affected due to growing number of private institutions (74%), whereas the increase in the number of public institutions was 52%.

In the period 2001-2010 there was about 110% enrollment increase in higher institutions, and, although there was also an increase in public institutions enrollments (74%), the most significant increase in private area entrance meets their grown movement referred above.

The admittance number in higher education institutions increased by 109% in 2000's decade, of which almost 78% were covered by private institutions.

According to INEP (Anísio Teixeira National Institute of Educational Studies), enrollment is the sum of the student application to a higher course equal to attending and formed numbers, while the number of incomes is the sum of student bonds to a higher course that refers to the same year Census was raised, or 2010.

In terms of graduation, the 2010 Higher Education Census shows that there was an increase of 44% of graduates from public institutions, totalizing, in 2010, 973.839 graduates, while private schools achieved a 197% increase in the number of graduates, reaching 783.242 graduates in 2010, which represented 80% of graduates in general.

Given these numbers, which reveals significant growth of both graduates as well as registered and enrolled numbers, the role of education, ie, the higher education institutions - especially private ones -, can be considered a factor of social emancipation, in aid of construction of citizenship. The new private higher education institutions, public entities private in nature, should be seen not only as institutions that provide technical

knowledge for the labor market, but also, and especially, as places of empowerment and building of an including society, contributing to the formation of citizens capable of making their own circumstances.

**The role of private higher education institutions in achieving the fundamental purposes of the Republic: inwards new paradigms of corporate social responsibility**

As per Sen and Kliksberg (2010), the role that should be played by private institutions in contemporary society is under constant changing in recent years, evolving from a vision which defended the purpose of generating profit for its owners - only to whom it would might concern - in direction to its responsibility, in a perspective that goes far and indicates a paradigmatic rupture in relation to previous conceptions, in regards of their high social responsibility.

In the Brazilian Constitutional Law, the social function of the company was raised to the status of constitutional principle, by the recognition of increasing importance exerted by particular that begins to be seen as relevant instrument for the achievement of the fundamental purposes of the Republic. On the other hand, free enterprise needs to be reconciled with the other principles and values enshrined in the Constitution (Amaral, 2008). Certainly, this concept transforms individuals into social actors in the development process and gives them relevant papers, which go beyond the mere pursuit of their own economic interests, in favor of the ability to meet increasingly social demands remarked in Brazilian society on daily basis. In other words, free enterprise must remain committed to ethical values, and focused on the preservation of human life in all its fullness.

In this sense, one of the biggest challenges to private higher education institutions is the decentralization of its campuses, in both locally and regionally national perspective. The presence throughout the national territory is a vision which consolidates the ideal solution for expanding the opportunities of access to higher education, previously restricted to the main centers, for significant portions of society in places hitherto excluded. When approaching higher access possibilities to people, logistical issues related to difficulties and costs of displacement, rather an almost insurmountable barrier, fall considerably. Decentralization undeniably contributes to one of the main needs of the country: the reduction of social and regional inequalities. It also collaborates to its links with society.

Another of its commitments is focusing on quality, with solid training models, tailored to the needs of education and specialization, and focused on research and scientific initiation. By the way, with no quality, it is

clear that near location and low price will not work. However, it is also correct to affirm that if quality is achieved, but there is missing location and prices Brazil will not win the new heights of development, so it will not be "open" to anyone who wants to access higher education. Once maintained as determinant, enhanced by offering courses with the same standard of quality in different locations, shifts and schedules that maximize resources and manpower available, the gains of its decentralization will be aligned with the fundamental purposes of Republic, in accordance, therefore, with the roles which they should play.

It is also important to highlight the pursuit of employability of its students in a competitive world by new sensibilities and skills. The covenants are essential in order to allow the pick-up of students and graduates, respectively, for internships or jobs related to their fields of knowledge, thus linking the study with work, and enhancing the activities performed by its students and alumni in society.

All of these challenges, and others, should guide the actions of private institutions in their commitment to higher education in Brazil, as from the recognition that they should not only meet their particular interests, but also the interest of the whole society.

### **The regulatory intervention of the Ministry of Education and the challenges to concretization of fundamental purposes of the Republic**

In Brazil, there are currently a number of problems that generate negative impact on the pursuit of development, among which excessive regulatory intervention by the State which, under the pretext of searching for education qualification, has mistakenly imposed unjustified barriers to the sector in some cases, focusing on their analysis, merely rhetorical discourse, instead of taking into account Brazilian reality.

In the field of higher education, the intervention is performed by SERES - Department of Regulation and Supervision of Higher Education - which is a department from the Ministry of Education that is in charge of regulating and supervising public and private institutions. That regulatory public agency imposes some limitations which aim to combine and harmonize their activities with collective interests.

Regardless of the technique to be used, state intervention is legitimate only when directed to the achievement of public interest, and with a singular purpose which is the persecution of social welfare. In other words, it is imperative that the role of the government aims to guarantee effect to the values enshrined by the Constitution. Thus, the question which arises is the intensity of such an intervention, as well as raise of its fair measure, in order to adjust it to the value of freedom, which is an inviolable right granted by Democratic State Law.

In an education perspective, the intervention of the Ministry of Education at some restricted sectors seems to be excessive and contrary to constitutional systematic, especially regarding some issues related to the evaluation of higher education institutions.

*Evaluation of the evaluation: for a fair appraisal of higher education system.*

The evaluation of higher education institutions has been one of the most significant points of intervention in educational sector. It was established by the Ministry of Education to infer the quality and excellence of the courses in general. It is particularly important not only for the consequences set out in the parameters created by the Government, but mainly for the impact on the expansion of higher education in Brazil, from which it is emerged the need for permanent reflections and discussions about its progress.

The main mechanisms for evaluating higher education institutions created by the Ministry of Education are the index of courses – which is called IGC – and the preliminary concept of course - the CPC -, which have been raised as key indicators to the state and, by extension, to media and market. Through the IGC, the Government grades educational institutions, ranging from 1 to 5, with "feathers" as accreditation of institutions, closure of courses, and restricted spaces. The CPC is resulted from a calculation that takes into account issues such as the performance of the students (55%), the infrastructure and organization of the course didactics (15%), and faculty members (30%). According to this criterion, whether doctors attendance in courses reaches 15% (+7.5% related to the physical attendance by of masters +7.5% for teachers in full devotion), they will represent over 50% of the assessment of faculty members.

As per Chaves (2013), these criteria lead to inconsistencies while evaluating 6.8 million undergraduate students in the face of such an important attribute assigned to doctors. Taking into account the synopsis of higher education in 2011, which states 30,400 undergraduate and 1700 doctoral courses, as well as 107,000 of docent doctors (30% of total), of which 70.9 million (66.3%) are in public universities, it is highlighted that private higher education institutions, with 4.9 million enrollments (73.7% of total enrollment), and only 36,000 doctors available (0.7% of their undergraduates), would face an inevitable trend of low valuation of its faculty, as consequence of the very impossibility of meeting the parameters imposed by the Ministry of Education. The author also criticizes the National Assessment of Higher Education - SINAES – in regards of its determination concerning differences between Universities and Colleges, as well as regional inequalities in economic and social perspectives, which failed while considering that states as Acre and Roraima have no Ph.D. courses available. In addition, there are some states as Amapá and Rondônia that hosts only one doctorate in ecology and parasitology, respectively. Mr. Chaves warns that in the entire northern region it is held 56 doctoral programs, while only the

University of São Paulo holds 147. To make general scenario even worse, there are other states as Alagoas, Sergipe and Piauí that do not hold any doctorates in management, law, physical and IT subjects.

He also points out the need for more doctors graduations by public universities side. This lack is drastically missing in most poor states. Meanwhile, it could not be filled by private higher education institutions because they would get even lower grades in those states that doctoral graduation is not in place so far. As result, private institutions would be subject to “reprobation” by the Ministry of Education, what would affect their reputation as educational institution. Thus, the establishment and maintenance of criteria evaluation, which should be consonant with current reality concerning formation of doctors in Brazil is urged. It is mandatory that huge social and economic differences between regions of country are taken into consideration, followed by the concentration of doctors in southern regions of Brazil, which reaches 75.5% of total number of doctors of the country.

The author concludes that the evaluation is essential to qualification permanent process, especially when referred to higher education because of its importance for development. However, the same quality that is required from evaluated parties should be also requested by the instruments raised for their evaluation. Given the absence of fairer parameters, the evaluation is distorted, confused and, therefore, do not properly qualify institutions. On the opposite, it constituted an obstacle to the achievement of fundamental purposes of the Republic.

## **Conclusions**

The statistics and data presented in this paper demonstrate a reconfiguration in Brazilian higher education sector, since its activities became to be exercised primarily by the private sector. The role of these institutions as means of development factor grows in importance with definitive scope in the concretization of further purposes of the Republic. This relevant role requires from the institutions highest levels of commitment, ethics and social responsibility at all. It requires that their activities have to be stimulated permanently. Besides, this initiative must be understood as national project, and State should act as inductor of the new order, aiming to the raise and maintenance of such an institutional arrangement that suits to sustenance of development purposes.

In the face of this scenario, it should be put in place permanent reflections on regulation and supervision of sector, given the importance of private institutions for the development. It is unquestionable that State plays an important role as regulator. In this sense, it is imposing that Brazil reevaluates some aspects of intervention under the pretext of searching for qualified education. In some cases, it is erroneously imposed unjustified barriers to the sector, which is distorted focused on their analysis that is a mere rhetorical discourse that is far from Brazilian

reality. It is clear that it plays a reverse role to the development and realization of other fundamental purposes of the Republic. It is essential that regulation contributes to maximization of potential of the private higher education, and supports the achievement of most important interests and needs of society.

The Brazilian regulatory model should be conciliator in its essence. It should guarantee elementary basis to the promotion of indispensable intervention that should be ruled by the following premises: i) just the most elevated level of access to higher education will be able to promote the evolution and welfare feeling in overall country; ii) the concretization of fundamental purposes of the Republic should not dispense the effective participation of private higher education institutions. All in all, they do play definitive role for the achievement of constitutional purposes, and also for the social practice of value projects of Brazilian society in general.

**Abstract**

The work shows the research results of dependence of generated dissociated texts spatial structure satisfaction degree from a text spatial characteristic. The randomized sample was composed of 50 student age people from Institute of Professional Education and Information Technologies of the Bashkir State Pedagogical University, Ufa city, Russian Federation. As the only independent variable which characterizes spatial organization of the text the leading was used - total 13 grades from 0.8 to 2.2. The text printed on white paper substrates was reviewed by respondents with constant light conditions. The dependence of the page spatial structure positive assessment frequency from the leading has a maximum in range of 1.35–1.85. The ranking method offered allow to reveal the internal structure of assessments. In the field of low leadings a consensus assessment was observed in the range of 0.8–1.6. In the field of high leadings assessments were polar, therefore a bimodality was observed.

---

**Introduction**

The problem of creating human-oriented products exist in almost all spheres of human activity. It is especially sharp in education. This is related to the fact that the effectiveness of the learning depends on the usability of its carriers. Currently, electronic and paper media are competing with each other. Despite the rapid development of information technology the paper media, however, is still very important in the learning process. According to ISO 9241 (1998), the usability is the effectiveness, efficiency and satisfaction with which specified users achieve specified goals in particular environments. In this work the question of high school textbook texts quality assessment is considered in terms of usability. The usability of texts is closely related to their readability. Readability is a property of the text material which characterizes the ease of perception of it by a man. The readability of text is related to it spatial organization. The analysis of researches in the field of readability of texts shows insufficient scrutiny of issues related to finding the best representation of the spatial characteristics of textual information. In this work text leading is selected as the only one independent variable of spatial structure of texts. Thus, the research of perception of the spatial characteristics of the type page area on the example of leading seems to be actual. The aim of the research was to investigate the student age people perception of the text-based information from the leading. The research was conducted by direct interview and questionnaire. It involved 50 respondents, which are mainly made by the students of the Institute of Professional Education and Information Technologies of the Bashkir State Pedagogical University and Ufa State Aviation Technical University.

## 1. Readability overview

### 1.1. Readability and main features of text and font

The main readability criteria of specific typographic sample is reading speed of this sample. The measure of readability is the time in which one can read the text, or the amount of text that can be read over a period of time. Also readability is one of the major advantages of a good (“readable”) font. The readability of the font is determined by speed, i.e. quickness of perception, and the readability of individual characters, and the text as a whole, as well as the accuracy of comprehension without undue stress and fatigue. When reading due to a readable font the eye pressure doesn’t increase (Glushkova, 1987), the attention concentrates mainly on the information itself, rather than the means of transmission. So it is advisable to choose a set of quality and legible fonts to text typing on the prepress stage, as well as the correct choice of other text typing parameters and layout.

Readability of font is influenced by: form of font characters, typographic composition, font definition, font clarity. Necessity of obeying the readability requirements caused by psychophysiological characteristics of man, manifested in the process of reading and understanding the text (Smirnov, 2007). Question of the font size influence on legibility in a coherent text is well studied and confirmed by practice. Most readable font size for the text connected to adult skilled readers is the size of 10 points (Dubina, 2004). Smaller font sizes are read with a lot of stress when placing signs. If the font is too small, the reader is often "lost line": having read to the end of the line, hardly finds the beginning of the next. With too large font sizes line, by contrast, are shortened, resulting in some of the transitions to the next line.

Line length also affects readability. James Felichi (2004) gives several ways to determine the optimal length of the line: it is equal to 1.5-2 lengths of all lowercase alphabetic characters line length; optimal length line should contain 9–10 words on average consist of 5 letters each; the minimum length of the line is 27 characters, the optimum length is 40 characters, the maximum length is 70 characters.

This work is focused on another spatial characteristics of page, the leading. Leading factor is calculated by dividing the line spacing to the font size (in points). Line spacing - the distance between the baselines of the text. Baseline – an imaginary line along the bottom edge of the main element of character. In Fig. 1 shows the basic lines of text, and the distance between them.

Fig. 1. Line spacing

### 1.2. Readability researches

History of readability research dates back more than 100 years. In 1885, Cattell (Cattell,1885) attempted to assess the readability by tachystoscopic measuring of the recognizability threshold. Tachystoscopia is allow to determine the minimum time required for recognition of characters, words, groups of words. Based on these studies, Cattell placed lowercase letters of the alphabet in their degree of recognizability in sequence. Sanford (1987) had repeated studies, but using a different font, he received another letter order. This suggests that the fonts do differ in their recognizability. Pyke (1926) summarized the results of studies of readability. Report noted

the fragmentation of research and the lack of a systematic approach to the research of text recognition and readability. Pyke himself singled out 15 readability criteria and the first was reading speed. Based on the analysis, Pyke concluded that readability is not to be confused with the letters and words discernibility, it should be studied separately from the discernibility. He proposed to assess the readability by comparing the text read with that is understood when read. Thus, it was concluded that the readability should be judged not by the disparate characters, but on the examples that contain meaningful text. Then there was the question of the speed of reading. The reading speed means the amount of time which takes to read a particular text. First reading speed as a readability criteria was proposed by Weber in 1881, but actually became considered after the Pyke's report. Tinker and Paterson (1929) got the following results: text of capital letters read by 11.8% slower than typed with upper and lower letters; italics not slow reading speed, if used short; bold no less readable than light, and sans-serif fonts are not inferior to the readability of serif fonts; fonts from a size 8 to 13 are equally readable with a size optimal for a given length of the string.

In the USSR the research of a comparative readability of fonts was conducted in 30-40's. of XX century in OGIZ research institute, in 50-60s. of XX century in the department of movable types of Polygraphmash institute. Artemov V.A. (Artemov, 1933) proposed to distinguish the concept of visibility and readability of font, as readability significantly affected by the certain physiological reading characteristics of the reader, while the visibility of the font depends on the quality of type faces and features of the person's vision. In 1973, in the Moscow Polygraphic Institute Geshev (Geshev, 1973) and Kolosov where investigated the effect of font size, string format, inter-word spacing and leading on the text readability. It was concluded that the optimal value of inter-word space is constant and independent of other factors. The optimal value of the font size and format of the string is the smaller, when the font is more readable. (Tokar, Zilbergleit, Petrova, 2004) Also since the late 19th century, there have been many studies on the optimal line length for printed publications made, but the ideal solution has not appeared. Wide paragraph gives the best results in reading speed, but eyes get tired faster. In a long line, the eye has to overcome a greater distance, making it harder to find the following line (Vakorin, 2005). Readability is also associated with the color. The human eye is much easier to perceive colored letters on a colored background (Teksheva, 2008). If we collect the results of research, it is possible to draw some conclusions (see Table 1).

### *1.3. Description of some known methods*

Noted to the facts listed above objective methods of readability surveys have been formed. They can be divided into two groups:

1. Methods which aimed primarily at researching legibility of words, individual characters and their combinations:

- a) tachystoscopia;
- b) determination of the threshold distance;
- c) determination of the illumination threshold;
- d) optical measurement of visibility.

2. Methods that are relevant to the research of reading:

- a) measurement of the reading speed;
- b) registration of eye movements during reading;
- c) registration of blink frequency;

d) counting the number of errors when reading aloud.

Table 1. Researches to determine the optimal length of a line of text

Inverstigator	Optimal length of text line, cm	Notes
Weber (1881)	10.0	Maximum line length 15 cm
Tinker, Paterson (1929)	7.5–9.0	Used black text on white paper, size 10 pts, Paragrphs with length 18,5 cm read slower than the others
Cohn (1883)	9.0	Maximum line length 10 cm
Duchnický and Kolers (1983)	18.7	Line 18.7 cm read faster by 28% than 1/3 of the screen - 6.2 cm
Dyson and Keeping (1998)	18.2	Used text 12 points. Tests have shown that reading speed increased along with the number of characters per line. The slowest readable text length 10 cm
Youngman and Scharff (1998)	20.0	Used text 12 points. 20 cm have been optimized for speed reading, but users preferred length 10-12.5 cm
Bernard, Fernandes and Hull (2002)	24.5	Used text 12 points. This test did not reveal any difference in reading speed between the three sizes - 24.5 cm, 14.5 cm and 8.5 cm. But adult users choosen 2 shorter lengths.

Tachystoscopia allows to determine the minimum exposure time required to recognition of characters, words and groups of words. The disadvantage of this method is the fact that sometimes parts of images are detected before the end of the exposure, thus suggesting the correct answer. This method is more suitable for assessing the distinctiveness of individual characters, than to measure the readability of solid text. The method of determining the threshold distance. The set of some signs placing at a certain distance from the observer, so that he could not recognize them. Then they are getting closer to that range until the observer begins to identify them correctly. However, this procedure is suitable for the selection of fonts for posters, signs, ads, urban orientation system, where a few words have to be read from a distance. Method of optical measurement of visibility is used with an optical device, which measures the visibility of images from a common to read distance. Changing the lens focusing, the observer determines the point at which the image is recognizable. The result is approximately corresponds to the threshold distance. In the method of the research of the reading process to count the number of errors the subject must read the text aloud, and the experimentally found that the rate of such reading would be about three times slower than reading silently. Therefore, in this method, as the readability criteria it should choose not text read time, but the number of errors recorded in the reading process. But at the same time reading aloud is not typical and is not familiar to most skilled readers. Errors when reading may be due to the forced text pronunciation. The value of eye movements registration method in reading is that as a result of its use some features of the process of reading have been set. As a result of experiments conducted by S.E. Taylor (Taylor, 1966), (Taylor, 1965), it was found that the speed of reading is characterized by a large individual variation even among subjects with the same reader's qualifications.

The most objective and functional method of readability researching is considered to be method for reading speed measuring. It is to determine the time of reading a connected or disconnected text of a given size. Another embodiment of the method is to determine the number of characters read by the subjects over time (Tokar, 2011). And this method is used in this work. In this research, the text reading speed was adopted as a main criterion of specific printing solution in the hard copy version readability. When considering the various leading readability some contradictions that have led to finding the optimal ratio spacing for printed and electronic texts have been found. It's attempted to identify the laws relating the perception of the text and its spatial characteristics.

## 2. Sampling and procedure

### 2.1. Sampling

As respondents 50 students (age 20-22) were selected. The experiment was conducted in daylight once a week in the classroom of the Bashkir State Pedagogical University, Ufa city, Russia. As a stimulus material 13 dissociated (meaningless) texts of 1000 characters were specially generated. It was made to eliminate the cognitive aspect from the perception which could affect the reading speed. Texts were placed to individual pages with different leading values and under identical set of other (knowingly readable) parameters: font Times New Roman, font size 14 points, margins 2 cm, indentation 1.25 cm, justification for the width of the page, text color is black, paper color is white. Selected leadings (according to MS Word) shown in Table 2. Stimulus material was printed on writing paper A4, 80 g/m<sup>2</sup> by laser printer KMBizhub C220. The average line length was 164.84 mm and 73 characters (include spaces). In addition line spacings and leadings on all pages were measured by microscope with a metric ruler, and metric leading factors were calculated (see Table 2).

Table 2. Values of line spacings and leadings on the samples

Leading (by MS Word)	0.8	1.0	1.1	1.2	1.3	1.4	1.5	1.6	1.7	1.8	1.9	2.0	2.2
Line spacing, mm	4.56	5.66	6.21	6.80	7.35	7.95	8.54	9.04	9.64	10.18	10.78	11.33	12.50
Font size, mm	4.50	4.50	4.50	4.50	4.50	4.50	4.50	4.50	4.50	4.50	4.50	4.50	4.50
Calculated leading factor	1.01	1.26	1.38	1.51	1.63	1.77	1.90	2.01	2.14	2.26	2.40	2.52	2.78

In the experiment the perception of the paper printed text patterns has been evaluated. Respondents were asked to read the series of 13 variants of stimulus material with a comfortable for themselves speed, without gaps or repetitions. Reading time of each page was controlled with stopwatch. Once reading of each 13 texts is completed, respondents made notes on the reverse side of the sheet: pleasant or unpleasant there was to read the text. After reading all of the material respondents, freely looking through, without paying attention to the content, laid out sheets left to right on a table in ascending order of perception comfort of the spatial structure only. Then every sheet was numerated by number from 1 to 13 according to the order in which the sheets were laid out. Thus, the number "13" was assigned to the most satisfied text (text with most perception comfortability).

### 2.2. Data preparation and processing

For the preparation for processing of data obtained during the experiment Microsoft Access 2007 was used. The file structuring the data obtained was created in the program. Values of time spent on reading the text of 1 000 characters were transferred to the values of reading speed in characters per second. For data processing a parametric and non-parametric statistical tests were used (Serpik, Yagudina, 2010). When processing results Z-test and non-parametric Mann-Whitney U-test was used and calculated in Statistica 10.

### 3. Results and discussion

#### 3.1. The satisfaction of texts

For drawing the plot of dependence of printed text satisfaction from leading (Fig. 2) the proportions of responses "nice" were calculated. According with the curve on the plot it can be concluded that the maximum located in the interval from 1.35 to 1.85. It is assumed that the maximum expressed implicitly due to insufficient data. To check the statistical significance of the observed differences a z-test was conducted 6 times. Proportions corresponding to the leadings of 1.5 and 1.7, 1.4 and 1.8, 1.3 and 1.9 with maximum proportion of leading 1.6 where compared.

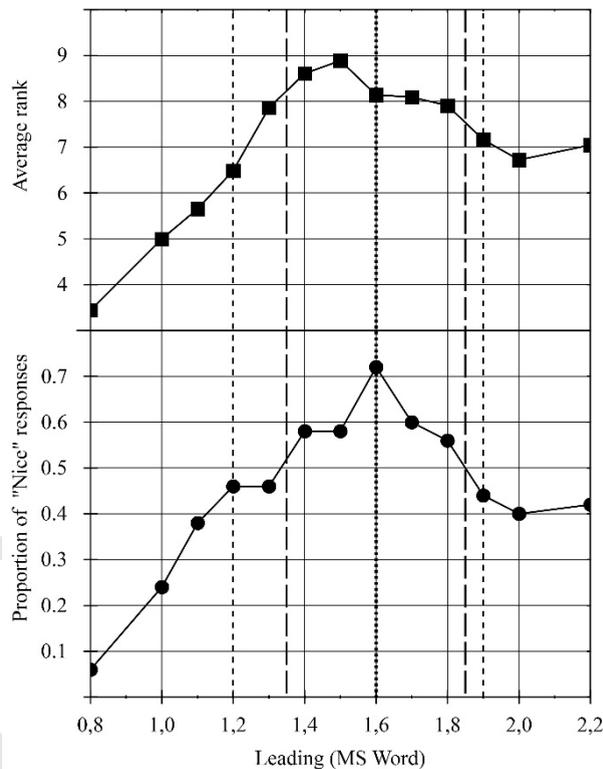

Fig. 2. Dependences of satisfaction from leading

That calculations were made to find the proportion of "nice" responses, in which achieved p-value would have been less than the given significance level  $\alpha = 0.05$ . Thus desired proportions corresponding with borders of interval of leadings from 1.35 to 1.85 have been found. This result confirms the assumption that the probability of a positive assessment of the spatial structure of the page on leading has a maximum. In particular, the observed maximum located in the interval (1.35-1.85).

#### 3.2. Ranking procedure

In the last stage of the experiment respondents assign ranks from 1 to 13 to texts in ascending order of perception satisfaction of the text spatial structure. Table 3 shows the matrix of rank frequencies. Ranking procedure has revealed the internal structure of rates: the table shows that in the "high" leadings the bimodality is observed. The presence of bimodality talks about the differences by some sign within the sample.

Normally, the average rank calculation is incorrect, but in this case it was used to evaluate the best leading, because distribution appeared bimodal. For further calculations the values of average ranks, standard deviation (SD) and coefficient of variation were determined. Table 3 shows that the lowest coefficient of variation and standard deviation match the leading 1.5. The dependence of average rank from leading shown in the plot in Fig. 2. The plot shows that the maximum is reached at the point corresponding to the leading of 1.5. Such it's concluded that the most satisfaction of text perception found with leading of 1.5. Fig. 3 shows a 3D bar chart constructed on the basis of the matrix of rank frequencies (Table 3). The diagram shows that the best unimodality achieved with leading of 1.5. This shows the least variation in estimates, i.e. most consensus of opinions among the respondents.

Table 3. Matrix of rank frequencies

	Leading												
	0.8	1.0	1.1	1.2	1.3	1.4	1.5	1.6	1.7	1.8	1.9	2.0	2.2
<b>1</b>	<b>0.63</b>	0.02	0.02	0.00	0.02	0.00	0.00	0.02	0.00	0.05	0.02	0.05	<b>0.16</b>

<b>8</b>	0.05	0.02	0.07	<b>0.16</b>	0.02	0.00	<b>0.14</b>	<b>0.19</b>	0.05	<b>0.12</b>	0.07	0.09	0.02
<b>9</b>	0.00	0.07	0.02	0.09	0.07	<b>0.19</b>	0.09	0.09	<b>0.21</b>	0.09	0.02	0.02	0.02
<b>10</b>	0.02	0.02	0.07	0.00	0.07	0.05	0.02	<b>0.12</b>	<b>0.23</b>	<b>0.16</b>	<b>0.14</b>	0.02	0.07
<b>11</b>	0.00	0.02	0.05	0.07	0.07	<b>0.12</b>	<b>0.14</b>	0.07	0.07	0.07	<b>0.14</b>	<b>0.16</b>	0.02
<b>12</b>	0.05	0.09	0.00	0.07	0.09	0.09	<b>0.12</b>	<b>0.12</b>	0.05	0.07	0.07	0.09	0.09
<b>13</b>	0.07	0.00	0.07	0.02	<b>0.14</b>	<b>0.16</b>	0.09	0.05	0.05	0.07	0.00	0.05	<b>0.23</b>
Average rank	3.40	5.00	5.70	6.50	7.90	8.60	8.90	8.10	8.10	7.90	7.20	6.70	7.00
Standard deviation	4.03	3.4	3.31	3.16	3.51	3.31	2.46	2.97	2.94	3.18	3.09	3.87	4.78
Coefficient of variation	1.17	0.68	0.58	0.49	0.45	0.38	0.28	0.36	0.36	0.40	0.43	0.58	0.68

To determine the interval of leading which contains maximum average rank the Mann-Whitney U-test with significance level  $\alpha = 0.05$  was used. The sample corresponding to the leading of 1.5 was compared in turn with the samples, relevant to nearby leadings (1.2, 1.3, 1.4, 1.6, 1.7, 1.8, 1.9). This procedure was similar to the procedure of proportion comparison. Thus, it can be concluded that the maximum average rank lies in the range of leading from 1.2 to 1.9.

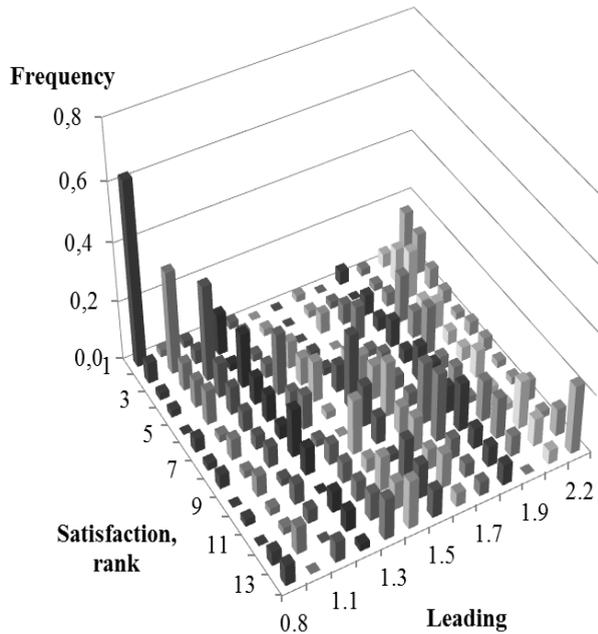

Fig. 3. 3D bar chart constructed on the basis of the frequency table

#### 4. Conclusion

When considering the question of usability with various leadings some contradictions have been found. It has led to the need to find the optimal leading for textbooks. We attempted to identify the features relating the satisfaction with perception of the text depending from its spatial characteristics.

The analysis of the literature led us to the formulation of hypotheses: the probability of a positive assessment of the spatial structure of the page varies with a leading variation. To test the hypotheses experiments with 50 student age respondents were designed and conducted. Then developed a method of processing the data, allowing to obtain the valid conclusions in terms of research objectives.

Analysis of the text perception data and using Z-test showed that the page spatial structure positive assessment probability on the leading has a maximum in the interval from 1.35 to 1.85. To verify this conclusion the Mann-Whitney test has been used. With this criterion the interval of leadings 1.2-1.9, which contain maximum average rank relevant to the leading 1.5 was defined.

The text spatial structure perception data ranking method also helped to identify the sample heterogeneity caused by differences on the unknown attribute inside the sample.

Results of the research can be used to optimize the texts makeup in education in order to facilitate its perception, which will improve the quality of information assimilation. Because the text perception is culturally conditioned it's very important to conduct the same research in different culture media and for different languages.

# How can i be a better teacher? Development of Finnish adult pre-service teachers' pedagogical thinking.

Valli, P<sup>a</sup> ., Perkkilä, P<sup>b</sup> . & Valli, R<sup>c</sup>

<sup>abc</sup> *University of Jyväskylä, Kokkola University Consortium Chydenius, PL 567, 67701Kokkola, Finland*

## Abstract

Adult students with experiences of teaching have often certain views about good teaching and a teacher. One of the most important roles in teacher education is to support future teachers to develop their pedagogical thinking systematically. Teacher's pedagogical thinking comes up in her/his actions and reflections on the teaching and learning situations. This article is based on research project which aims at to find out pre-service teachers' progress in pedagogical thinking during three different practicums in Adult Teacher Education Program. The article will describe this thinking process during the first practicum which is carried out after three months studying.

*Keywords:* practicums, adult teacher education, pedagogical thinking

## 1. Introduction

The teachers' thinking is concretely seen in their operation, words and actions. The teacher has a great amount of so-called tacit knowledge, in other words, the knowledge acquired through the work and which is not easy to explain exhaustively to others. According to Toom (2006), theoretical information as well as practical experience gained through the teaching-learning situations are needed in acquiring tacit knowledge. One of the tasks of the teacher education is to direct students to grow into the teacher's professionalism and that path of growth every student must travel by themselves. With the help of supervision it is safe to go along this path and everyone's professionalism can develop from their own starting points. The teaching practices provide the students with the opportunity for developing their own teacher's professionalism. The development of the pedagogical thinking is a process, which is not yet promoted by the information that has been received solely from research but external guidance is needed for it. As teacher educators we are interested in those processes through which especially the adult students' professionalism develops.

Kokkola University Consortium Chydenius is an independent university-level teaching and research unit located in the region of Central Ostrobothnia that is affiliated to the University of Jyväskylä that operates under the auspices of the universities of Jyväskylä, Oulu and Vaasa. The Department of Education in Kokkola is the only permanent department in Finland which offers adult education for primary school class teachers. Kokkola University Consortium in co-operation with the Faculty of Education at the University of Jyväskylä, arranges continuation courses leading to the degree of Master of Education and qualification as a basic school class teacher. These courses are particularly aimed at persons studying through the Open University, those contemplating a change of career and those changing the emphasis of their studies in education. The annual intake of adult students for training as primary school teachers is 40 persons. All the students are required to have prior university studies and teaching experience (min. 4 months). That is why the average age of the students is about 33-39 years. The studies last for 2 to 2.5 years, depending on the agreed individual study plan. All the students in our education programme have some completed studies of the pedagogics and work experience from the teacher's profession. So one can think that they are not so-called novice teachers but they have routines which

have been formed through the experience and theoretical knowledge, based on which they have formed their theory-in-use. Indeed our research differs in that regard from the earlier studies of pedagogical thinking that our target group consists of adult students of different ages and educational backgrounds.

The transforming and developing of a teacher's own professionalism requires considering one's own operation and its foundations. The consciousness of oneself as a teacher develops, in which case the questioning and restructuring of own assumptions begin to increase; the pupil centeredness and interaction with the pupils strengthen. Our objective is to train pedagogical thinkers and reflective teachers who want to develop their teacher's professionalism also in the future.

The objective of this article is to describe the class teacher students' start level in their pedagogical thinking at the beginning of the first teaching practice and its development throughout the practice according to the level model of the pedagogical thinking developed by Kansanen (1993).

## **2. Theoretical frame of reference of the study**

According to Kansanen (2004), the thinking is pedagogical when it is connected to the goals and objectives of the curriculum. The pedagogical thinking is also how the teachers justify their solutions with the help of the theory. It is a question of the teacher's pedagogical system of beliefs, information resources and theory-in-use behind it. The teachers will become conscious of the foundations of their solutions at the latest when they are being asked about them. (Syrjäläinen, Jyrhämä & Haverinen 2004). In the background of the teacher's pedagogical thinking affects the teacher's personal theory-in-use. The theory-in-use can be generally understood as thinking which directs the teacher's work. Different assumptions about the teacher's thinking and of information which directs the teacher's action are included in the theory-in-use. As a concept, the objective of the theory-in-use is to also take into consideration the teacher's practical knowledge in addition to the scientific knowledge. Argyris and Schön (1982) see the theory-in-use included in the theory of action which directs the actions of a person. The theory of the operation can be divided into theories supported by the person (espoused theory) and the theories-in-use. With the help of espoused theories the people explain their own operation but they may be conflicting with the theories-in-use. Tacit knowledge is assumed to be included in the theory-in-use. The tacit knowledge includes assumptions about oneself, the others, the conditions and about how the own operation, its consequences and the present situations are connected. The human being is seldom aware of their own tacit knowledge. Thus a view of the information can be linked to the theory-in-use, according to which a human being knows more than they can indicate with words and more than can be seen in their action. At most, the theories-in-use can include all the assumptions which are related to the everyday life of a human being about themselves, other people and the objects and phenomena of the environment. The theory-in-use can form in two different ways. A part of the forming of the theory-in-use is a straightforward accumulation of experiences. The old parts of the theory-in-use are replaced by better and wider particles thus strengthening the theory-in-use. The second view on the forming of the theory-in-use applies to the change in the basic assumptions in the background of the theories-in-use. However, a clear conflict between one's own intentions and the consequences of the operation is needed for the change in the basic assumptions of the theories-in-use. However, it is to be noted that the theories-in-use are quite permanent. Human beings try to maintain their old theory-in-use to the very last. In order to operate effectively, human beings must be able to trust their theory-in-use and to operate accordingly. (Argyris & Schön, 1982.)

The concept of the theory-in-use defined by Argyris and Schön (1982) has also been used by Osternan and Kottkamp (2004) as well as Ojanen (2000). Partly parallel concepts which describe the teacher's thinking have

been used for the theory-in-use, such are, among others, the Practical Knowledge by Elbaz (1983) and Johnston (1992), the information that has been bound to the operation (Knowing-in-Action, Knowledge in Action) by Schön (1987) as well as Ethell and McMeniman (2000), the teacher's pedagogical thinking and knowing (Pedagogical Knowing) used by Patrikainen (1997) and Husu (2002) and the teacher's personal practical knowledge (Personal Practical Knowledge) used by Connelly and Clandinin (1995). These share in common the fact that the thinking which directs the teacher's work includes mainly practical knowledge instead of the scientific information.

In addition to the theory-in-use, also the routines direct teacher's thinking and operation. Routines have been accustomed to be opposite to the reflective thinking already since the times of Dewey. However, for the teachers they are a means to manage the tasks ahead. Realizing the significance of these routines and the operational models awakens the need for the new contents or for emphasizing the existing ones. (Jyrhämä 2002.)

Could the routines be utilized as a basis for the pedagogical thinking and would it be possible to develop pedagogical thinking best by reflecting on the routines? The teacher's professional development is seen in the routines. With the help of routines the young teachers can try new solutions and find the suitable ones for themselves whereas the expert teachers withdraw from the routines and think about the suitable solutions. The teacher can develop through the routines by reflecting them professionally, by changing them and by giving them up. The teacher's process of professional development appears as a rhythm of stabilization and experimenting with the new, as regression and standstill. The teacher's thinking can be developed through the routines, in which case it is thought that the routine is practical solution with a principle in its background. The pedagogical principle is seen in the operation as a routine and on the other hand the routine is verbalized on the basis of a pedagogical principle. Verbalizing of the routines helps the teacher to understand the objectives and values which come true in the teaching. The teacher forms a routine consciously when making pedagogical choices which in turn gradually leads to the establishing of the teacher's ways of thinking. The professional growth as a teacher requires the teacher to encounter the new, which stirs the desire to reform the thinking and to change the routines. When the teacher's new thoughts are seen in the operation as routines, the change in the pedagogical thinking will probably be permanent. (Hellström, 2008.)

The level model of the teacher's pedagogical thinking by Kansanen (1993) (Fig.1) is based on the ideas of König. Kansanen (2004) divides the teacher's pedagogical thinking into three levels, of which the first is an action level. This level means the pedagogical practice containing the planning and evaluation of the teaching. The teacher makes the decisions situation specifically depending on the basic teaching skills. The second level is the level of object theories which refers to the object theories which the teacher has formed, in other words the theories-in-use which direct the teacher and which have formed through the earlier experiences. At this level the connection of the theoretical concepts and models to the teaching event is thought about. The teacher needs theoretical expertise and the critical evaluation of contents. The third level of thinking is the level of the metatheory. At this level a final analysis of pedagogical decisions takes place. So the teachers analyze their object theories, draw up syntheses and consider the reasoning. The questions of value in the education are central because through them the starting points for the values have to be sought after.

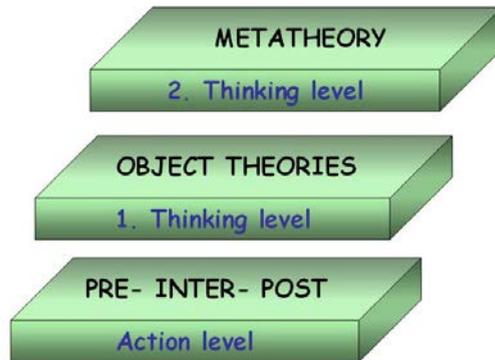

Fig 1. Teachers' Pedagogical Thinking (Kansanen, 1993)

These thinking levels are continuously in the interaction amongst themselves thus the theory and the practice integrate. The practice develops through the analysis of reasoning and on the other hand, the examining of the operation develops reasoning.

### 3. Target group of the study and research materials

We examined the starting points of the adult students' pedagogical thinking and development in the first teaching practice in the spring of 2013 in our study. In this teaching practice the curriculum is emphasized as the foundation for teaching and educational activity as is the organization of teaching according to the different levels of development of the pupils. The length of the teaching practice is one month, of which one week is for observing the class teacher's and the pupils' work and three weeks for the students to work as the class teacher themselves. The teacher of the class acts as the second supervisor during the practice with the senior teacher of the university. The first tutorials concerning the practice will begin a month before the beginning of the practice.

#### 3.1. Target group of the study

The 12 students who were supervised by the researchers and had begun studying in January 2013 were marked off as the target group of the study. The students' work experience is focused on the class teacher's work (to grades 1-6) of which all the students chosen for the education had little more than two years on average (24,6 months). They had over a year of other teaching experience (13,5 months). So altogether they have more than three years of work experience on average. Of the 40 students only eight (20%) students did not have any experience of working as a class teacher. For most (60%) the length of the work experience is between four months and four years, but 20% of the students have even more than four years. The target group's (n=12) length of work experience or the lack of it was almost similar to those of the whole class (40 students). The average work experience for the ones participating in the research was over 3 years and only two students did not have any experience of the

class teacher's work at all.

### *3.2. Research material*

With the supervision, the development of the pedagogical thinking can be influenced in many ways. In this article we have not studied the significance of the supervisor but we concentrate on describing the level of the students' pedagogical thinking with the help of the students' written theories-in-use and learning diaries. Before the teaching practice, the students wrote their own theory-in-use, in which they described their typical teaching event. The purpose of the description was that the students realize their own significant matters which direct their work as a teacher. Based on the theory-in-use, a discussion in which the student's strengths and areas that needed developing as well as personal aims set for the practice were thought about. The objective was to make the student aware of their current routines and beliefs which are related to the teacher's professionalism and of thinking which directs their own operation. Immediately after the first tutorial in March the students began writing their own personal learning diary and continued until the last day of the teaching practice. The purpose of the writing was to think and to evaluate own experiences on a daily basis and use them to find new points of view and points of contact with what has been learned and experienced previously. For the students, the learning diary was a tool for examining their own thinking and learning, structuring, developing and for building the professional identity.

### **4. The method of analyzing the research material**

The research material was analyzed with the help of the content analysis. According to Berelson (1952) the analysis of the contents is a suitable research technique for objective, systematic and quantitative description of the contents of the communication. The content analysis can be used to study linguistic materials, in which case an attempt is made to analyze contents and structures which are related to the phenomenon to be examined with the help of classification of contents. In the content analysis the subject of the examination is usually either originally in a written form (for example the theories-in-use and learning diaries written by the students) or material transcribed into a written form (for example the interviews). Based on the material the systematic and comprehensive description is aimed at. The description is made for the contents or structure of the material to be analyzed. In this study a material based content analysis has been used, which means the formation of content categories from the research material, in other words from the students' theories-in-use and from the learning diaries.

## 5. The analysis of the research and the findings

We analyzed the theories-in-use and the learning diaries written by the students by content analysis. First we analyzed the students' theories-in-use to two main categories using the NVivo program; learning situation and good teacher's professionalism. The learning diaries were analyzed by classifying and by dividing statements written by the students by theme into two main categories; planning, teaching-learning situation containing especially the interaction in the teaching situations. Next we describe the results emerging from the students' theories-in-us and the learning diaries.

### 5.1. The students' theories-in-use

The students examined in their theories-in-use the learning situations they had concretely implemented and described the properties of the good teacher's professionalism. From these two descriptions the main categories of theories-in-use were created.

#### **Learning situation**

The students generally described the learning environments of learning situations as versatile and pupil-centered. The conception of pedagogics and the conception of learning were significantly distinguished as factors which affect the learning situations. In the conception of pedagogics the teacher's set of values, cooperative skills, comprehensive support for the individual pupil's growth and the idea of a safe adult came forth. In the conception of learning a constructivist theory of learning was emphasized. The students strongly brought out the learner's active role in the learning situations. On the other hand, a part of the target group experienced that they were only moving towards a constructivist conception of learning.

*"My own teaching style with the preschoolers is moving towards the constructivists learning styles. According to the constructivists theory of learning the learner is an active individual who creates and edits information. (Student 5)*

The students emphasized the learning atmosphere and the teacher's role in connection with the learning situations. The significance of especially an educator /the teacher emerged as a creator of the positive learning atmosphere. In addition to the teacher, the interaction between the teacher and the pupils and between the pupils as well as the working methods and the teacher's conception of learning were mentioned as factors contributing to the learning atmosphere. The teacher was seen both as an educator and as an instructor of learning situations.

*"The educator also creates the atmosphere for the situation with the way they operate and with their presence. (Student 5)*

*"My own role was a directing, circulating observer, a helper of ideas, an enthusiastic participant!" (Student 2)*

In connection with the curriculum, the conception of learning in the curriculum, the objectives and the approaches were brought out. Especially, the students searched for the support from the curriculum for their conception of learning, for the objectives and the approaches. In enabling the learning the target-oriented working, the provision of the time for the learning and interaction with the peer group and the teacher as well as active structuring of information emerged. The child-centeredness and the objectives of teaching and learning were also mentioned in connection with the learning situations.

*"The teacher should choose the methods of teaching according to how well they promote the studying and teaching which is in accordance with the objectives of the teaching." (Student 6)*

*" In my opinion, the teacher's educational work and teaching should always be child-centered. (Student 6)*

### **Good teacher's professionalism**

In connection with the descriptions of learning situations the students' views on the good teacher's professionalism emerged clearly. The teacher who develops oneself emerged strongest. Openness to new ideas and ICT-skills were seen as the properties of the teachers who develops themselves.

*"I am not set in my ways but want to learn and to develop as a teacher. Things can be done in many ways, sometimes you must wake yourself up by looking at the matters 'from outside the box.'" (Student 4)*

It was experienced that the good teacher's professionalism gave room for the active role of the pupil. Some of the students saw that they still have to develop their role as a teacher who gives room for the pupils.

*"I want to direct pupils towards being active, to creativity and to a certain kind a criticism. It is important that the pupils realizes matters and significances spontaneously by themselves." (Student 12)*

The teacher's ability to combat stress was brought out in connection with the busy working day and in connection with the different situations of interaction such as when meeting difficult parents. The curriculum as a foundation for the teacher's work, the versatile approaches, the permissive atmosphere, paying attention to different learners and the cooperative skills were also mentioned. The importance of the curriculum was emphasized both generally and from the evaluation point of view.

*"And here we get to the importance of the core Curriculum. It requires a great deal of the teacher to, when necessary, withdraw from the teacher's manual based teaching tradition of the work community!" (Student 6)*

The versatile approaches were considered to promote the learner's active role. The cooperative skills were emphasized especially from the point of view of a home-school cooperation. Furthermore, the cooperative teacher was considered to support the pupil's positive development as a human being and as a learner.

*"The gifted teacher is able to uplift and strengthen the individuals met at work –whether they are pupils, parents or colleagues - through the interaction." (Student 7)*

The creation of the permissive atmosphere in which the pupil has a right to show both joy and the feelings of disappointment, was mentioned as the property of the good teacher's professionalism. The teacher is an adult who listens and sees the child. The good teacher's professionalism also pays attention to different learners and learning styles. The organisational skills and the teacher's role as an supervisor emerged only once as a property of the good teacher's professionalism.

### **5.2. The learning diaries**

In their learning diaries the students thought generally about the growth in the teacher's professionalism and what it requires of them. Particularly those who had little work experience, thought about whether they are able to change their thinking.

*"What does the teacher's professionalism require? Do I have enough ability and motivation for it? I have already admitted to myself that "the growth to the profession" will require a long and in parts even a heavy journey." (Student 7)*

On the other hand, it was experienced in spite of the work experience that the mind was open to the changes. The students were ready to give up their routines and to test new solutions. At this stage it is indeed important that the student meets something new which strengthens the desire to reform their thinking.

*"I regard as my strength the fact that I have been allowed to work in short term supply posts and thus have not been forced to be the prisoner of my own pedagogics but to begin on the field with a very open mind. I have such no deep-rooted image of my own operation that I would not be ready to develop or to change." (Student 1)*

Next these considerations will be described a little more in detail from the points of view of planning and teaching-learning situations.

### **Planning**

All the students (n=12) had written some thoughts about the planning in the diary. The planning was considered important from the point of view of the fluency of the teaching and all the students told that they had understood the importance of the planning. Most of them described the points which are to be taken into account in the planning and their development in the planning at a general level. It was possible to see the widening of the perspectives related to the planning already after the first week of teaching practice.

*"What could be most essential in the planning of the future lessons? There are at least as many questions and insights as earlier but their contents have widened a little. (Student 7)*

To some students the significance of the planning opened in a new way, in which case they emphasized the setting of objectives and their significance in the learning situations. For these students the starting point for the planning changed from the activity to the objectives themselves. These students considered, among others, how planning can support paying individual attention to the pupils.

*"The lesson plan should be as methodically versatile as possible but as clear in its aims as possible. Thus it is possible for the teacher to differentiate the teaching to respond to the different learners' needs." (Student 6)*

*"My present conception is that efficient teaching is of a kind in which the teacher has known how to make the right observations of the pupils' needs (knowledge, ways of learning, interests ...) and knows how to integrate them into the objectives of the curriculum." (Student 7)*

The students also thought about the effect of their own human perception on the planning. They thought about how hearing the pupils' voices would also be important in the planning. The planning began to be thought about as a shared possibility of the class to affect the learning situations, not just as the matter for the teacher.

*"One had to learn to plan the lesson so that it is target-oriented learning. It was so opening and freeing to understand that I must plan my every lesson so that I promote the learning of the child. Realizing this helped me also to build my own teacher's professionalism in a brand new way. My own humanist conception on human being also strengthened; the pupil's voice can and indeed should be heard in the lessons and in planning of the lessons. Why cannot one ask how the pupils want to study a theme. Based on the ideas which have come from the pupils it is possible for me to plan my lessons so that I will fulfill the task which is given to the school. When the pupils are heard, their well-being at school and also outside it increases. (Student 1)*

This student found it also important that the pupils can plan teaching by themselves and enjoy what is being done. A humanist conception of a human being can be perceived in the background, and from that the student's set of values is also conveyed.

### ***Teaching-learning situations***

Teaching-learning situations were described a lot in the learning diaries. These situations that were described were significant in some way from the point of view of the learning. The students explored courageously outside their own strong area to experiment and to extend their knowledge and thought and realized well the reasons for the successful lessons.

*"My teaching practice lessons were not in my own strong areas. This was my conscious choice because I wanted to challenge myself. It, of course, was laboursome but also rewarding indeed!" (Student 6)*

*"My last lesson, the second mathematics half-group lesson went even better because I had practised to open and to explain concepts in more detail. (Student 7)*

*"The lesson (physical education) left me with a positive feeling. I had thrown myself fully in the world of drama, narration and physical education. In my opinion I managed to inspire pupils. The narration served as a good linking element throughout the lesson. The narration also helps me to keep the group better under control." (Student 4)*

The students thought much about those points which made the learning situations better and more functional. In this context, the matters to which the students had tried to pay attention beforehand and which in their opinion affected the success of the learning situation come forth. Through new information and experience some students had created their own new models of teaching, which they thought about in the diaries.

*"The experience was really educational because I noticed how I got additional ideas for implementing on a second lesson and could see how simply a place for the lesson can affect the effectiveness of certain methods. (Student 7)*

*"..how to get the pupils to concentrate and above all to get them excited about grammar for 90 minutes? The solution was a work station method, in which the pupils were allowed to circulate at their own pace completing different tasks in connection with the word classes. The method of work was not familiar so the amount of preparation was surprising. Therefore I can indeed state that the teaching experiment was extremely educational and rewarding." (Student 7)*

*"Setting out the structure of the lesson on the board was a big help to myself and to the pupils. The progress and structure of the hour took shape better. (Student 4)*

The students also reflected their own theory-in-use with the lessons that were carried out during the practice. A student described an environment and science lesson as corresponding with her own theory-in-use. A student had consciously aimed to pay attention to the thinking in the background of the teaching.

*"My own theory-in-use succeeded best in the environment and science lesson. The pupils had a problem-solving activity, they carried out experiment in a group and reported the findings at the end of the lesson. At the beginning of the lesson there was a short, teacher-led introduction and giving of instructions but after that the pupils themselves were allowed to be in the major role of the lesson." (Student 6)*

The students paid attention to the interaction between a teacher and the pupils. The students experienced generally that they were strong in the interaction between a teacher and the pupils. Especially providing space for the pupils and for the interaction between them was regarded as important.

*"In my own lessons I approached the child as I have got used to approaching the child. I went near the pupils in many situations and let them understand that I am willing to hear them and above all I am willing to take their learning forward. (Student 1)*

*"In my lessons I tried to be more of a supervisor than the teacher who talks throughout the lesson. Perhaps I could have been even more quiet sometimes! I aim for the pupils to be active themselves. I wanted the pupils to work mainly in pairs or in group tasks. (Student 12)*

The students often thought about the teacher's role in the teaching-learning situations. Most students wanted to move from a traditional teacher's role towards the role of the supervisor. In the learning situations the teacher's role had also been thought about a lot. The subject of the consideration was the teacher's role in relation to the pupils' role. Many students had a desire to move the focus to the pupils' active role from the teacher-led teaching.

*"Many matters such as learning environment affect the implementing of teaching situations but, in my opinion, the mental presence of the teacher is just the most important. The teacher's role is to act as a kind of a supervisor when the pupil meets new information." (Student 7)*

## 6. Conclusion

In the theories-in-use the start situation of the students' pedagogical thinking was distinctly seen. The students thought, among others, about the teacher's role, individuality, learning atmosphere, interaction, conception of learning, in other words one can say that their thinking included already many dimensions of the teacher's professionalism. The students' conceptions were based on the information (their own teacher experience) that was received through practice and an attempt was made to justify this information through the general knowledge of pedagogical theories. As Jyrhämä (2002) states, the student can have vast knowledge adopted at a theoretical level and have it connected to the own theory-in-use but it can be challenging to adapt everything to the teaching situations. The students were aware of the theory which dominates in the background but were not yet able to think about the connection between the theoretical concepts and methods, and the teaching event. The descriptions of learning situations were mainly the descriptions of pedagogical practices. The students had yet not reached the level of the object theory as stated in the model of Kansanen.

It can be said that by writing down the theories-in-use, the students became more aware of their own significant matters which are related to the teacher's pedagogical thinking. They wrote as though their own ideal description of the teacher's professionalism, which was seen in the theories-in-use in the descriptions of the good teacher's professionalism. They brought forward the teacher who develops oneself and the pupil's active role. According to the results the students were aware of a prevailing view on education and learning. However, it had not yet become fully concrete at a practical level.

It was possible to perceive clearly common themes which the students raised as the subject of the examination, in the theories-in-use and in the learning diaries. For example, the significance of the teacher's and the pupil's role and the individuality were dealt with in both. The students realized matters that were originally significant to them before the practice and delved into these matters again during the practice. For many, the pedagogical thinking deepened from the description of the theory-in-use to considering the reasons and to the critical evaluation of the teaching event. What earlier was described as important was concretely brought out in the practice and matters were thought about through the theory and given justifications. For example, the aims were seen as important already before the practice but during the practice their significance enlarged to include

paying attention to individuals and above all they began to direct the whole planning process. The theories-in-use often showed a constructivist theory of learning, either as dominating or as the ideal, but only through the teaching practice the students experienced what it means in practical work. The students began to implement their own conception of learning more during the practice and gained concrete experience from it. These teaching experiences helped students to create new solutions and thus extend their thinking that way.

It is important that the teaching practice is begun as soon as possible after the beginning of studies. According to Niemi (2005), the firm connection between the theoretical studies and the teaching practices provides innumerable opportunities for the confluence of a theory and practice. Our study showed that by working this way the reflective skills of the students and their critical awareness developed during the practice. In their learning diaries the students began to think clearly more about the reasons and arguments which affect the creation of a meaningful learning situation. In the diaries, the description on the action level of the pedagogical thinking as well as the thinking on the level of the object theory can be perceived but the thinking on the uppermost level remained minor. The teacher's role was begun to be examined more critically, which was seen as the students' increased why-questions. The teacher's actions began to be justified as target-oriented and it was reflected in the values in the background. When thinking about interaction in relation to the pupils and between the pupils, the students got to the level of the metatheory. According to Kansanen (1993) the examination of the values and moral conflicts which emerge in the interaction belong to the level of metatheory.

According to the results, the development into being a better teacher takes place by reflectively examining one's own operation by writing theories-in-use and by justifying the learning diaries. This way the students' practices in teaching develop and on the other hand the reflective examination of the operation shapes reasoning and increases the consciousness of their own operation. Being aware of the routines and of the matters significant to themselves distinctly helped the students to extend and to deepen their thinking to the level of object theories. In the students' learning diaries critical evaluation towards their own operation and consideration of theoretical models were seen which tells about their use of theoretical expertise.

# How can teacher's pragmatic speech help to initiate and develop the sense of verbal interactions of language learners?

Tilda Saydi\*

*Adnan Menderes University, Faculty of Science and Lettres 09010, "Aydın", Turkey*

## Abstract

Pragmatic speech effect of foreign language teacher on his teaching project specifies indeed, the ability of the learners to initiate and develop the sense of verbal interactions in target language. Teaching action works most of the time through linguistic interactions performed in our context in French and Turkish as teaching languages. In this approach are involved two vital didactic concepts, thanks to which, learners can have good command of a new language: context and inference. This is the reason why we study the pragmatic aspect of language teacher since we search to increase teaching effectiveness in university classroom.

Keywords: Pragmatic speech, teaching and learning a new language, linguistic interactions.

## 1. INTRODUCTION

When teaching, the teacher uses many helpful techniques serving to build up the ways to introduce a new lesson matter to teach and continues his/her teaching discourse in order to improve in his/her teaching task. For this purpose, the most important tool of the teacher is apparently the language through which he/she communicates with the students. Especially in the field of foreign language teaching, the teacher's speaking action imports in his/her communicational behaviors as well as the strategies he/she privileges. In other words, the teacher's linguistic style helps to produce his/her didactic action. With this in mind, we are going to try to analyze in this article, the contribution of a pragmatic teaching discourse to the learning process of a foreign language learner. In that intention, some theories will help to show how linguistic interactions together with their derived archetypes, are connected in a teaching and learning act.

It is possible to establish a conceptual connection between mental representations of a teaching act and the didacticism of the person who is in charge of teaching in a classroom environment. The language used by the teacher mostly provides the didacticism in question. Therefore, the language used when teaching and the teaching phenomenon itself (here, teaching French as foreign language) are complementary facts as it is of evidence. In that sense, they are apt to realize the teaching and learning relationship in a mutual manner. In this perspective, teaching pragmatism can be defined as follows: it is a fact of pragmatism of verbal exchanges occurred between speakers and it's strictly related to the convention concept. As defined by Herman (1980, P.265) the convention notion is *the representation of pragmatic strategy and its internalization is mutually known, accepted by the interactants*. In fact, we can accept that speech pragmatism contains mostly traditional language forms and those

forms serve to develop a certain application of the knowledge. Vernant (2009) says that *co-speakers construct together a common image of their world*. In the classroom, co-speakers are the teacher and the learners. Therefore it is necessary to see the teaching action of a new language via the teacher's professional practice as pragmatic didactic discourse.

As mentioned by Bachman (1990), language familiarity includes, as the incorporation of the knowledge, *Organizational knowledge* and *pragmatic knowledge*. Organizational knowledge involves the code of the language. In other words, it refers to having some knowledge on grammatical, morphological, structural and syntactical elements as written in grammar books. Nevertheless, it does not mean compulsorily that this kind of knowledge, brings to the user the capacity to produce the language as a skill, even if it exists in the knowledge storage of the user and even if it serves to understand the organization of the language. On the other hand, pragmatic knowledge let the user be communicational, understand meanings since context, make anticipation and inference, get the figurative meanings. Therefore, pragmatic competence procreates a sociolinguistic skill which is extremely important in language learning. Quite rightly, Llorca (2000, P.93) says in his article that *competence may be accepted in its Chomskyan formulation as a static and permanent state in all human beings, regardless of whether they are using their first or second language, whereas communicative language ability will be applied to speakers' ability to use a given language, with a special emphasis on second language use*. In addition, it is important to consider language level of the students. In order to clarify better the pragmatism notion, let's see the essential points on which the notion is constructed.

## 2. PRAGMATICS : ESSENTIAL ASPECTS

### 2.1. 2.1 Context and inference

Provided that all kind of interactions get significant in a logic frame, all speakers select words to spend, into an enormous terminology baggage. This conscious selection is undeniably mindful because it is made as a result of a specific speech issue as well as some particular conditions of which both (or all) speakers involved are aware. Therefore, every speech act is realized in and for a special situation; otherwise, speakers would not understand each other. This is an implicit agreement, named equally speech convention, between speakers, as a transparent rule proving reciprocal understanding. It means that the subject of the interaction together with the situation is so-called context. When a pragmatic speech appears, logic is as well established via context. The formula is certainly simple: no context, no meaning just for acting in response. That's why the notion of context is vital.

*Language is not only code* states Fishman (1977, P.21). Language becomes meaningful when introduced in a context, a social group and a given situation. Afterward, its limited capacity of reflecting sense turns out to be full of potential. In other words, the code which is grammatical content of the language, involves only concrete aspects such as structural, grammatical, syntactic and lexical characteristics. The other facet is the insubstantial side, abstract and fully expressive. For Moeschler (2001, P.99), context notion has a very important role in the production of interlocutory acts. The context contains *the whole of the information which all makes relevant the statement of the speaker*. As a result, the expressivity of verbal interactions comes from the context they belong. Meanwhile, situations with slight context can ultimately exist however even there, speakers stand in some physical conditions frame: some persons, somewhere, interacting on some subject, recognized or not. Moeschler (ibid, P.98) points out this matter: These types of models are called *completives* because the context fulfills the role of completing the sense of the interaction content. That's why Moeschler (ibid) says that *the context is the whole information making significant the discourse of an interacting person*. In other words, context is a promising element as it reflects the inference especially when teaching and learning a new language. Context

awareness supplies partly the comprehension. Even though a language learner hears a word or an expression for the first time, he/she can infer a sense thanks to the knowledge of the context of the interaction. In this way, the learner assumes or guesses cognitively through a reasoning process. Sperber and Wilson (1989) study this point with their theory of pertinence. The theory of the relevance such as it is developed by Sperber and Wilson resumes the center of the theory of Grice: the central purpose of the human communication is to recognize, thanks to a cooperative effort, the communicative intention of the interlocutor. This theory is based on the model of inference, models according to which a speaker is going to supply to his interlocutor a number of indications which, situated in parallel with the context, are going to allow to the interlocutor to deduce the intention of communication.

In this perspective, inferences appear in contextual situations between speakers. To exemplify, let's imagine the teacher says: "I have good news for you"; the students answer by asking "so, can we leave now?" What is the relation which easily makes a coherent dialogue these two incoherent sentences? The relation is that, the day before, the teacher and the students discussed if the next day would be considered as half day holiday. When everyone is aware of the context, the content of the interactions can be cut down however the signification is never reduced in a non-sense. Everyone understands the same thing and the same details: a kind of verbal agreement is settled out because every one has a contextual background. As shown in this example, inferences are contextual when verbal interactions are in question. Therefore, grammatical indications are not always necessary or sufficient to produce a signification. That's the characteristics of the pragmatic speech and it's a didactic tool which is able to assure the familiarization with a foreign language when it is regularly applied with simplicity in a classroom environment.

In a second example, Paul (the student) asks the teacher: "When shall we start the course in the afternoon?" The teacher answers: "I don't need the viewer today. Thank you". The speech acts seem to be irrelevant but speakers communicate successfully. For those who know nothing about the context, it is impossible to make some inferences. In fact, the speech acts in the example take place on a Friday and are situated in a classroom ritual: The teacher uses visual devices for his language course each Friday and Paul is the student who helps the teacher to arrange visual devices each Friday. In this specific situation the interaction depends on ritual behaviors. Therefore, context is powerfully able to allow speakers produce inferences. The difference between an inference and a hypothesis is determined by the context. A simple estimation without knowledge of the context is a hypothesis. On the other hand, an estimation based on the knowledge of the context is an inference and is situational. This means that this kind of pragmatic inferences can be considered as pertinent.

## 2.2 Values of teacher discourse

Among the types of discourses used by the language teacher when teaching, imperative speech takes frequently place. As a result, imperative speech uses a conative language in order to be injunctive. In the classroom and during teaching period, the teacher uses instructional speech acts with imperative conjugation mode as *follow-me on your book, page 25; take note please; don't forget the essays for tomorrow; present your paper briefly; try to remember the expression; can you read please; let's discuss now this point; if you translate in Turkish what would you find then?; be attentive; more effort please; look for it in the dictionary; finish the work till Monday; show-me the title; go on please*. Those examples are valuable in classroom context and between the teacher and the students who are dealing with the same work. The reactions of the students, in return, are in accordance with the directives of the teacher. They do what the teacher asks them to do. The students have the role of associates of a verbal statement. Thus, repeated and diversified interactions flow up usually and get installed into language learner's mind. So, this kind of speech act fulfills the perlocutory function of the language since students respond correctly with appropriate verbal and gesticulating attitudes. Vernant (ibid) calls

*the engageants*, this kind of sentences because they engage the speech act partners to direct or indirect comprehension. The *engageants* build up an engagement of mutual understanding.

Till now, the examples we analyzed provide direct understanding. We just meet again the inference notion when indirect understanding exists. The teacher says: *this is really easy for you; exercises are well done.* . The students react: *let's don't wait for a week; let's begin to study the new subject now.* The students infer that the teacher would like to accelerate the didactic rhythm and they propose to learn the upcoming matter. This is a production of inference made available by the words of the teacher. If the interaction would not be appealing, the students would not react. Therefore, we can suggest that teacher's speech has the power to drive the student to interact as well as it stimulates the teaching and learning act, which is a motivating fact in all didactic process.

Meanwhile, as mentioned above, speech acts differ from situation to situation. Provided that learning motivation comes also extrinsically from teacher's stimulation due to his speech acts, many contributions are mainly assigned to engageants. So, they bring out the didacticism of the teaching act by:

- Drawing the student into the language by stimulating his curiosity
- Creating an instinctive need of interaction within student's comprehension trial
- Providing memory indices, a kind of clues for the student because he often imitates his teacher expressivity and those repetitions are necessary for keeping in mind language-specific properties
- Developing student's anticipation and annotating capacity in foreign language
- Inciting a cognitive learning strategy in favour of inferential findings.

As a result, locutory or perlocutory speech acts, when they are regularly repeated in a same/similar context (foreign language courses) and situation (teaching and learning a foreign language), like a language teacher does in his teaching process, have pragmatic aspects, which are very important for the learners. Pragmatic facts are communicational dimensions of a language besides its linguistic code. The code knowledge is important especially in writing abilities and is undetectable from foreign language teaching and learning. The pragmatics' specificity is that it is able to teach how to communicate, how to speak familiar language, how to be understood and to be comprehensible. Particularly when foreign language teaching action is realized in an environment without native language teachers, as in our context in university, teacher's pragmatic speech in the target language becomes more and more functional.

### 3. HOW DOES PRAGMATIC LANGUAGE TEACHE?

#### 3.1 Didactic relationship

Teaching activity concerns the teacher and the learner as well as learning activity involves the same two performers. The teacher teaches in order to help the student to learn but he cannot learn in his place. He can only show the ways, the instruments and the strategies to use. In the mean time, knowledge, as a matter to transfer by the teacher towards the learner and as a matter to acquire by the learner, is the didactic substance between them.

When we model the didactic relationship structured by Houssaye (2000), we find out these three dimensions: teaching, learning and knowledge. The original title in French is *triangle pédagogique*; Chevallard (1985) calls it *didactique triangle* and as many other educational researchers, we mention it because we believe it explains the complicated relations that a language teacher and a language learner are handling. Teaching process, learning process and knowledge itself are preconditioned facts for the founding of a didactical process. The contribution of these facts to the pragmatic communication between the teacher and the learner is operational with regard to

didactic activity. So that, at the end of this interference, didactic activity gains success or fails. In other words, the student does learn or contrarily, he does not. The system depends on how the teacher presents the knowledge, how he takes into consideration the learning styles of his students and how his pragmatic discourse appeals the learner to get closer to the knowledge. **Conversely, the student's role is equally important.** Is he dealing properly with his responsibilities and settling himself in position of learner? Namely, is he making necessary efforts, paying attention, using necessary cognitive, metacognitive and social-emotional strategies advised by the teacher and/or targeted by himself?

In language learning, when the teacher integrates in classroom ritual interactions as ritualized and diversified words, sentences, expressions in target language, the learner feels progressively approached to the language he learns; he gets familiar with a new language sound; he tries repetitively to give sense to words and sentences, he frequently finds the opportunity to imitate his teacher intrinsically or extrinsically. Therefore, using pragmatically the target language, enables the learner himself creating an inherent learning climate. This event is also a kind of establishment of a learning aptitude and of an acquisitional skill. The phenomenon in question provides to the learner several linguistic abilities to perform in target language, as summarized below:

- Adapting himself to the learning environment of a new language
- Developing comprehensive capacity
- Interpreting and getting the meaning of indirect and elliptic speech acts
- Being appealed to respond which conducts to reacting verbally
- Building unconsciously mimetic competence
- Decreasing his feeling of linguistic incapacity
- Changing his position from being simply a receptor versus being producer

### 3.2 *Learning blank spaces*

Ideal teaching process promises in result ideal learning outcomes. Meanwhile, we wonder if the idea of an ideal teaching process is completely found somewhere. In consequence, we don't know if exhaustive learning outcomes exist. Seeing that teaching and learning process is multidimensional, the relationship between teaching and learning acts is far away of being simple. As teaching practitioners, we can only state that we always witness some average blank spaces in the mind and performance of the student. Therefore, we do our best to obtain optimal learning outcomes. In return, the situational context of a language classroom is a place where the occupants wait for the apprehension of knowledge, for its analysis and its synthesis. After all, they usually expect to have a language competence in a so-conditioned environment the reason why teaching and learning atmosphere (classroom) can be considered as a likely natural didactic location. Brousseau (1998) already indicates that, as if a didactic contract is signed between the teacher, the learners and the knowledge, there is currently an implicit agreement which brings out the learning performance.

Even if we know, due to our experience, that learning and teaching blank spaces occur in didactical process, we however consider this educational situation as typical when it reflects a minimal portion of the didactic transfer. As far as we continue to let available the pragmatism of teacher speech in coherent educational situations, the accomplishment of learners cognitive tasks are promoted better and better. So, when the teacher uses regularly and professionally a pragmatic call in target language toward his students, it contributes much to didactic process and fill out the blanks in favor of didactic agreement.

In conclusion, learning blank spaces are never entirely reduced and there is always a missing part of the knowledge the teacher tries to transfer to the learner. It can be partly recovered by some compensating strategies

used by the learner, such as academic self-management: repeating, exercising, researching, asking questions and help, revising and concentrating. To this tridimensional relationship, we would like to add, as a didactical support, the repetitive pragmatic speech of the teacher, able to implement in learner's cognitive conscience additional and complementary knowledge which makes smaller blank spaces.

### *3.3 Language classroom: pedagogical components*

Let's consider three elements necessary to realize a didactical situation in language learning: the knower (teacher), the candidate (learner), the information (knowledge). The knower is the coach; he trains, instructs and informs the candidate. The candidate needs and requests to reach the information. The information tells about and describes the knowledge. Afterward, we will underline the way the information turns out to functional knowledge.

The information is the tool enabling the candidate to understand and to produce a different language than his, in written and verbal forms. The information does not come by itself but by the pragmatic competence regarding the teaching language. All details involved in teaching language depend on this pragmatic side. Without this aspect, grammatical and theoretical issues can be certainly apprehended however taking an active part in sensible ways for expressing and understanding a language rather than having fixed unassociated knowledge, would be impossible. Ellis (1994, P.407) proposes that learning is environmentally driven and learners need very little in the way of innate knowledge. Therefore, when a language user candidate is trained in such a pragmatic communicational speech acts environment, his candidacy improves as his language learning level improves until he becomes an intern. Being a language learner intern means having abilities to communicate via the target language, at different levels. In that case, the candidate gets in touch with the knowledge because not only he knows it but he also uses it.

In learning environments like ours, where the target language is not used at all, except the course content, where the teacher explains everything in the mother tongue of both the teacher and the students, language teaching process becomes slow and related learning process becomes more and more restricted and useless. Meanwhile, this situation does not signify that the mother tongue should be excluded from the teaching and learning process. Especially at the beginning level and in situations where troubles occur, when complicated points have to be cleared up, the use of mother tongue in teaching process is crucial and solves problems.

In this perspective, language teacher better uses the target language when communicating with and teaching his students. It is particularly necessary to establish a natural communicational ambiance for transporting the information from the teacher to the learner rather than creating only an artificial area full of theoretical knowledge. If, most of the time, as a habit, the mother tongue is used as the vehicle to transport the information, the link between the language to learn by the learner and the information used to do so, would not be transparent and smooth. This fact would afterward constitute a major barrier to the growth of student's cognitive capacity.

### *3.4 Teaching process via pragmatic speech*

Paying attention to the effects of didactic relationship (3.1), learning blank spaces (3.2) and language classroom (3.3), we can see that pragmatic speech helps pedagogically teaching process. First of all, this kind of teaching process describes, expresses and explains the knowledge in a more obvious and visible way. In a pragmatic speech, the teacher tells about what to teach and learn, what to use and how to use. Secondly, the teacher adjusts and standardizes his/her teaching action vis-à-vis his/her learners' learning attitudes and skills resulting from these strategies. Taking into consideration classroom observations, the teacher can decide to repeat

a lesson, explain again a notion and revise the exercises; he/she can illustrate the lesson matter; rearrange the work to fit the learning level of the students. At the third step, the teacher feels advanced on his/her teaching process and sees how the learners learn and apply the knowledge. He/She notices that a part of the work, which looked hard at the beginning, starts now to look easy. That's why the students know furthermore to a certain extent, the knowledge. We can call this situation of recognition, the transference of the knowledge, enabled and getting lighter. So, the knowledge is at this moment mobilized in a sense of recovered and improved in the mind of the learners. The fourth step consists on using this knowledge for creating authentic productions: the learner is able to synthesize the knowledge and to get an appropriate skill.

All this process is in fact derived from the pragmatic teaching style using the target language. Facing all the time a similar process, repetitively and constantly, make seize the facts of "how to do" and "how to be" in the target language and culture. Thus, the distance run by the knowledge between the teacher and the learner gets smaller. Consequently, it is conceivable that pragmatic speech in teaching foreign language has a diminutive role concerning the disproportion between teaching act and learning act since teaching act appears easier while learning act demands more time and effort. As a reality, we know, after all, that the teacher is experienced but the learner is apprentice. It is true that this asymmetry, as apprenticeship, cannot be erased in the situation of organized learning and that the places of learners and teacher are not exchangeable. The teacher is exactly considered as a key figure of the process of teaching and learning. Pragmatic speech in language classroom creates a didactic nature and combines this nature to normal teaching features to maximize the process of acquisition.

In that case, the effect of the pragmatic speech in the teaching process points out two important works: the work of the teacher and the work of the students. The teacher does not only expose the knowledge, the problems and the resolutions like written in a book but takes the responsibility for proposing situations where the student as a learner could be able to construct a knowledge by asking a question in target language and searching for its answer. The pragmatic side of the teacher constructs here a kind of reorganization of the context and recontextualization of the knowledge. Once effectuated, this can lead to the repersonalization of the knowledge by the learner. Recontextualization and repersonalization are two important processes to built and memorize new knowledge.

On the other hand, the student should not only learn the definitions, theorems and techniques, memorize, retain, know methods but should also be able to expose his inabilities, create or resolve a syntactical, structural, lexical or semantic problem, discuss the subject, produce answers as approaches, comparisons with mother tongue and formulations. The student should try to prove the ways he learns and show their pertinences.

The above-mentioned process reminds Socratic maieutic dialectic method, which is a technique engendering knowledge by asking motivating questions via pragmatic speech. The difference is that, in a classroom, environmental conditions are also taken into consideration. Definitely, we have a student who is already adapted to a specific teaching-learning situation. So, teaching-learning situations formed inside a pragmatic speech milieu helps a lot to be more and more adapted to a new language. In such manner, what is new and unknown becomes progressively usual and known. This is not only a linguistic interaction between the teacher and the students but also between the students and the classroom environment because this specific environment is mobilizing cognitively the knowledge of the student.

Teaching a language is in fact a pragmatic art. How to teach without using the targeted language itself especially when we teach a foreign language? Consistent and permanent pragmatic speech acts, interactions and intercommunications in language learning context, are a strong teaching institution apart. Lhote (1995, P.82)

mentions that *being a good listener in foreign language, it is at first to observe the behavior, the attitudes; it is to try to get the accentuated elements which are inevitably connected to the theme or to the way an interlocutor is situated with regard to him/her*. This notice explains indeed, how the style of the teacher is characterized by regular alternations between didactic interventions and those to maintain the interaction with students. Teacher's speech style regulates the teaching and learning process.

### 3.5 Regulating teaching and learning

As one of our many pragmatic classroom interactions, it would be useful to revise a practice recorded during a collaborative and playful classroom work. We practice a vocabulary game similar to scrabble in order to deal with French vocabulary, grammar and orthographic competences of the students. The teacher, acting as a guide, helps the learners to amplify the puzzle. Three groups of four students, with level B1, are playing the game. The game is on the screen via Internet connection. The mother tongue of the students is Turkish; they learn French since three years and they know English as another foreign language. Here are a part of the interactions in question. Speech acts in French of the students are partially erroneous. We give in parentheses the translation in English.

- (1) Student 1 – Il y a un mot en moins ici. (There is a missing word here)
- (2) Teacher – Comment ça? Il y manque quelque chose? (How can it be? Anything is missing there?)
- (3) Student 2 – Pas de mot. Il y manque une lettre mais... (Not a word. A letter is missing but...)
- (4) Student 1 – Une lettre oui mais comme a, e, i. (A letter but like « a, e, i »)
- (5) Teacher – Une voyelle donc. (A vowel then)
- (6) Student 2 – Oui parce que avant il y a c et c. (Yes because there is c and c before)
- (7) Student 3 – Il devient occ. Deux c. (It becomes occ. Two c)
- (8) Teacher – Ça fait quoi alors exactement? (That makes what then exactly?)
- (9) Student 1 – Ça fait occuper. On peut faire verbe occuper. (It makes « occuper ». We can make the verb « occuper »)
- (10) Student 2 – Non, nous ne pouvons pas. Il y a la lettre a suivant. (No, we cannot. There is a letter following)
- (11) Teacher – Ah! Il y a un a qui suit! Attention là. Peut-être que ce n'est pas un verbe. (Ah! There is one « a » which follows. May be, it is not a verb.)
- (12) Student 3 – On forme un nom. Occupation. (We construct a noun. Occupation)
- (13) Student 4 – La case qui suit c'est p. C'est difficile. On trouve quoi par p? (The case which follows it is « p ». It is difficult. What can we find with « p »?)
- (14) Teacher – Pas grand chose alors? Bon. Continuez avec un préfixe si vous voulez. (Not much then? Good. Go on with a prefix if you want)
- (15) Student 5 – Préfixe. Pré. Je trouve pré pour mettre devant occupation. (Prefix. Pre. I find « pre » to install in front of « occupation »)
- (16) Student 1 – Ça fait préoccupation. (It makes « préoccupation »)
- (17) Student 6 – Mettons un s après pour pluriel. (Let's add an « s » after for the plural)
- (18) Teacher – A la fin? Pour le pluriel? Pourquoi pas! Bonne idée. (At the end? For the plural? Why not? Good idea)
- (19) Student 3 – A la fin du mot. De cette façon, on obtient un mot plus long. (At the end of the word. Thus, we obtain a longer word)
- (20) Student 4 – Plus de points alors. C'est nous qui gagne. Nous gagnons! (Much more points then. We win)

In this empirical sample, we can observe how the teacher is able to regulate the teaching-learning moments by implementing and conducting pragmatically a mental exercise. Furthermore, verbal communication between students themselves and between the teacher and the students is mostly important. Let's analyze the sequences.

- Interactions (1), (2) and (3) are complementary. Interaction (3) shows how student 2 seizes from his teacher's words (interaction (2)), the correct way of talking and how he corrects the wrong way of talking of student 1.

The students are imitating the teacher and thus, they are completing their missing knowledge. This mimetic competence is vital for the transposition of the student to the position of a learner.

- Interactions (4), (5), (6) and (10) are as well complementary. In those interactions, words like “letter” (interactions (3) and (4)) instead of “mot” (interaction (1)), are used by the students. When one of the students forgets a word, the other one reminds. The interaction helps them activating their knowledge stored up in their mind. Pragmatic speeches allow the accumulated knowledge to be mobilized.
- Interaction (5) remembers the right word “voyelle” and in interactions (6) and (7) we see how the meaning is implicitly and completely understood by students 6 and 7.
- Interactions (7), (8), (9) and (16) demonstrate how the utilisation of “devient” turns out smoothly to the utilisation of “ça fait”.
- Interaction (12) gives to interaction (9) a corrective feedback: student 3 uses the sentence “on forme” as a paraphrase towards interaction (9) “on peut faire” performed by student 1.
- In interaction (10) we see the wrong use of “suivant”. However, in interactions (11) and (13) the correct form appears. In interaction (11), the teacher repeats in an implicit and corrective approach, the words of student 2 (interaction (10)). Interaction (13) proves that the interaction (11) has got the power to teach furtively the use of the relative pronoun “qui”.
- In interaction (14) the teacher gives slightly an idea using the word “préfixe”. Even hearing the word “préfixe” has been sufficient to be creative enough and discover the word “préoccupation” for student 1 in interaction (16).
- Interactions (17), (18) and (19) reinforce the use of “à la fin” instead of “après”.
- Interactions between students, like interactions (19) and (20), underline the use of the comparative and superlative “plus”.
- Interaction (20) shows how speaking freely and fearlessly is a way of being autocorrective. In that interaction, student 4 says first “c’est nous qui gagne”. But, he thinks he makes an error. That’s why he says “nous gagnons” just then.

As affirmed by Pennac (2007), *the teacher needs to know to play with the knowledge. The game is the respiration of the effort, it’s another heartbeat; it does not harm the seriousness of learning; it is the counterpoint. Beyond all, playing with the lesson matter means improving more in the matter.* Pragmatic speech is a good tool for reaching the stated aim.

#### 4. TOWARDS A CONCLUSION

The virtues of the pragmatism in foreign language teaching find their justifications in the familiarization aspect as a teaching outcome. Familiarization is adaptation. It is a primary aptitude that a foreign language learner should acquire because a new language arrives together with its authentic linguistic and cultural characteristics. It is not possible to treat the new language as identical to the mother tongue of the students (Turkish in our situation). Languages and cultures may certainly have similar features which are helpful for learning a new language. However, points which are not parallel abound. They seem distant, inaccessible, difficult to get. When a foreign language teacher is able to teach using pragmatically the target language, distance and inaccessibility may disappear or decrease. The learners get adapted and familiarized. That is a serious reason to facilitate the learning.

The first rule of automatic (in a sense of habitual) foreign language learning is to be regularly exposed to authentic speech acts. Finally, interactants manage to understand each other and learners imitate the teacher. Learners enrich more and more their knowledge and their skills. The teacher’s skill adhere, in a mnemotechnical

and mimetic way, to the learner's cognition and it becomes step by step a skill belonging to the learner. This linguistic phenomenon is developed by the comprehension of the context. Besides, the context brings the inference. To be able to make inferences due to the context means to comprehend the language, to handle it and to communicate into that language. In this way, the memory's blindness is converted into awareness.

*Communication research perceives teaching as a process of oral communication where a commonness of understanding is created between a sender and a receiver. The process consists of a sequence of events whose desired effects on the receiver can be arranged [...].* states DeLozier (1979). As indicated by DeLozier (idem): 1. Getting and maintaining attention/awareness 2. Gaining understanding 3. Developing or changing attitudes (e.g., toward the topic being taught to create an atmosphere for learning) 4. Learning 5. Action (application of the material learned) are the results as desired effects. As a foreign language teacher, we play the role of sender. What we send is the knowledge (for us, French language). The receiver is the student. We believe and see that sending pragmatically in French language the knowledge, by taking into account and regulating the level of the language acts and by paying attention not to exceed the didactic and pedagogical limits of the learner public, will mainly achieve a success in teaching and learning process of a new language.

## Abstract

This century has brought upon significant changes in Portuguese language curriculum in Portugal; one of those was the approval of a new syllabus for basic education (Reis, 2009). In order to help teachers understand the new curricular guidelines and change their teaching and assessment methodologies, the Bureau for Innovation and Curriculum Development organized a training program which involved teachers from the various schools, educational cycles, and regions of Portugal.

Some were from the Portuguese Autonomous Regions of Azores, and they became responsible for conducting the training process in the archipelago, under the supervision of the Regional Secretary of Education and a university professor.

That training process started in 2009 and it was organized in three phases. Phases one and two lasted from 2009 to 2011. They involved approximately eight dozens of Portuguese language teachers from eight islands of the archipelago and half a dozen of formers. The process included classroom training and distance learning, planning tasks, didactic material construction and experimentation, as well as peer work in schools. The third phase lasted from 2011 to 2013. It was mostly based on peer work in schools, under the supervision of the teachers who participated in the previous phases.

This process is now being researched in order to analyze teachers' representations on its organization, relevance, impact and constraints, as well as on the new curriculum guidelines (changes, adequacy and demands).

It uses a mixed methodology based on content analysis on documents produced by the teachers who participated in the training process (portfolios, reports, and didactic sequences) and their testimonies on online forums, as well as on a questionnaire, test results and a study case.

We here present some preliminary results on how teachers evaluate the training process based on content analysis on their individual reports.

Keywords: teacher training, curriculum changes, Portuguese language curriculum.

## 1. INTRODUCTION

This has been quite a busy century on what concerns language education in Portugal. Since 2001 the ministers of educational affairs have appointed several work groups whether to produce new syllabus for Portuguese language classes in secondary education (Coelho, 2001-2002) and basic education (Reis, 2009)<sup>†</sup>; or to establish the essential competences Portuguese language classes should promote in basic education (ME, 2001)<sup>‡</sup>, and the

\* Corresponding author. Tel.: 296650155

E-mail address: leal@uac.pt

<sup>†</sup> In Portugal, basic education is organized in three study cycles (1<sup>st</sup> cycle includes grades 1 to 4, 2<sup>nd</sup> cycle comprises grades 5 and 6, and 3<sup>rd</sup> cycle incorporates grades 7 to 9) and secondary education comprises grades 10 to 12.

<sup>‡</sup> The *National Curriculum for Basic Education – Essential skills* was subsequently repealed by Order 17169/2011, December 23.

learning goals it must achieve (ME, 2010), and the curricular goals it should pursue (MEC, 2012); or to change the linguistic terminology (Decree 1488/2004, December 24), and adjust it a few years later (DGIDC, 2008); or to establish the use of the Portuguese Language Spelling Agreement in schools (Resolution n. 8 of the Council of Ministers, January 25, 2011)<sup>§</sup>.

Not only there have been many changes in the area as those have been significant and challenging for teachers, even more because they are not always consistent. For example, the curricular framework for Portuguese language in secondary education (Coelho, 2001-2002) clearly moved away from the literary and cultural trends that lasted for long in language teaching in Portugal and embraced a communicative approach, not without some discomfort and contestation in the media by some scholars and national individualities<sup>\*\*</sup>.

The curricular framework for Portuguese language in basic education shows however that there is no real consensus on the goals the area should pursue, for as it claims for an “(...) effective presence of literary texts in language teaching, valued as testimonies of an aesthetic legacy, not to be treated as mere typological cases similar to others with less cultural density (...)” (Reis, 2009, p. 5), it states that language classes should value “(...) essential aspects of language use: understanding discourse, verbal interaction, reading as a regular and critical activity, correct, multifunctional and typologically differentiated writing, and linguistic analysis with metacognitive purposes” (Reis, 2009, p. 14).

In fact, the area has been quite volatile depending on political ideas and decisions that sometimes reinforce the role of education in developing fundamental skills, as the Portuguese language framework for secondary education (Coelho, 2001-2002), or the National Curriculum for Basic Education (ME 2001) illustrate; others focuses primarily on the acquisition of knowledge and content, as the Curricular Goals for basic education indicate (ME, 2012).

In short, these have been challenging times for mother tongue language teachers in Portugal. Such turmoil demands constant updating and great commitment and resilience. Acknowledging that, the heads of education both on a national and a regional level have organized some training programs to help teachers cope with curricular changes and improve the literacy levels in the country.

It was so between 2007 and 2010, when the Ministry of Education carried out the National Program on Portuguese Teaching – PNEP (Order 546/07, January 11). Involving only teachers from the 1<sup>st</sup> cycle of education from the continental regions (Madeira and Azores were not included), PNEP was based, on the one hand, on the training, by college and university professors, of school teachers, who then became responsible for carrying out the formative process of their colleagues in their schools/groups of schools, through theme sessions on language teaching issues and tutorial sessions, in which they supervised their colleagues’ work in classes, through observation and analysis<sup>††</sup>.

<sup>§</sup> The *Language Spelling Agreement* was ratified by Portugal, Angola, Brazil, Cape Verde, Guinea-Bissau, Mozambique, São Tomé and East Timor, in 2008.

<sup>\*\*</sup> On this issue, you may read Dionísio & Castro (Orgs.), 2005, or Mira Leal (2012).

<sup>††</sup> On PNEP you may read Raposo (2010).

Another example of such training programs was the 120 hour course promoted by the Bureau for Innovation and Curriculum Development between October 2009 and May 2010. This Training Program for Formers on the Portuguese Language Syllabus for Basic Education (Reis, 2009) involved 150 Portuguese language teachers from the 2nd and 3rd cycles of basic education from all over the country, including Madeira and Azores. The course was organized into four modules, combining distance learning, through an e-learning platform, with classroom training in Lisbon with the authors of the new Portuguese language syllabus for basic education (Reis, 2009) and experts in didactics and linguistics from Portuguese universities.

### *1.1. Teachers' training on the new Portuguese language syllabus for basic education in Azores*

Six teachers from the Autonomous Region of Azores took part in that training program, and were then appointed by the Regional Secretary of Education to undertake the training of their peers in Azores in order to prepare them for the implementation of the new Portuguese language syllabus for basic education. Under the scientific supervision of a professor from the University of Azores, the Regional Commission for the Implementation of the Portuguese Language Syllabus for Basic Education designed a training program adjusted to regional specificities (territorial discontinuity and financial restraints) and curricular guidelines, namely the Regional Curriculum for Basic Education and the Regional Reading Plan.

The training program implemented in the Azores was organized in three phases. Phases one and two directly involved around 80 teachers from the 1<sup>st</sup>, 2<sup>nd</sup> and 3<sup>rd</sup> cycle of basic education from 8 of the 9 islands of the archipelago, and indirectly many of their school peers who participated in working sessions in schools. Phase three took place in schools and involved the teachers who were teaching the new syllabus under the supervision of those who had directly participated in phases one and two.

Phase one took place in school year 2009/2010. It included 50 hours of classroom training and 70 hours of distance learning, as well as working sessions in schools, organized and conducted by the teachers involved in the program in ways found fit to each context. This phase aimed mostly to help teachers understand the organization of the new Portuguese language syllabus for basic education, its key concepts and principles and methodological options, as well as to promote sharing and discussion between teachers on teaching principles and methodologies, both in classroom training, sessions in schools and on the e-learning platform.

For classroom training teachers were organized into three groups according to their geographic location. Even though there was a common action plan for all groups, it was then adjusted to each group's needs, concerns and difficulties. That led to different group dynamics, as well as to the organization of complementary initiatives, such as a workshop on the new linguistic terminology with experts from de University of Azores.

Classroom sessions involved the analysis of the new syllabus as well as didactic materials provided by the Bureau for Innovation and Curriculum Development, such as annual plans, didactic sequences and Guides to implement the syllabus on Reading (Silva, Bastos, Duarte & Veloso, 2009), Writing (Niza, Segura & Mota, 2010), Oralcy (Silva, Viegas, Duarte & Veloso, 2011) and Grammar use (Costa, Cabral, Santiago & Viegas, 2011).

Distance learning used an e-learning platform. It aimed at clarifying the training process; promote the analysis and discussion on the new syllabus' key concepts, principles and methodological options on theme forums; and encourage teachers from different educational cycles, schools and islands to share ideas, difficulties, teaching practices and projects.

Teachers' evaluation on phase one was based on: task accomplishment and interaction in classroom sessions; contributions to online forums; results on an online test on the new curricular framework (formonline); and an individual portfolio.

Phase two, which took place in school year 2010/2011, was affected by a set of constraints. The governmental decision to postpone the implementation of the new syllabus to the following school year, to make it simultaneous with the implementation of the Portuguese Language Spelling Agreement, invalidated the initial training plan, which included a clinical supervision process of the implementation of the new syllabus in schools.

The training program had to be redesigned and made fit to the new circumstances. Because of that the Regional Secretary of Education took too long to inform schools on how the training program would proceed; and schools did not organize teachers' schedules in order to facilitate their participation in the training process, which made it very difficult to create collaborative dynamics in schools in a systematic basis. It all depended on teachers' good will and time available. The process was than based mostly in distance learning (also for financial reasons given teachers' geographical dispersion).

This phase included teachers' participation in theme forums on the moodle platform and the construction and testing of teaching plans (didactic sequences) and materials, under the supervision and feedback of the Regional Commission for the Implementation of the Portuguese Language Syllabus. Teachers' evaluation in this phase was therefore based on the quality of their participation on the different online forums; their ability to plan, test and improve didactic sequences and materials according to the new syllabus; and their critical analysis on the training process (individual reports).

Phase three took place in 2011/2012 and 2012/2013. It was carried out in schools and was supervised locally by the teachers who had been involved in phase one and two, who worked with their peers on the implementation of the new syllabus, helping them plan their lessons and create didactic materials.

### *1.2. Research methodology*

The training process described above is now under analysis in a research project aiming to analyze teachers' representations on the training program's organization, its relevance for their updating and curriculum understanding, its impact on their planning and teaching practices as well as on collaborative work in schools, and the constraints they experienced along the road. It also aims to understand teachers' perception of the changes the new syllabus introduces, their evaluation on the syllabus' adequacy to their teaching contexts, as well as the demands and implications it has both on a professional and (inter)personal level.

The study uses both a quantitative and a qualitative methodology, combining document analysis (teachers' portfolios, critical reports, didactic sequences, and participation on forums) with a questionnaire, test results and a study case.

The study takes place in two steps. The first step addresses phases one and two, and it involves those teachers who participated in classroom training and distance learning from 2009 to 2011 under the supervision of the Regional Commission for the Implementation of the Portuguese Language Syllabus for Basic Education. The second step addresses phase three, and it involves the teachers from the archipelago who were already working with the new syllabus in schools under the supervision of those who participated in phases one and two.

The results we here present relate to the first step of the research process, and regard both qualitative and quantitative content analysis on the teachers' individual reports written by the end of phase two. Our sample includes 55 reports (18 from 1<sup>st</sup> cycle teachers, 16 from 2<sup>nd</sup> cycle teachers and 21 from 3<sup>rd</sup> cycle teachers) in a total of 1035 content units (CU) distributed per educational cycles according to Fig 1.

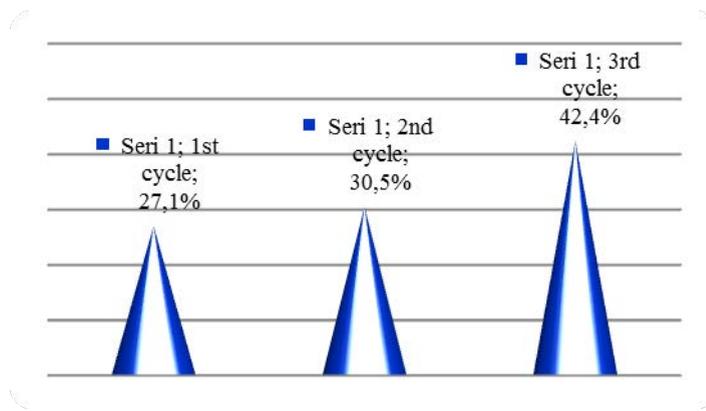

Fig. 1. Distribution of content units per educational cycle

Data refers to the dimension "Representations on the training process" and its analysis was based on the coding scheme presented in Table 1 (categories, subcategories and indicators were generated inductively from the data).

Table 1. Content analysis coding scheme

Categories	Subcategories	Indicators
Organization	Goals	Clarity Adequacy
	Duration	Adequacy
	Tasks	Adequacy
	Feedback	Clarity Efficacy
	Evaluation	Clarity Adequacy
Relevance	Knowledge update / application	Portuguese spelling agreement
		Linguistic terminology
		Teaching strategies
		Evaluation strategies
Impact	Curriculum appropriation	Understanding curriculum principles and concepts
		Understanding curriculum organization
		Getting ready to implement the new syllabus
Impact	Changes in practices	Getting enthusiastic on the implementation of the new syllabus
		Teaching strategies and materials
		Planning
Impact	Collaborative work	Evaluation strategies
		Sharing ideas/discussing/working together
		Sharing teaching strategies and materials
Constraints	Learning results	Transfers to other contexts of activity in schools
		Reading
		Listening and speaking
Constraints	Political / organizacional	Writing
		Others
Constraints	Political / organizacional	The postponement of the new syllabus's implementation

Professional	Distance learning
	No conditions for collaborative work in schools
	Teachers' replacement between phase one and two
	Lack of time or energy
	Difficulty in planning didactic sequences
	Difficulty in using different teaching strategies
	Difficulty in using different evaluation strategies

### 1.3. Results

An overall view of the results per category shows that when teachers address the training process they emphasize its impact (419 CU) over its relevance, its organization or the constraints they experimented (see Fig. 2). Although this highlight is common to teachers from all three cycles, 3<sup>rd</sup> cycle teachers are more critical on organizational issues and express more constraints.

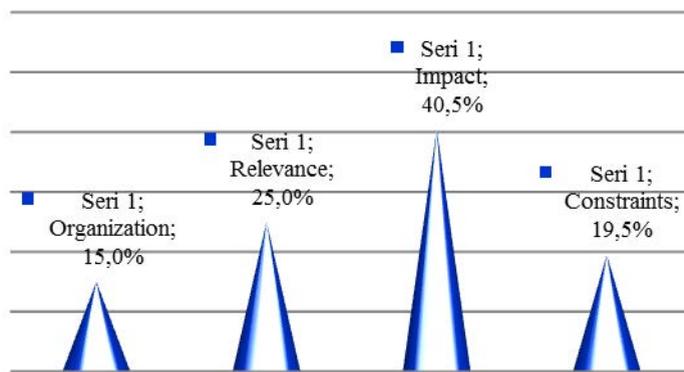

Fig. 2. Distribution of content units per categories

When teachers refer to the “Impact” of the training process, they mostly emphasise that it favoured collaborative work, mainly in what concerns *sharing ideas, discussing or working together* (124 CU). Teachers from all three cycles clearly point out this indicator over others, mostly due to the continuous interaction that theme forums allowed between teachers from different educational cycles, schools, and islands (see Fig. 3).

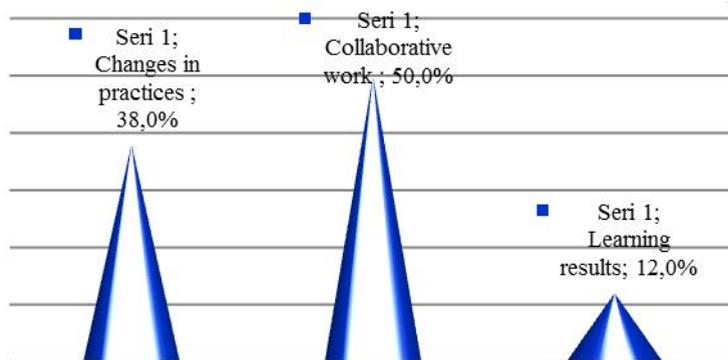

Fig. 3. Distribution of content units per subcategories in category "Impact"

*Sharing experiences and materials* is second in line (50 CU). It mostly happened during peer work in schools, which many teachers found difficult to promote (37CU) either because schools did not organize teachers' schedules in order to allow them to meet on a regular basis or because many of their peers did not show much interest or lacked time to do so.

Indicator *Transfers to other contexts of activity in schools*, though less referred to (34 CU), occurs in all cycles. For example, some teachers say they took a more active role in textbook selection, others say they suggested strategies to promote reading in school libraries, others even say they called the department coordinators' attention to certain pedagogical issues that should be discussed. This is in fact interesting information, for it shows that training on curricular issues may create opportunities for teachers to rethink their educational roles and activities beyond the classroom.

Subcategory *Changes in practices* (160 CU) follows collaborative work. In this case, teachers particularly say the training process helped them *change strategies and materials* they used in their classes (113 CU). We cannot prove so for there was no observation involved in this study. Besides, we must not forget these reports were meant to be evaluated by the commission that supervised the training process, and even though the evaluation criteria did not include reporting changes in teaching practices there may be a contamination effect.

Although we cannot say that these numbers correspond to effective change and we all know educational changes take long time are not without some discomfort and great effort, we must take this data into account as we analyse teachers' didactic sequences (a task that will take place later on according to the chronogram of the study). It is also important to relate this data to the fact that teachers sometimes give notice of the impact those changes had in their students' learning results in reading (18 CU), listening and/or speaking skills (10 CU) or writing (3CU). Some teachers are less specific or just say their students became more enthusiastic and interested in language learning (20 CU).

The "Relevance" of the training program is also quite highlighted in reports (164 CU). Teachers mostly refer that it allowed them to better *understand curriculum principles and concepts* (78CU), and helped them *get ready to implement the new syllabus* (52 CU) (see Fig. 4). Nevertheless, they don't seem to *feel very enthusiastic* to do so yet (15 CU), maybe because many still find it difficult to plan didactic sequences (22 CU), change teaching strategies (13 CU) or evaluating strategies (4 CU). It is mostly 3<sup>rd</sup> cycle teachers that say so (16 CU), which is

quite unexpected for they also teach in secondary education, so they must be working with a similar curricular framework for quite some time (remember Portuguese Language Syllabus for Secondary Education was approved in 2001). No doubt curricular changes walk faster than pedagogical ones.

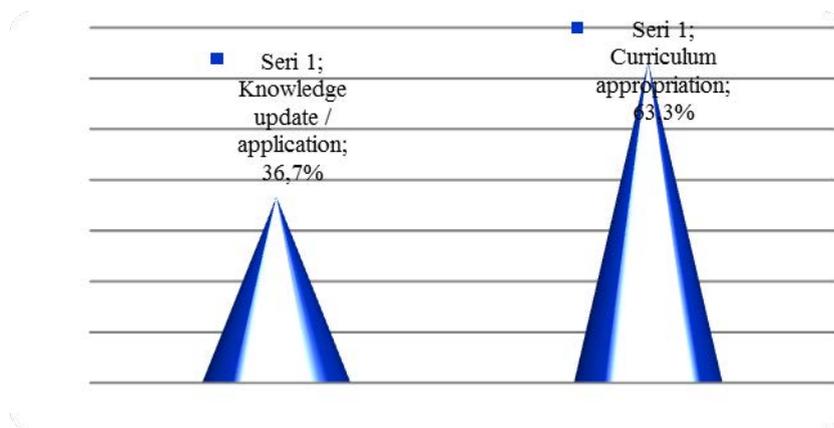

Fig. 4. Distribution of content units per subcategories in category “Relevance”

“Constraints” is the second last category teachers refer to. The constraints they point out are either related to political and organizational factors, or to professional issues (see Fig. 5). The constraint teachers refer the most is their *lack of time or energy* to further invest on their tasks (60 CU), namely interaction on online forums (21 CU) and sequence planning (12 CU). In this subject matter 1<sup>st</sup> cycle teachers are the ones who complain the most (24 CU), compared to 3<sup>rd</sup> cycle (19 CU) and 2<sup>nd</sup> cycle (17 CU) – remember 1<sup>st</sup> cycle reports are the ones with less CU in total.

They also find a great constraint in *distance learning* (45 CU). They don’t think it is as effective as classroom training, because it “makes the communication between participants more difficult and does not allow sharing ideas during tasks” (13)<sup>‡‡</sup>. Teachers blame this constraint on the political decision to *postpone the implementation of the new syllabus* (14 CU) as they find this decision made it more difficult to *promote collaborative work in schools* (37 CU), for, as we previously explained, schools did not organize teachers’ schedules in order to make that happen and teachers say their peers found that once the syllabus had been postponed there was no rush to get familiar with it.

<sup>‡‡</sup> Teachers’ reports were coded to preserve their identity. The letter refers to the author and the number to his/her cycle of education.

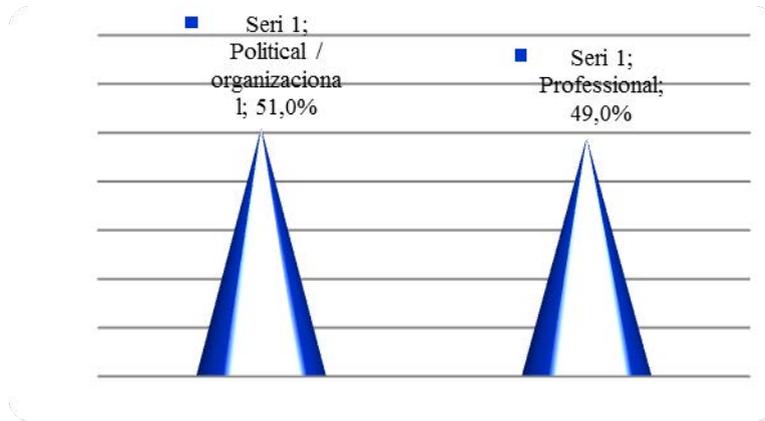

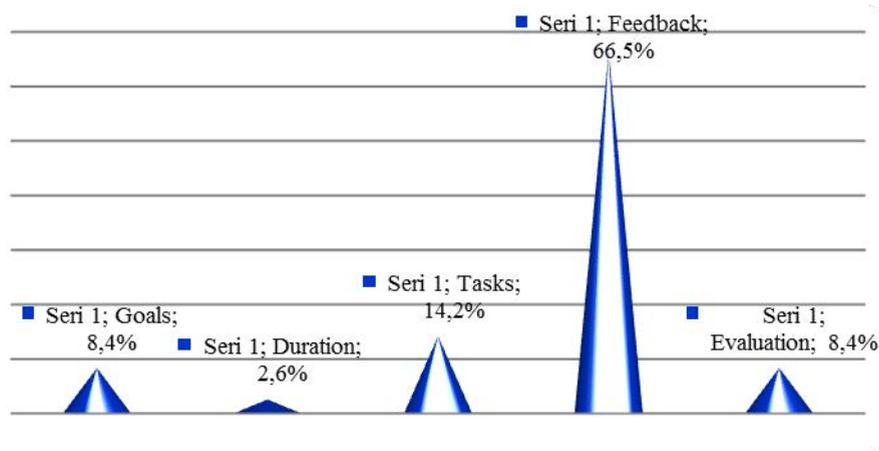

Fig. 5. Distribution of content units per subcategories in category "Constraints"

Other constraints they refer to are mostly professional and derive from the didactic changes the new syllabus demands: *planning* (22UR), *teaching methodologies* (13 CU), *evaluation strategies* (4 CU). It is curious that evaluation does not get much attention from these teachers. It appeared quite a problematic area in a study conducted on the implementation of the Portuguese Language syllabus for secondary education in Azores (Mira Leal, 2008), mainly because it valued oral skills and formative practices. Didactic sequences' analysis may prove relevant to better understand these results.

"Organization" is the category teachers refer to the least (155 CU) in a direct manner. In this category teachers focus mainly in feedback (see Fig. 6), maybe because it was the most important strategy included in phase two to help teachers put the syllabus' principles and methodological instructions in action.

Teachers who refer to feedback mostly say it was efficient (55 CU) and clear (13 CU), nevertheless some say that “the fact that it was only in writing, without dialogue between the formers and the teachers ma[de] it a unilateral process, more evaluative than formative” (13). That is also the argument used by those who find feedback not clear (6 CU) or effective (27 CU), mostly 3<sup>rd</sup> cycle teachers (24 CU).

This feedback referred to the tasks teachers had to perform – sequence planning and material construction, as well as participation in online forums. Even though not many teachers refer directly to the adequacy of such tasks (16 CU say they were adequate to the training goals, 6 CU say they were not adequate to the constraints they faced during the process), results make it clear that teachers found their training process in general, and those tasks in particular, relevant and with great impact in their professional lives in and beyond the classroom (671 CU).

Very few teachers refer to duration (4 CU) and evaluation (13 CU). In the first case they mostly find it adequate (3CU). That is not so in the second one (5 CU say it was clear and adequate, 8 CU say the opposite), mostly because they didn’t agree with criteria or final grade. Almost all teachers refer to the training goals but only a few discuss their clarity or adequacy (13 CU). Nevertheless, those who do so say the training goals were clear (6 CU) and adequate (6 CU).

## CONCLUSION

Curricular changes are usually demanding and challenging for teachers. Even more if those are various, recurring and constitute significant change to teachers knowledge or pedagogical action.

Educational authorities must take that into consideration and help teachers cope and adapt. Training is usually the best way to do so. But training can go many ways. The training program we here analyzed had different approaches to the training process, including classroom training, distance learning and training in context. We here focused mainly on the distance learning phase to which our data referred to specifically, even though it may somehow be impregnated with teachers’ ideas on phase one, that combined classroom training with distance learning.

Results indicate that teachers do not find distance learning as effective as classroom training, which many say “would have had a more positive and efficient impact on the adjustment that must take place” (E3). Nevertheless, they see significant impact and relevance in the training process mostly in promoting collaborative work in schools, understanding the new curricular framework for Portuguese language classes in basic education, and changing pedagogical practices, despite the various constraints they refer to.

Even though the professional constraints they signal are expected and quite natural in a process that aims to help teachers deal and adjust to change, the political and organizational ones should have been avoided or minimized, for they seem to have created some anxiety, confusion and disbelief among teachers, feelings that do not help educational change.

We expect this study to bring more interesting information on the training process it scrutinizes as we go along the various research tasks and stages.

# How should be a good faculty of education and a good student in the faculty of education?

Tuba Kaplan <sup>\*a</sup>, Ahmet Işık<sup>a</sup>, Ferhat Öztürk<sup>a</sup><sup>a</sup>Ataturk University, Faculty of Kazim Karabekir Education, "Erzurum", Turkey

---

## Abstract

In this study, it is aimed to find out the views of the students in the faculty of education on a good faculty of education and the profile of a good student in the faculty of education considering that it is required to get feedbacks from the students who are a good observer each to enhance the quality of the faculties of education. The research group of the research includes 34 third grade students studying at the department of primary school mathematics teaching of a state university during the academic year 2011-2012. As the research design, the case study which is one of the qualitative research methods has been used, and a test consisting of 2 open-end questions has been applied to the 34 participants as determined in the sampling, and the written opinions have been asked from the participants. The data collected has been assessed by dividing into codes and categories by means of content analysis method.

Keywords: faculty of education, teachers, teacher training

---

## 1. INTRODUCTION

As it is known, the guarantee for our future is closely related to the education level of the individuals, and therefore, the society. It is no doubt that the development of the society would be increased to the extent that the education levels of the individuals of the society are increased (Aydın, 2003). Existing educational institutions has assumed to carry out the education of the societies. Qualitative education and raising qualified individuals are adopted as the main purpose at all stages from the primary education to the higher education. It is obviously seen that the universities plays an important role in raising the professional groups that enable the development of the societies. The universities are the higher educational institutions that operate as public entity with scientific autonomy, and provide education-teaching, scientific research, publishing and consulting at a high level, and include faculties, institutes, high schools, and similar bodies and units (Yüksek Öğretim Kanunu, R. G. 17506). It is no doubt that qualified individual profile can be raised as expected from the universities by effective application of the curriculums. Therefore, the academics and instructors as the practitioners of many curriculums are the focus of the education system as all agreed.

\* Corresponding author.  
Email address:

Considering that the students who are raised today with the thoughts and skills of the teachers will be the lawyers, doctors, teachers or scientists in the future, the importance of the teachers' profession can be more clearly understood. Therefore, it will be not wrong to tell that one of the essential members of our education system is teacher. The institutions that raise teachers, that are the faculties of education, are primarily responsible for raising the qualified teachers (Murat, Aslantaş & Özgen, 2006). In this sense, the importance of the faculties of education established to raise qualified teachers cannot be ignored. Because each of the teacher candidates studying at the faculties of education will deliver education to thousands of students in the future and share the information with them (Arslantaş, Özkan & Külekçi, 2012). Thus, all the countries in the developing and changing world to have well-raised teachers try to question their education systems and policies for raising teachers, and to continuously keep them up-to-date (Day, 2010). As raising teachers is perceived as raising individuals in general terms, it should be considered that socio-economic, socio-cultural and political developments have an important impact on developing teacher raising policies (Aslan, 2003; Darling Hammond, 2005). Therefore, it can be concluded that each society is to have a specific policy for raising teachers.

Our country has more than 150 years of experience in raising teachers (Öztürk, Doğan & Koç, 2005). According to Akyüz (2001), the institutions that has continued their activities under the Ministry of National Education with the beginning of Republican period have been transferred to universities as of 1982 (Aslan, 2003). According to Çakır (2005), the programs raising teachers are expected to equip the teacher candidates with certain professional qualifications. In this sense, considering that in primary education departments of all the faculties of education in our country, the package program as determined by the YOK (Council of Higher Education) is commonly applied, it can be said that all the competencies aimed to be gained by the teacher candidates through this program are the same for all the faculties of education (Terzi & Tezci, 2007). It has been specified in the Basic Law No. 1739 of National Education that the programs should include general cultural information, special field education and pedagogical formation courses, with respect to the programs for raising teachers (Yüksel, 2009).

Since the foundation of the faculties of education, at almost all scientific conference held, the properties required to be held by the faculties of education, educational process, physical conditions, social opportunities, and the qualifications that they aim at making the students gain have been discussed in detail. According to Çokluk Bükeoğlu and Yılmaz (2007), while it is applicable for all the levels of education, the faculties especially which delivers education at university education level should not only be the institutions where education is delivered, but also the places where the students come willingly, can participate in social, cultural and sportive activities, and develop their thought. As the reason for being of all the institutions from the primary schools to the universities are the students (Semerci, 2003), the views of the students as a good observer each have been required, when it comes to the a good faculty of education, considering that it can only be achieved by getting

feedbacks from the students to the questions how all these are assessed by the students, and whether these meet the expectations of the students. Therefore, this study has been carried out considering that the perspectives of the students who take place at the center of the education and teaching concepts of a faculty of education, and their views on the qualifications of a student in the faculty of education are important.

## **2. METHOD**

In this study, case study which is one of the qualitative researches has been used. The case study is an empirical study method which studies on a current case within the framework of the real-life of itself, and is used when the borders between the case itself and the content where it is involved is not obvious with sharp lines, and when there is more than one source of evidence or data (Yin, 1984).

The research group of the research includes 34 third grade students studying at the department of primary school mathematics teaching of a state university during the academic year 2011-2012.

As a data collection tool, a test consisting of two open-end questions have been used. While it was tried to determine a profile of a good faculty of education which is conceived of by the students with the first question, it was tried to reveal how a good student should be in a faculty of education through the students' perspectives in the second question. The expert views were taken about the questions involved in the data collection tool. The data from these questions was collected in writing at one week intervals.

The content analysis was used while analyzing the data from the research. The purpose of the content analysis is to reach the terms and relationships that can describe the collected data. Thanks to content analysis, the realities hidden in the data are tried to be uncovered (Yıldırım & Şimşek, 2011). The data was continuously compared with each other, and was analyzed considering their relationships between each other. In addition, the data was repetitively read for the accuracy of the analysis of data, and the parts which are not considered to be involved within the scope of the study were excluded. Following to the coding, the similar codes were integrated, and grouped under the appropriate categories, and their frequencies were calculated. In addition, the sample quotes were provided below related to the views of the participants which are coded as P1, P2, ... , P34 in respect of the created categories and codes.

## **3. FINDINGS**

The data collected were outlined and classified in accordance with the research questions, and the categories and codes were created. According to the questions from the question "How should be a good faculty of education?", three categories were determined as "academic", "physical conditions of the faculty of education," and "educational process". The data from the question "How should a good student be in a faculty of education?" were studied in two categories including "personal characteristics" and "proficiencies". These categories are

shown in the Figure 1. Each category is explained with codes, and the quotes from the views of the participants are directly given.

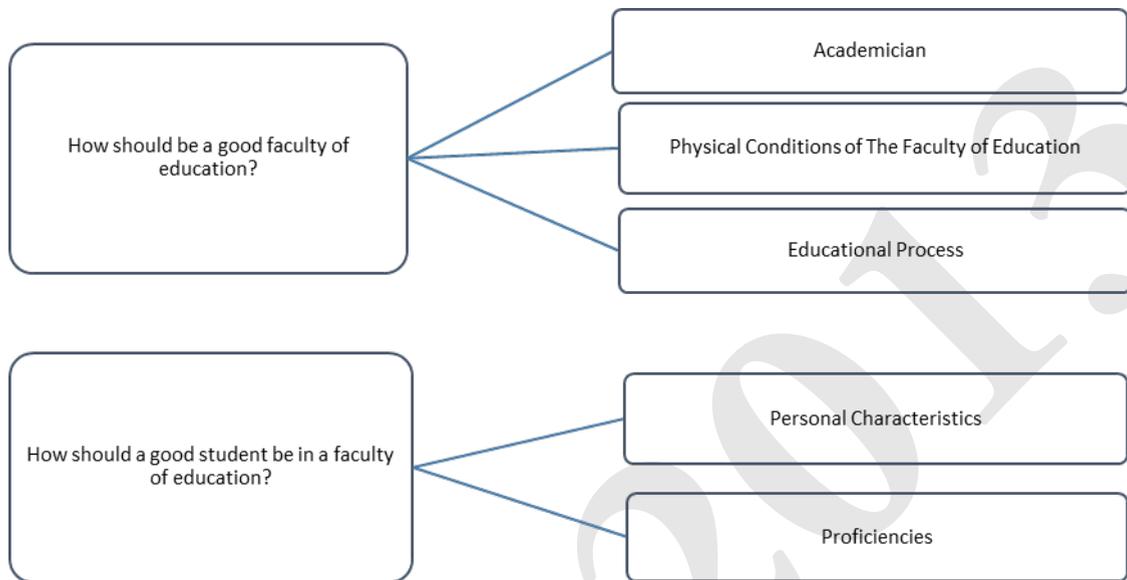

Figure 1: Research questions and created categories

### 3.1. Findings related to the question “How should be a good faculty of education?”

In the table below, the findings about the views of the participants about the question how a good faculty of education should be are mentioned. In this sense, the codes created under the category of “academic” in the Table 1, and the frequencies for these codes are given.

Table 1. The codes and frequencies involved in the “Academic” category

Category	Code	Frequencies
Academic	They should have field and professional proficiencies	16
	They should have good communication skills	14
	They should encourage the students to make research	6
	They should be a role model	4
	They should be coherent	3
	They should be mentors	2
	They should be democratic	2

When the Table 1 is examined, it is seen that the participants mostly emphasize upon that the academics should have field and professional proficiencies (16); should have good communication skills(14), and should encourage the students to make research(6) under the academics category. The quotes from the written views about these findings are directly given below.

While they state that P7 and P27 academic should have proficiencies in their fields and professions,

*P7: ...Our teachers should be equipped in field knowledge and profession...,*

*P27: ...The academics should be professional and equipped with respect to field and career...,*

P15 and P19 academics should have good communication skills,

*P15: ...They state that the communication between the student and the teacher within the framework of respect and tolerance for us to establish communication especially in future, in the faculties of education...*

*P19: ...The relationships between the teacher and the students should be good in a good faculty of education...*

P14 and P17 state that academic are required to encourage the students to make research as below.

*P14: ...The academic should encourage the students to make research...*

*P17: ...The academics should much encourage the students to make research...*

The codes and frequencies for the categories “Physical specifications of the faculty of education” as another category created in accordance with the answers to the question how a good faculty of education should be are given in the Table 2.

Table 2. The codes and frequencies related to the category of "Physical specifications of the faculty of education".

Category	Code	Frequencies
Physical specifications of the faculty of education	Should have a good physical equipment	13
	Should have a technological equipment	11
	Should not be crowded	5
	Should be safe	1

When Table 2 is examined, 13 students emphasize that the faculty of education should have physical equipment, 11 students emphasize that it should have technological equipment, 5 students emphasize that it should not be crowded, and 1 student emphasizes that it should be safe. The quotes from written views related to these findings are given below.

P1 and P25 state that the faculties of education have to have a good physical equipment, and P12 and P15 also state that the faculties of education have to have technological equipment with the following statements.

*P1: ...The buildings should be equipped with better physical structure for more applications...*

*P25: ...The teaching environments in a good faculty of education should be structured so that it will be best suitable for the students...*

*P12: ...The classrooms in the faculty building should not be lack of technological devices...*

*P15: ...The technological equipment should be supplied smoothly...*

The codes and frequencies related to the category of “educational process” created in accordance with the answers to the question how a good faculty of education should be are given in the Table 3.

Table 3. The codes and frequencies related to the “educational process”

Category	Code	Frequencies
<b>Educational Process</b>	It should be concentrated upon the teaching practice courses	10
	It should be concentrated upon the applications in courses related to education	10
	Much importance should be given to the courses related to education	9
	It should have different social activity clubs	6
	They should be aware of that they are raising teachers	3
	It should also include interview while selecting the students	3
	Care should be taken for the preparations of course and exam schedules	3
	Learning and the learner should be given priority	2

When the Table 3 is examined, it is seen that the students put emphasis on that it should be concentrated upon the teaching practice during the educational process, It should be concentrated upon the applications in courses related to education, much importance should be given to the courses related to education, and It should have different social activity clubs with respect to the category of educational process. P4 and P11 state that it should be concentrated upon the applications in courses related to education during the educational process,

*P4: ...It is not enough to raise qualified teachers that the teaching practice courses are just delivered in the final year. It is essential in terms of the ability to understand and apply their proficiencies for being a*

teacher, and to measure the tendency to being a teacher to receive the teaching practice courses as of the first grade...

*They stated with the following words:*

*P11: ...First, it would be better to have much more teaching practices. Although this is our third year, we are still not equipped so that we could know how to lower the level to the primary school level and to instruct to them...*

P6 and P17 stated that it should be concentrated upon the applications in courses related to education during the educational process,

*P6: ...Only information is provided during the courses related to education, and I think it should be almost 70% practical ...*

*P17: ...First of all, there are those courses related to education we are delivered every term. In these courses, the information and practices should be provided, which are mostly practical and will be useful for the students when they become a teacher, instead of delivering the courses according to this theory, or that theory, or like, the definition of the education is that...*

In addition, P11 and P26 put emphasis on that much importance should be given to the courses related to education during the educational process with the following words.

*P11: ...I think that the courses related to education should be given much more importance. We need to have powerful knowledge of education as much as we have powerful knowledge about our field of study...*

*P26: ...Much importance should be given to the courses related to our field of study; however, definitely, the courses related to education should be given priority and intense...*

### **3.2. Findings related to the question “How a good student in a faculty of education should be?”**

The views of the participants related to the question “How a good student in a faculty of education should be?” are studies under the categories of “personal characteristics” and “proficiencies”. The codes and the frequencies related to these codes, which are created under the category of “personal characteristics” are indicated in the Table 4.

Table 4. The codes and frequencies related to the category of “personal characteristics”

Category	Code	Frequencies
----------	------	-------------

<b>Personal Characteristics</b>	Should be social	9
	Should be willing and determined to learn	8
	Should be morally good	8
	Should be responsible	6
	Should be critical	4
	Should have self-confidence	2

When the Table 4 is examined, it is seen that the participants give priority to such personal characteristics of a good student in a faculty of education as to be social, to be willing and determined to learn, to be morally good and responsible. P8 and P13 stated that a good student in a faculty of education should be social with the following words.

*P8: ...We should not come to the faculty just to listen to the instructor and then, go away. We should be involved willingly in the social activities and social responsibility projects of the clubs...*

*P13: ...Of course, the student should not be only limited to the courses. At the same time, they should spare enough time for the social activities because when enough time is spared for he/she social activities, they could know the activities where they feel comfortable and should recommend the same to their students at school, and therefore, they would be a better role model teacher for their students with their sophistication...*

P2 and P24 state that a good student in a faculty of education should be willing and determined to learn with the following words.

*P2: ...A student who comes to the faculty of education should be an individual who knows what they want at first, and then, who is aware of why they are here, has good level research skills, if not high-level, and who is willing and determined to learn...*

*P24: ...They should be interested in, and concerned about, the courses, and willing to make research and to learn new things...*

P20 and P21 stated that the student should be morally good as below.

*P20: ...They should be morally good because the teacher means a role model individual...*

*P21: ...For the individuals who will become a teacher, the widely comprehensive adjective attributable is socially ethical on my mind. The student should be socially ethical. And if this student is studying at the faculty of education, then they should be more careful about those two times, or even,*

*ten times more...*

The codes and the frequencies related to these codes, which are created under the category of “proficiencies” in accordance with the findings about the participants’ views about the question “How a good student in a faculty of education should be?”, are given below in the Table 5.

Table 5. The codes and frequencies related to the category of “ Proficiencies”

Category	Code	Frequencies
Proficiencies	Should develop themselves	17
	Should be a role model	15
	Should be aware of that they will become teachers	11
	Should have adequate knowledge of their field and profession	10
	Should have good communication skills	10
	Should have general culture knowledge	6
	Should like their department	6
	Should have a library	4

When the Table 5 is examined, it is seen that the participants highlight that a good student should develop themselves (17), should be a role model(15), should be aware of that they will become teachers(11), should have adequate knowledge of their field(10) and profession, and should have good communication skills(10).

P9 and P12 stated that a good student in a faculty of education should develop themselves with the following words.

*P9: ...The student should learn only during the course but they should make research out of the courses, and they should develop themselves with respect to the assignments and projects...*

*P12: ...A good student in a faculty of education should develop themselves so as to be a teacher who will be beneficial to the society. The student should improve themselves in the course they run and should achieve a higher level knowledge than required level...*

While P12 and P17 stated that a good student in a faculty of education should be a role model with the following words:

*P12: ...A student of a faculty of education who improve themselves so as to be a role model in every respect will be a teacher who raises the students who will be role models in every respect...*

*P17: ...The teacher is the individual who is a role model for the society with all their acts and behaviors. Therefore, a student who study at the faculty of education should be aware of that they will be a teacher in the future, and they should serve as a model with all their acts....,*

P1 and P22 stated that a good student in a faculty of education should be aware of that they will become a teacher with the following words.

*P1: ...A student in the faculty of education give should be aware of that they will become a teacher, and do well by being a teacher candidate in all aspects such as their acts, behaviors, and appearance, etc...*

*P22: ...A good student should be an individual who does not regard the teaching profession as a comfortable and unengaged profession but who are prepared so that they can bear the sacredness and weight of this profession...*

#### **4. DISCUSSION AND RESULT**

According to the data from the test applied to the participants, the students have assessed the faculties of education in terms of academic, physical conditions of the faculty of education and educational process. Mostly emphasized characteristics in respect of the academics include that the academic should have field and professional proficiencies; they should have good communication skills, and they should encourage the students to make research. According to the physical conditions of the faculty of education, they stated that the faculties of education should have good physical and technological equipment. With respect to the educational process, it is seen that they have highlighted such properties as that there should be more concentrated upon the courses related to education in faculties of education, and the applications in the courses related to education, and also, that there should be social activity clubs.

According to the participants, when considering a good student profile in the faculty of education, it is seen that the data is divided into two categories including “personal characteristics” and “proficiencies”. While for the personal characteristics, such characteristics stand out as to be social, to be willing and determined to learn, and to be morally good, for the proficiencies, it is seen that such characteristics as that a good student in the faculty of education should develop themselves; should be a role model; should be aware of that they will be a teacher in the future; should have adequate field and professional knowledge, and should have powerful communication skills.

Although the views of the participants were received in writing without any limitation of subjects, it has been seen that the views are concentrated upon the academics, educational process and physical equipment. It is seen that the participants’ views on the academic and educational process are similar with the findings of the study carried out by Basturk (2011) titled “Assessments of the mathematical teacher candidates about the educational

process in the faculty of education” in terms of academic in that “the academic should develop themselves”; in terms of physical conditions, in that the technical facilities and physical equipment should be improved, and in terms of the educational process, in that the number of courses related to education should be increased. It is seen that participants have mostly pointed out with respect to the educational process that the practices for the courses related to education are low in number, and less importance is given to the courses related to education, and such result is coherent with the results of the study as carried out by Sahin and Balkar (2007).

The results achieved through the assessments made by the students on a good faculty of education and a good student profile in the faculty of education under this study provide clues about the education in the faculty of education, while showing what the students expect from a faculty of education.

Considering the findings of this study and similar studies, we think that the managers of the faculties of education as well as the heads of department should take into account the opinions and views of the students involved in this study to enhance the quality of education and to become competitors with the international faculties of education. Moreover, this type of studies can be supported with interviews for more detailed data, and become more common, and large-scale studies can be conducted in all other faculties of education in Turkey.

# How Technology helps to create new learning environments by use digital museum resource

Vincenza FERRARA<sup>a\*</sup>, Sonia SAPIA<sup>b</sup>

<sup>a</sup> *Sapienza University of Rome, Digilab, "Rome", Italy*

<sup>b</sup> *Istituto Comprensivo "Via Val Maggia", "Rome", Italy*

## Abstract

Multimedia Technologies, communication and WEB allow the opportunity to develop tools to apply new teaching methodologies and learning way in the School. On the other side Museum resources are available online to support teaching activities. The research team (*Digilab of Sapienza University* and *"Via Val Maggia" School*) has launched a project to develop a new way to teaching based on objects specially museum digital resources, therefore new learning environments have been created. A particularly Information System and a tool to build e-book have been designed to teachers to improve student learning by use digital museum objects information. The *Polo Museale Sapienza* has given a important contribution with its digital cultural heritage. Linked and Open Data technologies have been applied to share cultural heritage with education materials. We will discuss the results of the project and we will show examples of the creative means that teachers have built to use museum objects in the classroom through tools developed by Project. The project results could be important to develop a distance learning system to help student at home or to long life learning

Keywords: learning environment, museum, distance learning

## 1. INTRODUCTION

In recent years in the schools, the availability of computer labs and tools adoption such as IWBs (interactive whiteboards), contribute to the possibility to rethink teaching methodologies and to use the materials available online to engage students and implement information contents and possible multidisciplinary links. Technologies allow:

- To establish new training for a more effective teaching
- To use online engaging content to students
- To work out multidisciplinary lessons

The museums are important teaching centres that will be able to engage students and improve learning, in addition to the school environment. These institutions are rethinking their visit paths by connecting to student knowledge and curiosity. Museums have adopted WEB technologies and communication to build a tool to enable special access to school for sharing cultural heritage online resources.

New teaching methodology includes making arrangements for museum visits according to the curriculum.

Recent theories of education indicate museum objects as ideal tools for teaching: the museum object, in fact, can take on different meanings and stimulate the creation of associative content and of further information related to: the structure, function and disciplinary or spatial context in which it is inserted. We are going to propose new way to use cultural heritage that would make teachers protagonists of communication of their subject. Using technical tools teachers will be able to re-contextualize museum objects within a lesson. We present “School and Museum: the museum object as a tool for teaching“, a project funded by Italian Ministry of Education that has promote cultural heritage resources use by teachers to make lesson within class using IWBs or such as LO on the WEB.

## 2. MUSEUM AND EDUCATION

In recent years museum have developed a communication model to allow different relationship between cultural heritage and public (Falk, 2000) and they have taken more articulated roles and functions in relation to territory and visitors. These institutions are ongoing to develop new ways for disseminating scientific culture in order to meet a growing demand for interdisciplinary teaching, based on new learning and communication forms also according to available technologies.

Technologies have prompted museums to revisit the paths within their structures and produce personalized access to their content for meeting the diverse needs related to knowledge and interests of users. Many projects are underway to promote laboratories and personalized itineraries for various types of users (e.g. for young people, adults and general purpose tourists).

A special study field in this sector involves content personalization by user for applying human-centered approach to online access. A personalized access as a means of navigation or accessing the contents has therefore become a useful tool to valorise the digital heritage available. Studies on visitors seem to confirm that learning is stimulated when They can better understand and apply the concepts to their knowledge. Customization is therefore a new communication strategy based on a continuous process of collaboration, learning and adaptation between museum and visitor. A first important distinction concerns the control on a user in the customization process (Bowen, 2004), (Ardisonno & al. 2012)

A personalized access can be very important to connect museum and school.

The museum represents a privileged means of education, a real learning environment where to lead the children at the end of a training program initiated and developed in the classroom. Peoples, events of the past, tools, inventions become tangible through the collections, the objects, the evidence preserved in the museum. The student, through the thematic paths and the explanation of the guide, is involved in the discovery of ancient history, science, art and technology in a context certainly more appealing than the classroom in which he lives his everyday role of the learner. The teacher at the same time, during the educational visit, has a privileged point of view in the observation of their student and can check the development in cognitive, affective and identity areas. The child during the museum visit will have to comply with rules and relate to others in a proper way (area of identity); will have to arrange with the classmates the educational visit, think of the educational kit that will serve during the visit, support mates in distress (emotional area); must eventually gather information, prepare for possible questions to ask the expert, select museum objects they are interested and get further information about the object itself (cognitive area).

The use of technology and multimedia products, along with the ability to integrate with informative content different from the traditional ones, may be suitable means to facilitate the overcoming of a teaching based on the transmission / reception of content that are most often fragmentary and superficial, in some cases obsolete, to the advantage of creating a stimulating learning environment. Recent theories of education indicate museum objects as ideal tools for teaching the museum object, in fact, can take on different meanings and stimulate the creation of

associative content and of further information related to: the structure, function and disciplinary or spatial context in which it is inserted.. Indeed museum object can be used as image related to concept within a lesson. In this case museum visit, after lesson class, can be improve learning level of student through object experience (Paris, 2002).

There are many theories on learning that can be applied to build a system for the development of activities for students and, more in general, in the context of lifelong learning, such as the theory of Kolb [Kolb, 1984], the use of which can be applied to museum objects (Marie, 2010).

New paths and laboratories have been built by curators within museums and a teaching space has been devoted on museum WEB site. The virtual educational areas provide games, customization paths and LO. Different mode and contents have been provided:

- Lessons related to the course of study such as the museum of Anthropology of Wake Forest University \* with Programs for grades K through 12 focus on specific cultures and other anthropological topics e Kits contain hands-on objects, photographs, activities, labels, instructions, and historical materials.
- Interactive games such as Museum of Galileo† in Florence
- interesting image on their own PC such as Demonstrator‡ (CHIP project -Cultural Heritage Information Personalization) such as come nel caso del Rijksmuseum in Amsterdam§ (Aroyo & al, 2007).
- Tools to built personal virtual tour of museum through reserved area. The teachers can downloaded
- Opportunity to access to reserved area by teacher to make online lesson integrated by object museums and LO such as teaching center of Canada museum\*\*

### 3. THE PROJECT

The project aims to test a new teaching methodology which involves the production of e-books related to curriculum using non-traditional content, integrating digital cultural heritage resources. New museum role on education suggests opportunity to connect its cultural heritage to school through technology. The “*Polo Museale*” of Sapienza University of Rome††, with its 20 museums aims to promote activities in this field. Every year many primary school classes visit Sapienza museums in according to their courses. Different initiatives are ongoing such as education tours and experimental laboratories to cultural heritage dissemination. In this context *The Polo Museale* with Primary School “*ViaVal Maggia*” of Rome have launched a project to use object museums in teaching field.

The research team, consisting of museums and technological experts from university and primary school teachers, have analyzed the possibility to support teaching activities with multimedia technology and digital resources accessible through a

personalized path. The personalized catalog consist of content and images of museum objects chosen by the individual user. After an initial review of the tools available to the school, in this case the IWBs, the computers and the Internet connection, it was proceeded to design an application to allow teachers to build a personalized path through the web with the possibility to activate a download of such information, aggregated in a xml file, on each computer to be used in the production of multimedia lessons, according to a communication strategy based on a continuous process of collaboration between the museum and the teacher (Bowen, 2004), (Wang, 2007).

The “*Polo Museale*” aims to develop Repository for managing different and heterogeneous objects from digital catalogues of museums using Linked Data technology to promote cultural heritage dissemination, to encourage museum visits and to share digital content to make hypermedia lessons. It was then carried out mapping of data based on appropriate RDF to build metadata catalogue of museum objects.

Personalized access tool to Repository has been designed to allow teachers to build a preserved area to store the content and image related to museum objects chosen. This digital content may be used to describe teaching subject by class lessons.

The personalized catalogue has been stored on xml file based on RDF model. Teacher will be able download this file on its PC. The xml file includes in metadata based on Linked Open Data technology to allow access to object information, museum WEB Site, image by Hypermedia lesson.

This tool has been integrated with another one developed by Sapienza University, ASDscuola (Accessible Site Developer), which allows to build automatically a hypertext from contents, accessible via web. To manage contents, ASD is based on a couple of technologies: Java and XML. Web pages are in XHTML language. ASD does not require any particular hardware and software, it's a portable system (Ferrara & Campanella, 2011). The

user can choose a customized itinerary downloaded previously in the editor of ASD tool and he can put the images and information related to the content of the lesson, so that the teachers will be able to explain the lesson with museum objects images and information. Following the teachers can take the students to the museum where they will find the objects previously observed in the context lesson. The students can build up reports by associating theoretical knowledge with museum objects, after visiting the museum. Results and hypertext made by teachers are available via website project.\*\* (Fig.1)

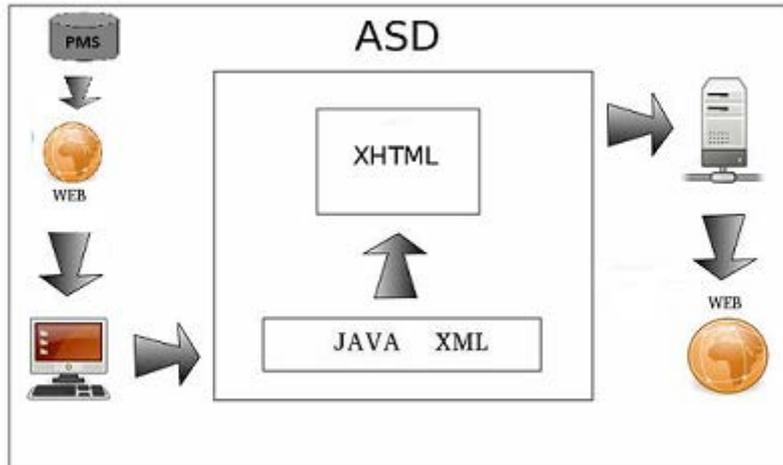

Fig. 1. Project scheme "Museum and School"

#### 4. RESULTS

The realization of multimedia products through collaboration between School and University, has shown a suitable tool for improving education. The project experimented at the "Via Val Maggia" school involved in the start-up phase, the science teachers who have been trained by experts from the University, on the use of educational software that gives access to information about objects in museums.

Teachers, who are often in trouble to acquire the means to facilitate and support the teaching of science subjects in class, joined with enthusiasm and participation in the training course, during which we proceeded to the construction of scientific hypertext. These are shown first in the classroom using new multimedia technologies (IWBs) and then made available on the WEB contributing to a platform for distance education.

Each teacher has first organized their own learning path on a topic already discussed in class, the subject was then segmented into paragraphs. Each paragraph has been listed as a node in the construction of hypertext. Each node provides historical, geographical and scientific information about topic that gives the title to hypertext and in each node were inserted images selected from the catalogs of the Museums of Sapienza in support of the

\*\* [www.musei.uniroma1.it/progettomiur/index.html](http://www.musei.uniroma1.it/progettomiur/index.html)

informative page. They were created hypertext on the Scales, on Temperature, on Light, on Works of Art. Thanks to the Project teachers have worked in the premises of the school by consulting the volumes in the library and using the multimedia computer stations. After searching for the information material has surfed online within the virtual paths offered by the Museums, to track down objects useful to implement the contents in order to create a custom e-book, a container of explanatory panels and virtual museum objects relating to the subject matter. Each teacher has created, thanks to supplied software, , the path of hypertext with the support of images of the museums of Sapienza, object of the experiment, submitted to the students during the frontal lessons. In the next visits to museums students will see objects that have already got to know, placed within the hypertext ., In this way the students can implement the associative and experiential activities for the improvement of their cognitive abilities.

The student, starting from the previous experiences, will consolidate the knowledge gained during the teacher frontal lessons, will verify the information, will formulate hypotheses and he reaches skills through interaction with the museum objects , building something new and exciting that he himself have helped to achieve. Students are not only active, but also actors (Dillembourg, 2002). Concluded the path / process of building the multimedia way, the student will be able to check the acceptability of their own thinking through the guided visit and direct experimentation in museum labs.

The project has therefore allowed the virtual learning environment creation, useful to development of distance education for further information or simply to assist the student in the 'integration of the lesson in the classroom.

## 5. Conclusion and New perspectives

New communication strategy, learning theory and technologies can be useful to develop relationship between museum and school. The project result have shown that digital resources and technology tool can be developed a way for teaching to build new learning environment. Often, however, the information of the cultural heritage are written in a language not easily accessible for the general public or to teachers and students. To solve this problem technologies can provide opportunities to rethink the implementation and presentation of contents. New project is going to launch to build a framework to allow, using Sematic Web, to develop annotation tool to increase digital object description by teachers. In this way the appropriate Web Site will be useful to promote a virtual learning environment based collaborative work to share content and LO for many school. The aims project will be to assess the impact of technology to verify the quality of engagement and learning by students

## Abstract

Compared with worldwide models for executing these types of evaluations, there are three notable features of the Taiwanese approach: (1) peer evaluation, (2) professional growth orientation, and (3) a school-based model. This study investigated 53 selected schools to examine how blogs/websites improved the knowledge and skills of school evaluators, established mutual trust and a culture of sharing, and promoted teacher professional development and school development. A questionnaire, field interviews, and observations were employed to analyse the effectiveness of e-evaluation.

This study had five notable results: (1) In more than 50% of the schools, the e-evaluation system included an announcement system, a digital portfolio, and a professional growth activity based on the evaluation report. Most of this information was available to the public. In 14.6% of the schools, the e-evaluation system contained information from teaching observations, portfolio assessments, and final reports, most of which was not available to the public. (2) The more comprehensive the e-evaluation system, the higher the passing rate for the evaluation personnel was during training and the more on-campus evaluators were involved, especially high-level evaluators. (3) The e-evaluation system included functions for model demonstration and the exchange of curricular materials, which helped to promote curricular reform and to earn the recognition of parents. (4) The schools quickly established cultures of sharing and discussion to form cooperative teams, enter various competitions and win awards, and raise school awareness. (5) The management of e-evaluation was a great help to the school administrators, reduced paper consumption, and improved progress control.

Keywords: teacher evaluation, e-evaluation, teacher professional development

## 1. Introduction

Some researchers (e.g., Calabrese, Sherwood, Fast, & Womack, 2004; Kersten & Israel, 2005; Marshall, 2005; Timperley, 1998) have indicated that the conventional supervision and evaluation process is not an effective strategy for improving teaching and learning, mainly because (1) teachers receive inaccurate ratings related to teaching performance, especially teachers of poor and marginalised students; (2) many evaluation processes appear to be mandatory rituals and waste valuable instructional time; (3) the evaluation process has almost no influence on personnel decisions, teacher development and the structure of teaching; and (4) teachers are dissatisfied with the evaluation process because they lack teacher input, they evaluate only a fraction of teaching, the lessons that principals evaluate are often atypical, the evaluators lack the necessary expertise for conducting

\* Corresponding author. Tel.: +886 7 8060505; fax: +886 7 8060930.

E-mail address: liyiafeng@gmail.com

evaluations, and there is lack of connection between evaluation results and professional development. In 2005, Taiwan began to promote K-12 teacher evaluation for developmental purposes.

More than half of Taiwanese schools are medium or large, having more than 1,000 students and 35 classes. And half of high schools have more than 3,000 students and 60 classes. As a result, the administrative staff is not able to conduct all of the evaluations in these schools. Part of the reason for negative perceptions of teacher evaluations and evaluation schemes is the well-documented tension between the accountability purposes and the developmental purposes of evaluation (Timperley, 1998). Developmentally oriented evaluations have found greater acceptance among educators than accountability-oriented evaluations (Danielson & McCrea, 2000; Mayo, 1997). Self-evaluations and peer evaluations are commonly accepted among teachers (ASCD, 1999; Marshall, 2005; Ministry of Education, 2006a).

One of the keys to delivering quality education is the promotion of teachers' professional competence. The Taiwanese government has emphasised using teacher evaluations for professional development within the K-12 system and has attempted to create administrative regulations and funding subsidies for teacher evaluations (Ministry of Education, 2006b). In Taiwan, 31.16% of schools and 18.32% of K-12 teachers have joined a teacher evaluation project (Ministry of Education, 2012a). In Taiwan, teachers can choose their peer evaluators, and because schools tend to be large, effective evaluation is a challenge (Ministry of Education, 2012b). Over the next three years, in addition to revising the regulations for teacher evaluation, the Ministry of Education will focus on finishing the evaluation website, establishing the database for evaluation personnel, strengthening the training procedures for evaluation personnel, and implementing the comprehensive evaluation process (Ministry of Education, 2013).

One of the objectives of this study was to find out how effectively an e-evaluation system can manage evaluation procedures and enhance the knowledge of evaluators. Self-evaluation tools and peer observations, including systematic classroom observations and professional meetings among teachers, allow teachers to share their experiences, reflect on teaching, and expand their professional knowledge and skills (Goldstein, 2007; Kersten & Israel, 2005). In short, we want to know what the requirements of an e-evaluation system for effective school-based teacher evaluation are.

The second objective of this study was to assess the abilities of the e-evaluation systems developed by the schools to meet accountability requirements in addition to developmental requirements, the latter of which are usually preferred by educators (Feng, Su & Yang, 2011; Kassabian, 2009). An evaluation system should reflect the performance of teachers. We will investigate how a system can be developed to enhance evaluator competence, build a culture of trust and sharing, and improve the school curriculum, teaching materials, student learning outcomes, school visibility, and student recruitment.

## **2. Literature review**

Relevant studies have found that teacher evaluation is a time-consuming task. Kersten and Israel (2005) found that evaluating a teacher took more than five hours on average for 65% of the administrative staff in the United States. The major issues for teacher evaluation in Taiwan are that the school administrators and the teachers both feel that it is hard to allocate time to evaluation, that the workload is heavy, and that evaluation affects teaching (Ministry of Education, 2008). Previous studies have found that teachers have to engage in a variety of non-teaching activities when being evaluated. Because teacher evaluation in Taiwan is peer-based, all evaluation activities create extra work for the teachers involved (e.g., conducting classroom observations, providing face-to-face feedback after each classroom observation, and writing a public appraisal of the teacher). Feng, Su, and

Yang (2009) found that, on average, every teacher in Taiwan spent 12 hours on self-evaluation and 8 hours on evaluating peer performance.

Teacher evaluation practices also emphasise a commitment to sharing and renewal (Claudet, 1999; Ovando, 2001). Mayo (1997) suggested that an evaluation system for professional development should give a teacher (1) useful feedback on student needs, (2) the opportunity to learn new teaching techniques, and (3) advice from the principal and other teachers about how to make changes in the classroom. Marshall (2005) also proposed 13 strategies for implementing a developmentally oriented evaluation system: (1) continuously analysing teacher learning; (2) energising the teaching team; (3) supervising the curriculum units; (4) frequently making unannounced visits; (5) quickly sampling multiple lessons; (6) conducting authentic conversations based on real data; (7) continuously making suggestions and redirecting teachers; (8) providing focused and face-to-face feedback; (9) fostering a candid give-and-take in conversations; (10) everyone asking, "Is it working?"; (11) continuously looking for new ideas and practices; (12) improving teaching in every classroom; and (13) orchestrating school-wide improvement. According to previous research, teachers need to engage in a variety of activities collaboratively, collectively making inquiries and sharing teaching resources.

Technology has brought a new dimension to teacher evaluation and is poised to offer a unique contribution, as technological innovations can offer opportunities to elicit teacher reflections on video data. The Taiwanese Ministry of Education provided technology funding to the schools that joined the teacher evaluation project. Pecheone, Pigg, Chung and Souviney (2005) found that electronic portfolios allow users to engage in online discussions, and Hartnell-Young and Moriss (2007) found that a digital portfolio is a powerful tool for improving professional development. However, there is no strong evidence for the effect of electronic portfolio evaluation on teacher learning. Some researchers have found that the concerns regarding validity, reliability, and cost have limited the implementation of technology-enhanced teacher evaluation (Melnick & Pullin, 2000; Youngs, Odden & Porter, 2003). Teacher evaluation in Taiwan is mainly peer-based, and technology-enhanced aspects include evaluator training, electronic portfolios, observation of teaching videos, and peer partnerships. Thus, it is important to examine the effects of electronic evaluation on evaluator training as well as on the monitoring and sharing of the evaluation process.

In recent years, a new focus in teacher evaluation has been on self-evaluation. For example, the Association for Supervision and Curriculum Development (1999) advocated that teacher evaluation should focus on self-evaluation and that evaluation items should primarily focus on improving teacher skills. Haung (2010) suggested that schools should plan to promote the professional growth through self-evaluation. Teachers participate in professional development activities to enhance their professional knowledge, skills, and attitudes (Zhao, 2010). According to the theory of teacher change (Ross & Bruce, 2007), self-evaluation is a powerful mechanism for improve the teacher achievement. Self-evaluation is closely related to professional growth. Ross and Bruce (2007) found that by providing teachers with clear teaching standards, self-evaluation could help teachers reach instructional goals and reduce the gap between educational expectations and results. There are many forms of teacher self-evaluation. Teachers can select an appropriate form according to their own teaching and developmental needs. Danielson and McGreal (2000) advocated that professional development is the most essential element of teacher evaluation. Teacher evaluation systems in many places have similar designs. For example, the supervision and evaluation system of Malden Public Schools in Massachusetts is based on the professional growth cycle, and a professional growth plan is one of the required evaluation items in yearly teacher evaluations in Singapore (Ministry of Education, 2009). However, schools must meet certain conditions to effectively encourage and support the growth and development of their teachers (Association for Supervision and Curriculum Development, 1999). As Ministry of Education (2013) stated, whether teacher evaluation promotes professional development is affected by several factors, including the teachers themselves, the

evaluator, the process of collecting the evaluation data, and the context in which the feedback and evaluation take place. These factors are relevant to the contents and methods of teacher evaluation.

There are three notable features of the Taiwanese approach: (1) the use of peer evaluation, (2) a professional growth orientation, and (3) the use of a school-based model. The teacher evaluation system in Taiwan uses self-evaluation and peer evaluation (observing teaching and reviewing a portfolio) and establishes professional development plans based on evaluation results. Teachers in Taiwan working in different contexts likely experience varying levels of support in presenting their teaching, developing their portfolios, and reflecting on their teaching for the purpose of instructional improvement. We need to know what types of core support are essential for an e-evaluation system that adds value rather than stress. It is also unclear whether teacher evaluation can elicit professional learning in other teachers who have not joined the teacher evaluation project.

### **3. Research methods**

#### *3.1. Participants*

The participants in this study were 159 teachers, 53 principals, and 53 directors of 53 schools (28 elementary schools, 11 middle schools, and 14 high schools) recommend by city or county governments. To be recommended, a school had to have promoted teacher evaluation for at least three years, have more than half of its teachers participating in evaluation, have more than half of the participating teachers be licensed evaluators, have an increasing number of people participating in evaluation every year, and be a core school for teacher evaluation in the county or city.

#### *3.2. Procedure*

In this study, a self-assessment questionnaire was first sent to the school and completed by the principal or director; interviews and field visits were conducted after this. A total of 20 staff members conducted the visits, and they established rating consistency through a six-hour discussion of the project. After collecting the data, data triangulation was performed by the investigator according to the contents of the interviews, the school self-assessment questionnaires, and school surveys. In addition, if there was any doubt about the information provided, the research team personally contacted the school by phone or through an on-site follow-up review.

#### *3.3. Instruments*

Based on the relevant requirements and the funding restrictions of the Ministry of Education as well as on the results of a literature review, three categories were used to classify the information gathered in the interviews: (1) The extent of the school's participation in the evaluation program—whether the number participants was stable or growing year by year, the training situation of the evaluation staff, and whether the evaluation plan encompassed data from multiple evaluations; (2) The content of the school's e-evaluation system—the management of the evaluation process, including the operation and effectiveness of various meetings about teacher evaluation, the management of the evaluation methods and the evaluation report, the mechanism for sharing information among teachers in the school, the school's incentives, the integration of the teachers' evaluation plans and the school's plan, and the publishing and sharing of the evaluation results of the school; and (3) The mechanism for professional development—the operation of the teachers' professional learning community, the school's support for professional development programs, and the school's mechanism for professional development evaluation.

The mixed method was used in this study, consisting of qualitative and quantitative approaches. This research use interviews with qualitative data to find common characteristics. The resulting tables of interview data were revised by six principals, directors, and teachers from elementary schools and middle schools as well as the 20 visiting staff members to ensure their validity based on expert opinion. Descriptive statistics was performed to analyze the collected quantitative data.

## 4. Findings and discussion

### 4.1. Usage of e-teacher evaluation systems

Table 1. The proportion of schools with an established e-evaluation system

Teacher evaluation system	School size	Number of schools	% of schools
Paper and pencil	Fewer than 35 classes	8	15.10
	More than 36 classes	4	7.55
	Total	12	22.65
E-evaluation	Fewer than 35 classes	5	9.43
	More than 36 classes	36	67.92
	Total	41	77.35

As shown in Table 1, among the 53 selected schools, 41 of them (77.36%) had established a teacher e-evaluation system, indicating that e-evaluation has played an important role in teacher evaluation for improving the performance of good schools. In addition to the cost of the e-evaluation equipment that was subsidised by the Ministry of Education, the use of e-evaluation was associated with school size: there was a higher proportion of e-evaluation usage in larger schools.

### 4.2. Main features of e-evaluation systems

Table 2. Subsystems of school-based e-evaluation systems (n=41)

E-evaluation subsystem	Number of schools	% of schools
Announcement system	28	69.96
Digital portfolio	21	51.22
Submission and storage of the evaluation report	6	14.63
Professional growth activities based on the evaluation report (e.g., PLC)	30	73.17

As shown in Table 2, the e-evaluation systems of the 41 schools can be divided into four subsystems: (1) an announcement system, which includes the evaluation criteria, the evaluation forms, the period of evaluation, the

minutes of meetings, and notifications about activities and important evaluation messages (for example, a notification for collecting the evaluation report and a list of the current evaluation personnel); (2) a digital portfolio, which is a personal portfolio set up for teachers and not only provided to the evaluators for evaluation but also available to campus peers or people outside of the school; (3) a system for the submission and storage of the evaluation report, including submission of a personal teaching video and a self-evaluation report completed by the teachers to be evaluated and submission of the teaching observation report, the portfolio assessment report, and the overall report form by the evaluator; (4) a professional growth activity based on the evaluation report, including the provision of information on learning activities, activities in progress, shared results about the activities, shared personal practices, and the materials and methods from research and development on teaching conducted by a group or an individual.

Based on the interviews and the documents, the schools' e-evaluation systems were most likely to include a school announcement system, followed by a digital portfolio, followed by professional growth activities based on evaluation reports, and finally a system for the submission and storage of evaluation reports. Although most schools used digital portfolios during the second year of the program, the portfolios were not as the professional growth activities based on the evaluation reports, the latter of which garnered the recognition and support of teachers. Making documents for the portfolios was time-consuming and there was a large range of variability in the teachers' information capabilities. Thus, improving teachers' capacities for digital portfolio production is still the goal of the schools in the next three years. The popularity of the system for submission and storage of the evaluation report was not high, mainly due to concerns about the confidentiality of the evaluation results and the time teachers thought they had to spend on word processing. Some of the teachers' comments are shown below:

*Since the first year, teachers have not been able remember so many details, and the administrative staff needed a control mechanism. So a website dedicated to teacher evaluation was constructed within the school's homepage to help the teachers understand the underlying processes and information. Because the website showed good results, its function has been expanded year after year. For example, teachers continued to be concerned about the database of the evaluators and the training materials. The digital portfolio was promoted in the second year. It was first demonstrated and its use was led by some teachers with strong information abilities. Most teachers have already set it up, but the updating process needs to be improved. Even so, the digitalisation of the documents has still shown its influence on communication. For example, the social studies teachers formed a group to maintain the media teaching materials for each unit, including the introduction of Power Points, videos, and books, which accidentally became digital learning resources for the students.*

*In addition to visiting other schools, the principal and the director also considered the students' learning performance, which is the key point of teacher evaluation. Annually, three demonstrations of digital portfolio making were conducted. Because the digital portfolio in our school focused on information about students' learning outcomes and remedial measures, a closed system was adopted. Outsiders were not allowed to enter and browse. Only evaluators could enter and provide feedback on the teaching observation. At the end of the school year, a presentation was held with a recommended teacher for each subject who shared his/her teaching files and published student feedback on their academic achievement, which was a big event at the end of the school year.*

*The teaching files in our school were combined with the professional growth activities. Most teachers put community learning accomplishments into their files. Parents and students were encouraged to read them so that they could*

*understand their teacher's teaching philosophy and the evaluation methods. This was an open file system so that teacher from other schools that had recently adopted this type of system could observe it online. Young teachers were more involved, while older teachers did not want to spend much time on it. Considering the insufficient capabilities of some teachers, the school agreed that teachers could use either paper portfolios or digital portfolios.*

Based on the interviews, it was found that schools that placed more emphasis on a professional growth plan had a stronger sharing culture. Not only were the processes and outcomes of executing the personal professional growth plans shared using the Internet, but the teaching files were also made available to external members, and the personal records of teaching observations were even posted on the Internet. Some comments follow:

*The teachers in our school participated in the teacher evaluation as a team, without any reservations. For example, if the school invited an outside guest to give a speech at the school and a member of the team was unable to attend due to a conflicting class schedule, other members of the same team would assist in recording or taping the content of the study to help him (her) understand the new information. The electronic equipment contributed to the peers-helping-peers process.*

*The evaluation system has been promoted for six years. The Ministry of Education has repeatedly emphasised that the professional growth activity should be not only based on the evaluation report but also results-oriented. The professional growth activity emphasises continuous improvement. Using the observation of teaching and the other files, we could retrieve student learning outcomes, which are also considered in the evaluation process. The detailed information from our personal evaluations of peers was uploaded to the webpage. We are not afraid that our peers can read our own evaluation records and learn from each other. The evaluators from other schools have often learned from us using the internet after being authorised to do so. We do not mind sharing with other schools. This year, 85% of the teachers volunteered to participate in the teacher evaluation project, which is a result of the sharing culture and mutual trust.*

To sustain these systems of school-based teacher evaluation and to support teacher learning and program improvement, technologies must be designed to make these complex systems more accessible. The labour and fiscal costs of these systems are great, and technology holds the promise of greatly reducing these burdens. What is needed, in part, is an electronic platform that seamlessly and efficiently enables users to upload their portfolios manually and to share their work with their peers (evaluators), students, and parents for formal and informal feedback. These efforts will allow teachers to focus on their work rather than the assembly of their portfolio and should significantly enhance the performance of teachers. In addition, electronic platforms that are transparent and supportive of system efficiency facilitate the training of evaluators and the teachers' responses. The establishment of a process to assess the reliability of the systems is necessary.

#### 4.2. Influences of e-evaluation systems on teacher professional development

Table 3. Influences of e-evaluation systems on teacher professional development

Professional growth activities based on the evaluation report	Number of schools	% of schools
Exchange of teaching materials, methods, and course designs (environmental education, reading education, informational education)	23	56.10
Observation of, demonstration of, and feedback on teaching	18	43.90
Sharing of learning experiences and learning content	9	21.95
Research and development of teaching media (E-materials are available in 15 schools, or 36.58%)	22	53.65
Assessment and review of student learning	10	24.39
Sharing activities with examples	25	60.98

We found that the professional development activities that teachers participated in after the e-evaluation were mainly based on education issues, including "curriculum materials design", the research and development of teaching media, the collection of and participation in shared activities with other teachers, and observations or demonstrations of teaching using electronic platforms (accounting for 56.10%, 53.65%, 60.98%, and 43.90% of the schools, respectively, that used an e-evaluation system); 36.58% of the schools developed teaching courses in e-learning. Table 3 indicates that the promotion of e-evaluation contributed to the professional growth of teachers who were concerned about the school curriculum and to the enhancement of student learning. However, a long-term effort on the part of the administrative staff is required by, for example, training the ranked teachers and organising the sharing activities. Some relevant comments follow:

*The promotion of the digital portfolio by the school required the placement of assisting staff and the allocation of study time, and the responses of the teachers are mixed. Considering the fear response of the teachers, the Department of Education's policies regarding information technology teaching, and the supporting grants, the principal decided to apply e-learning to the course design and the implementation of teaching, including the establishment and promotion of the e-classroom. Three teachers with excellent results in the performance evaluation were selected to form a teacher professional learning community for e-classrooms and to participate in learning and peer coaching. At the end of a school year, a meeting was held to share these teachers' accomplishments with other teachers, and the teaching materials that were researched and developed were posted online. Over the next two years, many similar teacher professional learning communities were founded. A lot more e-learning equipment has also been brought to the school.*

*After sharing my design of an interactive whiteboard lesson plan, because of the discussion with and feedback from my peers, I was more concerned about my personal teaching and the students' learning, with getting a more positive response from the parents and the students. Encouraged by the principal, I participated in a teaching competition of our city this year. Although I did not win, I did learn a lot. The teachers in our school have increasingly accepted the e-evaluation system.*

Technology can increase the viability of these complex teacher evaluation systems, elevate peer-to-peer and student-to-teacher interaction, and make systems of teacher evaluation more cost effective. The promise of technology to enhance the professional development of the teachers through the development of school-based

teacher evaluation systems is great, although a small number of teachers continue to resist the online portfolio. As has been found in related studies, if a school can embed the process of collecting evaluation data, feedback, and information about the evaluation context into an electronic platform based on a sharing culture with mutual trust, it can effectively encourage and support its teachers in their application, growth, and development of teaching skills (Association for Supervision and Curriculum Development, 1999; Chang, 2004; Hartnell-young & Moriss, 2007; Ovando, 2001).

#### 4.3. Effects of e-evaluation systems on school development

Table 4. Effects of e-evaluation systems on school development (N=41)

Effects	Number of schools	% of schools
Increase in the number of teachers participating in evaluations	28	68.29
Awards for teaching	17	41.46
Increase in the number of admissions	12	29.26
Correction of the school curriculum	6	14.63
Improvement in students learning (increase in test scores and competitive awards)	5	12.19

This study found that because a large number of evaluators were working in groups, the evaluation process was not easy to manage. The application of an e-evaluation system is expected to encourage teachers to achieve the ideal situation of conducting both self-evaluations and peer evaluations within a sharing culture and to update their growth goals. Most e-evaluation systems are open systems, which allows for browsing by off-campus viewers. Does an open system affect the visibility and development of the school? According to Table 4, due to the effect of promoting e-evaluation systems, 68.29% of schools showed an increasing trend in the number of teachers participating in the evaluation, and 41.46% of schools received awards for research and development resulting from the evaluation process, such as the Teaching Excellence Award, the Creative Teaching Award, and others. Even in the face of the low birth rate in Taiwan, the number of classes in 29.26% of the schools actually increased year by year because of the excellent performance of the teachers or the promotional messages about the teacher evaluation systems. Using information from the teaching observations and the teaching files as well as information about the learning achievements of the students from the e-evaluation system, 14.63% of the schools modified their school curriculum. Although the e-evaluation systems of some schools included subsystems for e-classrooms and e-assessments oriented to student learning and analysis, only 12.19% of the schools showed a significant change in student learning outcomes. Some comments follow:

*All assessment activities were posted on the webpage. Whether or not they participated in the teacher evaluation, all teachers could access the relevant information. Some teachers would ask the office of academic affairs to announce the personal teaching observation time so that their colleagues, in addition to the specified evaluators, could be invited to observe the lesson or to participate in the feedback meeting. Some teachers uploaded their personal teaching video into their teaching files in order to discuss operational processes with other teachers teaching the same subject, which could serve as a reference for course modification. With a safe atmosphere of mutual trust, new teachers participated in the*

*evaluation project every year, while very few people dropped out. Even those teachers about to retire soon volunteered to participate and insisted on doing so until their last moment of teaching.*

*With the integrated program advocated by the principal, the teachers from this school year all participated in the professional learning community about the teaching of reading and held discussions through the dedicated website for the professional learning community. Using the peer coaching mechanism (modifying the process of teaching based on the teaching observation data), with abundant data on implementation and modifications, we obtained the highest award from the Ministry of Education last year: the Gold Award for Excellence in Teaching.*

*Our school is a small school on the border of the city and county. Because of the promotion of the teacher evaluation system, the research and development potential of the teachers was stimulated. They participated in various teaching programs, increasing the visibility of the school. The evaluation network provided information about the current status and effectiveness of the management and counselling as well as the course implementation, providing information about every class to parents and teachers. In the past two years, we have even attracted students from other districts to our school, so the teachers do not have to worry about being laid off due to reductions in class size, which is the greatest benefit of the technology-based teacher evaluation system for development.*

We have some evidence showing that teachers improve their teaching practices as a consequence of participating in an e-evaluation system, and the corroborating data includes observations and information on student learning. However, the evidence for the effects of e-evaluation systems on schools is not sufficient.

## **5. Conclusion and suggestions**

For teacher evaluations in Taiwan, only the evaluation standards and the practice of self-evaluation are common to all schools, while the ratio of evaluators to people being evaluated, the evaluation period, and the evaluation methods (observation of teaching, teaching files) are not uniform. Teacher evaluation in Taiwan is peer- and school-based. To help the teachers grow professionally and effectively manage the evaluation process and its quality, e-evaluation systems are increasingly used in schools. Especially for schools having 35 or more classes (more than 1000 students), an electronic platform should be designed to meet the school's needs. Such platforms mainly include an announcement system, a digital portfolio, and a professional growth activity based on a teacher's evaluation report. Because philosophies vary between schools, the openness of the system also differs. For schools trying to promote a culture of sharing among teachers with a strong foundation of mutual trust, the systems are open to the public. Where confidentiality is concern, schools set the system to be only partially open to internal school peers. The teacher evaluation systems of most schools are only accessible to the evaluators and the teachers being evaluated. Most of the announcement systems and the systems for professional growth activities based on evaluation reports are open to the public because schools would like to use these electronic platforms or technologies to encourage teachers who have not participated in teacher evaluations to join the evaluation project or to reinforce the goal of teacher professional growth. However, the promotion of a digital portfolio does not have an immediate effect, and teachers need to be provided with enough education on using information technology; thus, the evaluation of digital teaching files is not mandatory in some schools.

The schools and the governments of the cities/counties studied require teachers to use digital instruction. Senior teachers may not be able to enact this type of teaching practice promoted by teacher e-evaluation.

Therefore, many schools have used e-evaluation in conjunction with supporting and induction programs, presuming that the administrative staff and peers can support the teachers as they complete the evaluation process. This study also found that the promotion of an e-evaluation system required sharing activities among teachers. The more frequently this occurred, the better the outcome.

Proactive schools usually combined e-evaluation and their educational policy to encourage teachers to review their performance on digital instruction, creative instruction, or reading instruction. Based on the evaluation results, a group was formed to discuss and study the instruction, and the research and development of curricular materials followed. The effectiveness of teaching was analysed through the observation of teaching and the teaching files to form a cycle of evaluation and growth. This model has various effects, including the improvement of the pedagogical knowledge of the teacher, the increase in school recognition, and the reduction of pressure from declining class sizes. However, in terms of enhancing student learning with an e-evaluation system, the evidence found in this study is not strong.

The 53 schools investigated in this study were recommended for participation by the governments of 20 cities or counties. Whether the effectiveness of teacher evaluations resulted from the use of technology and other evaluation-supporting measures or from the school culture and peer partnerships needs to be clarified.

Considering that there was no school that integrated the teacher evaluation, the professional development, and the student learning into an electronic platform, this study tried to use the successful elements of the e-evaluation systems used in 41 schools to propose a model for using electronic platforms to integrate teacher evaluation, professional development, and student learning into an evaluation system.

## Acknowledgements

The authors would like to thank the Ministry of Education, Taiwan for its support of this work through the grant 101L004-06

## Abstract

Current practices in the field of foreign language teacher education and specifically assessment of student teachers at foreign language teaching (FLT) departments have an inclination to make use of traditional means. Today assessment practices in FLT are more innovative and modern through alternative and authentic assessment tools. No matter how much more eligible for objective testing, time consumption and applicability rather than old fashioned assessment tools both the policy makers and the universities as practitioners should take a step to utilize and develop alternative assessment types in language teacher education to change the direction of this flow back and to meet the educational needs of prospective teachers who are digital natives and international criterion to be an autonomous and successful language teacher. Thus, the European Portfolio for Student Teachers of Languages (EPOSTL) as a standard self-assessment tool for students in foreign language teacher training departments across Europe was developed in the light of The Common European Framework of Reference for Languages (CEFR) and the European Language Portfolio (ELP) by the European Centre for Modern Languages of the Council of Europe (ECML). In this study it was aimed to transfer this material into an electronic setting so that this digital material will become an electronic portfolio "the E-EPOSTL" and those prospective teachers dealing with digital natives just like themselves can have the opportunity to evaluate themselves whenever and wherever they are online. In this study the procedure for the transfer of the EPOSTL into the E-EPOSTL will be discussed and defined via some visual e-materials.

Keywords: EPOSTL, CEFR, ELP, ICT, foreign language teaching, digital natives, reflection, autonomy, teacher education, prospective teachers

---

## 1. Introduction

Although assessment should be a means to see the weaknesses and strengths of the learners, it has become the main goal of education. That is to indicate the necessity to change this attitude vice versa, No matter how much time consuming or difficult to try alternative assessment, not only the policy makers but also the universities as practitioners should take a step to utilize and develop alternative assessment types in language teacher education to change the direction of this flow back.

The Council of Europe Language Policy Division in Strasbourg, France (<http://www.coe.int/t/dg4/linguistic/>), and the Council of Europe Center for Modern Languages in Graz, Austria (<http://www.ecml.at/>) collaborate to direct and develop the practices in the field of foreign language learning and teaching across Europe. The Common European Framework of Reference for Languages (CEFR) developed by the Council of Europe is a standard

\* Corresponding author. Tel.: +90 532 779 48 06  
E-mail address: [herguner@gazi.edu.tr](mailto:herguner@gazi.edu.tr)

reference framework for foreign language learning, teaching and assessment (CoE, 2001) ; the European Language Portfolio (ELP), which is also developed by the council is a standard self-assessment tool for language learners (Little 2005); and the European Portfolio for Student Teachers of Languages (EPOSTL) as a standard self-assessment tool for students in foreign language teacher training departments across Europe. It is available on <http://epostl2.ecml.at/> in different languages such as English, French, German, Polish, Romanian, Hungarian, Lithuanian, Greek, Italian, Russian and Spanish.

The EPOSTL was developed for the European Centre for Modern Languages of the Council of Europe (ECML) by a team of teacher educators from five different countries (Armenia, Austria, Norway, Poland, and U.K.). It is a by-product of a project 'A Framework for Teacher Education' carried out by the ECML between 2004 and 2006 (Krišjāne et al 2009, Newby 2012), the aim of which is to harmonize teacher education across Europe. The group members of the project decided to develop it on already existing documents developed by the Language Policy Division of the Council of Europe – the CEFR and the ELP as well as the European Commission-financed project European Profile for Language Teacher Education – A Frame of Reference (Profile).

Behind the EPOSTL, three main documents that helped to construct the EPOSTL are the CEFR, the ELP and Profile. First of all, 'can-do' formulations, and most of the terms in it and insights from the CEFR have been incorporated into the descriptors of the EPOSTL, the core of this document. Next, the common feature of the ELP and the EPOSTL is their having the three-part structure (personal statement – self-assessment – dossier). Also, they both have a focus on reflection. However, there is a significant difference between the two; while the ELP is concerned with language competences; the EPOSTL is concerned with didactic competences. Finally, the EPOSTL provides a frame of reference, the idea of which came from the Profile. However, while teacher educators and curriculum designers are at the target of the Profile, the EPOSTL aims mainly at the student teachers.

While preparing students for their future profession in various teaching contexts, the EPOSTL is an instrument to chart progress and it provides invaluable support during teaching practice and can be a useful source in negotiations with mentors, which will also enable mentors to provide systematic feedback.

The EPOSTL is the property of the student teacher enabling him/her to see his/her strengths and weaknesses. Thus, it is, in fact, a means of enhancing autonomous learning. Still, the teacher educator has an important role to provide guidance for the best use of the EPOSTL. The EPOSTL should have a close relation to the existing course structures. Using it over a period of time-if possible throughout the teacher education programme- is a must because of the fact that it is an instrument which evaluates the process. Then, it is possible to chart progress and growth.

Although it is a document for student teacher, the EPOSTL will do a lot for teacher educators involved in curriculum design by providing a tool in helping to clarify aims and determine content and see the strong and weak points in teacher education programmes. It can be seen as a helpful complementary to the European Profile for Language Teacher Education. It can also be used by teacher educators across countries to discuss anything in the field of training student teachers of English.

EPOSTL is originally a digital document; student teachers can download and print it, which would be time-consuming and demanding for most of them. Using the technological facilities, a website with the same content of the EPOSTL with its complementary files like glossary, index, a user's guide and a video, **www.myepostl.com** was developed. The aim of the research is to present the procedure for the transfer of the EPOSTL into the E-EPOSTL discussing and defining it via some visual e-materials.

## 2. The EPOSTL and The E-EPOSTL

The EPOSTL encourages the students undergoing their initial teacher education to reflect the didactic knowledge and the skills needed to teach languages, evaluate their own didactic competences and enables them to monitor their progress and to record their experiences of teaching during their teacher education at the faculties. The EPOSTL consists of three main sections (<http://www.ecml.at/epostl>):

- a personal statement section: providing some activities to reflect on aspects related to teaching in general and to think about questions that may be important at the beginning of their teacher education.
- a self-assessment section: which contains lists of 196 'can-do' descriptors relating to didactic competences related to language teaching constitute the self-assessment section. The descriptors target future school teachers in secondary education (ages 10 – 18), who teach general language. Different descriptors may be needed for other specific courses. The descriptors were formulated by the ECML project group members after consulting student teachers and teacher educators from 33 European countries. The EPOSTL does not have an aim to impose a rationale or methodology, though identifying core competences and making these competences transparent are hoped to make a small contribution to the student teachers who wants to cross not only institutional but also national borders and to look for common principles applicable across Europe. The descriptors are grouped into seven general categories which have the following headings: 1. Context, 2. Methodology, 3. Resources, 4. Lesson Planning, 5. Conducting a Lesson, 6. Independent Learning, 7. Assessment of Learning. Each general category has sub-categories. For example, 'Conducting a Lesson' includes the subheadings: 'Using Lesson Plans', 'Content', 'Interaction with Learners', 'Classroom Management', and 'Classroom Language'. Also, while several descriptors make references to principles of autonomous learning, these are spread through various sections. This reflects the fact that learner autonomy pervades many aspects of learning and teaching. Within each sub-heading each descriptor is numbered for ease of reference. Each descriptor is accompanied by a bar, a self-assessment scale, which helps students to evaluate themselves. Student teachers are encouraged, with or without the participation of their tutors and peers, to review these bars from time to time to reflect on whether and why improvement has been indicated. Whilst in the *Common European Framework of Reference* and in the *European Language Portfolio* self-assessment descriptors are scaled (A1, B2 etc.), the EPOSTL does not use any numerical scale since the authors believe that it is very difficult to quantify didactic competences. It should be noted that it is not expected that all bars should be filled in at the end of the teaching education programme. Learning to teach and becoming a good teacher is a continuous and life-long process.
- a dossier section: in which students can document progress and record examples of work relevant to their teacher education and their future profession. The documents in the dossier are proofs of what they indicated for self-assessment of 'can do' statements. Although the dossier is the property of the student

teacher, he or she can share items with tutors, mentors, peers etc. The followings could be included in the dossier.

- A. Evidence from lessons the student teacher has given
- B. Evidence in the form of lesson observations and evaluations
- C. Evidence such as detailed reports, comments, checklists etc. compiled by different people involved in the teacher education programme
- D. Evidence from an analysis of what students have done as a teacher
- E. Evidence in the form of case studies and action research
- F. Evidence from reflection

A 'list of documents' checklist can be found at the end of each category to help students collect evidence systematically.

Apart from its three main units, the EPOSTL has an introduction, which provides a brief overview of the EPOSTL, a glossary of the most important terms relating to language learning and teaching used in the EPOSTL, an index of terms used in the descriptors and a users' guide.

Mirici (2007) proposed that seminars, symposiums and conferences should be organized to share ideas and broaden the viewpoint concerning the ELP development, implementation and dissemination, which can be carried out through collaboration between the Ministry of Education, national contact persons, portfolio developers, academics and teachers. This is a must for the EPOSTL, as well.

With in-use traditional student teacher evaluation applications, it is not possible to evaluate the whole process a student teacher has experienced thoroughly. Hence, utilizing EPOSTL can be beneficial to provide reflection by the student teachers and makes it possible for them to participate in their own evaluation. EPOSTL is originally a digital document; student teachers can download and print it, which would be time-consuming and demanding for most of them. However, the developing technology and needs of new learners should be met. They already carry smart phones with internet connection. They may find it difficult to carry another thing to evaluate themselves. By using the technological facilities, the researchers designed a website with the same content of the EPOSTL with its complementary files like glossary, index, a user's guide and a video. By using this online-electronic version of the EPOSTL, learners can access their E-EPOSTL whenever and wherever they like since most students have the internet connection on their phones, or there are Wi-Fi connection nearly everywhere.

### **3. Digital natives and ICT**

Scientists say that there is a new generation entering into our educational institutions and this era is theirs. It is a time when children are born roughly between 1980 and 1994 (Prensky, 2001) as "digital natives", a term used for the new generation which is also called as "Net Generation". These young people are said to have grown up

with information and communication technology (ICT) as an integral part of their everyday lives imbuing them with sophisticated technical skills and learning preferences for which traditional education is unprepared (Bennet et. al, 2008). There is a need for an educational reform to accompany the technological developments the new generation follows very closely because as Prensky (2001) indicated that our students have changed radically and today's students are no longer the people our educational system was designed to teach. One of the biggest problems facing education today is that our Digital Immigrant instructors, who weren't born into the digital world but even later in their lives adopt most aspects of the new technology and who speak an outdated language (that of the pre-digital age), are struggling to teach a population that speaks an entirely new language (Prensky, 2001). Being a digital material, EPOSTL is a practical document for the digital natives. On the other hand, what can make the EPOSTL more accessible and practical are probably the internet and the recent technology. In this study, thanks to the rapidly developing technology and its facilities, the EPOSTL was transferred into an electronic and online environment and it became E-EPOSTL, so that the teacher candidates can reach it without any time or place constraints.

Nowadays both international and intercultural communication mainly takes place in the virtual reality, via the Internet. That's why we offer to use this assessment tool through the internet for the digital natives, who are volunteer and good at using the technological products and like to multi-task.

#### **4. Reflection, Autonomy and Professional Development**

Research on effective teaching over the past two decades has shown that effective practice is linked to inquiry, reflection, and continuous professional growth (Harris, 1998). At the very heart of the EPOSTL, there is an aim to grow up reflective and autonomous language teachers. According to Little (1990), learners become responsible when they are ready to take their own decisions, take part of their own learning process by being critical. Sinclair (2001) also stated that autonomy takes place when learners establish their own objectives, select methods and techniques that work; regulate and monitor their own process and is able to evaluate what they have acquired. Likewise, Benson (1996) indicated that autonomy is a multidimensional capacity that will take different forms for different individuals. She (2001) defined autonomy as the resulting challenge is to "take greater account of learners' ability to set learning goals and to organize their own activity" Though it may imply a degree of independence in the learner, it does not imply isolation. Autonomy and reflection are also in the center of teacher development, which is preferable to teacher training in that it allows the teachers to see their own weaknesses and strengths and try to find out solutions to them in various ways, like action researches, seminars, conferences and so on. Moving from these definitions and explanations of autonomy, it can be said that, in a nutshell, EPOSTL is the right instrument to enhance autonomy in student teachers by helping them to reflect on their strengths and weaknesses. As they take the control to evaluate themselves, they can organize their own learning process as student teachers by putting new goals necessary to develop teacher competencies that they need to see better. As being online and more accessible, the E-EPOSTL looks as a multifunctional tool to develop candidate EFL teachers in Turkey.

#### **5. Developing the E-EPOSTL**

Firstly, a domain name was adopted. Then, a hosting, which has a Php, mysql support, was rented. Next, the importation of the content of the EPOSTL into [www.limesurvey.org](http://www.limesurvey.org) came. It is an open source survey application system which is written in PHP language. It works on the Linux, an operating system. LimeSurvey allows users to quickly create intuitive, powerful, online question-and-answer surveys that can work for tens to thousands of participants without much effort. The survey software itself is self-guiding for the respondents who are participating. Its manual is thus focused at how to install the application, administer the

installation, and support survey creators, administrators and report generation users alike. The followings are significant features of [www.limesurvey.org](http://www.limesurvey.org):

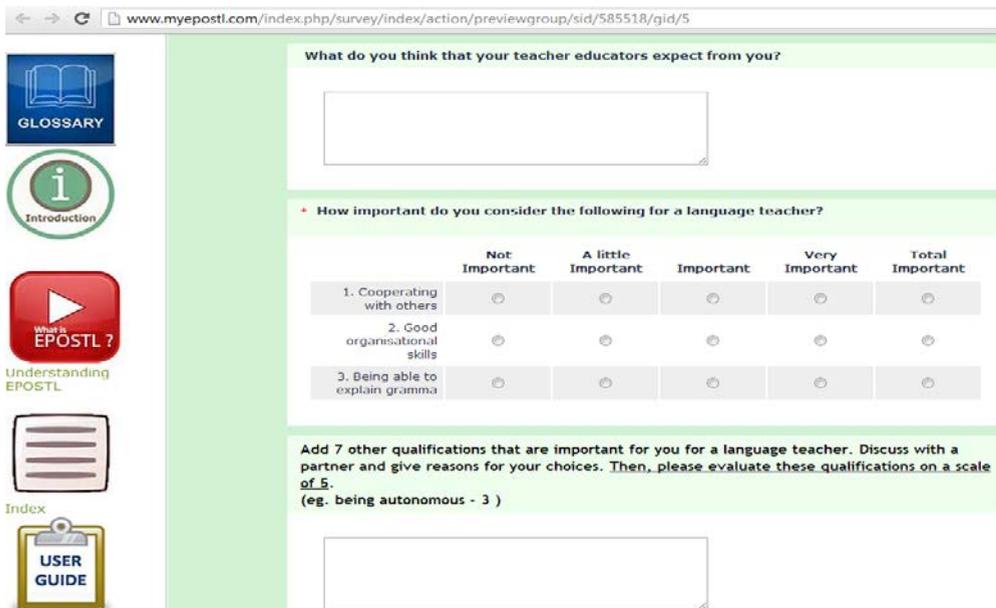

- Unlimited number of surveys at the same time
- Unlimited number of questions in a survey (only limited by your database)
  - Unlimited number of participants to a survey
  - Multi-lingual surveys
  - User-management
  - 28 different question types with more to come
  - Quotas management
  - Integration of pictures and movies into a survey
  - Creation of a printable survey version

**The followings are the possible areas of application of [www.limesurvey.org](http://www.limesurvey.org)**

- Ordinary marketing surveys
- Psychological tests
- Customer satisfaction surveys after buying from an online shop
- General data collection for example by phone at call centers
- Quality management (inter alia in the field)
- Query of candidate qualifications
- Order Form for Product Samples
- Invitation management for events ("I come with X people, we would like to eat Y and Z need overnight accommodations)
- Theory test for Driving School
- Review of lectures at universities
- Event tool like for college fests

These are the question types that limesurvey provides its users: Arrays(5 point choice/(10 point choice/ Yes-No/ Uncertain/ Increase/ Same/ Decrease/ by column/ dual scale/ Numbers/ Text); Mask questions (Date/ File upload/ Gender/ Language switch/ Numerical input/ Multiple numerical input/ Ranking/ Text display/ Yes-No/ Equation); Multiple choice questions (Multiple choice/ Multiple choice with comments); Single choice questions (5 point choice/ List Dropdown/ List (Radio)/ List with comment); Text questions (Short free text/ Long free text/ Huge free text/ Multiple short text).

Creating the sub categories (personal statement- self assessment- dossier) and the items (different sorts of questions-Short free text/Long free text/File upload/Numerical input/array (5 point choice) was the next step.

Also a glossary, which isn't available on the limesurvey.org was separately created by the developer. The following snapshots are from the website [www.myepostl.com](http://www.myepostl.com)

The grid will help you to record your reflections on the descriptors.

**Reflection Grid**  
The grid will help you to record your reflections on the descriptors.  
Please type your comments for any descriptor you like in the self- assessment section by indicating the **descriptor number and the date of reflection.**  
Here is an example for you.  
**METHODOLOGY G2 / 25.03.2013: I find some virtual communities on the internet for my students and help them to interact with these communities.**

**What do I put in the dossier?**  
It will be clear from the list which follows that not all of its suggested evidence can be gathered during your particular training period; some may only be possible when you are a practising teacher. Indeed there is no expectation that everything listed below should be produced during your initial teacher education.  
In order to draw up and update the document, you are encouraged to include:  
A. Evidence from lessons you have given  
B. Evidence in the form of lesson observations and evaluations  
C. Evidence such as detailed reports, comments, checklists etc. compiled by different people involved in your teacher education  
D. Evidence from your analysis of what you have done as a teacher – your 'teacher actions' - and from learners' tasks and related performance  
E. Evidence in the form of case studies and action research  
F. Evidence from reflection

# Hpcs: a web based homework & project control system

M. Fatih Adak<sup>a\*</sup>, Nejat Yumuşak<sup>a</sup><sup>a</sup> *Sakarya University, Faculty of Computer and Information Sciences 54187, Sakarya, Turkey*

---

**Abstract**

For a university, the way of giving lectures practice oriented makes a lecture less boring and more comprehensive. However, the increase in the number of students and the restricted number of academic staff makes it particularly difficult for practice homework to be given or to be followed, if any. The common homework submission method of e-mailing is not a practical method since the email may not be delivered, may be recognized as spam or the large number of homework emails may cause a clutter in the email inbox. In this study, a web based homework control system is developed where students send their homework and instructor access to homework, list them and evaluate them. The system is successfully tested in the lectures given in the Computer Engineering Department. The use of the system over the entire university will facilitate submission and evaluation processes of the homework and will enable the success analysis of the past.

Keywords: homework submission, homework rating, group homework, HPCS, online education

---

**1. INTRODUCTION**

The effect of homework and projects given in a lecture on the understanding of the subject is a long-standing debate. Eren and Henderson carried out a study examining whether large number of homework is actually a waste of time for the students. They have analyzed the positive effect of homework on exams and found that while homework has a marked effect in life sciences, they have almost no effect in social sciences [1]. Ronning, on the other hand, questioned how the differences in the socio-economic status of the family affect the impact of the homework on the success. Results show that for the students with high socio-economic status homework has a strong impact on success while it has no impact for the ones with low socio-economic status [2].

These and the other similar analysis [3,4] show that homework has an important effect on the success in life sciences, which is the field with the intended student population of this study, so it is inevitable to give homework for departments with advanced Math studies. Therefore, it is a necessity to have a system to be able to assign homework to student, to have the homework submitted, and to evaluate and announce the results.

It is important to speed up these homework-related processes to prevent time losses. Therefore, a system is needed where the homework is sent online and is evaluated and graded by the instructor and where the results are announced. Some web-based systems with similar capabilities have been developed. For example, Moodle is an open-source code system and is developed to serve as a course management system. It is not restricted to

\* Corresponding author. M. Fatih Adak, Res. View., Tel.: +90 264 295 70 49  
E-mail address: fatihadak@sakarya.edu.tr

homework and projects, it also includes course contents, announcements and activities [5]. Several studies concerning Moodle carried out; it is compared with other systems and beneficial results of Moodle are proven [6,7,8,9]. However, in Turkey since for most of the universities the course contents and announcements are shared via a different system, in some cases a system is needed where only the homework and the projects are assigned, received and graded. Currently, this need is met using emailing in most of the universities. However, emailed homework may sometimes not be delivered because of the file type it includes or may be received as a spam mail.

In addition, mailing method for the homework submission causes clutter in the email inbox and makes it difficult for the instructor to control and evaluate the homework. A system enabling a web-based homework submission and grading will be able to avoid these significant problems.

Some web-based systems have been also developed who serve only for homework submission and grading. For instance, Webwork is an open-source web-based system which provides online homework submission and grading services. It is developed much rather for mathematical homework that the student provide the solution online [10]. Thereby, Webwork is not suitable for all types of homework submission. On the other side, in the web-based homework submission system developed by Hsu (HWSAM) the homework sent by the student is submitted to the instructor as a file and document hierarchy. Each homework document is gathered in the file of the related course. Group submission feature has also been considered but the simple and inefficient interface of the system makes it fairly difficult to interact with different systems [11]. The detailed system developed by Banker, CHARLIE (A Computer Management Homework, Assignment and Response, Learning and Instruction Environment), not only serves for the submission and grading of the homework but also serves as a system that enables course content input, activity publishing, file sharing and other many similar features [12].

As it can be seen from the studies detailed above, there are systems which allows web-based homework submission and grading. However, they are not able to fully satisfy the needs of a certain university in Turkey nor they are able to be integrated with an existing system. Hence, in this study, a web-based system providing homework submission and grading in Sakarya University particularly Computer Engineering Department is developed. The details of the system are given in section 2 and the assessment of the system is given in section 3.

## **2. HPCS SOFTWARE**

The system is developed as a web-based application and is coded in .Net platform using C# programming language. MsSQL is used as database and Linq library is used to link tables. There are 3 types of user in the system developed. These users and the operations they can perform are shown in Table 1.

Table 1. The operations of user types

User Type	Operations
Admin	Add user, edit user, add and edit course, add and edit activity, view and delete sent homework, add and edit announcement
Instructor	add and edit activity, edit course lists, view delete and grade homework, add and edit announcement
Student	View and update sent homework, upload files to activities, view grade and class average

Users cannot login unless they are registered to database of the university. In this manner, it will not be necessary to give extra user name and passwords to students and they will use the system easily. As a first step to run the system properly, the instructors and courses should be added by the admin. And when instructors log in to the system they can add the students and the activities of their courses to the system. A detailed flow chart of the system is shown in Fig 1.

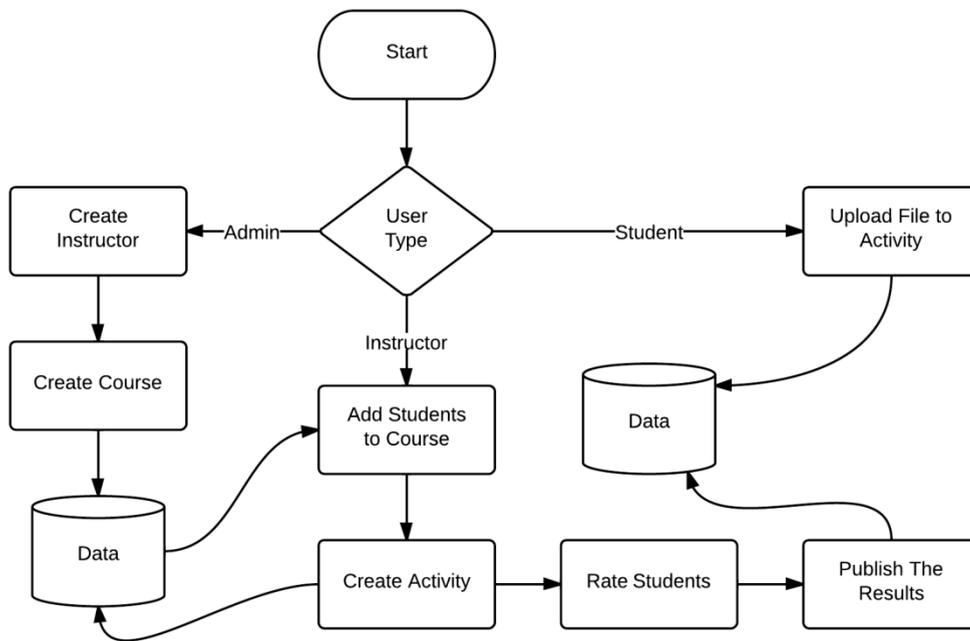

Fig. 1. System flow chart

An instructor may restrict the submission day of the activity by assigning a due date and a late due date. The instructor may also view the students' documents over the system, grade the documents and publish the grades

again using the system. An unregistered student cannot login to the system. When a student login he/she can view his/her registered courses on homepage. The student can send his/her document for the existing activities and update the document before the due date set by the instructor. The interface from which the instructor can add an activity is shown in Fig 2.

The screenshot displays the 'Activity Control Page' for the 'Data Structures' course. The page header includes the department name and the system title. A navigation bar shows 'COURSES' and a 'Logout' link. The main content area is divided into two sections: 'Data Structures' on the left and 'Activity Control Page' on the right. The 'Activity Control Page' contains the following form fields:

- Course: Data Structures (dropdown menu)
- Activity Name: Assignment 2 (text input)
- Group Size (0:No Group): 4 (text input)
- Activity File: C:\Users\MFA\Docu (text input) with a 'Browse...' button
- Due Date: 3/6/2013 11:59 PM (calendar and clock icons)
- Late Due Date: 3/9/2013 11:59 PM (calendar and clock icons)
- A watermark 'H1G7' is visible over the form.
- A 'Save' button is located at the bottom right of the form.

Fig. 2. Activity control page

Some of the activities (homework or projects) may be allowed or required, by the instructor, to be done in groups. In this case, instructor should state the size of the group when he/she adds the activity. The size shows the maximum number of students that a group can have. When a student login and wants to submit the homework as group homework, he/she adds the group members as shown in Fig 3.

Each of the added group members can view the homework from his own page once the activity is submitted. If the instructor views and grades any homework from the group then all the group members will be graded automatically. In this manner, a time loss due to dealing with the same homework of the group members is eliminated.

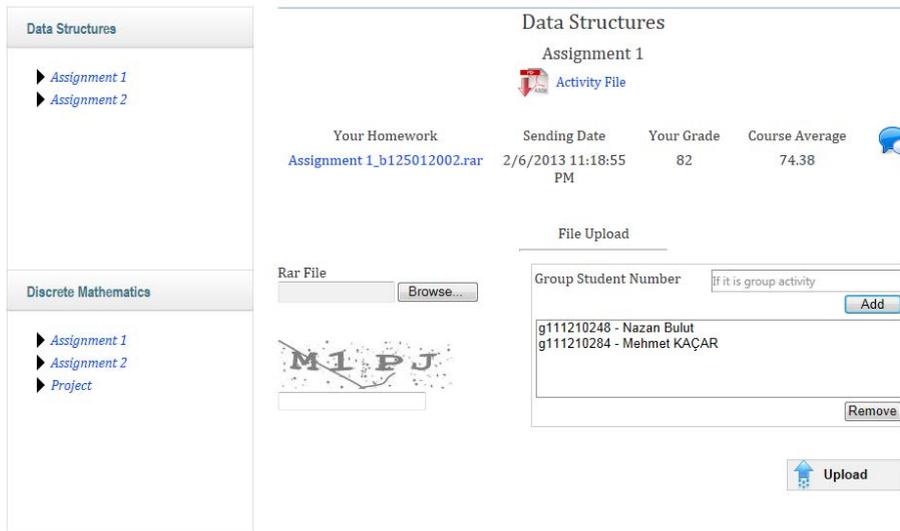

Fig. 3. Student activity sending and controlling page

MsSQL is used as a database and tables are connected to each other with relations. The activity files sent by instructors and homework files sent by students are stored in the database. By this way, the security of the files is provided and the files are prevented from irrelevant people. The database has been constructed as 7 different tables and these tables link to each other with relations. The class diagram of these tables is given in Fig 4. As it can be seen from the figure there may be one or more courses linked to each instructor and each course may have one or more activities. In addition, all the data flow in the system is stored in log table.

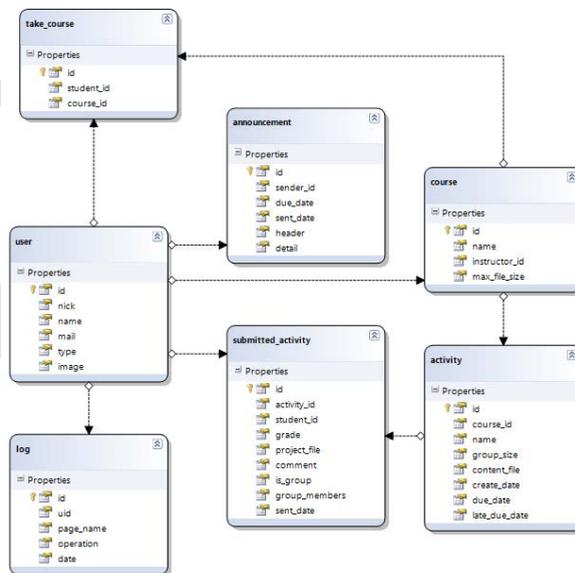

Fig. 4. Data class diagram

### 3. CONCLUSION

The Homework and Project Control System developed here provides an environment where students submit their homework easily. The grades as well as the comments of the instructor become visible once the instructor announces the results of the homework. By this system, problems due to the submission of the homework via email or in a CD are prevented. Group homework is graded easily by the instructor, grading only one of the group members is sufficient, all the group members are graded by the system accordingly. The security of the files is ensured by keeping the homework and projects in the database. HPCS is being tested in Computer Engineering Department and successful results are obtained. In future, the system can be used throughout the entire university.

# Human Capital, Education and the Labor Market: Evaluation of Interaction in Latvia

Viktorija Šipilova<sup>a\*</sup>

*<sup>a</sup>Daugavpils University, Faculty of Social Sciences, the Institute of Social Research, LV-5401, Daugavpils, Latvia*

---

## Abstract

Smart, sustainable and inclusive economic growth with high employment level (the strategy „Europe 2020”) is the goal to which Latvia aspire. Achievement of this goal is largely dependent on human capital and its quality. In this context, it is necessary to develop such skilled workforce, which would be able rationally respond to labor market needs and its changes, otherwise the sustainability of economic growth and prosperity will met more difficulties. In this paper the interaction between human capital, education and the labor market is evaluated. As an indicator for evaluation higher education and vocational training are used, which are quite important parameters affecting the quality of human capital, while the interaction and the results are evaluated using the Latvian experience.

Keywords: human capital, high education, vocational training, labor market, Latvia

---

\* Corresponding author.

E-mail address: sipilova.viktorija@inbox.lv

## 1. Introduction

The objectives of the society in conditions of limited resources are ensuring of existence and improvement of well-being. The process of raising welfare is complex and can occur at two levels:

- at national level, when a country through its economic activities provide increases in GDP and thus in GDP per capita;
- at individual level, where the paid employment is one of the most important in processes of provision, sustenance and improvement of welfare.

European labor market is characterized by rising unemployment, as well as untapped potential in certain sectors that particularly is relevant for countries with strong fiscal consolidation, decreased average household income in many European Union member countries, as well as high and ever-increasing labor taxes, which are impede job creation (European Commission, 2012). Consequently, competition not only among job seekers, but also among employees increases. As one of the main factors, which could influence the opportunities of job seekers and employees to realize their potential in the labor market and through this improve their well-being, the human capital is, the quality of which is directly dependent on education.

Human capital is recognized as a key resource in Latvia. However, development of human capital facing the challenges of aging and depopulation, an as a result loses of productivity and changes in labor structure. Latvia ranks fifth place among Central and Eastern European countries in terms of usage of human capital (Saeima of the Republic of Latvia, 2010).

As is indicated in the strategy „Latvia 2030” - continued investment in basic values of human capital and the use of it would be useless spending, if human productivity during next few years will not be significantly improved (Saeima of the Republic of Latvia, 2010). Productivity growth contributes to increasing of social welfare, therefore it is necessary motivate individuals to develop their human capital, but in this aspect the making of right choice is important.

An individual's choice in favor to vocational or higher education and specific programs is an important issue in Latvia, because:

- mismatch of labor skills and competences with labor market requirements in Latvia is observed (Ministry of Economics of Republic of Latvia, 2011);
- investments in human capital at the workplace are relatively small (Latvijas Republikas Saeima, 2010);
- most of the Latvian workers are not employed on professions according to their acquired education (LR LM, 2007);
- a large number of workers occupies several jobs (LR LM 2007) what points to the lack of specialists.

At the same time the Latvian education system stands in the face of changes and one of the main arguments in favor of this changes the fact that the existing offer of vocational and higher education do not meet needs of economy could be mentioned (Ministry of Economics of Republic of Latvia, 2011). Forecasts indicate that imbalance in offer and demand of labor force in Latvia in period from 2014 till 2020 is possible. The biggest shortage of labor force since 2014 till 2020, by forecasts in following professions and occupational groups is expected:

- professions - tourism professionals, professionals in quality management systems;
- occupational groups - paramedical staff, nurses, other social science professionals, low-skilled workers (LR LM, 2007).

Given the above trends, the aim of the article is to assess the interaction between human capital, education and labor market in Latvia.

The article is organized as follows: the second section presents the theoretical basis of role of human capital and education in economic growth, economic development and welfare improvement, as well as in the labor market, in the third chapter the author explains the methodology used for the study, in the fourth chapter the research results are discussed, followed by conclusions.

## 2. Literature Background: Short Overview
